Volume 1 of 5
eBook Release Years: 1900–2004
30 Works • Chronological Order

Project Gutenberg Collection

Contents — Volume 1

1. Dao De Jing — Lao Zi [?]

2. Untitled — G. H. (Godfrey Harold) Hardy [?]

3. Discourse on the Method of Rightly Conducting One's Reason and of Seeking Truth in the Sciences — René Descartes [1993]

4. Discourse on the Method of Rightly Conducting One's Reason and of Seeking Truth in the Sciences — René Descartes [1993]

5. Collected Articles of Frederick Douglass — Frederick Douglass [1994]

6. The Count of Monte Cristo — Alexandre Dumas [1998]

7. The Republic — Plato [1998]

8. Romeo and Juliet — William Shakespeare [1998]

9. Untitled — William Shakespeare [1998]

10. Untitled — William Shakespeare [1998]

11. Apology — Benedictus de SpinozaThe Project Gutenberg eBook of Apology [1999]

12. The Indian Cookery Book (c.1900) — Anonymous [2001]

13. Untitled — Unknown [2001]

14. Untitled — Bertrand Russell [2001]

15. Untitled — Unknown [2001]

16. Untitled — Unknown [2003]

17. The Critique of Pure Reason — Immanuel Kant [2003]

18. An Enquiry Concerning the Principles of Morals — David Hume [2003]

19. Untitled — Henri Bergson [2003]

20. Beyond Good and Evil — Friedrich Wilhelm Nietzsche [2003]

21. Beyond Good and Evil — Friedrich Wilhelm Nietzsche [2003]

22. Incidents in the Life of a Slave Girl, Written by Herself — Harriet A. Jacobs [2004]

23. Zur Männerfrage! — Clara SchachneThe Project Gutenberg eBook of A Discourse Upon the Origin and the Foundation of the Inequality Among Mankind [2004]

24. Twenty-Two Years a Slave, and Forty Years a Freeman — Austin Steward [2004]

25. Uncle Tom's Cabin, Young Folks' Edition — Harriet Beecher Stowe [2004]

26. Utilitarianism — John Stuart Mill [2004]

27. Don Juan Tenorio — José Zorrilla [2004]

28. Don Juan Tenorio — José Zorrilla [2004]

29. Untitled — Wolfgang Amadeus Mozart [2004]

30. Civilization and Beyond: Learning from History — Scott Nearing [2004]

Dao De Jing

Lao Zi

Project Gutenberg Release: Unknown · eBook #0

Dao De Jing by Lao Zi A Minimalist Translation By Bruce R. Linnell, PhD 2015 Welcome to yet another translation of the Dao De Jing (DDJ), or Tao Te Ching in the old-fashioned spelling. Why should you want to read this translation? This version attempts to include an exact translation of every Chinese symbol in the original text, with as few added words and paraphrasing as possible. This results in sentences which hopefully provide a more literal translation, but are bare and minimalist, sometimes awkward, and often doesn't make sense. You, the reader, will have to wrestle with some sentences, trying to wring out of them whatever meaning their author was trying to express 2300 years ago, instead of my simply telling you what I think they mean. I also show you what words were translated exactly, what was interpreted, and what was added or left out, so you can see exactly how much the English translation has in common with the original Chinese. I even point out alternative translations, so you can choose for yourself in some cases. Another difference is that while this translation is primarily based on the "Wang Bi" ancient manuscript (used by most translators), it presents some of the ideas from the earliest versions of the DDJ we have available, if those ideas are present in the majority of all the sources. Finally, scholars have long speculated that different parts of the DDJ were written by different authors at different times. By analyzing the symbols, phrases, and themes in each chapter, the chapters can be separated into at least three groups. The appendix presents the chapters in these groups, so that the reader may better see the common themes each group focused on. Who Wrote the DDJ and When? There is a great deal of debate over these questions, enough to fill a book in their own right! What follows is just a very brief introduction for the first-time reader who has no idea who "Lao Zi" was (please note that all dates are very approximate). Although the author of the DDJ is always given as "Lao Zi" or "Lao Tsu" (old spelling), we have no historical proof of his existence. A Chinese court historian named Sima Qian, who lived around 115 BCE, wrote a biography of Lao Zi (literally "old master", unless Lao is a family name – in which case "master Lao") that presents three different possible traditions, although the accuracy of any of them is doubtful. The first says that Lao Zi was a contemporary of Confucius (500 BCE). His family name was Li ("plum"), his given name was Er ("ear"), and he was posthumously called Dan ("long ear"). He was an official in the imperial archives, but when the Zhou dynasty began to decline, he decided to leave China. When he reached the northwest border of China, the border guard asked him to write down his teachings, which resulted in a document of about 5000 characters in two sections. Later in the same document, Sima Qian also speculates that Lao Zi may or may not have been Lao Dan ("old long ear"), an advisor to Duke Xian (370 BCE). Finally, Sima Qian says that a man named Lao Laizi ("old returning master") authored a Daoist book that had 15 parts, was born in the same province as Lao Zi, and also was a contemporary of Confucius. These three accounts are further complicated by reported meetings between Confucius and someone called Lao Dan in various Confucian texts. References to the DDJ by other ancient Chinese writers indicate that at least some parts of the DDJ were in existence by 300 BCE, and it was being referred to extensively by 250 BCE. One linguistic analysis of the rhyme schemes indicates that it may have originated as early as 450 BCE, and if the DDJ contains the written version of earlier oral traditions, these rhymes may reflect its oldest origins (because rhymes are easier to memorize). Other references and linguistic analyses place its beginnings around perhaps 375-325 BCE, and the earliest known written portions of it (described in the next section) date to about 300 BCE. So, some parts of the DDJ seem to have first appeared in written form between roughly 350-300 BCE, although its roots could be much older. It certainly existed in some version of its finished form (roughly 5000 characters in 81 chapters) by 200 BCE. There is also debate on whether the text represents the work of mostly one author, or was added to by different authors over the course of about a century, or was later compiled from different traditions by one person. The most recent versions of the DDJ are separated into 81 chapters, and two major parts. The first part, consisting of chapters 1-37, primarily discusses Dao, while chapters 38-81 primarily discuss De. Ancient authors referring to the DDJ also speak of versions that are divided into 64, 68, or 72 chapters. Different Versions of the DDJ There are at least six different ancient sources of the text (all dates are approximate) : "Guodian" (GUO) – discovered in 1993 and written around 300 BCE or slightly earlier, this version matches only about 31 chapters of the later versions of the DDJ, and its chapters are ordered completely differently than the later versions. The Chinese symbols are so ancient that scholars disagree on what modern symbols they should correspond to, and there are occasional spots on the originals where the characters can no longer be read. "Mawangdui" (MWD) – discovered in 1973, there are two slightly different versions ("A" and "B"), obviously written by two different people, dating to about 200 BCE and 175 BCE respectively. While all 81 chapters are present, both versions reverse the two major parts ("Dao" and "De") compared to later versions. In addition, the order of a few of the chapters within the parts is different, as is the order of some sections within the chapters! The Chinese symbols are also so ancient

that scholars disagree on what modern symbols they should correspond to, and there are many spots where the characters cannot be read. “Fu Yi” (FY) – Fu Yi was a scholar who lived around 600 CE and claimed that the version he presents and discusses was found in a grave that from his description could possibly be dated to around 200 BCE. “Wang Bi” (WB) – written around 240 CE, this is the “standard” version that most translators use, although there are several slightly different variations of it. “He Shang Gong” (HSG) – a legendary and possibly mythical person who may have lived around 170 BCE, but the work which presents and discusses the version of the DDJ associated with him is not mentioned by others until 300 CE. Many scholars think this version was probably written closer to 300 CE and attributed to He Shang Gong to give it authority. There are also many slightly different variations of this text available. In comparing the six sources, it is easy to see the changes in philosophy of the early Daoists over the centuries. In general, the three earliest versions (GUO, MWD/A, MWD/B) more-or-less agree with each other, the three later versions (FY, WB, HSG) more-or-less agree with each other (despite the tentative dating of FY to 200 BCE), the two groups are often slightly different from each other, and occasionally very different. However, FY does sometimes agree with the three earlier versions. Only the later versions contain the vast majority of criticisms of Confucianism, although even GUO has a few. WB, HSG, and FY were chosen as sources for this translation mainly because their earliest manuscripts are complete, and the Chinese characters are “modern” enough that there is less doubt as to their meaning. But there are occasional differences between them, so a 2/3 majority vote was used to determine which symbol to use. This would result in a document which is essentially the same as WB, since WB and HSG are almost always the same. However, in comparing all six sources (or fewer if the chapter is not in GUO, or the earlier symbols cannot be read), it becomes obvious that sometimes significant changes were made only in the most recent sources. Thus a symbol was changed to the one used by the older sources if the majority of all available sources use the different symbol, and it adds to the understanding of the sentence. In the case of a tie, the more recent symbol was used. These rules were used for adding or deleting symbols as well. The Translation Process There are many reasons why translations differ, besides the problems inherent in translating from a language where : each symbol represents a word that has multiple (sometimes very different) meanings; tenses, articles, and plurals are not indicated; and one symbol can represent either a noun or adjective, another a verb or adverb, another all four! 1. What source is used : for WB and HSG, which version of what source; in the oldest sources, what modern symbols to use 2. Accurately knowing all the possible English meanings for each symbol (and sometimes pairs of symbols), including changes in meaning over the millennia, and understanding ancient idioms 3. Having to pick just one meaning for each symbol 4. Organizing each sentence into something that makes sense, which is helped by understanding something of ancient Chinese grammar The cultural background, knowledge, biases, beliefs, and agenda of the translator affect every step but the first. “Agenda” refers to how the translator approaches the content of the DDJ : as a work of mysticism vs. philosophy vs. military strategy vs. advice to emperors, etc. The goals for this translation were : Include an English word or phrase for every Chinese symbol in the sentence Use exact translations of the Chinese symbols wherever possible Minimal interpretation of individual symbols, only where needed for clarity Use the same English word(s) for the same symbol(s) when appropriate As few added English words as possible to make it a correct English sentence No interpretation of the final translated sentence Individual symbols are interpreted only when they either don’t make as much sense literally, or the resulting sentence would be awkward in English. In some cases, if a symbol means two English words that both seem to fit equally well, they are combined into one phrase, such as “heart/mind” for ■ (see the next section), or ■ which can mean “mystery”, “profound”, “deep”, or “dark”, and is consistently translated as “deep and mysterious” or “deep mystery”, depending on the context. The above goals hopefully help minimize, but cannot eliminate, translator bias. The problem is that each Chinese symbol still has several meanings, and the translator must pick just one for each symbol (step 3) to create an English sentence that makes sense (step 4). It is impossible to avoid translator bias here because the translator must choose what makes sense or feels right to them, in both word meanings and overall grammar. For example, there is a line in chapter 58 : ■ ■ ■ ■ ■ ■ where ■ can mean “good fortune” or “happiness” and ■ can mean “misfortune” or “disaster”, but by reflection with ■ could also be interpreted as “unhappiness”. ■ can mean “lean on”, “rely on”, or “depend on”, so all of these are valid translations : Misfortune is that which good fortune leans on. Misfortune is that which good fortune relies on. Misfortune is that which good fortune depends on. Unhappiness is that which happiness leans on. Unhappiness is that which happiness relies on. Unhappiness is that which happiness depends on. Beyond the differences between using “fortune” (less personal : what happens to you) versus “happiness” (more personal : how you feel), there are also subtle differences : saying that one “relies” on the other is different than saying that they mutually support each other (as possibly indicated by the sentence following this one, not shown here). Unlike the previous example, where the different translations for each symbol are more-or-less related, sometimes the choice the translator makes can affect the overall meaning or even the emotional impact of the sentence. In chapter 20, there is a line : ■ ■ ■ ■ in which the last symbol can be variously translated into : I alone seem lost. I alone seem to have lost everything. I alone seem to have been left behind. I alone seem to be forgotten. Each of which says a completely different thing. And in chapter 46, there is a line : ■ ■ ■ ■ ■ ■ where the first symbol can mean any of : “sin”, “crime”, “vice”, or “fault”, so

(ignoring options for the other symbols), all of these are valid : There is no sin greater than the capacity for desire. There is no crime greater than the capacity for desire. There is no vice greater than the capacity for desire. There is no fault greater than the capacity for desire. “Sin” of course has very negative religious connotations in the West, while “crime” and “vice” also have stronger negative associations than “fault”. But there are other, even more significant ways in which the translator’s choices affect the result. Because of the many (sometimes unrelated) possible meanings of each Chinese symbol, it is possible to come up with multiple translations of the exact same sentence that are completely different in meaning! For example, in chapter 41, there is a line : ■ ■ ■ ■ where ■ can mean both “region” and “square”, while ■ can be “border” or “corner”, so both of these are valid translations : The greatest region is without borders. The greatest square is without corners. And in chapter 45 : ■ ■ ■ ■ where ■ can be “skillful” or “clever”, and ■ can mean “stupid” or “clumsy”, both of these are equally likely : Great skillfulness seems clumsy. Great cleverness seems stupid. Finally, even when there is no ambiguity about the meaning of the individual symbols, it sometimes hard to determine what overall meaning was intended. From chapter 35, there is a line : ■ ■ ■ ■ ■ ■ in which the first four symbols literally mean “words of Dao”, but does this mean “talking about Dao” or “the words that come out of Dao”? It can be argued both ways due to subtleties in the meanings of the symbols, but there is a tremendous difference in meaning between the two translations. In addition, there are a few symbols whose modern English meanings just don’t make sense within the context of the sentence, probably due either to transcription errors or changes in meaning over the millennia. The English words used for these symbols are usually selected according to context. Common Terms Because the translation itself is meant to involve minimal interpretation and explanation, some of the words and phrases that are used repeatedly need to be discussed beforehand for clarity. Keep in mind that volumes have been written about some of these concepts – these are just brief summaries for the reader new to Daoism. ■ Dao : most often translated as the “way”; according to various passages in the DDJ, Dao appears to be the way of nature (or the universe), the process of being in harmony with that way, the source that creates and nourishes all things, and absolute ultimate reality itself (and according to the opening lines of the first chapter, this description is completely inadequate); it is left untranslated so that readers may “fill in the blank” for themselves as they read; “the Dao” is used as little as possible because in English that implies that Dao is more of a thing than a process; Dao is sometimes referred to as “it” to avoid awkward grammar (or if it was written that way in the original Chinese), but do not think of Dao as a noun (just for fun sometime, try reading “Dao” as “Daoing”…); one exception is when “Dao of” is used (for example, “the Dao of heaven”) – this seems to be literally referring to the way heaven does things, so it is translated as “the Way of heaven”, but “Way” is capitalized to remind the reader that this is also Dao; similarly, “this Dao” seems to be referring more to “this way (of following Dao), and is translated “this Way” ■ De : most often translated as “virtue”, “integrity”, or “(inner) power”, De is described in chapter 49 as “goodness” or “virtue” and “honesty” or “trust”; De might be infused into things when they are created by/from Dao, or something that develops when Dao is fully expressed through a person; De seems to be both the quality of being virtuous and the power that comes from being virtuous, so it might best be thought of as “the power of one’s virtue” or “the power from one’s integrity”, but it is also left untranslated so that readers may “fill in the blank” for themselves as they read ■ “heaven” : a complex concept, this symbol seems to have connotations of the sky, nature (including people and societies), that which controls our destinies, as well as possibly that of a celestial god-like spirit (and/or perhaps ancestral spirits) ■ ■ “heaven and earth” : everything, the universe, all that is ■ ■ “the world” : literally “heaven under”, it is perhaps better thought of as “all things under heaven”; it is left as “the world” because the English grammar sometimes gets awkward using the more accurate phrase; some translate it as “the empire”, which gives the entire document a much more imperialistic and militaristic slant ■ ■ “ten thousand creatures” : “ten thousand” as used here does not refer to a specific number, but means “innumerable” or “myriad”; together the symbols are perhaps better thought of as “all creatures and things” ■ ■ “sage” : literally “holy man”; in the DDJ, a sage is anyone who fully embodies and expresses Dao and De; as the ruling class would have been one of the few literate groups in ancient Chinese culture reading the DDJ, it seems possible that references to the way the sage does things could have also been a subtle way of saying “this is what a wise ruler would do” (especially in chapters like 5, 57, and 66, where the sage seems to be the ruler) ■ “ever-constant” : while this is often translated as “eternal”, it probably had more of a sense of “constant” or “permanent” in ancient China; unfortunately “constant” doesn’t imply the enduring nature of “permanent”, nor does “permanent” imply the unchanging quality of “constant”, so “ever-constant” is used here ■ “heart/mind” : usually translated as either “heart” or “mind” (the symbol means both), “heart/mind” seems to be the best translation ■ ■ “naturally so” : this has the connotation of something that happens spontaneously, without being forced (“of itself”, “of its own accord”, “on its own”); Dao is “naturally so”, and although the DDJ does not say so explicitly, presumably the sage acts “naturally so” as well ■ “uncarved block” (of wood) : just as a block of wood can be carved into virtually anything, in the DDJ the “uncarved block” represents the limitless undefined potential of our original nature ■ ■ “non-action” : not passivity or lack of action, but spontaneous action taken at the proper time according to the situation ■ ■ “non-interference” : to change the natural order of things as little as possible in achieving your goals ■ ■ “without-knowledge” : not an absence of knowledge, but a kind of understanding that does not resort to pre-conceived ideas or

rules ■ ■ “without-name” : a reminder that things, concepts, and experiences are far more than the names we give them and ultimately cannot be described with words (in contrast to the Confucians, whose goal was to find the “correct name” for everything) ■ ■ “without-desire” : not a total lack of desire, but desires that do not control us or our happiness; a sort of spontaneous, unattached desire ■ or ■ ■ “non-being” : the nameless absolute that is the source of all existence (“being”) ■ “strive” : to struggle or make vigorous effort to achieve something, perhaps competing against others to get it; the opposite of non-action ■ “yin” : the feminine principle; receptive, yielding, dark, cool, soft ■ “yang” : the masculine principle; aggressive, active, light, warm, hard ■ “qi” (ch’i, chi) : vitality, life energy, life force, vital energy ■ “virtue” : the traditional sense of moral virtue and goodness ■ “stillness” : a mental/emotional stillness of the heart/mind ■ “valley” : the image of the valley is often used in the DDJ; a valley represents receptiveness (because it accepts all things that come into it), openness, and emptiness, and so is feminine in nature ■ “self” : often translated as “body” by others (it can mean either), it is my personal bias that this symbol seems to consistently refer to the sense-of-self, personality, or ego ■ or ■ or ■ ■ or ■ “returning” : the DDJ uses four different symbols to refer to the concept of returning, and it is used many times; beyond the everyday meaning, in the DDJ creatures and people often return to their source, true nature, or original state of pure and unformed potential; sometimes they just “return”, and from where or to where is not specified ■ “insight” : an intuitive, without-knowledge, understanding of what is; this is another personal bias – while the literal translations include “wise”, “clear”, “understanding”, “perceptive”, and “sight”, it seems that this symbol can be consistently interpreted as “insight” (which is in agreement with the literal translations); in addition, it is variously translated by other modern translators as “enlightenment” and even “insight” ■ “duties” : one’s personal and business affairs, responsibilities, etc. ■ “I” : on the rare occasions this is used, think of this as someone who is a sage-like Daoist rather than merely “the author” ■ ■ “100 families” : in ancient times this phrase referred to the entire ruling class ■ “scholar” : around the time of the DDJ, this referred to the elite “intellectual” class of Chinese society, the teachers and philosophers (Confucius would have been considered a scholar) ■ “ruler”, ■ “king”, etc. : there are many symbols and euphemisms for various members of the nobility (“nobles”, “superiors”, “master of the people”, “son of heaven”, “master of 10,000 chariots”, etc.) ■ “high rank” : any position of power or admiration While the DDJ is over 2000 years old, its wisdom is still applicable today, but don’t be fooled by the ancient wording! “King” could today apply to anyone who runs things, manages others, or leads any kind of group (from the nation’s leader to a corporation CEO to…your boss), and “high rank” could apply to government officials, billionaires, or even movie stars. There are also many Confucian terms used in the DDJ : ■ “kindness” : being benevolent, kindhearted, humane ■ “righteousness” (translated as “morality” to avoid religious associations) : having a sense of justice, doing the right thing, being morally upright ■ “propriety” : ritual courtesy and formality; proper etiquette ■ “wise”, “wisdom” : as it says ■ “truth”, “trust”, “honest” : as it says ■ “loyalty” : as it says ■ “courage”, “brave” : as it says ■ “honorable” : having a sense of honor or integrity; incorruptibility ■ “filial piety” (translated as “devoted children”) : respect your elders and parents, duty to your parents, care for the elderly ■ “compassion” : benevolence, mercy; as specifically applied to parents’ attitude towards their children, this is translated as “loving parents” ■ ■ “noble man” : literally “son of the ruler”, this can mean “nobleman” (one who belongs to the nobility), but is also a Confucian term that means one who is noble or moral in character and embodies the above qualities; sometimes translated by others as “gentleman” or “superior man” Many symbols in the DDJ are used to provide emphasis (similar to an exclamation point in English), and can either come at the end of a sentence or can be used to emphasize a word or phrase in the middle of a sentence. Many translators ignore these latter symbols entirely, while others preface the emphasized word with “so…”, “such…”, “very…”, “oh,…”, etc. Here, an exclamation point is used immediately after the word, but then the sentence continues on. One symbol in particular implies that what precedes it is not only true but has always been true, which is translated as “indeed!” References Introduction : Laozi, by Alan Chan; Stanford Encyclopedia of Philosophy, http://plato.stanford.edu/archives/spr2009/entries/laozi/; 2009 Translations : Dao De Jing : A Philosophical Translation, by Roger T. Ames and David L. Hall; Ballantine, New York; 2003 (note that this is a translation of the MWD sources) Lao Zi zhi Dao De Jing : Two Literal English Translations, by Bradford Hatcher; http://www.hermetica.info/LaoziA.htm; 2005 Lao Tzu, Tao Te Ching, by D.C. Lau; Penguin Books, London; 1963 (this is a reasonably literal translation, with minimal interpretation; note that his 1994 book is an MWD translation) The Way and Its Power, by Arthur Waley; Grove Press, New York; 1958 These were mostly used for their own explanations of the more difficult passages and ancient Chinese idioms, but were sometimes used for comparison during the translation process. Ancient Chinese Sources : Comparisons of Chinese Versions, by Nina Carerra; http://www.daoisopen.com/Comparisons.html; 2005 These charts were used to compare the symbols between all sources, and for end-of-sentence and end-of-chapter markers. I personally verified the WB symbols in these charts against several different references. Key to Notations Symbols used for the translation • = end-of-line character appears in some source (•) = symbol usually starts or ends a line Of the 6 ancient sources (see Introduction), this translation uses WB except where the majority of the other sources disagree with it. The notations for these changes are : ( ) = WB symbol has been changed __ = WB symbol has been deleted [ ] = symbol not in WB has been added The final English translation Sections separated by blank lines are the opinion of the

translator. Raw translation underline = verbatim translation italics = interpreted translation; exact translation is to the far right in [brackets] underlined italics = combined literal meanings from one symbol underline2 or italics2 or underlined italics2 = 2 symbols used to provide translation {word} = equally likely translation of single symbol [word] = symbol left out for grammatical clarity [word] = word added for clarity that significantly influences the meaning of the sentence word* = Confucian concept word° = untranslatable; word is chosen for consistency ♦ = all symbols in the sentence are the same in all or all but one of the sources (sentence is identical or essentially identical across all sources); this does not account for different symbols with the same meaning! Footnotes and cross-references Differences between the sources are sometimes noted, but not every difference is noted. Footnotes in italics provide my own possible interpretations of the more difficult passages, which you may certainly ignore! Chapter One • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ ■ • ■ The Dao that can be spoken of is not the ever-constant Dao. The name that can be named is not the ever-constant name. That which is without-name is the beginning of heaven and earth. That which possesses a name is the mother of the ten thousand creatures. Therefore : always without-desire, thus you observe its subtle mystery. Always possessing desires, thus you observe its external appearances. These two, they arise from the same source but have different names; This sameness is called their deep mystery. Deep mysteries, and again deep mysteries – The gateway of many subtle mysteries. ♦The Dao that can be spoken of is not the ever-constant Dao. ♦The name that can be named is not the ever-constant name. [That which] is without-name is the beginning of heaven and earth.A ♦[That which] possesses a name is the mother of the ten thousand creatures. Therefore : always without-desire, thus you observe its subtle mystery. Always possessing desires, thus you observe its external appearances. [boundary,surface] These two, they arise from the same [source]B but have different names; This sameness is called their deep mystery. ♦Deep mysteries, [] and again deep mysteries – The gateway of many subtle mysteries. Notes : A : this line and the next may just as likely be translated as Non-being is named as the beginning of heaven and earth. Being is named as the mother of the ten thousand creatures. either way, compare to #40, where the world and the ten thousand creatures are created from being B : literally, “they have the same arising” Cross-references : without-name : #32, #37, #41 mother : #20, #25, #52, #59 always/ever-constantly without X : #32, #34, #37 without-desire : #3, #34, #37, #57 mystery : #6, #10, #15, #27, #51, #56, #62, #65 mysterious sameness : #56 gateway : #6, #10, #52, #56 Chapter Two ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ __ ■ ■ (■) • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ • ■ ■ ■ ■ • In the world, when all know that the action of beauty is beautiful, then ugliness ensues. When all know that the action of good is goodness, then not-good ensues. Therefore : being and non-being create each other, Difficult and easy complete each other, Long and short contrast each other, High and low lean on each other, Tone and voice harmonize each other, Before and after follow each other. Thus the sage : Lives by using non-action in his duties, And practicing no-talking in his teachings. The ten thousand creatures arise, but do not have a beginning. Creating but not possessing; Acting, but not concerned with the results; Accomplishing tasks, but not dwelling on them. Now : only because there is no dwelling, Thus the results do not depart. In the world2, when all know that the action of beauty is beautiful, then ugliness°{evil} ensues. [thereafter,afterwards] When all know that the action of good is goodness, then not-good ensues. [thereafter,afterwards] Therefore : being and non-being create each other,A Difficult and easy complete each other, Long{lasting} and short{brief} contrastB each other, [forever] [compare] High{above} and low{below} lean on each other,C Tone and voice{sound} harmonize each other, Before{front} and after{back} follow each other. Thus2 the sage2 : Lives by [using] non-action in his duties, And practicing no-talking in his teachings. [performs] The ten thousand creatures arise, but do not have a beginning. Creating but not possessing;D ♦Acting, but not concerned with [the results]; [depend upon,rely upon] Accomplishing tasks, but not dwelling on them. [results,achievements] Now : only because there is no dwelling, ♦Thus2 [the results] do not depart. Notes A : compare to #40, where non-being creates being B : FY, MWD, and GUO all have different words here (for example : “shape”, “form”, “mold”, etc.) C : compare to #39, where low is the foundation of high D : this line is missing in the earliest three sources; there is no indication in the original Chinese as to whether it is the sage or the creatures that are the ones acting in this and the following lines, so it is left ambiguous here as well Cross-references beauty and ugly : #20 non-being : #40, #43 tone and voice/sound (same symbol) : #41 non-action : #3, #37, #38, #43, #48, #57, #63, #64 sage practices non-action : #43 teaching : #27, #42, #43 no-talking in his teachings : #43 creates but does not possess : #10, #51 acting but not concerned : #10, #51, #77 accomplishing tasks : #9, #17, #34, #77 and not dwelling on them : #9, #77 Chapter Three ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

then all will be governed! Not honoring [those who are] esteemable [virtuous,talented] Ensures that the citizens do not strive. [cause,make] ♦Not valuing rare2 [] goods Ensures that the citizens do not act like thieves. [cause,make] Not showing [that which] can be desired Ensures that the citizens' heart/minds do not become confused. [cause,make] ♦Thus2 the governing of the sage2 ♦Empties their heart/mindsA, fills° their stomachs, ♦Weakens their ambitions, strengthens their bones. ♦By always ensuring that the citizens are without-knowledge and without-desire, [cause,make] Those who make men wise*B will not dare to act. Act with non-action, then all2 will be governed ! Notes A : presumably of striving, greed, and confusion B : presumably referring to Confucians; earlier sources use the non-Confucian term "knowledgeable" instead of "wise" Cross-references no striving : #8, #22, #66, #68, #73, #81 rare goods : #12, #64 without-desire : #1, #34, #37, #57 weak : #29, #36, #40, #55, #76, #78 strong : #29, #30, #33, #36, #52, #55, #67, #78 not daring to act : #64, #67, #69 non-action : #2, #37, #38, #43, #48, #57, #63, #64 act with non-action : #63 anti-Confucian : #18, #19, #27, #33, #38 Chapter Four ■ (■) ■ ■ ■ (■) ■ ■ • ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • Dao is like a cup or bowl, yet use it and there exists no need to fill it. Profound and deep!, it appears to be the ancestor of the ten thousand creatures. It blunts their sharpness, Loosens their tangles, Softens their brightness, Makes them the same as the dust of the world. Deep and profound!, it seems to barely exist. I do not know whose child it is – Its image came before that of god. Dao is like a cup or bowlA, yet use it and there exists no [need to] fill it. Profound and deep !, it appears to be the ancestor of the ten thousand creatures. It blunts their sharpness, [dampens,subdues] ♦Loosens their tangles,B ♦Softens their brightness,C ♦Makes them the same as the dust of the world D. Deep and profound !, it seems to barely exist.E [might,maybe,perhaps] I do not know whose [] child it is – ♦Its image came before that of god{emperor}. Notes A : while the symbol used here only appears in one out of four sources, it gives the most straightforward translation; Dao is like a cup in that its usefulness is in its emptiness (see #11 and #25) B : this line could just as likely be translated as Clarifies their confusion C : compare to #58, where the sage is bright but does not dazzle D : according to Waley, "dust" is a metaphor for the "noise and fuss of everyday life" E : compare to #6, where the spirit of the valley also "seems to exist" Cross-references use does not exhaust : #5, #35 blunt the sharpness : #56 loosen the tangles : #56 soften the brightness : #56 dust of the world : #56 Chapter Five ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ Heaven and earth are not kind – Thus the ten thousand creatures become as straw dogs to them. The sage is not kind – Thus the 100 families become as straw dogs to him. The space between heaven and earth, How is it just like a bellows or flute? It is empty, yet does not run out. The more it moves, and the more it produces. Too much talking is exceptionally exhausting, Which is not as good as maintaining what is within. ♦Heaven and earth are not kind* – ♦Thus the ten thousand creatures become as straw dogsA to them. ♦The sage2 is not kind* – ♦Thus the 100 families become as straw dogs to him. The space between [] heaven and earth, [How] is it just like a bellows or flute ? ♦It is empty, yet does not run out. [subdue,submit,yieldgive up,quit] The more it moves, and the more it produces. Too much talking is exceptionally exhausting, Which is not as good as maintaining what is within.B Notes Only lines 5-8 are in GUO A : Hall&Ames describe "straw dogs" as items that were carefully created for a sacrificial ritual, and treated with great respect during the ritual, but afterwards were casually tossed away and not given another thought B : this sentence could just as likely end with "maintaining your center" Cross-references 100 families : #17, #49 use does not exhaust : #4, #35 Chapter Six ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ (■) ■ • ■ ■ ■ ■ ■ ■ ■ ■ The spirit of the valley does not die – It is called the deep and mysterious feminine. The gateway of this deep and mysterious feminine – It is called the source of heaven and earth. Unbroken, it seems to exist. Using it takes no effort. ♦The spirit of the valley does not dieA – It is called the deep and mysterious feminine. The gateway of this deep and mysterious feminine – It is called the source of heaven and earth. Unbroken2, it seems to exist.B Using it takes no effort. [diligence,hard work] Notes A : the qualities ("spirit") of a valley (receptiveness, openness, emptiness) never leave it B : compare to #4, where Dao also "seems to barely exist" Cross-references die/death : #33, #42, #50, #67, #74, #75, #76, #80 valley : #15, #28, #32, #39, #41, #66 mystery : #1, #10, #15, #27, #51, #56, #62, #65 feminine : #10, #28, #61 gateway : #1, #10, #52, #56 Chapter Seven ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) • (•)■ ■ ■ ■ ■ • Heaven is eternal, earth is enduring. The reason that heaven and earth can be eternal and enduring Is because they do not live for themselves. Therefore they can live forever. Thus the sage : Puts his self behind others, yet finds his self before them. Considers his self extraneous, yet his self survives. Is this not because he has no self-interests? Therefore he can achieve his self-interests. ♦Heaven is eternal, earth is enduring. [forever] [for a long time] ♦The reason that2 heaven and earth can be eternal and enduring [entities] [forever] [also] [for a long time] ♦Is because they do not live for themselves.A ♦Therefore they can live forever. Thus2 the sage2 : Puts his self behind others, yet finds his self before them.B Considers his self extraneous, yet his self survives. [foreign,external] Is this not because he has no self-interests ? [selfish] ♦Therefore he can achieve his self-interests. [selfish] Notes A : while this translation is more consistent with the sentiments that follow it, an equally possible translation is Is because they do not give themselves life B : presumably meaning leading them; this line and the next are written in this awkward manner to emphasize that it is the personality or sense-of-self that is being talked about (in the translator's opinion – see the

Introduction and cross-references below) Cross-references self : #9, #13, #16, #26, #44, #52, #54, #66 before/behind others : #66, #67 Chapter Eight ■ [■(•)] • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ • (•)■ ■ ■ • The highest virtue is like water – Water's virtue benefits the ten thousand creatures, yet it does not strive. It dwells in places that everyone detests, Therefore it is almost comparable to Dao! In dwelling, the virtue is in the land. In your heart/mind, the virtue is in being profound and deep. In relations, the virtue is in being kind. In speech, the virtue is in being truthful. In governing, the virtue is in being honest and just. In your duties, the virtue is in being competent. In action, the virtue is in the timing. Now : only because there is no striving, Therefore there is no blame. The highest virtue is like water – Water's virtue benefits the ten thousand creatures, yet it does not strive. It dwells in places that everyone2 detests, Therefore it is almost comparable to Dao ! In dwelling, the virtue is in the landA. ♦In your heart/mind, the virtue is in being profound and deep. In relations, the virtue is in being kind*. B [getting along with,participating] In speech, the virtue is in being truthful*. ♦In governing, the virtue is in being honest and just. ♦In your duties, the virtue is in being competent. ♦In action, the virtue is in the timing. ♦Now : only because there is no striving, ♦Therefore there is no blame. Notes A : although it is best translated as "land" here, this is the same symbol for earth, as in "heaven and earth" B : this could also be translated as In giving, the virtue is in being kind FY, MWD/A, and MWD/B all have differences in this sentence compared to WB and HSG and each other Cross-references be honest and just in governing : #57 no striving : #3, #22, #66, #68, #73, #81 only because there is no striving : #22 Chapter Nine ■ ■ ■ ■ ■ ■ ■ ■ ■ (■) ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ • Holding and filling it Are not as good as your stopping short. Hammering and sharpening it Can not be forever maintained. When gold and jade fill a room, There is no one who can protect it. To have wealth and high rank, but with arrogance – Then naturally their loss is your own fault. When the task is successful, the self should let go of it. This is the Way of heaven. Holding and filling itA Are not as good as your stopping [short]. [his] Hammering° and sharpening itB Can not be forever maintained. When gold and jade fill a room, There is no one who can protect it. [they] To have wealth and high rank, but with arrogance{pride} – Then naturally their loss is your own fault. [his] When the task is successful, the self should let go of it. [result,achievement] [withdraw,step away] ♦This is the Way of heaven. Notes A : presumably, a cup; Lau says that this refers to a vessel in a temple that stood upright when empty but overturned when nearly full (thus you had to hold it to fill it up) B : presumably, a sword or knife; you can only re-shape and re-sharpen it so many times Cross-references accomplishing tasks : #2, #17, #34, #77 and not dwelling on them : #2, #77 self : #7, #13, #16, #26, #44, #52, #54, #66 Way of heaven : #47, #73, #77, #79, #81 Chapter Ten ■ ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ ■ ■(•) • ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ [■] ■ ■(•) ■ Carrying and managing a body while embracing the One, Are you able to not separate them? Concentrating your Qi to become soft, Are you able to be like a newborn infant? Cleansing and clearing your deep and mysterious perception, Are you able to be without blemish? Loving the citizens and governing the nation, Are you able to use non-action? Opening and closing the gateway of heaven, Are you able to serve as the feminine? Attaining clear insight in all directions, Are you able to not use your knowledge? Creating them and raising them, Creating but not possessing, Acting but not concerned with the results, Leading yet not governing – This is called deep and mysterious De. ♦Carrying and managing a body{soul} while embracing the One, ♦Are you able to not separateA them ? ♦Concentrating your Qi to become soft, [attain,bring about] ♦Are you able to [be like] a newborn infant2 ? Cleansing and clearing your deep and mysterious perception, [remove,eliminate,wipe out] Are you able to be without blemish ? Loving the citizens and governing the nation, Are you able to [use] non-action ? Opening and closing the gateway of heaven, ♦Are you able to serve as the feminine ? ♦Attaining clear insight in all directions, [wise,sight] [four directions,all around] Are you able to not use your knowledge ? ♦Creating them and raising them, ♦Creating but not possessing, Acting but not concerned with [the results],B [depend upon,rely upon] ♦Leading yet not governing – ♦This is called deep and mysterious De. Notes A : that is,"keep from separating" B : this line is not in the earlier sources Cross-references embracing the One : #22 Qi : #42, #55 soft : #36, #43, #52, #55, #76, #78 gateway : #1, #6, #52, #56 baby/infant/child : #20, #28, #49, #55 newborn infant : #20, #28, #55 feminine : #6, #28, #61 creating but not possessing : #2, #51 acting but not concerned : #2, #51, #77 leading yet not governing : #51 mystery : #1, #6, #15, #27, #51, #56, #62, #65 deep and mysterious De : #51, #65 Chapter Eleven ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • Thirty spokes of a wheel share one hub; In its emptiness exists the usefulness of the cart. Mix water with clay thus making a vessel; In its emptiness exists the usefulness of the vessel. Cut out doors and windows thus making a room; In their emptiness exists the usefulness of the room. Therefore : what exists thus makes a thing profitable; Emptiness thus makes it useful. Thirty2 spokes of a wheel share one hub; ♦In its emptiness exists the usefulness of the cart. [just at] Mix water with clay2 thus making a vessel; In its emptiness exists the usefulness of the vessel. [just at] Cut out doors and windows thus making a room{house}; [chisel,bore,pierce] ♦In their emptiness exists the usefulness of the room{house}. [just at] ♦Therefore : what exists thus makes a thing profitable; [it] ♦Emptiness thus makes it useful. Notes Cross-references Chapter Twelve ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

The five colors can make people’s eyes blind. The five tones can make people’s ears deaf. The five flavors can make people’s mouths dull. Excessive hunting and horse racing can make people’s heart/minds become wild. Rare goods can make people’s behavior corrupt. Thus the sage : Acts on what is inside, he does not act on what he sees. Therefore he leaves that and chooses this. ♦The five colors [can] make people’s eyes blind. The five tones [can] make people’s ears deaf. The five flavors [can] make people’s mouths dull °. Excessive hunting and horse racing [can] make people’s heart/minds become wild. [hunt hunt] [gallop2] Rare2 [] goods [can] make people’s behavior corrupt. [undermine,harm,impede] Thus2 the sage2 : Acts on what is inside, he does not act on what he sees.A Therefore he leaves thatB and chooses thisC. Notes Everything in the first five lines would have been enjoyed to excess only by the wealthy and the ruling class! A : compare to #49, where the 100 families “follow their eyes” B : presumably, acting on what he sees C : presumably, acting on what is inside Cross-references rare goods : #3, #64 leaves that and chooses this : #38, #72 Chapter Thirteen ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ • ■ ■ ■ ■ ■ ■ ■ ■ (•) (•)■ ■ ■ ■ ■ ■ ■ • ■ ■ [■] ■ ■ ■ [■(•)] • ■ ■ ■ ■ ■ ■ ■ ■ [■] ■ ■ ■ [■(•)] • Favor and disgrace seem alarming. High rank brings great suffering if you have a self. What is meant by “favor and disgrace seem alarming”? Favor makes you the inferior, so gaining it seems alarming. Losing it also seems alarming. This is what is meant by “favor and disgrace seem alarming”. What is meant by “high rank brings great suffering if you have a self”? I am the reason that I have great suffering, I who act like I have a self. When I am without a self, how could I have suffering? Therefore : he who is high ranking and uses his self to serve the world – It seems he can thus be entrusted with the world! He who is loving and uses his self to serve the world – It seems he can thus be entrusted with the world! ♦Favor and disgrace seem alarming. ♦High rank brings great suffering if you have a self. What is meant by “favor and disgrace seem alarming”? Favor makes you the inferiorA, so gaining it seems alarming. ♦Losing it [also] seems alarming. This is what is meant by “favor and disgrace seem alarming”. What is meant by “high rank brings great suffering if you have a self”? ♦I am the reason that2 I have great suffering, I who act like I have a self. When I am without a self, how could I have suffering? Therefore : [he who] is high ranking and uses his self B to serve the world2 – It seems he can thus be entrusted with the world2 ! ♦[He who] is loving and uses his self to serve the world2 – It seems he can thus be entrusted with the world2 ! Notes A : Ames&Hall point out that “favor” here means something that is bestowed upon you by a superior at their whim, thus it emphasizes your inferiority to them; and since it could be taken away just as easily, merely gaining it is cause for “alarm” (worry, anxiety, etc.) B : this is written in this awkward manner to emphasize that it is the personality or sense-of-self that is being talked about (in the translator’s opinion – see the Introduction and cross-references below) Cross-references self : #7, #9, #16, #26, #44, #52, #54, #66 serve the world : #39, #49 Chapter Fourteen ■ • ■ ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ [■ ■] ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ [■] ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

Yielding!, like ice that is about to to break off. Honest and genuine!, they are like the uncarved block. Wide and open!, they are like a valley. Unclear!, they are like muddy water. Who can take muddy water and use stillness to slowly and gently make it pure and clear? Who can take what is tranquil and use continual movement to slowly and gently bring it to life? He who maintains this Way does not desire to be full. Now : only because he is not full, Thus he can be hidden and unfinished. The virtue of the ancients made they who were scholars subtle, mysterious, obscure, deep, and penetrating4. Their mysterious depths can not be understood. Now : only because they can not be understood, Therefore we try to emulate their appearance : [act like,become] Hesitant !, as if crossing a winter stream. Wary !, as if afraid of their neighbors all around. [scheming] Respectful !, they are like a visiting guest. Yielding° !, like ice that is about to to break off. [release,disperse] Honest and genuine !, they are like the uncarved block. Wide and open !, they are like a valley. Unclear !, they are like muddy water.A [confused,muddy] Who can take muddy water and use stillness to slowly and gently make it pure and clearB? Who can take what is tranquil and use continual movement to slowly and gently bring it to life? [for a long time] He who maintains this Way does not desire to be full. Now : only because he is not full, Thus2 he can be hidden and unfinished 2. [not finish] Notes The last two lines are not present in GUO A : in this sentence and the next, “muddy water” appears to be a metaphor for one’s state of mind, thus referring to churned-up thoughts and feelings B : apparently referring to a purity and clarity of the heart/mind Cross-references the ancients/elders : #14, #22, #38, #39, #62, #65, #68 virtue of the ancients : #65 scholar : #41, #68 mystery : #1, #6, #10, #27, #51, #56, #62, #65 fear/afraid : #17, #20, #72, #74 uncarved block : #19, #28, #32, #37, #57 valley : #6, #28, #32, #39, #41, #66 stillness : #16, #26, #37, #45, #57, #61 he who “possesses Dao” : #23, #24, #31, #65, #77 hidden : #41 Chapter Sixteen ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ [■] ■ • (•)■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ [■] ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ Attain the utmost emptiness. Maintain a profound stillness. The ten thousand creatures arise in unison, And thus I observe their return. Now : all the myriad creatures return to their source. Returning to the source speaks of stillness. Stillness is called returning to the natural order. Returning to the natural order speaks of the ever-constant. Knowing the ever-constant speaks of insight. Not knowing the ever-constant is foolish and creates misfortune. Knowing the ever-constant leads to tolerance. Being tolerant leads to being just and unbiased. Being just and unbiased leads to being kingly. Being kingly leads to heaven. Heaven leads to Dao. Dao leads to what endures. When the self disappears, there can be no danger. Attain the utmost emptiness. Maintain a profound stillness. [sincere,devoted,true] The ten thousand creatures arise in unison, [together,simultaneously] And thus I observe their return. Now : all the myriad creatures return2 to their source. [multitudinous2] Returning to the source speaks of stillness. Stillness is called returning to the natural order. [order,destiny,fate] Returning to the natural order speaks of the ever-constant. [order,destiny,fate] Knowing the ever-constant speaks of insight. [wise,sight] Not knowing the ever-constant is foolish and creates misfortune. [arise,makes] [unfortunate,evil] ♦Knowing the ever-constant [leads to] tolerance. [allow,permit,forbear] ♦Being tolerant leads to being just and unbiased. [allow,permit,forbear] [thereupon,consequently] ♦Being just and unbiased leads to being kingly. [thereupon,consequently] ♦Being kingly leads to heaven. [thereupon,consequently] ♦Heaven leads to Dao. [thereupon,consequently] ♦Dao leads to what endures. [thereupon,consequently] [for a long time] ♦When the self disappears, there can be no danger. Notes Only the first five lines of the entire chapter are present in GUO Cross-references stillness : #15, #26, #37, #45, #57, #61 returning : #14, #19, #20, #22, #25, #28, #34, #40, #52, #58, #60, #64, #65, #80 knowing the ever-constant speaks of insight : #55 self : #7, #9, #13, #26, #44, #52, #54, #66 no danger : #25, #32, #44, #52 when the self disappears, there can be no danger : #52 Chapter Seventeen ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

the families are very confused, There exists loyal officials. When the great Dao is abandoned, There exists kindness* and morality*. [righteousness] When intelligence and wisdom*A arise, There exists a great deal of deceptionB. [false,fake] When the six relationships*C are not in harmony, There exists devoted children* and loving parents*. When the nation and the families are very confused2, There exists loyal* officials{ministers,subjects}. Notes By looking at all the sources, it is easy to see that this chapter grew more anti-Confucian over time! A : the MWD texts use “knowledge” (a non-Confucian term) instead of “wisdom”; this whole sentence is absent in GUO B : this symbol could also be interpreted as hypocrisy, pretense, lying, dishonesty, etc. C : the six relationships refer to “all” the possible kinds of relationship in a family (in ancient China) : husband to wife, wife to husband, father to son, son to father, older brother to younger brother, younger brother to older brother Cross-references great Dao : #34, #53 nation and families : #57 anti-Confucian : #3, #19, #27, #33, #38 Chapter Nineteen ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • Renounce sacredness, abandon wisdom, And the citizens benefit 100-fold. Renounce kindness, abandon morality, And the citizens return to being devoted children and loving parents. Renounce cleverness, abandon profit, And thieves and bandits will not exist. These three things thus make a civilized society, but are not enough. Therefore : to ensure the citizens have a place to belong – See the simplicity, Embrace the concept of the uncarved block, Less selfishness, Fewer desires. Renounce sacredness, abandon wisdom*, ♦And the citizens benefit 100-fold. Renounce kindness*, abandon morality*, [righteousness] And the citizens return to being devoted children* and loving parents*. Renounce cleverness, abandon profit, And thieves and bandits{traitors} will not exist. These three things thus make a civilized society, but are not enough. [entities] [formal,polite,culture] Therefore : to ensure [the citizens] have a place to belongA – [make,cause] See the simplicity, Embrace the [concept of the] uncarved block, Less selfishness, Fewer desires. Notes GUO is significantly different about what to renounce or abandon, and the results, and it uses no Confucian terms; as early as MWD/B and MWD/A some Confucian terms had appeared A : perhaps meaning a place worth belonging to? Cross-references returning : #14, #16, #20, #22, #25, #28, #34, #40, #52, #58, #60, #64, #65, #80 thieves and bandits : #57 uncarved block : #15, #28, #32, #37, #57 anti-Confucian : #3, #18, #27, #33, #38 Chapter Twenty ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ (■) ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

symbols, they have the same meaning, thus making a majority); the symbol in WB means “wind”, and so is incorporated into the added phrase; the “I” is added at the beginning to maintain the I/they alternation Cross-references beauty and ugly : #2 fear/afraid : #15, #17, #72, #74 baby/infant/child : #10, #28, #49, #55 newborn infant : #10, #28, #55 returning : #14, #16, #19, #22, #25, #28, #34, #40, #52, #58, #60, #64, #65, #80 observant and alert : #58 mother : #1, #25, #52, #59 Chapter Twenty One ■ ■ ■ ■ (■) ■ ■ ■ ■ ■ ■ ■ (■) ■ (■) ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ (■) ■ (■) ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ (■) ■ (•) ■ ■ • The greatest De is possible only when Dao is followed. The action of Dao on creatures is just indistinct, just confusing. Confusing! and indistinct!, within it exists image. Indistinct! and confusing!, within it exists things. Obscure! and dark!, within it exists essence. Its essence is extremely real and true. Within it exists truth. From the present, reaching to antiquity, Its name has not departed – Thus I observe the father of the multitudes. How do I thus know the father of the multitudes is like this? By means of this. ♦The greatest De [it] is possible only when Dao is followed. [allowed,permitted] The action of Dao on creatures is just indistinct, just confusing.A [only] [only] Confusing ! and indistinct !, within it exists image. Indistinct ! and confusing !, within it exists things. Obscure ! and dark !, within it exists essence. Its essence is extremely real and true. ♦Within it exists truth*. From the present, reaching to antiquity, [since] [ancient,old] Its name has not departed – Thus I observe the father of the multitudes. [examine,inspect] How do I thus know the father of the multitudes [it] is like this ? ♦By means of thisB. Notes A : compare to #14, where something (presumably Dao) is also indistinct and confusing, and to #40, where Dao specifically “returns” and “weakens” B : “this” could be referring to observing the action of Dao, or just observing the world in front of you, or to the teachings of the DDJ, or something else – you decide! Cross-references confusing and indistinct : #14 essence : #55 how do I thus know : #54, #57 by means of this : #54, #57 Chapter Twenty Two ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ [■] ■ • ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ (•)■ (•) • ■ ■ ■ ■ ■ What is wrong then becomes whole and perfect. What is bent then becomes straight. What is hollow then becomes filled. What is worn out then becomes new. Have little, then gain. Have too much, then become confused. Thus the sage : Embraces the One, thus serving as an example to the world – He does not display himself, therefore he has insight. Does not consider himself correct, therefore he distinguishes himself. Does not boast about himself, therefore he possesses merit. Does not brag about himself, therefore he endures. Now : only because he does not strive, Therefore no one in the world can strive against him. That which the ancients say : “He who is wrong then becomes whole and perfect” – How can these be empty words? Be truly whole and perfect, and return to it. ♦What is wrong{bent} then becomes whole and perfect. What is bent then becomes straight. ♦What is hollow then becomes filled. ♦What is worn out then becomes new. ♦Have little, then gain. ♦Have too much, then become confused. ♦Thus2 the sage2 : Embraces the One, thus serving as an example to the world2 – He does not display himself, therefore he has insight. [show] [wise,sight] Does not consider himself correct, therefore he distinguishes himself. [manifest,displaystand out] ♦Does not boast about himself, therefore he possesses merit. Does not brag about himself, therefore he endures{leads}. [boast] [long,forever] ♦Now : only because he does not strive, Therefore no one in the world2 can strive against him. [together with] ♦That which the ancients [they] say : “He who is wrong{bent} then becomes whole and perfect” – How can these be empty words ? Be truly whole and perfect, and return to itA. Notes A : there is no indication what the “it” is referring to in the original Chinese, so you decide! This symbol also means “them”, perhaps meaning “return to the ancients”? Cross-references embraces the One : #10 serves as an example to the world : #28 not displaying oneself (showing off) : #24, #47, #72, #77 display…insight : #24 correct…distinguishes : #24 boast : #24, #30 boast…merit : #24 brag : #24, #30 brag…endures : #24 no striving : #3, #8, #66, #68, #73, #81 no one in the world can strive against him : #66 the ancients/elders : #14, #15, #38, #39, #62, #65, #68 returning : #14, #16, #19, #20, #25, #28, #34, #40, #52, #58, #60, #64, #65, #80 Chapter Twenty Three ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

[gain,get] If you do not trust* enough, then you will not have anyone's trust*. Notes A : this sentence and the next are very different across the sources, and the sentence before (about Dao) is not in the MWD's Cross-references naturally so : #17, #25, #51, #64 he who "possesses Dao" : #15, #24, #31, #65, #77 not trusting enough : #17 Chapter Twenty Four ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■ ■ • ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ • He who stands on tiptoe does not really stand. He who stands astride can not travel. He who displays himself does not have insight. He who considers himself correct does not distinguish himself. He who boasts about himself is without merit. He who brags about himself does not endure. He who lives in Dao – Calls these leftover food and unnecessary behavior. Creatures detest them, no matter what. Therefore : he who possesses Dao does not live by them. He who stands on tiptoe does not [really] stand. He who stands astride can not travel. ♦He who displays himself does not have insight. [shows] [wise,sight] ♦He who considers himself correct does not distinguish himself. [manifest,displaystand out] ♦He who boasts about himself is without merit. ♦He who brags about himself does not endure{lead}. [boasts] [long,forever] ♦He [who] lives in Dao – ♦Calls these leftover foodA and unnecessary behavior. [excess, remainder] ♦Creatures detest them, no matter what. Therefore : he who possesses Dao does not live byB them. Notes A : presumably, the inedible scraps (not something good, as in "leftover turkey") B : there is some debate over the last symbol in this line – both FY and HSG use this symbol (making it a majority), and some WB versions also use it; other WB versions use ■, thus reading he who possesses Dao does not dwell with them Cross-references not displaying oneself (showing off) : #22, #47, #72, #77 display…insight : #22 correct…distinguishes : #22 boast : #22, #30 boast…merit : #22 brag : #22, #30 brag…endure : #22 creatures detest them : #31 he who "possesses Dao" : #15, #23, #31, #65, #77 Chapter Twenty Five ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ A good traveler is without wagon track or footprint. A good speaker is without flaw or disgrace. A good accountant does not use counting tokens. A good barrier is without bar or lock, yet can not be opened. A good binding is without cord or restraint, yet can not be loosened. Thus the sage : Is always good at helping people, Therefore he does not abandon people. Is always good at helping creatures, Therefore he does not abandon creatures. This is called following your insight. Therefore : he who is a virtuous person is the teacher of he who is not a virtuous person. He who is not a virtuous person is the resource of he who is a virtuous person. If the latter does not value his teacher, Or the former does not love his resource, Even if there is wisdom, there will be great confusion. This is called the essential subtle mystery. A good traveler is without [wagon] trackA or footprint. A good speaker is without flaw{fault} or disgrace{blame}. A good accountant does not use counting tokens2. [counter] [token method] A good barrier is without bar or lock, yet can not be opened. [obstruction,blockage] A good binding is without cord or restraint, yet can not be loosened. ♦Thus2 the sage2 : Is always good at helping people, Therefore he does not abandon people. Is always good at helping creatures, Therefore he does not abandon creatures. This is called following your insight. [wise,sight] Therefore : he who is a virtuous person is the teacher of [he who] is not a virtuous person. He who is not a virtuous person is the resource of [he who] is a virtuous person. [wealth,supply,support] ♦[If the latter] does not value his teacher, ♦[Or the former] does not love his resource, [wealth,supply,support] Even if there is wisdom*, there will be great confusion. This is called the essential subtle mystery. Notes A: this symbol also has the connotation of “rut”, hence the track of a vehicle Cross-references one who is not virtuous : #49, #62, #81 teaching : #2, #42, #43 mystery : #1, #6, #10, #15, #51, #56, #62, #65 anti-Confucian : #3, #18, #19, #33, #38 Chapter Twenty Eight ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

every source has a different pair in this line! Cross-references possess or take hold of the world or nation : #48, #57, #59, #61 have no choice : #30, #31 he who acts, ruins it : #64 he who grasps, loses it : #64 creatures sometimes X…Y : #42 strong : #3, #30, #33, #36, #52, #55, #67, #78 weak : #3, #36, #40, #55, #76, #78 Chapter Thirty ■ ■ ■

in the world2 can conquer it. If noblesA and kings could maintain it, ♦The ten thousand creatures would naturally obey. ♦Heaven and earth would join with each other, Thus dropping a sweet dew.B There are no citizens who would make this happen, [they] Yet [it]C would be naturally fair and impartial. ♦And so, begin to divide D and you have names. [cut&make garments] ♦Once names [also] exist, [now that] Men should also be ready to know when to stop. Knowing when to stop is the reason that2 there is no danger. An analogy for the action of Dao in the world2 : It is similar to a stream in a valley that [becomes] part of a large river or ocean. [it] [together with,take part in] Notes A : while this symbol does literally mean “nobles”, it also specifically refers to a “Marquis”; the Western equivalents for the five grades of Chinese nobility (below the royal family) were Duke, Marquis, Count (or Earl), Viscount, and Baron, in descending order B : Waley comments that this phrase is used to indicate that the kingdom is at peace C : “they” could be used here, referring to the citizens instead of this process D : see #28, where the uncarved block is divided Cross-references always/ever-constantly without X : #1, #34, #37 without-name : #1, #37, #41 nobles (in general) : #37, #39, #42, #62, #80 if nobles and kings could maintain it : #37 uncarved block : #15, #19, #28, #37, #57 ten thousand creatures would naturally… : #37 knowing when to stop : #44 no danger : #16, #25, #44, #52 valley : #6, #15, #28, #39, #41, #66 Chapter Thirty Three ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • He who knows people is wise; He who knows himself has insight. He who is victorious over people possesses power; He who is victorious over himself is strong. He who knows he has enough is wealthy; He who uses force possesses ambition. He who does not lose his place endures; He who dies yet does not perish has longevity. He who knows people is wise*; ♦He who knows himself has insight. [wise,sight] ♦He who is victorious over people possesses power; ♦He who is victorious over himself is strong. ♦He who knows he has enough is wealthy; ♦He who uses force2 possesses ambition. ♦He who does not lose his placeA endures; [for a long time] He who dies yet does not perish has longevity.B Notes A : possibly meaning one’s center, source or root (but then why not use one of the many symbols used elsewhere for these words?), this may be referring to one’s station or position in life (ancient Chinese society was highly stratified); but on the other hand, that sounds very Confucian – so you decide! B : this line has generated much speculation over the millennia; perhaps it refers to being remembered after you die, or the death of the “self”? Cross-references strong : #3, #29, #30, #36, #52, #55, #67, #78 knowing one has enough : #44, #46 die/death : #6, #42, #50, #67, #74, #75, #76, #80 anti-Confucian : #3, #18, #19, #27, #38 Chapter Thirty Four ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ (■) ■ ■ ■ ■ • ■ ■ ■ [■] ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ [(•)■] ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ (■) ■ • (■ ■ ■ ■ ■ ■ ■ ■ •) [■ ■ ■ ■ ■ •] (•)■ ■ ■ __ ■ Great Dao is like a vast flood! It is able to flow left and right. The ten thousand creatures depend on it in order for life, And are not rejected. It accomplishes its tasks successfully, Yet does not possess a name. It clothes and supports the ten thousand creatures, But does not act as their master. Therefore : since it is ever-constantly without-desire, It can then be named insignificant. Since the ten thousand creatures return to it But it does not act as their master, It can then be named great. Thus the sage can achieve greatness Because he does not act great. Therefore he can achieve greatness. Great Dao is like a vast flood ! ♦It is able to flow left and right.A The ten thousand creatures depend on it in order for life, and are not rejected. [decline,dismiss] It accomplishes its tasks successfully, yet does not possess a name. [results,achievements] It clothes and supports the ten thousand creatures, But does not act as their master. Therefore : since it is ever-constantly without-desire, ♦It can then be named insignificant. ♦Since the ten thousand creatures return to it But it does not act as their master, It can then be named great. Thus2 the sage2 [he] can achieve greatness Because he does not act great. Therefore he can achieve greatness.B Notes A : in other words, everywhere B : the last three lines are significantly different between sources. What is used here comes from the MWD’s, and FY says the exact same thing with slightly different symbols (thus making it the majority). But HSG reads Thus2 the sage2 is whole, but does not act great. Therefore he can achieve his greatness. And WB reads (with no reference to the sage, presumably still referring to Dao from earlier in the chapter) Because it is whole, it naturally does not act great. Therefore it can achieve its greatness. WB also switched from saying the sage is great to Dao is great in #67 Cross-references great Dao : #18, #53 accomplishing tasks : #2, #9, #17, #77 always/ever-constantly without X : #1, #32, #37 without-desire : #1, #3, #37, #57 returning : #14, #16, #19, #20, #22, #25, #28, #40, #52, #58, #60, #64, #65, #80 sage can achieve greatness : #63 Chapter Thirty Five ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ (■) ■ (■) ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • Holding fast to the great image, The entire world comes towards you. Comes towards you, and meeting with no harm, There is the greatest peace and calm. Music together with good food make passing guests stay, But Dao’s words are bland! They are without flavor. Look for it, there is not enough to see. Listen for it, there is not enough to hear. Use it, there is not enough to exhaust. ♦Holding fast to the great image, ♦The [entire] world2 comes towards you. ♦Comes towards you, and [meeting with]A no harm, There is the greatest peace and calm2. [peace,calm calm,peace] Music together with good food make passing guests stay, [cakes] But Dao ’s words2 are bland !B ♦They are without flavor. ♦Look for it, there is not enough to see. ♦Listen for it, there is not enough to hear. Use it, there is not enough to exhaust°. Notes A : “doing” could just as easily be used here, but since the sage is the one who does no harm in #58, #60, and #66, “meeting with” is used B : the sentence-as-a-whole can be interpreted in two different ways (see the Introduction) : “speaking about Dao” or “the words that

come out of Dao” (which is used here); also note that in the majority of the sources this line is a statement, not a question Cross-references no harm : #56, #58, #60, #66, #81 look, not seen and listen, not heard : #14 use does not exhaust : #4, #5 Chapter Thirty Six ■ ■ ■

trying to show that he has De B : “coerces” is the same symbol as “acts”, but is used here to emphasize that it is the opposite of “non-action” C : this line varies greatly between all the sources, and there is no majority; this comes from FY as it seems to make the most sense D : this could also mean “future knowledge” and so is often translated as “foreknowledge”, “prescience”, etc. E : fruit provides nourishment, whereas a flower is merely showy F : compare to #50 and #75, where living for the “substance” is apparently a bad thing G : presumably, appearance and the “flower” vs. substance and the “fruit” (respectively) Cross-references non-action : #2, #3, #37, #43, #48, #57, #63, #64 the ancients/elders : #14, #15, #22, #39, #62, #65, #68 substance : #50, #55, #75 leave that and choose this : #12, #72 anti-Confucian : #3, #18, #19, #27, #33 Chapter Thirty Nine ■ ■ ■

only Dao is good at beginning and also good at completing. The superior scholar hearing of Dao works hard and practices it. [performs] The average scholar hearing of Dao seems to keep it, seems to lose it. [middle] ♦The inferior scholar hearing of Dao laughs greatly at it. ♦If he did not laugh, it would not be qualified3 to be Dao. Therefore : in the established sayings2A that exist, it is said – Insight into Dao seems like darkness. [wise,sight] ♦Advancing in Dao seems like retreating. ♦Smooth Dao seems knotted.B ♦Superior De seems like a valley. ♦The greatest purity seems like disgrace. ♦The most extensive De seems like it is not enough. ♦Established De seems aimless. Real and true character seems inconsistent. [change] ♦The greatest region is without borders.C The greatest vessel is last to be completed.D [late] The greatest tone is a tenuous sound. [rare] The greatest image is without-form. Dao is hidden and without-name. Now : only Dao is good at beginning and also good at completing.E Notes A : Ames&Hall comment that it is unknown whether “established sayings” is referring to proverbs in general, or a specific work that no longer exists B : compare to #53, where “Dao is extremely even” C : this line could just as likely be translated as The greatest square is without corners but considering that the DDJ often refers to nations, this translation seems more appropriate D : a euphemism for “great talents mature slowly” E : although this line only survives in MWD/B of the three earlier sources, it is used here because it is much more straightforward and understandable than the later three Cross-references scholar : #15, #68 valley : #6, #15, #28, #32, #39, #66 tone and voice/sound (same symbol) : #2 tenuous : #14 hidden : #15 without-name : #1, #32, #37

Chapter Forty Two ■ ■ ■

clumsy. Great debaters seem slow of speech. Restlessness conquers cold. Stillness conquers heat. Purity and clarity along with stillness makes the world proper and correct. Great achievement seems incomplete, [lacking] But its usefulness is not impaired. [harmed] Great fullness is like a cup or bowlA, Its usefulness is not exhausted. Great straightness seems bent. Great skillfulness seems clumsy.B Great debaters seem slow of speechC. ♦Restlessness conquers cold. [victorious,beats] ♦Stillness conquers heat. [victorious,beats] Purity and clarity D along with stillnessD makes the world2 proper and correct{honest and just}. Notes A : the symbol used here only appears in 1/5 sources, but gives the most understandable translation (and matches the first line in #4) B : this line could just as likely be translated as Great cleverness seems stupid. C : this is a euphemism for stammering, but also represents a personal quality that Confucius recommended people cultivate D : presumably referring to inner, mental/emotional qualities Cross-references stillness : #15, #16, #26, #37, #57, #61 stillness and restlessness : #26 Chapter Forty Six ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • (■ ■ ■ ■ ■ ■) ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■(•) • When the world possesses Dao, Riding horses are nonetheless used for manure. When the world is without Dao, War-horses are bred in the countryside. There is no fault greater than the capacity for desire. There is no misfortune greater than not knowing when you have enough. There is no error greater than desire for gain. Therefore : knowing the sufficiency of having enough, there is always enough! ♦When the world2 possesses Dao, ♦Riding horses are nonetheless used for manure. [still,yet,however] ♦When the world2 is without Dao, ♦War-horses are bred in the countryside. [military] [produced] [open spaces/outskirts] ♦There is no fault greater than the capacity for desire.A [ability] ♦There is no misfortune greater than not knowing when you have enough. ♦There is no error greater than desire for gain. Therefore : knowing the sufficiency of having enough, there is always enough !B Notes A : this line is in every source except WB B : The core of this sentence is “■ of ■ always ■”, where ■ can mean “enough”, “sufficient”, or possibly “satisfaction” (and by interpretation, “contentment”), so it can be translated in many ways; while I usually use the same English word for each symbol (when appropriate), in this case it seems clearer to use different words with equivalent meanings within the same sentence; this would be similar to changing the phrase “appears to have appeared” to “seems to have appeared” Cross-references knowing you have enough : #33, #44 Chapter Forty Seven ■ ■ ■ [■] ■ ■ ■ ■ ■ ■ [■] (■) ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

■ (his/their) could be referring to the sage or to the 100 families; the choices made here are consistent with the first two lines of the chapter C : compare to #12, where the sage does not act on what he sees D : adding “his” turns this line from something deragatory (“treats them all like children”, which seems out of character) into something that matches #42, where the sage becomes an “elder teacher” (literally, godfather) Cross-references 100 families : #5, #17 one who is not virtuous : #27, #62, #81 serve the world : #13, #39 baby/infant/child : #10, #20, #28, #55 Chapter Fifty ■ (•)■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ (■) ■ (•)■ ■ ■ • ■ ■ ■ ■ ■ Between coming out into life and entering death, Followers of life are 3 in 10. Followers of death are 3 in 10. People whose lives are merely moving them towards the place of death Are also 3 in 10. Now : what is the reason? Because they live life for its substance. But I have heard that he who is skilled at taking in life Can travel the mountains and does not meet rhino or tiger, Can enter a battle not wearing armor or weapons. The rhino has no place to thrust its horns, The tiger has no place to use its claws, The weapon has no place to allow its blade. Now : what is the reason? Because for him there is no place of death. ♦Between coming out into life and entering death, ♦FollowersA of life are 3 in 10B. [10 has 3] ♦Followers of death are 3 in 10. [10 has 3] People whose lives are [merely] moving them towards the place of deathC [their] Are also 3 in 10. [10 has 3] Now : what is the reason? Because they live life for its substanceD. ♦But I have heard that he who is skilled at taking inE life Can travel the mountains and does not meet rhino or tiger, ♦Can enter a battle not wearing armor or weapons. [army,military] ♦The rhino has no place to thrust its horns, [send,put in] The tiger has no place to use its claws, [employ] ♦The weapon has no place to allow its blade. Now : what is the reason? Because for him there is no place of death. Notes A : “follower” as in disciple or one who agrees with a particular way of looking at things B : this phrase can also be interpreted as “13”, possibly referring to the 4 limbs and 9 openings of the human body, but when using “3 in 10” then the first five lines discuss 9 out of 10 people, and the remaining lines seem to talk about the tenth (presumably sage-like) person C : there are many different interpretations of this phrase (and the entire sentence); presumably, the “place of death” is the end destination of the journey of life as opposed to a literal location (a more modern interpretation of the symbols is the “point of death”); while the symbols for this sentence come from WB and HSG and are technically a minority, the phrasing they use here matches that in the third line following D : compare to #38, where living for the “substance” is apparently a good thing, and #75, where it is a bad thing E : compare to #49, where the sage “gathers in the world”; the last part of this sentence could also be translated as “he who has virtue and takes in life” Cross-references die/death : #6, #33, #42, #67, #74, #75, #76, #80 follower of life and follower of death : #76 substance : #38, #55, #75 Chapter Fifty One ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

to return2 to your insight. [his] [his] [wise,sight] Do not lose your self in misfortune. This is called practicing the ever-constant.A Notes A : while this could also be translated as This is called the ever-constant practice the symbol for “practice” is instead “follow” in FY and MWD/A; since “the ever-constant following” doesn’t make since, the line is translated this way Cross-references mother : #1, #20, #25, #59 mother of the world : #25 self : #7, #9, #13, #16, #26, #44, #54, #66 no danger : #16, #25, #32, #44 when the self disappears, there can be no danger : #16 gateway : #1, #6, #10, #56 block your senses, close your gateway : #56 returning : #14, #16, #19, #20, #22, #25, #28, #34, #40, #58, #60, #64, #65, #80 soft : #10, #36, #43, #55, #76, #78 strong : #3, #29, #30, #33, #36, #55, #67, #78 Chapter Fifty Three • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ (•) If I correctly use the tiniest bit of knowledge that I possess While travelling on the great Way, It is only walking off the path that I need to fear. The great Way is extremely even, But the citizens are fond of side paths. Although the royal court is very well-kept, The fields are very overgrown with weeds, The granaries are very empty. While at the court they wear refined multicolored silks, Carry sharp swords, Stuff themselves with drink and food, And have an excess of wealth and goods. This is called robbery and extravagance, Not Dao, indeed!! If I correctly use the tiniest bit of knowledge that I possess ♦While travelling on the great Way, It is only walking off the path that I need to fear. ♦The great Way is extremely even,A But the citizens are fond of [side] paths. ♦[Although] the royal court is very well-kept, [remove,wipe outclean] ♦The fields are very overgrown with weeds, ♦The granaries are very empty. [While at the court] they wear refined{formal} multicolored silks, ♦Carry sharp swords, Stuff themselves with drink and food, [satiate,satisfy] ♦And have an excess of wealth and goods. This is called robberyB and extravagance, ♦Not Dao, indeed! ! Notes A : compare to #41, where “smooth Dao seems knotted” B: a play on words, since ■ (robbery) is also pronounced “dao” Cross-references great Dao : #18, #34 Chapter Fifty Four ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ __ ■ ■ ■ ■ (■) ■ ■ __ ■ ■ ■ ■ ■ ■ ■ __ ■ ■ ■ ■ ■ ■ ■ __ ■ ■ ■ ■ ■ ■ ■ __ ■ ■ ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

[auspicious,lucky] ♦Heart/mind making Qi speaks of strength. ♦When creatures are robust but old, ♦We call them “not Dao”. [That which is] “not Dao” has an early finish. Notes The last sentence is in all sources except GUO A : this sentence and the next are sometimes reversed in meaning, as their last symbols have both positive and negative interpretations Cross-references substance : #38, #50, #75 baby/infant/child : #10, #20, #28, #49 newborn infant : #10, #20, #28 weak : #3, #29, #36, #40, #76, #78 soft : #10, #36, #43, #52, #76, #78 strong : #3, #29, #30, #33, #36, #52, #67, #78 essence : #21 knowing the ever-constant speaks of insight : #16 Qi : #10, #42 when creatures are robust but old : #30 “not Dao” has an early finish : #30 Chapter Fifty Six ■ ■ ■ ■ • ■ ■ ■ ■ • ■ • (•)■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ (•)■ ■ ■ ■ ■ • He who knows does not speak; He who speaks does not know. Block your senses, close your gateway. Blunt your sharpness, Loosen your tangles, Soften your brightness, Be the same as the dust of the world. This is called a deep and mysterious sameness. Therefore : you can not gain it and be friendly, Can not gain it and be unfriendly, Can not gain it and benefit, Can not gain it and cause harm, Can not gain it and have high rank, Can not gain it and be lowly. Therefore you become valuable to the world. ♦He who knows does not speak; ♦He who speaks does not know. ♦Block your senses°, close your gateway. [his] [his] Blunt your sharpness, [dampens,subdues] [his] ♦Loosen your tanglesA, [his] Soften your brightness,B [his] ♦Be [you] the same as the dust of the world C. [his] ♦This is called a deep and mysterious sameness. ♦Therefore : you can not gain itD and be friendly, [love,in favor of] ♦Can not gain it and be unfriendly, ♦Can not gain it and benefit, ♦Can not gain it and cause harm, ♦Can not gain it and have high rank, ♦Can not gain it and be lowly. [worthless] ♦Therefore youE become valuable to the world2. Notes A : this line could also be translated as Clarify your confusion B : compare to #58, where the sage is bright but does not dazzle C : according to Waley, “dust” is a metaphor for the “noise and fuss of everyday life” D : there is no noun in the original Chinese, so you decide what “it” is! E : “it” (whatever “it” is in the previous lines) could just as reasonably be used here Cross-references gateway : #1, #6, #10, #52 block your senses, close your gateway : #52 blunt the sharpness : #4 loosen the tangles : #4 soften the brightness : #4 dust of the world : #4 mystery : #1, #6, #10, #15, #27, #51, #62, #65 mysterious sameness : #1 no harm : #35, #58, #60, #66, #81 being valuable : #62, #70 therefore become valuable to the world : #62 Chapter Fifty Seven • ■(•) ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ [■] ■ ■ ■ ■ ■ ■ (■) ■ [■] ■ ■ ■ ■ ■ (■) ■ (■) ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

misfortune [it] lies on. ♦Who knows their limits C? [utmost,extreme] ♦They are not honest and just. ♦Honesty and justness returns, becoming strange and unusual. ♦Virtue returns, becoming weird and strange. ♦The confusion of the people – ♦Its days have indeed been everlasting. [undoubtedly] [for a long time] Thus2 the sage2 : ♦Is honestD and does not divideE, Is honorable* and does not injure, ♦Is straightforward and does not indulge in excess, Is bright but does not dazzleF. Notes The very's in the first four lines are implied by the repeated symbols at the end of each line A : every source has a different symbol here; this comes from WB B : this line and the next can be translated many ways because of the numerous meanings of their last symbols (see the Introduction) – the translation given here is the most "neutral", saying only that they depend on each other C : literally "their extremes", presumably in the sense of "to what extremes they will go" or "how far will they go"; compare to #59 D : this symbol also has the sense of "morally upright", "principled", and "ethical" E : compare to #28 where the "greatest cutting does not divide" (also in relation to the sage) F : every source has a different symbol, but three of them mean "to shine, dazzle, be glorious" thus making a majority in meaning; compare to how the sage does not "display" in #22, #47, #72, #77 Cross-references observant and alert : #20 returning : #14, #16, #19, #20, #22, #25, #28, #34, #40, #52, #60, #64, #65, #80 honest and just, strange and unusual : #57 no harm : #35, #56, #60, #66, #81 Chapter Fifty Nine ■■■■■■(•)■■■■■■

merging place of the world2, [intersection,exchange,mixing] The female of the world2. The female always uses stillness to conquer the male. [victory,beat] By using stillness, she becomes lower-thanB. ♦Therefore : if a great nation is [thus] lower-than a small nation, ♦Then it takes hold of the small nation. ♦If a small nation is [thus] lower-than a great nation, Then it is taken hold of by the great nation. ♦Therefore : sometimes one [nation] is lower-than in order to take hold of, [maybe,perhaps] ♦Sometimes one [nation] is lower-than and then it is taken hold of. [maybe,perhaps] A great nation merely2 desires to combine livestock and people, ♦A small nation merely2 desires to get work for its people.C Now : for both nations to each get that which is their desire, [entities] It is proper for the great nation to be lower-than. [entity] Notes A : ■ (flow) has associations with water B : literally “below”, “under”, or “inferior”, here “lower- than” is used to indicate taking the lower or inferior position in a relationship (which in ancient Chinese culture was the better thing to do); Lau translates it as “taking the lower position” C : the end of this line can also be translated as “desires to join and serve people” Cross-references feminine : #6, #10, #28 stillness : #15, #16, #26, #37, #45, #57 lower-than : #66, #68 possess or take hold of the world or nation : #29, #48, #57, #59 Chapter Sixty Two ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) (•)■ ■ ■ ■ ■ That which Daos is the obscure mystery of the ten thousand creatures. This is the treasure of a virtuous person, And that which is the protection of a person who is not virtuous. Beautiful speech can be used in the market, Respectful behavior can benefit people. People who are not virtuous, Why abandon them? Therefore : when inaugurating the son of heaven, Or installing the three nobles – Even if you possessed jade disks drawn by a team of four horses, That is not as good as sitting and offering this Way. What was the ancients’ reason that they valued this Way? Did they not say : Seek in order to obtain, Have faults in order to be forgiven? Therefore Dao becomes valuable to the world. That which Daos is the obscure mysteryA of the ten thousand creatures. [This is] the treasure of a virtuous person, ♦And that which is the protection of a person who is not virtuous. ♦Beautiful speech can be used in the market,B Respectful behaviorC can2 benefit people. [add,increase,augment] ♦People who are not virtuous, [they] ♦Why abandon them2? [their existence] ♦Therefore : when inaugurating the son of heavenD, [establishing] Or installing the three noblesE – [dukes] Even if you possessed jade disks2 drawn by2 a team of four horses,F [using,by means of before] That is not as good as sitting and offering this Way. ♦What was the ancient ’s reason that2 they valued this Way? Did they not say : Seek in order to obtain, Have faults in order to be forgiven ? [exempt,spare,excuse] ♦Therefore [Dao]G becomes valuable to the world2. Notes A : although they are in the minority, I rather like what the MWD’s say : That which Daos is the flowing together of the ten thousand creatures B : presumably, for bartering C : these two symbols could just as likely be translated as “honorable deeds” D: the “son of heaven” is a standard phrase referring to the emperor E : specifically Dukes (see #32), but in keeping with other chapters, this is interpreted more generally as “nobles”; the phrase “three Dukes” specifically refers to the highest state officials, advisors, or ministers F : a very expensive and impressive offering, indeed! G : there is no subject in the original Chinese; Dao is assumed based on the 4th line previous Cross-references mystery : #1, #6, #10, #15, #27, #51, #56, #65 treasure : #67, #69 one who is not virtuous : #27, #49, #81 nobles (in general) : #32, #37, #39, #42, #80 the ancients/elders : #14, #15, #22, #38, #39, #65, #68 being valuable : #56, #70 therefore becomes valuable to the world : #56 Chapter Sixty Three • ■ ■ ■ • ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • What is peaceful is easy to hold. What has not yet been revealed is easy to plan for. What is brittle is easy to shatter. What is minute is easy to scatter. Act on it while it does not yet exist. Govern them while they are not yet confused. A tree too big to embrace is created from the tiniest shoot. A terrace of nine stories rises from a pile of dirt. A journey of a thousand miles begins from under the feet. He who acts, ruins it. He who grasps, loses it. Thus the sage : Does not act, therefore he does not ruin. Does not grasp, therefore he does not lose. Citizens are always on the verge of achieving their undertakings, yet they ruin them. Be as careful in the end as if it was the beginning, Then you will not ruin your affairs. Thus the sage : Desires to not desire, Does not value rare goods, Learns to not learn. He returns to that which everyone else has passed over, Thus helping the ten thousand creatures to be naturally so, Yet not daring to act. ♦What is peaceful is easy to hold. [it] ♦What has not yet been revealed is easy to plan for. [it] [omen,sign,portent] ♦What is brittle is easy to shatter. [it] [fall apart] What is minute is easy to scatter. [it] ♦Act on it while it does not yet exist. [<preposition>] ♦Govern them while they are not yet confused. [<preposition>] ♦A tree [] too big to embrace2 is created from the tiniest shoot. [least] [tip,end] A terraceA of nine stories rises from a pile of dirt. [soil,land,ground] A journey of a thousand milesB begins from under the feet. [travel] ♦He who acts, ruins it. ♦He who grasps, loses it. ♦Thus2 the sage2 : ♦Does not act, therefore he does not ruin. ♦Does not grasp, therefore he does not lose. Citizens are always on the verge of achieving their undertakings2, yet they ruin them. [almost] Be as careful in the end as if it was the beginning, Then you will not ruin your affairs. ♦Thus2 the sage2 : ♦Desires to not desire, ♦Does not value rare2 [] goods, ♦Learns to not learn. He returns to that which everyone2 else [they] has passed over, Thus helping the ten thousand creatures [them] to be naturally so2, Yet not daring to act.C Notes A : in ancient China, terraces were man-made hills with paths cut into in their sides, leading up to a plateau at the top from which to view the surrounding landscape B : around the time the DDJ was written, a ■ was probably equal to about 1/3 of a mile C : this line is intentionally left ambiguous as to whether it is the sage or the creatures that do not dare to act, as it is also ambiguous in the original Chinese Cross-references he who acts, ruins it : #29 he who grasps, loses it : #29 non-action : #2, #3, #37, #38, #43, #48, #57, #63 rare goods : #3, #12 returning : #14, #16, #19, #20, #22, #25, #28, #34, #40, #52, #58, #60, #65, #80 naturally so : #17, #23, #25, #51 not daring to act : #3, #67, #69 Chapter Sixty Five ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ (■) ■ • (•)■ ■ (■) ■ ■ ■ ■ ■ • ■ ■ (■) ■ ■ ■ ■ ■ • ■ ■ ■ ■■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) ■ ■ ■ ■(•) __ __ ■ ■ ■ ■ The virtue of the ancients (they who acted in Dao), Did not use it to enlighten the citizens, But would have used it to keep them ignorant – The citizens are hard to govern Because they have too much knowledge. Therefore : using knowledge to govern the nation Is the bane of the nation. Not using knowledge to govern the nation Is the good fortune of the nation. He who has knowledge of these two also has them as examples. To always understand these examples – This is called deep and mysterious De. Deep and mysterious De is so profound! and remote! That when creatures return, it returns with them! Then they reach the greatest harmony. ♦The virtue of the ancients (they who acted in Dao), ♦Did not use it to enlighten the citizens, [wise,sightinsight] ♦But would have used it to keep them ignorantA – [stupid,foolish] ♦The citizens [they] are hard to govern Because they have too much knowledgeB. Therefore : using knowledgeB to govern the nation Is the bane of the nation. [evil] Not using knowledgeB to govern the nation Is the good fortune of the nation. ♦He who has knowledge of these two also has [them as] examples2. To always understand these examples2 – This is called deep and mysterious De. ♦Deep and mysterious De is so profound ! and remote ! ♦That when creatures returnC, it returns [together]with them ! Then they reach the greatest harmony. [go along with,same direction,agreeable] Notes A : ignorance here is a good thing, as in #20 where the sage is foolish (using the same symbol) B : only WB and HSG have the Confucian term “wisdom” here, making these sentences anti-Confucian C : as in #25, where “being remote speaks of returning”; this sentence could also be translated as That it helps [all] creatures to return ! Cross-references the ancients/elders : #14, #15, #22, #38, #39, #62, #68 virtue of the ancients : #15 he who “possesses Dao” : #15, #23, #24, #31, #77 citizens are hard to govern : #75 mystery : #1, #6, #10, #15, #27, #51, #56, #62 deep and mysterious De : #10, #51 returning : #14, #16, #19, #20, #22, #25, #28, #34, #40, #52, #58, #60, #64, #80 De and returning : #28, #60 remote : #25 remote and returning : #25 Chapter Sixty Six ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ ■ [■ ■] ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ ■ The reason that rivers and seas can act as kings of the 100 valleys Is because they are good at being lower-than them. Therefore : they can act as kings of the 100 valleys. Thus the sage : In desiring to be above the citizens, He must by means of his speech be lower-than them. In desiring to be before the citizens, He must by means of his self be behind them. Thus the sage : Lives above them, but the citizens are not burdened. Lives in front of them, but the citizens are not harmed. Thus the world is pleased to promote him, and does not tire of him. Because he does not strive, Therefore no one in the world can strive against him. The reason that2 rivers and seas [they] can act as kings of the 100 valleys Is because they are good at being lower-thanA them. Therefore : they can act as kings of the 100 valleys. Thus2 the sage2 : In desiring to be aboveB the citizens, He must by means of his speech be lower-than them. In desiring to be beforeC the citizens, He must by means of his self be behind them. Thus2 the sage2 : Lives above them, but the citizens are not burdened. [heavy] Lives in

front of them, but the citizens are not harmed. Thus2 the world2 is pleased to promote him, and does not tire of{despise} him. Because he does not strive, ♦Therefore no one in the world2 can strive against him. [together with] Notes A : literally “below”, “under”, or “inferior”, here “lower- than” is used to indicate taking the lower or inferior position in a relationship (which in ancient Chinese culture was the better thing to do); Lau translates it as “taking the lower position” B : presumably, to rule over C : presumably, to lead Cross-references valley : #6, #15, #28, #32, #39, #41 lower-than : #61, #68 before/behind others : #7, #67 self : #7, #9, #13, #16, #26, #44, #52, #54 no harm : #35, #56, #58, #60, #81 not tire of leadership : #72 no striving : #3, #8, #22, #68, #73, #81 no one in the world can strive against him : #22 Chapter Sixty Seven ■ ■ ■ ■ ■ __ ■ ■ ■ ■ (•)■ ■ (■ ■) ■ [■] (■) • ■ ■ • ■ ■ ■ ■ ■(•) (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ • ■ (•)■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■(•) (•)■ In the world, all say I am great, But do not seem to be like everyone else. Now : only because I am not like everyone else, therefore I can be great. If I was like everyone else, Long ago! I would have become insignificant, indeed! Now : I possess three treasures – Hold and maintain them. The first is called compassion, The second is called economy, The third is called not daring to act first in the world. With compassion, you can therefore be brave. With economy, you can therefore expand. By not daring to act first in the world, Therefore you can achieve the capacity for leadership. At present, people abandon compassion but also try to be brave, Abandon economy but also try to expand, Abandon being behind but also try to be first – This is death! Now : when compassion is used in war, the consequence is victory. When it is used for protection, the consequence is strength. When heaven would help you, Using compassion it protects you. In the world2, all say I am great,A But do not seem to be like [everyone else].B Now : only [because I am] not like [everyone else], therefore I can be great.C ♦If [I was] like [everyone else], Long ago ! I would have become insignificant, indeed! [he] [minute,tiny] Now : I possess three treasures – Hold and maintain them. ♦The first is called compassion*, ♦The second is called economy, [thrifty,frugal] ♦The third is called not daring to act firstD in the world2. ♦With compassion*, you can therefore be brave*. ♦With economy, you can therefore expandE. [thrifty,frugal] ♦By not daring to act first in the world2, Therefore you can achieve the capacity for leadership. At present, people abandon compassion* but also try to be brave*, Abandon economy but also try to expandE, [thrifty,frugal] Abandon being behind but also try to be first – This is death ! Now : when compassion* is used in war, the consequence is victory. ♦When it is used for protection, the consequence is strength. When heaven would help you, [him] Using compassion* it protects you. [him] Notes A : this may sound egotistical, but the sage is described as being “great” in #34 and #63 and “valued” in #70; only WB and HSG changed this and the next four lines to read In the world2, all say my Dao is great, And does not seem to be like [anything else]. Now : only [because it is] great, therefore it does not seem to be like [anything else]. If [it was] like [anything else], Long ago ! it would have become insignificant, indeed! WB also switched from saying the sage is great to Dao is great in #34; also note that here it is everyone else, not the sage, who says the sage is great B : see #20 for many examples of how the sage is not like everyone else; this and the next three lines are translated in many different ways because ■ (“seem”, “resemble”) sounds the same as a different symbol meaning “small” and so is sometimes interpreted that way, and because ■ ■ can also mean “unworthy” C : this sentence comes from MWD/B for consistency with the previous lines D : presumably take the lead, rule, etc.; compare to #7 and #66 about being behind to be first E : this could be referring to expanding your territory or kingdom Cross-references treasures : #62, #69 not daring to act : #3, #64 before/behind others : #7, #66 die/death : #6, #33, #42, #50, #74, #75, #76, #80 strong : #3, #29, #30, #33, #36, #52, #55, #78 Chapter Sixty Eight ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

underestimating the enemy. By underestimating the enemy, I nearly lose my treasures. Therefore : when armies on opposing sides are evenly matched, Then they who mourn will be victorious! Those who command troops2 have a saying : ♦I dare not act like the master, but instead act like a guest. Dare not advance an inchA, but instead retreat a footB. This is called marching without marching, [travelling] [travelling] ♦Seizing without using your armsC, Routing without having an enemy, [throw out] DefendingD without using weapons. [hold,maintain] There is no misfortune greater than underestimating the enemy.E [frivolous,unimportant] By underestimating the enemy, I nearly lose my treasures. [frivolous,unimportant] Therefore : when armies on opposing sides are evenly matched, [similar,like each other,comparable2] Then they who mournF will be victorious ! Notes A : ■ was a unit of length, very close to one inch B : ■ was a unit of length, very close to one foot C : this symbol is definitely referring to the limb, not the English synonym for “weapons”; this and the next two lines can be translated in many ways due to their terseness D : as in “hold the fort” or “maintain your position” E : there is a great deal of variation between the sources for this line and the next, so WB and HSG are taken as the “standard”; each later source made changes to try to turn it into something that made sense! F : presumably, mourning the need to fight and/or the death it involves; compare to #31, where war is compared to dwelling at a funeral Cross-references not daring to act : #3, #64, #67 treasures : #62, #67 Chapter Seventy ■ ■ ■ ■ ■ • ■ ■ ■ • [■] ■ ■ ■ [■] ■ ■ • ■ [■] ■ ■ • ■ ■ ■ • ■ ■ ■ (•)■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ [■(•)] ■ ■ ■ ■ ■ ■ [■] ■ ■ My words are very easy to understand, Very easy to practice. But there is no one in the world who can understand them, There is no one who can practice them. My words possess a lineage, My duties possess a ruler. Now : only because I am without-knowledge, Thus I am not understood. Those who understand me are rare, Consequently I am one who is valued! Thus the sage wears coarse cloth, but carries jade in his heart. ♦My words are very easy to understand, ♦Very easy to practice. [perform] But there is no one in the world2 who can understand them, [they] There is no one who can practice them. [they] [perform] ♦[My]A words possess a lineage, [My]A duties possess a ruler. ♦Now : only because [I am]B without-knowledge, ♦Thus2 I am not understood. ♦Those who understand me are rare, Consequently I am one who is valued ! ♦Thus2 the sage2 wears coarse cloth, but carries jade in his heart. Notes A : “My” is inferred here from the first line, but could just as reasonably be left out, or “All” substituted B : there is no subject in the original Chinese, so this could also be saying “only because [the previous two lines] is not understood”, but because ■ ■ (without-knowledge) is specifically used, it is translated in this way Cross-references no one who can practice this : #78 being valuable : #56, #62 Chapter Seventy One ■ ■ ■ (■) [■(•)] ■ ■ ■ ■ [■(•)] (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ Knowing that you do not know is honorable! Not knowing that you know is a sickness! Now : only when you are sick of sickness, Thus you are not sick. The sage is not sick Because he is sick of sickness. Thus he is not sick. Knowing that you do not know is honorable ! Not knowing that you know is a sickness ! Now : only when you are sick of sickness, Thus2 you are not sick. The sage2 is not sick ♦Because he is sick of sickness. ♦Thus2 he is not sick. Notes The third and fourth lines are not in the MWD’s This chapter can be translated many different ways due to its terseness and the many ways to interpret ■ (disease, sickness, to be ill) “Sickness” here presumably refers to the suffering that comes from not following Dao Cross-references Chapter Seventy Two ■ ■ ■ ■ ■ ■ ■ ■ [■(•)] • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ If the citizens do not fear your authority, Then a greater authority will arrive! Do not disrespect their dwellings, Do not despise their livelihood. Now : only because you do not despise them, Thus they will not tire of you. Thus the sage : Knows himself but not display himself, Loves himself but does not exalt himself. Therefore he leaves that and chooses this. If the citizens do not fear [your] authority, Then a greater authority will arrive !A ♦Do not disrespect their dwellings2, ♦Do not despise their livelihood2B. [detest] [that which they produce] ♦Now : only because [you] do not despise [them], [detest] ♦Thus2 [they] will not tire of{detest}C [you]. ♦Thus2 the sage2 : ♦Knows himself but not display himself, [show] ♦Loves himself but does not exalt himself. [high rank,respected] Therefore he leaves thatD and chooses thisE. Notes A : possibly meaning someone else will take over, either from within or without? B : these two symbols could also be translated as “place of birth” or even “parents” (they who gave them life) C : this seems to be something of a play on words, because the symbol for “despise” in the previous line is the same symbol for “tire of”, so this line could also be translated as Thus2 they will not despise you but “tire of” is used here because of #66, where the citizens do not tire of the sage’s rule D : presumably, displaying and exalting E : presumably, knowing and loving Cross-references fear/afraid : #15, #17, #20, #74 citizens do not fear : #74 not tire of leadership : #66 not displaying oneself (showing off) : #22, #24, #47, #77 leaves that and chooses this : #12, #38 Chapter Seventy Three • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■

[choices], they sometimes cause benefit, sometimes cause harm. [maybe,perhaps] [maybe,perhaps] ♦That which heaven [it] detestsA – who knows its reasons? Thus2 the sage2 plans for things to be difficult.B [them] [schemes] ♦The Way of heaven : ♦Does not strive, yet skillfully achieves its goals. [victory,beat] ♦Does not speak, yet skillfully responds. ♦Does not summon, yet everything naturally comes to it. Is certainly unhurried, yet skillfully prepares.C [slow,patient,calm] [plans] ♦Heaven's net is extremely vast 2D; ♦It is wide meshed, yet does not fail. [sparce] Notes There are two themes in this chapter which do not seem to fit in with typical Daoist concepts – that of heaven conquering (literally "victory" or "beat", interpreted as "achieving its goals") which sounds more like striving than non-action, and planning (interpreted as "prepares") which seems contradictory to being "naturally so" (although the sage also "plans" here and in #63) A : in early societies, whatever endeavors failed were by definition what heaven (or the gods) "detested" B : this sentence only appears in the later sources, and seems to be a parenthetical comment; although it technically is in the majority, it seems so out-of-place that it is left out of the final translation above C : this sentence is nearly impossible to translate; while the first symbol in WB and HSG are the same, making them the default "majority", it is different in every other source, and none of their modern translations make sense; some translators use a symbol slightly different than that in WB and HSG but pronounced the same way; finally, "slow, patient, calm" is only the most likely translation that could be found for the first symbol D : "extremely" is implied by the repeated symbol Cross-references the sage plans for difficulties : #63 Way of heaven : #9, #47, #77, #79, #81 no striving : #3, #8, #22, #66, #68, #81 Chapter Seventy Four ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ • ■ ■ ■ ■ ■ __ (•)■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ __ ■ ■ ■ ■ ■(•) If the citizens do not fear death, How can you use death to frighten them? Assuming you could ensure that the citizens always fear death, And I get hold of those who act strange and unusual and kill them, Then who would be daring? There will always exist an executioner. Now : to take the place of the executioner to do the killing, This is called taking the place of a great craftsman to carve wood. Now : of those who take the place of a great craftsman to carve wood, Few will not injure their hand! If the citizens do not fear death, How2 can you use death to frighten them? Assuming you could ensure that the citizens always fear death, [make,cause] And I get hold of those who act strange and unusual and kill them, Then who would be daring{bold}? There will always exist an executioner3A. [he who attends to/manages killing] ♦Now : to take the place of the executioner3 to do the killing, [he who attends to/manages killing] This is called taking the place of a great craftsman to carve wood. ♦Now : of those who take the place of a great craftsman to carve wood, Few will not injure their hand ! [rare,infrequent] Notes A : it is speculated by some that this refers to heaven or Dao, and while that does make sense in context of the lines that follow, there is no direct support for it in the original Chinese Cross-references fear/afraid : #15, #17, #20, #72 citizens do not fear : #72 die/death : #6, #33, #42, #50, #67, #75, #76, #80 citizens do not fear death, take death seriously/lightly : #75, #80 Chapter Seventy Five • ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ (•)■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • The citizens are hungry Because their superiors eat too much of their taxes. Thus they are hungry. The citizens are hard to govern Because their superiors are compelled to take action. Thus they are hard to govern. The citizens take death lightly Because they seek the substance of life. Thus they take death lightly. Now : only he who has no use for being alive Is virtuous compared to he who values living. The citizens [they] are hungry Because their superiors eat too much of their taxes.A Thus2 they are hungry. The citizens [they] are hard to govern Because their superiors [they] are compelled to take actionB. [possess] Thus2 they are hard to govern. ♦The citizens [they] take death lightly Because theyC seek the substanceD of life. ♦Thus2 they take death lightly. Now : only he who has no use for being alive Is virtuous compared to [he who] values living.E Notes A : taxes were taken in grain at the time the DDJ was written, so this seems to be something of a play on words B : literally, they "possess action" C : HSG and FY have Because their superiors seek the substance of life thus placing the blame not on the people, but those who govern them (WB used the viewpoint of the earlier sources) D : compare to #38, where living for the "substance" is apparently a good thing, and #50, where it is a bad thing E : one who "values living" will be less virtuous than one who does not, because the former is out to get what he can for himself Cross-references citizens are hard to govern : #65 die/death : #6, #33, #42, #50, #67, #74, #76, #80 citizens do not fear death, take death seriously/lightly : #74, #80 substance : #38, #50, #55 Chapter Seventy Six • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • (•)■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ The people are born (indeed!) soft and weak. They die (indeed!) hard and inflexible. The ten thousand creatures, the grass and trees, are born (indeed!) soft and fragile. They die (indeed!) dried and withered. Therefore : that which is hard and inflexible is a follower of death. That which is soft and weak is a follower of life. Thus if a weapon is inflexible, the consequence is defeat. If a tree is inflexible, then it snaps. Inflexible and great dwell below. Soft and weak dwell above. ♦The people [they] are born (indeed!) soft and weak. They die (indeed!) hard and inflexible. The ten thousand creatures, the grass and trees, [they] are born (indeed!) soft and fragile. ♦They die (indeed!) dried and withered. Therefore : that which is hard and inflexible is a followerA of death. That which is soft and weak is a follower of life. Thus2 if a weapon is inflexible, the consequence is defeat2.B [not victory] If a tree is inflexible, then it snaps°. Inflexible and great dwell belowC. Soft and weak dwell above. Notes A : "follower" as in disciple or one who agrees with a particular way of looking at

things B : an inflexible weapon shatters easily; this line can be translated in many ways, because “weapon is inflexible” can also mean weapon is strong army is inflexible army is strong C : interestingly, this is the same symbol translated in #61, #66, and #68 as “lower-than” (which was a good thing), so in this case it is the inferior qualities which are lower-than Cross-references soft : #10, #36, #43, #52, #55, #78 weak : #3, #29, #36, #40, #55, #78 die/death : #6, #33, #42, #50, #67, #74, #75, #80 hard : #36, #43, #78 follower of death and follower of life : #50 Chapter Seventy Seven ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ • ■ ■ ■ ■ ■ ■ ■ ■ ■

in their customs. Although neighboring nations overlook one another, And sounds of roosters and dogs can be heard in one another – The citizens reach old age and die, And do not come and go between one another. ♦In a small nation with few citizens : Ensure that it has the weaponsA of ten noblesB, but does not use them. [make,cause] [tools] [Count] Ensure that the citizens take death seriously, and do not migrate far. [make,cause] Even though they have boats and carriages, there is no place to take advantage of them.C Even though they have armor and weapons, there is no place to display them.D ♦Ensure that the citizens return to knotting ropes and using themE, [make,cause] ♦Find deliciousness in their food, Beauty in their clothes, Contentment in their dwellings, Happiness in their customs. ♦[Although] neighboring nations overlook one another, [look at] [each other] ♦And sounds of roosters and dogs can be heard in one another – [chickens] [each other] ♦The citizens reach old age and die, ♦And do not come and go between one another. [each other] Notes A : the symbol literally refers only to tools, but has been associated with weapons in #31, #36, and #57 : “sharp tools”, “weapons are not the tools of a noble man” B : the symbol specifically refers to a Count (see #32), but in keeping with other chapters, this is interpreted more generally as “nobles”; the entire phrase probably means “as many weapons as the armies of ten Counts would have” C : have no need to use them; in other words, they do not want to leave, as supported by the last paragraph D : compare to #36, where the sharp tools of the nation cannot be shown to the people E : according to Ames&Hall, knotted ropes used to be used for record-keeping Cross-references nobles (in general) : #32, #37, #39, #42, #62 die/death : #6, #33, #42, #50, #67, #74, #75, #76 citizens do not fear death, take death seriously/lightly : #74, #75 returning : #14, #16, #19, #20, #22, #25, #28, #34, #40, #52, #58, #60, #64, #65 Chapter Eighty One ■■■

Chapter 2 was variously classified as belonging to all three layers, but the symbol distributions (below) simultaneously indicated that it cannot belong to any of them! If any chapter is truly a mixture of layers, it is this one (which Emerson agrees with), so it is not assigned to any. With the chapters separated as given above, it is possible to identify which symbols are used more often in one layer than another, as shown in the table below. Each line represents one symbol, and shows its various English meanings (as used in this translation). “Weak” symbols show up three to six times more often in the indicated layer than the other two, while “Strong” symbols show up more than six times more often. Within these sections, symbols are ordered from the least unbalanced to most unbalanced distributions between the layers. “Unique” symbols show up only in that layer, and not even once in the others. In these sections, words are listed from fewest appearances to most appearances. Weak and Strong symbols must show up in at least five chapters to be included, while Unique symbols must be in at least three chapters. Phrases (two or more symbols) are shown in italics. Some punctuation symbols are included as they tend to show differences in grammatical conventions between the layers. Where two symbols are consistently translated into the same punctuation, (#1) and (#2) are used to distinguish between them. Mostly Early Mostly Late Mostly Post-Guodian Weak valley call, say, speak return self deep mystery, deep and mysterious mother child, children fill, full maintain, protect do not act truth, honest, trust* affairs, duties, trouble honest and just non-action kind, kindness* wise, wisdom* heart/mind strong, inflexible, try originally, undoubtedly, firm, strong soft, softness, yielding dare, daring Dao of Strong ! (#1) name, fame, reputation choose, take, take hold of 100 weak, weakness victory, conquer die, death Unique ? (#1) army blended, mingled pure and clear clear, pure, bright newborn infant hard work unfortunate, bad nobles (specifically Marquis) within, middle exist, survive, keep disgrace without-name same, sameness stop, rest, stay ? (#2) no danger gateway image heaven & earth rare goods abandon non-interference family morality* clever, skillful bandit, evil thief, robbery confuse, confusion treasure hard teach, teaching The symbol for “die, death” that is strongly Post-Guodian is in only one non-Post-Guodian chapter (6, where the “spirit of the valley does not die”). All of the other 17 times (!) it is used is in Post-Guodian chapters, so if it wasn’t for the one use in chapter 6, this symbol would be strongly unique to the Post-Guodian chapters. Symbols that show up much more often in two layers but rarely in the other one are presented in the table on the following page, in the same format as the previous one. Symbols in the “Never” sections appear about equally often in the other two layers, but not once in the indicated layer. “Dao” is almost three times more likely to appear in Early and Late than Post-Guodian (and there almost always as “Dao of”), but not quite enough to make it into the following table (under “Rarely in Post-Guodian”). Besides the symbol distributions, it is interesting to note that of the six chapters in which the majority of the sources are anti-Confucian, all but chapter 33 are Late (and it is Post-Guodian) – thus none of the Early chapters are anti-Confucian. Also, the anti-military chapters (30, 31) are Early, while the chapters offering military advice (68, 69) are Post-Guodian. Finally, “living for the substance” is a good thing in chapter 38 (Late), but a bad thing in chapters 50 and 75 (both Post-Guodian). Early chapters are more concerned with heaven and earth, images of the feminine and the child, the concepts of “without-name” and “no danger”, and are the only chapters that try to describe Dao (1, 4, 14, 21, 25, 32, 34, 35), while they have little to do with the sage (only twice using “thus the sage” in 30 chapters), governing the nation, easy vs. difficult, and never mention the concept of “not striving”. Rarely in Early Rarely in Late Rarely in Post-Guodian Weak govern behavior, perform, travel virtue, good(ness), skilled ! (#2) sage weapons who, which ready, would, about to, general create, life, produce one De Strong benefit, profit, sharp nation citizens thus the sage Never virtuous person misfortune serious, double easy do not strive difficult, hard Qi good fortune scholar since, once maintain, protect master depend on, concerned with rare, few do not know 100 families female ocean, sea subtle mystery spirit bright, brightness empty arise, make move, movement, action begin, beginning arise, produce, go out !,? uncarved block not (■) Late chapters have more Confucian terms, advice on how to rule, and talk about non-interference, but at the same time are the only ones that talk about possessing or “taking hold of” the world or the nation. Post-Guodian chapters also offer some advice on how to rule, tend to deal with hard/soft/weak/strong, are the only chapters that offer military advice, and talk a lot about death, but rarely mention Dao or De, and never mention the feminine, the child, emptiness, or the uncarved block. The rest of the appendix collects all the chapters of each layer together, so the reader can see their common themes. The final section is called “What Would the Sage Do?”, and collects every reference to the Sage from the entire document. References A Stratification of Lao Tzu, by John J. Emerson; The Journal of Chinese Religions, #23, pp. 1-28; 1995 Lao Tzu Stratified, II: A Sketch, by John J. Emerson; http://www.idiocentrism.com/china.strata3.htm; 2003 Early One The Dao that can be spoken of is not the ever-constant Dao. The name that can be named is not the ever-constant name. That which is without-name is the beginning of heaven and earth. That which possesses a name is the mother of the ten thousand creatures. Therefore : always without-desire, thus you observe its subtle mystery. Always possessing desires, thus you observe its external appearances. These two, they arise from the same source but have different names; This sameness is called their deep mystery. Deep mysteries, and again deep mysteries – The gateway of many subtle mysteries. Four Dao is like a cup or bowl, yet use it and there exists no need to fill it. Profound and deep!, it appears to be the ancestor of the ten thousand creatures. It blunts their sharpness, Loosens their tangles, Softens their brightness, Makes them the same as the dust of the world. Deep and

profound!, it seems to barely exist. I do not know whose child it is – Its image came before that of god. Five Heaven and earth are not kind – Thus the ten thousand creatures become as straw dogs to them. The sage is not kind – Thus the 100 families become as straw dogs to him. The space between heaven and earth, How is it just like a bellows or flute? It is empty, yet does not run out. The more it moves, and the more it produces. Too much talking is exceptionally exhausting, Which is not as good as maintaining what is within. Six The spirit of the valley does not die – It is called the deep and mysterious feminine. The gateway of this deep and mysterious feminine – It is called the source of heaven and earth. Unbroken, it seems to exist. Using it takes no effort. Seven Heaven is eternal, earth is enduring. The reason that heaven and earth can be eternal and enduring Is because they do not live for themselves. Therefore they can live forever. Thus the sage : Puts his self behind others, yet finds his self before them. Considers his self extraneous, yet his self survives. Is this not because he has no self-interests? Therefore he can achieve his self-interests. Nine Holding and filling it Are not as good as your stopping short. Hammering and sharpening it Can not be forever maintained. When gold and jade fill a room, There is no one who can protect it. To have wealth and high rank, but with arrogance – Then naturally their loss is your own fault. When the task is successful, the self should let go of it. This is the Way of heaven. Early Ten Carrying and managing a body while embracing the One, Are you able to not separate them? Concentrating your Qi to become soft, Are you able to be like a newborn infant? Cleansing and clearing your deep and mysterious perception, Are you able to be without blemish? Loving the citizens and governing the nation, Are you able to use non-action? Opening and closing the gateway of heaven, Are you able to serve as the feminine? Attaining clear insight in all directions, Are you able to not use your knowledge? Creating them and raising them, Creating but not possessing, Acting but not concerned with the results, Leading yet not governing – This is called deep and mysterious De. Thirteen Favor and disgrace seem alarming. High rank brings great suffering if you have a self. What is meant by “favor and disgrace seem alarming”? Favor makes you the inferior, so gaining it seems alarming. Losing it also seems alarming. This is what is meant by “favor and disgrace seem alarming”. What is meant by “high rank brings great suffering if you have a self”? I am the reason that I have great suffering, I who act like I have a self. When I am without a self, how could I have suffering? Therefore : he who is high ranking and uses his self to serve the world – It seems he can thus be entrusted with the world! He who is loving and uses his self to serve the world – It seems he can thus be entrusted with the world! Fourteen Look, it is not seen; its name is called elusive. Listen, it is not heard; its name is called tenuous. Grasp, it is not gotten; its name is called subtle and obscure. These three things can not be investigated any further – Therefore they blend and become one. This one thing : Its highest point is not bright; Its lowest point is not dark. Continuous and unending!, it can not be named; It returns to non-existence. It is called the form of that which is without-form; The image of non-existence. It is called confusing and indistinct. Meet it and you do not see its beginning; Follow it and you do not see its end. Hold fast to the Way of the ancients In order to master the present moment. The ability to know the ancient beginning – This is called the main principle of Dao. Fifteen The virtue of the ancients made they who were scholars subtle, mysterious, obscure, deep, and penetrating. Their mysterious depths can not be understood. Now : only because they can not be understood, Therefore we try to emulate their appearance : Hesitant!, as if crossing a winter stream. Wary!, as if afraid of their neighbors all around. Respectful!, they are like a visiting guest. Yielding!, like ice that is about to to break off. Honest and genuine!, they are like the uncarved block. Wide and open!, they are like a valley. Unclear!, they are like muddy water. Who can take muddy water and use stillness to slowly and gently make it pure and clear? Who can take what is tranquil and use continual movement to slowly and gently bring it to life? He who maintains this Way does not desire to be full. Now : only because he is not full, Thus he can be hidden and unfinished. Early Sixteen Attain the utmost emptiness. Maintain a profound stillness. The ten thousand creatures arise in unison, And thus I observe their return. Now : all the myriad creatures return to their source. Returning to the source speaks of stillness. Stillness is called returning to the natural order. Returning to the natural order speaks of the ever-constant. Knowing the ever-constant speaks of insight. Not knowing the ever-constant is foolish and creates misfortune. Knowing the ever-constant leads to tolerance. Being tolerant leads to being just and unbiased. Being just and unbiased leads to being kingly. Being kingly leads to heaven. Heaven leads to Dao. Dao leads to what endures. When the self disappears, there can be no danger. Twenty Renounce learning and be without worry. “Yes” together with “yeah” – What is their mutual distance or nearness? Beautiful together with ugliness – What is their mutual distance or similarity? That which people fear, they are not able to not fear. How ridiculous! They are not yet centered! Everyone is very festive, As if enjoying the Tai Lao sacrifice, As if climbing terraces in the spring. I alone am unmoved! – Like one who has not yet given any sign, Like a newborn infant who does not yet act like a baby. Very tired and worn out!, as if without a place to return to. Everyone all has more than they need; I alone seem to have lost everything. I have the heart/mind of a foolish person, indeed!! I am very mixed up and confused! Common people are very clear and bright; I alone seem confused. Common people are very observant and alert; I alone am very gloomy and depressed. Tranquil!, they are like the ocean; I drift on the wind!, as if without a place to rest. Everyone all has a purpose; I alone am stupid and stubborn, and appear mean and shallow. I alone am different compared to other people, And value the food of the mother. Twenty one The greatest De is possible only when Dao is followed. The action of Dao on

creatures is just indistinct, just confusing. Confusing! and indistinct!, within it exists image. Indistinct! and confusing!, within it exists things. Obscure! and dark!, within it exists essence. Its essence is extremely real and true. Within it exists truth. From the present reaching to antiquity, Its name has not departed – Thus I observe the father of the multitudes. How do I thus know the father of the multitudes is like this? By means of this. Early Twenty three Minimal words are naturally so. Therefore : strong winds do not last the entire morning, Sudden rains do not last the entire day. Who makes these things? Heaven and earth. Even heaven and earth can not maintain them forever, And so how much less can people? Therefore : of those who engage in Dao – He who Daos is one with Dao. He who Des is one with De. He who loses is one with the loss. For he who is one with Dao, Dao is also pleased to have him. For he who is one with De, De is also pleased to have him. For he who is one with loss, Loss is also pleased to have him. If you do not trust enough, then you will not have anyone's trust. Twenty four He who stands on tiptoe does not really stand. He who stands astride can not travel. He who displays himself does not have insight. He who considers himself correct does not distinguish himself. He who boasts about himself is without merit. He who brags about himself does not endure. He who lives in Dao – Calls these leftover food and unnecessary behavior. Creatures detest them, no matter what. Therefore : he who possesses Dao does not live by them. Twenty five Something existed unformed yet complete, Before heaven and earth were created. Silent! Empty! Standing alone, not changing. It circulates everywhere, and causes no danger. It can be considered the mother of the world. I do not know its name; Its symbol is called Dao. If I tried to make its name, I would call it great. Being great speaks of departing. Departing speaks of being remote. Being remote speaks of returning. Dao is great, Heaven is great, Earth is great, The king is also great. Within the realm exist four that are great, And the king resides as one of them! People follow the earth. The earth follows heaven. Heaven follows Dao. Dao follows what is naturally so. Twenty eight Know your maleness, but maintain your femaleness. Serve as a stream to the world. Serving as a stream to the world, The ever-constant De will not depart, Returning you to the state of the newborn infant. Know your brightness, but maintain your darkness. Serve as an example to the world. Serving as an example to the world, The ever-constant De will not falter, Returning you to the state of the limitless. Know your honor, but maintain your disgrace. Serve as a valley to the world. Serving as a valley to the world, The ever-constant De will then be sufficient, Returning you to the state of the uncarved block. When the uncarved block is broken up, then it becomes tools. When the sage uses it, then he becomes the senior government official. Therefore : the greatest cutting does not divide. Early Thirty He who uses Dao to assist the master of the people Does not use weapons or strength on the world, For his troubles would likely return – In the dwelling places of armies, thorns and brambles are produced, And so what is left behind a great army must have a bad year. He who has virtue gets results and stops. He does not dare to take by using strength. He gets results, but never brags. Gets results, but never boasts. Gets results, but is not arrogant. Gets results, but only when he has no choice. Gets results, but never uses strength. When creatures are robust but old, This is called "not Dao". That which is "not Dao" has an early finish. Thirty one Now : fine weapons, they are not tools of good fortune. Creatures detest them, no matter what. Therefore : he who possesses Dao does not live by them. When a noble man is in his dwelling, then he honors the left. When he commands troops, then he honors the right. Weapons, they are not tools of good fortune. They are not the tools of a noble man. When he has no choice but to use them, To be calm and indifferent is superior – Never pleased, indeed! And he who is pleased enjoys killing people. Now : he who enjoys killing people Can not get what he desires from the world! Therefore : in fortunate affairs honor the left, In unfortunate affairs honor the right. Thus the assistant general of the army resides on the left, The supreme general of the army resides on the right. Thus we say they are dwelling at a funeral : When many people are killed, Then mourn and weep with grief for them. Victory in war thus means they will dwell at a funeral. Thirty two Dao is ever-constantly without-name. Even though the concept of the uncarved block seems insignificant, No one in the world can conquer it. If nobles and kings could maintain it, The ten thousand creatures would naturally obey. Heaven and earth would join with each other, Thus dropping a sweet dew. There are no citizens who would make this happen, Yet it would be naturally fair and impartial. And so, begin to divide and you have names. Once names exist, Men should also be ready to know when to stop. Knowing when to stop is the reason that there is no danger. An analogy for the action of Dao in the world : It is similar to a stream in a valley that becomes part of a large river or ocean. Thirty four Great Dao is like a vast flood! It is able to flow left and right. The ten thousand creatures depend on it in order for life, And are not rejected. It accomplishes its tasks successfully, Yet does not possess a name. It clothes and supports the ten thousand creatures, But does not act as their master. Therefore : since it is ever-constantly without-desire, It can then be named insignificant. Since the ten thousand creatures return to it But it does not act as their master, It can then be named great. Thus the sage can achieve greatness Because he does not act great. Therefore he can achieve greatness. Early Thirty five Holding fast to the great image, The entire world comes towards you. Comes towards you, and meeting with no harm, There is the greatest peace and calm. Music together with good food make passing guests stay, But Dao's words are bland! They are without flavor. Look for it, there is not enough to see. Listen for it, there is not enough to hear. Use it, there is not enough to exhaust. Thirty seven Dao ever-constantly resides in non-action, Yet nothing is left undone. If nobles and kings could maintain it, The ten thousand creatures would naturally transform. Transform, and if desire

arises, I would restrain it by means of the nameless uncarved block. In the state of the nameless uncarved block, Men also would be without-desire. Not desiring, thus they would be still – And the world would naturally settle. Thirty nine Of those who in ancient times attained oneness : Heaven attained oneness, thus becoming pure and clear. Earth attained oneness, thus becoming stable. Spirit attained oneness, thus becoming potent. The valley attained oneness, thus becoming full. The ten thousand creatures attained oneness, thus becoming alive. Nobles and kings attained oneness, thus serving the world faithfully. They attained it. If heaven could not use its purity and clarity, I fear it would split apart. If earth could not use its stability, I fear it would erupt. If spirit could not use its potency, I fear it would cease to be. If the valley could not use its fullness, I fear it would be used up. If the ten thousand creatures could not use their life, I fear they would be destroyed. If nobles and kings could not use their high rank and prominence, I fear they would fall. Therefore : humility thus serves as the source of high rank; Low thus serves as the foundation of high. Thus nobles and kings call themselves orphaned, lonely, and unlucky. Does this not mean that humility thus serves as the source? Does it not? Therefore : to attain exceptional popularity is to be without popularity – Do not desire to be scarce like jade, But common like rock. Early Forty one The superior scholar hearing of Dao works hard and practices it. The average scholar hearing of Dao seems to keep it, seems to lose it. The inferior scholar hearing of Dao laughs greatly at it. If he did not laugh, it would not be qualified to be Dao. Therefore : in the established sayings that exist, it is said – Insight into Dao seems like darkness. Advancing in Dao seems like retreating. Smooth Dao seems knotted. Superior De seems like a valley. The greatest purity seems like disgrace. The most extensive De seems like it is not enough. Established De seems aimless. Real and true character seems inconsistent. The greatest region is without borders. The greatest vessel is last to be completed. The greatest tone is a tenuous sound. The greatest image is without-form. Dao is hidden and without-name. Now : only Dao is good at beginning and also good at completing. Forty four Fame and self : which do you love? Self and property : which is greater? Gain and loss : which is the affliction? Extreme desire must lead to great expense. Collecting too much must lead to substantial loss. Knowing when you have enough, there can be no disgrace. Knowing when to stop, there can be no danger. Then you can forever endure. Fifty one Dao creates them, De raises them, Things shape them, Circumstances complete them. Thus among the ten thousand creatures, There are none who do not respect Dao and honor De. Respect of Dao, Honor of De – Now : there is no one who commands this, Yet it is always naturally so. Therefore : Dao creates them, De raises them. Leads them, nourishes them, Shelters them, heals them, Supports them, protects them. Creating but not possessing, Acting but not concerned with the results, Leading yet not governing – This is called deep and mysterious De. Fifty two The world had a beginning, Which can be considered the mother of the world. Once you have realized its mother, You thus know her children. Once you know her children, Return to and maintain their mother. When the self disappears, there can be no danger. Block your senses, close your gateway – All your life you will not struggle. Open your senses, be successful in your duties – All your life you will not have relief. Seeing the insignificant speaks of insight. Maintaining softness speaks of strength. Use your brightness to return to your insight. Do not lose your self in misfortune. This is called practicing the ever-constant. Early Fifty five He who embodies the substance of De Can be compared to a newborn child : Wasps, scorpions, snakes, and serpents do not sting him, Fierce beasts do not seize him, Birds of prey do not claw him. His bones are weak, his muscles are soft, yet his grasp is firm and strong. He has not yet known the union of female and male, yet his penis rises. He has the utmost essence, indeed! He cries the entire day yet does not get hoarse. He has the utmost harmony, indeed! Knowing harmony speaks of the ever-constant. Knowing the ever-constant speaks of insight. Benefitting life speaks of good fortune. Heart/mind making Qi speaks of strength. When creatures are robust but old, We call them “not Dao”. That which is “not Dao” has an early finish. Fifty six He who knows does not speak; He who speaks does not know. Block your senses, close your gateway. Blunt your sharpness, Loosen your tangles, Soften your brightness, Be the same as the dust of the world. This is called a deep and mysterious sameness. Therefore : you can not gain it and be friendly, Can not gain it and be unfriendly, Can not gain it and benefit, Can not gain it and cause harm, Can not gain it and have high rank, Can not gain it and be lowly. Therefore you become valuable to the world. Late Three Not honoring those who are esteemable Ensures that the citizens do not strive. Not valuing rare goods Ensures that the citizens do not act like thieves. Not showing that which can be desired Ensures that the citizens’ heart/minds do not become confused. Thus the governing of the sage Empties their heart/minds, fills their stomachs, Weakens their ambitions, strengthens their bones. By always ensuring that the citizens are without-knowledge and without-desire, Those who make men wise will not dare to act. Act with non-action, then all will be governed! Eight The highest virtue is like water – Water’s virtue benefits the ten thousand creatures, yet it does not strive. It dwells in places that everyone detests, Therefore it is almost comparable to Dao! In dwelling, the virtue is in the land. In your heart/mind, the virtue is in being profound and deep. In relations, the virtue is in being kind. In speech, the virtue is in being truthful. In governing, the virtue is in being honest and just. In your duties, the virtue is in being competent. In action, the virtue is in the timing. Now : only because there is no striving, Therefore there is no blame. Twelve The five colors can make people’s eyes blind. The five tones can make people’s ears deaf. The five flavors can make people’s mouths dull. Excessive hunting and horse racing can make people’s heart/minds become wild. Rare

goods can make people's behavior corrupt. Thus the sage : Acts on what is inside, he does not act on what he sees. Therefore he leaves that and chooses this. Seventeen The existence of the best ruler is barely known to the people. Next is one who they love and praise. Next is one who they fear. Next is one who they ridicule. If the ruler does not trust enough, then he will not have anyone's trust. Thoughtful!, he values his words. When tasks are accomplished and duties are successful, The 100 families all say "we are naturally so". Eighteen When the great Dao is abandoned, There exists kindness and morality. When intelligence and wisdom arise, There exists a great deal of deception. When the six relationships are not in harmony, There exists devoted children and loving parents. When the nation and the families are very confused, There exists loyal officials. Nineteen Renounce sacredness, abandon wisdom, And the citizens benefit 100-fold. Renounce kindness, abandon morality, And the citizens return to being devoted children and loving parents. Renounce cleverness, abandon profit, And thieves and bandits will not exist. These three things thus make a civilized society, but are not enough. Therefore : to ensure the citizens have a place to belong– See the simplicity, Embrace the concept of the uncarved block, Less selfishness, Fewer desires. Late Twenty two What is wrong then becomes whole and perfect. What is bent then becomes straight. What is hollow then becomes filled. What is worn out then becomes new. Have little, then gain. Have too much, then become confused. Thus the sage : Embraces the One, thus serving as an example to the world – He does not display himself, therefore he has insight. Does not consider himself correct, therefore he distinguishes himself. Does not boast about himself, therefore he possesses merit. Does not brag about himself, therefore he endures. Now : only because he does not strive, Therefore no one in the world can strive against him. That which the ancients say : "He who is wrong then becomes whole and perfect" – How can these be empty words? Be truly whole and perfect, and return to it. Twenty seven A good traveler is without wagon track or footprint. A good speaker is without flaw or disgrace. A good accountant does not use counting tokens. A good barrier is without bar or lock, yet can not be opened. A good binding is without cord or restraint, yet can not be loosened. Thus the sage : Is always good at helping people, Therefore he does not abandon people. Is always good at helping creatures, Therefore he does not abandon creatures. This is called following your insight. Therefore : he who is a virtuous person is the teacher of he who is not a virtuous person. He who is not a virtuous person is the resource of he who is a virtuous person. If the latter does not value his teacher, Or the former does not love his resource, Even if there is wisdom, there will be great confusion. This is called the essential subtle mystery. Twenty nine Would you take hold of the world and control it? I see you have no choice. Now : the world is a divine vessel, You can not control it (indeed!). He who acts, ruins it; He who grasps, loses it. Therefore : creatures are Sometimes active, sometimes passive, Sometimes breathe heavy, sometimes breathe easy, Sometimes strong, sometimes weak, Sometimes oppressed, sometimes overthrown. Thus the sage : Removes the extremes, Removes the extravagant and wasteful, Removes the arrogance. Thirty eight A man of highest De does not use his De, thus he possesses De. A man of inferior De does not lose his De, thus he is without De. A man of highest De uses non-action, and acts without motive. A man of inferior De coerces others, and has a motive to act. A man of highest kindness coerces others, and acts without motive. A man of highest morality coerces others, and has a motive to act. A man of highest propriety coerces others, and if there is no one who responds, Then he rolls up his sleeves and keeps doing it. Therefore : lose Dao, and later comes De. Lose De, and later comes kindness. Lose kindness, and later comes morality. Lose morality, and later comes propriety. Now : propriety is that which is merely the appearance of loyalty and honesty, And the beginning of confusion. He who is ahead in knowledge has the flower of Dao, But the beginning of stupidity and foolishness. Thus the greatest elders : Live by Dao's substance, and do not dwell on Dao's appearance. Live on Dao's fruit, and do not dwell on Dao's flower. Therefore they leave that and choose this. Late Forty five Great achievement seems incomplete, But its usefulness is not impaired. Great fullness is like a cup or bowl, Its usefulness is not exhausted. Great straightness seems bent. Great skillfulness seems clumsy. Great debaters seem slow of speech. Restlessness conquers cold. Stillness conquers heat. Purity and clarity along with stillness makes the world proper and correct. Forty six When the world possesses Dao, Riding horses are nonetheless used for manure. When the world is without Dao, War-horses are bred in the countryside. There is no fault greater than the capacity for desire. There is no misfortune greater than not knowing when you have enough. There is no error greater than desire for gain. Therefore : knowing the sufficiency of having enough, there is always enough! Forty seven You do not have to go out the door In order to to know the world. You do not have to look out the window In order to to know the Way of heaven. The farther you go out, You know even less. Thus the sage : Does not travel, yet knows. Does not display himself, yet has a reputation. Does not act, yet accomplishes. Forty eight The actions of those who learn daily increase. The actions of those who Dao daily decrease. Decreasing and again decreasing, In order to arrive at non-action. Use non-action, and nothing is left undone. To take hold of the world, always use non-interference. When you are compelled to interfere, Then you are not qualified to take hold of the world. Forty nine The sage does not have a constant heart/mind, Thus the 100 families' heart/minds become his heart/mind. He who is virtuous, I am virtuous to him. He who is not virtuous, I am also virtuous to him. Because De is virtue. He who is honest, I am honest with him. He who is not honest, I am also honest with him. Because De is honesty. The sage lives in the world, gathering it all in. And so he serves the world, merging with

their heart/minds. The 100 families all pay attention to their ears and eyes, And the sage treats them all like his children. Fifty three If I correctly use the tiniest bit of knowledge that I possess While travelling on the great Way, It is only walking off the path that I need to fear. The great Way is extremely even, But the citizens are fond of side paths. Although the royal court is very well-kept, The fields are very overgrown with weeds, The granaries are very empty. While at the court they wear refined multicolored silks, Carry sharp swords, Stuff themselves with drink and food, And have an excess of wealth and goods. This is called robbery and extravagance, Not Dao, indeed!! Late Fifty four That which is well established is not uprooted. That which is well embraced is not abandoned. Thus children and grandchildren offer sacrifices, and so sacrifices do not stop. Cultivate it in the self – your De will then be true and real. Cultivate it in the family – its De will then be more than enough. Cultivate it in the village – its De will then last forever. Cultivate it in the nation – its De will then be abundant. Cultivate it in the world – its De will then be everywhere. Therefore : use your self to contemplate the self. Use your family to contemplate the family. Use your village to contemplate the village. Use your nation to contemplate the nation. Use the world to contemplate the world. How do I thus know the world is like this? By means of this. Fifty seven Use honesty and justness when governing a nation. Use strange and unusual tactics when commanding troops. Use non-interference to take hold of the world. How do I thus know it is like this? By means of this : The world has many prohibitions and taboos, And the citizens become even poorer. The citizens have many sharp tools, And the nation and the families grow in confusion. The people have too much knowledge and cleverness, And strange things begin to increase. Matters of law are increasingly proclaimed, And more thieves and bandits exist. Therefore : the sage says – I use non-action, and the citizens naturally transform. I cherish stillness, and the citizens naturally become honest and just. I use non-interference, and the citizens naturally become wealthy. I am without-desire, and the citizens naturally return to the state of the uncarved block. Fifty eight If their government is very restrained, Its citizens will be very genuine and honest. If their government is very observant and alert, Its citizens will be very lacking and deficient. Misfortune! is that which good fortune leans on. Good fortune! is that which misfortune lies on. Who knows their limits? They are not honest and just. Honesty and justness returns, becoming strange and unusual. Virtue returns, becoming weird and strange. The confusion of the people – Its days have indeed been everlasting. Thus the sage : Is honest and does not divide, Is honorable and does not injure, Is straightforward and does not indulge in excess, Is bright but does not dazzle. Fifty nine When governing people or doing heaven's duties, It is better to be sparing. Now : only when you can be sparing, This is called early acceptance. Early acceptance is called doubling your accumulation of De. With a double accumulation of De, Then everything can be overcome. When everything can be overcome, Then no one knows your limits. When no one knows your limits, You can possess the nation. Possessing the mother of the nation, You can forever endure. This is called having a deep source and a firm foundation, The Way of long life and enduring sight. Late Sixty Governing a great nation is like cooking a small fish. Because Dao is present in the world, Its ghosts do not have spirit. Not that its ghosts do not have any spirit, But their spirit does not injure people. Not only does their spirit not injure people, The sage also does not injure people. Now : since these two do not injure each other, Therefore their De merges and returns! Sixty one A great nation is like the lowest places water can flow – The merging place of the world, The female of the world. The female always uses stillness to conquer the male. By using stillness, she becomes lower-than. Therefore : if a great nation is lower-than a small nation, Then it takes hold of the small nation. If a small nation is lower-than a great nation, Then it is taken hold of by the great nation. Therefore : sometimes one nation is lower-than in order to take hold of, Sometimes one nation is lower-than and then it is taken hold of. A great nation merely desires to combine livestock and people, A small nation merely desires to get work for its people. Now : for both nations to each get that which is their desire, It is proper for the great nation to be lower-than. Sixty two That which Daos is the obscure mystery of the ten thousand creatures. This is the treasure of a virtuous person, And that which is the protection of a person who is not virtuous. Beautiful speech can be used in the market, Respectful behavior can benefit people. People who are not virtuous, Why abandon them? Therefore : when inaugurating the son of heaven, Or installing the three nobles – Even if you possessed jade disks drawn by a team of four horses, That is not as good as sitting and offering this Way. What was the ancients' reason that they valued this Way? Did they not say : Seek in order to obtain, Have faults in order to be forgiven? Therefore Dao becomes valuable to the world. Sixty three Act with non-action. Handle duties with non-interference. Taste that which is without-flavor. Greatness is insignificant, too much is less. Repay animosity with De. Plan for the difficult while it is easy. Act on the great while it is tiny. In the world, difficult duties certainly start while easy. In the world, great duties certainly start while tiny. Thus the sage in the end does not act great, Therefore he can achieve his greatness. Men who make promises lightly, certainly few will trust. Men who expect most duties to be easy will certainly have many difficulties. Thus the sage plans for things to be difficult, Therefore in the end he is without difficulty! Late Sixty four What is peaceful is easy to hold. What has not yet been revealed is easy to plan for. What is brittle is easy to shatter. What is minute is easy to scatter. Act on it while it does not yet exist. Govern them while they are not yet confused. A tree too big to embrace is created from the tiniest shoot. A terrace of nine stories rises from a pile of dirt. A journey of a thousand miles begins from under the feet. He who acts, ruins it. He who grasps, loses it. Thus the sage : Does not act, therefore he does not ruin. Does

not grasp, therefore he does not lose. Citizens are always on the verge of achieving their undertakings, yet they ruin them. Be as careful in the end as if it was the beginning, Then you will not ruin your affairs. Thus the sage : Desires to not desire, Does not value rare goods, Learns to not learn. He returns to that which everyone else has passed over, Thus helping the ten thousand creatures to be naturally so, Yet not daring to act. Sixty five The virtue of the ancients (they who acted in Dao), Did not use it to enlighten the citizens, But would have used it to keep them ignorant – The citizens are hard to govern Because they have too much knowledge. Therefore : using knowledge to govern the nation Is the bane of the nation. Not using knowledge to govern the nation Is the good fortune of the nation. He who has knowledge of these two also has them as examples. To always understand these examples – This is called deep and mysterious De. Deep and mysterious De is so profound! and remote! That when creatures return, it returns with them! Then they reach the greatest harmony. Sixty six The reason that rivers and seas can act as kings of the 100 valleys Is because they are good at being lower-than them. Therefore : they can act as kings of the 100 valleys. Thus the sage : In desiring to be above the citizens, He must by means of his speech be lower-than them. In desiring to be before the citizens, He must by means of his self be behind them. Thus the sage : Lives above them, but the citizens are not burdened. Lives in front of them, but the citizens are not harmed. Thus the world is pleased to promote him, and does not tire of him. Because he does not strive, Therefore no one in the world can strive against him. Post-Guodian Eleven Thirty spokes of a wheel share one hub; In its emptiness exists the usefulness of the cart. Mix water with clay thus making a vessel; In its emptiness exists the usefulness of the vessel. Cut out doors and windows thus making a room; In their emptiness exists the usefulness of the room. Therefore : what exists thus makes a thing profitable; Emptiness thus makes it useful. Twenty six Serious serves as the source of frivolous. Stillness serves as the ruler of restlessness. Thus the noble man travels the entire day, And does not stray from his wagon. He is serious, even though glorious sights and feasts exist; He lives above them, like this. So how could one be the master of ten thousand chariots, And conduct his self frivolously in the world? Be frivolous, then lose the source. Be restless, then lose the rulership. Thirty three He who knows people is wise; He who knows himself has insight. He who is victorious over people possesses power; He who is victorious over himself is strong. He who knows he has enough is wealthy; He who uses force possesses ambition. He who does not lose his place endures; He who dies yet does not perish has longevity. Thirty six When you are about to gather something, You must have originally spread it out. When you are about to weaken something, You must have originally strengthened it. When you are about to abandon something, You must have originally been interested in it. When you are about to seize something, You must have originally given it. This is called subtle and obscure insight. What is soft and weak conquers what is hard and strong. Fish can not escape from the deep; The sharp tools of the nation Can not be shown to the people. Forty The movement of Dao returns things. The function of Dao is to weaken things. The ten thousand creatures of the world are created from being; Being is created from non-being. Forty two Dao creates one. One creates two. Two creates three. Three creates the ten thousand creatures. The ten thousand creatures carry Yin and embrace Yang, Pouring their Qi together, thus becoming harmonious. That which people detest : Being alone, orphaned, lonely, and unlucky – Yet kings and nobles thus name themselves. Therefore : creatures Sometimes lose, yet they gain; Sometimes gain, yet they lose. That which people teach, I also teach : Those who are bullies and hoodlums do not meet their natural death. I will thus become their elder teacher. Post-Guodian Forty three The softest things of the world Overrun the hardest things of the world. Non-being can enter where there is no space in between. Thus I know that non-action has benefits. The teaching of no-talking, The benefit of non-action – Few in the world attain these. Fifty Between coming out into life and entering death, Followers of life are 3 in 10. Followers of death are 3 in 10. People whose lives are merely moving them towards the place of death Are also 3 in 10. Now : what is the reason? Because they live life for its substance. But I have heard that he who is skilled at taking in life Can travel the mountains and does not meet rhino or tiger, Can enter a battle not wearing armor or weapons. The rhino has no place to thrust its horns, The tiger has no place to use its claws, The weapon has no place to allow its blade. Now : what is the reason? Because for him there is no place of death. Sixty seven In the world, all say I am great, But do not seem to be like everyone else. Now : only because I am not like everyone else, therefore I can be great. If I was like everyone else, Long ago! I would have become insignificant, indeed! Now : I possess three treasures – Hold and maintain them. The first is called compassion, The second is called economy, The third is called not daring to act first in the world. With compassion, you can therefore be brave. With economy, you can therefore expand. By not daring to act first in the world, Therefore you can achieve the capacity for leadership. At present, people abandon compassion but also try to be brave, Abandon economy but also try to expand, Abandon being behind but also try to be first – This is death! Now : when compassion is used in war, the consequence is victory. When it is used for protection, the consequence is strength. When heaven would help you, Using compassion it protects you. Sixty eight He who is good at being a scholar is not militant. He who is good at war does not get angry. He who is good at conquering the enemy does not engage them. He who is good at making use of people acts lower-than them. This is called the De of not striving. This is called the power of making use of people. This is called joining the elite of heaven's ancients, indeed! Post-Guodian Sixty nine Those who command troops have a saying : I dare not act like the master, but instead

act like a guest. Dare not advance an inch, but instead retreat a foot. This is called marching without marching, Seizing without using your arms, Routing without having an enemy, Defending without using weapons. There is no misfortune greater than underestimating the enemy. By underestimating the enemy, I nearly lose my treasures. Therefore : when armies on opposing sides are evenly matched, Then they who mourn will be victorious! Seventy My words are very easy to understand, Very easy to practice. But there is no one in the world who can understand them, There is no one who can practice them. My words possess a lineage, My duties possess a ruler. Now : only because I am without-knowledge, Thus I am not understood. Those who understand me are rare, Consequently I am one who is valued! Thus the sage wears coarse cloth, but carries jade in his heart. Seventy one Knowing that you do not know is honorable! Not knowing that you know is a sickness! Now : only when you are sick of sickness, Thus you are not sick. The sage is not sick Because he is sick of sickness. Thus he is not sick. Seventy two If the citizens do not fear your authority, Then a greater authority will arrive! Do not disrespect their dwellings, Do not despise their livelihood. Now : only because you do not despise them, Thus they will not tire of you. Thus the sage : Knows himself but not display himself, Loves himself but does not exalt himself. Therefore he leaves that and chooses this. Seventy three When your courage lies in daring, The consequence is killing. When your courage lies in not daring, The consequence is survival. These two choices, they sometimes cause benefit, sometimes cause harm. That which heaven detests – who knows its reasons? The Way of heaven : Does not strive, yet skillfully achieves its goals. Does not speak, yet skillfully responds. Does not summon, yet everything naturally comes to it. Is certainly unhurried, yet skillfully prepares. Heaven's net is extremely vast; It is wide meshed, yet does not fail. Seventy four If the citizens do not fear death, How can you use death to frighten them? Assuming you could ensure that the citizens always fear death, And I get hold of those who act strange and unusual and kill them, Then who would be daring? There will always exist an executioner. Now : to take the place of the executioner to do the killing, This is called taking the place of a great craftsman to carve wood. Now : of those who take the place of a great craftsman to carve wood, Few will not injure their hand! Post-Guodian Seventy five The citizens are hungry Because their superiors eat too much of their taxes. Thus they are hungry. The citizens are hard to govern Because their superiors are compelled to take action. Thus they are hard to govern. The citizens take death lightly Because they seek the substance of life. Thus they take death lightly. Now : only he who has no use for being alive Is virtuous compared to he who values living. Seventy six The people are born (indeed!) soft and weak. They die (indeed!) hard and inflexible. The ten thousand creatures, the grass and trees, are born (indeed!) soft and fragile. They die (indeed!) dried and withered. Therefore : that which is hard and inflexible is a follower of death. That which is soft and weak is a follower of life. Thus if a weapon is inflexible, the consequence is defeat. If a tree is inflexible, then it snaps. Inflexible and great dwell below. Soft and weak dwell above. Seventy seven The Way of heaven, how it is just like stretching a bow? He who is high is pressed down by it. He who is low is lifted by it. He who has excess is reduced by it. He who does not have enough is filled by it. The Way of heaven Reduces what has excess and fills what does not have enough. The Way of people on the other hand is not like this, And takes from those who do not have enough in order to offer it to those who have too much. Who can have too much and offer it to the world? Only he who possesses Dao. Thus the sage : Acts, but is not concerned with the results. Accomplishes his tasks, but does not dwell on them. He does not desire to display his virtue. Seventy eight In the world, nothing is softer and weaker than water. Yet for attacking that which is hard and strong, There is nothing that can surpass it. This is because it endlessly replaces itself. Weakness conquers strength. Softness conquers hardness. In the world, there is no one who does not know this, But there is no one who can practice it. Thus the sage says : Accepting upon oneself the disgrace of the nation Is called being master of the shrines. Accepting upon oneself the misfortune of the nation Is called being king of the world. Honest words seem contrary. Post-Guodian Seventy nine Harmonize a great resentment, And there must exist some remaining resentment. How can this be considered good? Thus the sage : Holds the left side of an agreement, But does not demand payment of people. Therefore : to have De is to take charge of your agreements; To be without De is to take charge of taking away from others. The Way of heaven, while without favor, Is always with virtuous people. Eighty In a small nation with few citizens : Ensure that it has the weapons of ten nobles, but does not use them. Ensure that the citizens take death seriously, and do not migrate far. Even though they have boats and carriages, there is no place to take advantage of them. Even though they have armor and weapons, there is no place to display them. Ensure that the citizens return to knotting ropes and using them, Find deliciousness in their food, Beauty in their clothes, Contentment in their dwellings, Happiness in their customs. Although neighboring nations overlook one another, And sounds of roosters and dogs can be heard in one another – The citizens reach old age and die, And do not come and go between one another. Eighty one True words are not beautiful; Beautiful words are not true. He who has virtue does not argue; He who argues does not have virtue. He who knows is not learned; He who is learned does not know. The sage does not accumulate things – Since through serving people, the more one has; Since through giving to people, one has even more. The Way of heaven benefits and does not cause harm. The Way of the sage acts yet does not strive. As mentioned above, chapter 2 seems to be a truly "mongrel" chapter, with characteristics that indicate it belongs to all three layers, and none of them. Therefore, it is presented here, separate from the other layers. Two In the

world, when all know that the action of beauty is beautiful, then ugliness ensues. When all know that the action of good is goodness, then not-good ensues. Therefore : being and non-being create each other, Difficult and easy complete each other, Long and short contrast each other, High and low lean on each other, Tone and voice harmonize each other, Before and after follow each other. Thus the sage : Lives by using non-action in his duties, And practicing no-talking in his teachings. The ten thousand creatures arise, but do not have a beginning. Creating but not possessing; Acting, but not concerned with the results; Accomplishing tasks, but not dwelling on them. Now : only because there is no dwelling, Thus the results do not depart. What Would the Sage Do? Thus the sage : Lives by using non-action in his duties, And practicing no-talking in his teachings. Thus the governing of the sage Empties their heart/minds, fills their bellies, Weakens their ambitions, strengthens their bones. The sage is not kind; Thus the 100 families become as straw dogs to him. Thus the sage : Puts his self behind others, yet finds his self before them. Considers his self extraneous, yet his self survives. Is this not because he has no self-interests? Therefore he can achieve his self-interests. Thus the sage : Acts on what is inside, he does not act on what he sees. Therefore he leaves that and chooses this. Thus the sage : Embraces the One, thus serving as an example to the world – He does not display himself, therefore he has insight. Does not consider himself correct, therefore he distinguishes himself. Does not boast about himself, therefore he possesses merit. Does not brag about himself, therefore he endures. Now : only because he does not strive, Therefore no one in the world can strive against him. Thus the sage : Is always good at helping people, Therefore he does not abandon people. Is always good at helping creatures, Therefore he does not abandon creatures. This is called following your insight. Thus the sage : Removes the extremes, Removes the extravagant and wasteful, Removes the arrogance. Thus the sage can achieve greatness Because he does not act great. Therefore he can achieve greatness. Thus the sage : Does not travel, yet knows. Does not display himself, yet has a reputation. Does not act, yet accomplishes. The sage does not have a constant heart/mind, Thus the 100 families' heart/minds become his heart/mind. The sage lives in the world, taking it all in. And so he serves the world, merging with their heart/minds. The 100 families all pay attention to their ears and eyes, And the sage treats them all like his children. Therefore : the sage says – I use non-action, and the citizens naturally transform. I cherish stillness, and the citizens naturally become honest and just. I use non-interference, and the citizens naturally become wealthy. I am without-desire, and the citizens naturally return to the state of the uncarved block. Thus the sage : Is honest and does not divide, Is honorable and does not injure, Is straightforward and does not indulge in excess, Is bright but does not dazzle. The sage also does not injure people. Thus the sage in the end does not act great, Therefore he can achieve his greatness. Thus the sage plans for things to be difficult, Therefore in the end he is without difficulty! Thus the sage : Does not act, therefore he does not ruin. Does not grasp, therefore he does not lose. Thus the sage : Desires to not desire, Does not value rare goods, Learns to not learn. Thus the sage : In desiring to be above the citizens, He must by means of his speech be lower-than them. In desiring to be before the citizens, He must by means of his self be behind them. Thus the sage : Lives above them, but the citizens are not burdened. Lives in front of them, but the citizens are not harmed. Thus the world is pleased to promote him, and does not tire of him. What Would the Sage Do? Thus the sage wears coarse cloth, but carries jade in his heart. The sage is not sick Because he is sick of sickness. Thus he is not sick. Thus the sage : Knows himself but not display himself, Loves himself but does not exalt himself. Therefore he leaves that and chooses this. Thus the sage : Acts, but is not concerned with the results. Accomplishes his tasks, but does not dwell on them. He does not desire to display his virtue. Thus the sage says : Accepting upon oneself the disgrace of the nation Is called being master of the shrines. Accepting upon oneself the misfortune of the nation Is called being king of the world. Thus the sage : Holds the left side of an agreement, But does not demand payment of people. The sage does not accumulate things – Since through serving people, the more one has; Since through giving to people, one has even more. The Way of the sage acts yet does not strive. A COURSE OF PURE MATHEMATICS CAMBRIDGE UNIVERSITY PRESS C. F. CLAY, Manager LONDON: FETTER LANE, E.C. 4 NEW YORK : THE MACMILLAN CO. BOMBAY CALCUTTA MADRAS

MACMILLAN AND CO., Ltd. TORONTO : THE MACMILLAN CO. OF CANADA, Ltd. TOKYO : MARUZEN-KABUSHIKI-KAISHA ALL RIGHTS RESERVED A COURSE OF PURE MATHEMATICS BY G. H. HARDY, M.A., F.R.S. FELLOW OF NEW COLLEGE SAVILIAN PROFESSOR OF GEOMETRY IN THE UNIVERSITY OF OXFORD LATE FELLOW OF TRINITY COLLEGE, CAMBRIDGE THIRD EDITION Cambridge at the University Press 1921 First Edition 1908 Second Edition 1914 Third Edition 1921 PREFACE TO THE THIRD EDITION No extensive changes have been made in this edition. The most impor- tant are in §§ 80–82, which I have rewritten in accordance with suggestions made by Mr S. Pollard. The earlier editions contained no satisfactory account of the genesis of the circular functions. I have made some attempt to meet this objection in § 158 and Appendix III. Appendix IV is also an addition. It is curious to note how the character of the criticisms I have had to meet has changed. I was too meticulous and pedantic for my pupils of fifteen years ago: I am altogether too popular for the Trinity scholar of to-day. I need hardly say that I find such criticisms very gratifying, as the best evidence that the book has to some extent fulfilled the purpose with which it was written. G. H. H. August 1921 EXTRACT FROM THE PREFACE TO THE SECOND EDITION The principal changes made in this edition are as follows. I have in- serted in Chapter I a sketch of Dedekind's theory of real numbers, and a proof of Weierstrass's theorem concerning points of condensation; in Chap- ter IV an account of 'limits of indetermination' and the 'general principle of convergence'; in Chapter V a proof of the 'Heine-Borel Theorem', Heine's theorem concerning uniform continuity, and the fundamental theorem con- cerning implicit functions; in Chapter VI some additional matter concern- ing the integration of algebraical functions; and in Chapter VII a section on differentials. I have also rewritten in a more general form the sections which deal with the definition of the definite integral. In order to find space for these insertions I have deleted a good deal of the analytical ge- ometry and formal trigonometry contained in Chapters II and III of the first edition. These changes have naturally involved a large number of minor alterations. G. H. H. October 1914 EXTRACT FROM THE PREFACE TO THE FIRST EDITION This book has been designed primarily for the use of first year students at the Universities whose abilities reach or approach something like what is usually described as 'scholarship standard'. I hope that it may be useful to other classes of readers, but it is this class whose wants I have considered first. It is in any case a book for mathematicians: I have nowhere made any attempt to meet the needs of students of engineering or indeed any class of students whose interests are not primarily mathematical. I regard the book as being really elementary. There are plenty of hard examples (mainly at the ends of the chapters): to these I have added, wherever space permitted, an outline of the solution. But I have done my best to avoid the inclusion of anything that involves really difficult ideas. For instance, I make no use of the 'principle of convergence': uniform convergence, double series, infinite products, are never alluded to: and I prove no general theorems whatever concerning the inversion of limit- operations—I never even define $\partial^2 f / \partial x \, \partial y$ and $\partial^2 f / \partial y \, \partial x$. In the last two chapters I have occasion once or twice to integrate a power-series, but I have confined myself to the very simplest cases and given a special discussion in each instance. Anyone who has read this book will be in a position to read with profit Dr Bromwich's Infinite Series, where a full and adequate discussion of all these points will be found. CHAPTER I

REAL VARIABLES

1. Rational numbers. A fraction r = p/q, where p and q are pos- itive or negative integers, is called a rational number. We can suppose (i) that p and q have no common factor, as if they have a common factor we can divide each of them by it, and (ii) that q is positive, since p/(–q) = (–p)/q, (–p)/(–q) = p/q. To the rational numbers thus defined we may add the 'rational number 0' obtained by taking p = 0. We assume that the reader is familiar with the ordinary arithmetical rules for the manipulation of rational numbers. The examples which follow demand no knowledge beyond this. Examples I. 1. If r and s are rational numbers, then r + s, r – s, rs, and r/s are rational numbers, unless in the last case s = 0 (when r/s is of course meaningless). 2. If λ, m, and n are positive rational numbers, and m > n, then $\lambda(m^2 - n^2)$, $2\lambda mn$, and $\lambda(m^2 + n^2)$ are positive rational numbers. Hence show how to determine any number of right-angled triangles the lengths of all of whose sides are rational. 3. Any terminated decimal represents a rational number whose denomina- tor contains no factors other than 2 or 5. Conversely, any such rational number can be expressed, and in one way only, as a terminated decimal. [The general theory of decimals will be considered in Ch. IV.] 4. The positive rational numbers may be arranged in the form of a simple series as follows: $\frac{1}{1}, \frac{2}{1}, \frac{1}{2}, \frac{3}{1}, \frac{2}{2}, \frac{1}{3}, \frac{4}{1}, \frac{3}{2}, \frac{2}{3}, \frac{1}{4}, \ldots$. Show that p/q is the $[\frac{1}{2}(p + q - 1)(p + q - 2) + q]$th term of the series. [In this series every rational number is repeated indefinitely. Thus 1 occurs as $\frac{1}{1}, \frac{2}{2}, \frac{3}{3}, \ldots$. We can of course avoid this by omitting every number which has already occurred in a simpler form, but then the problem of determining the precise position of p/q becomes more complicated.]

2. The representation of rational numbers by points on a line. It is convenient, in many branches of mathematical analysis, to make a good deal of use of geometrical illustrations. The use of geometrical illustrations in this way does not, of course, imply that analysis has any sort of dependence upon geometry: they are illustrations and nothing more, and are employed merely for the sake of clearness of exposition. This being so, it is not necessary that we should attempt any logical analysis of the ordinary notions of elementary geome- try; we may be content to suppose, however far it may be from the truth, that we know what they mean. Assuming, then, that we know what is meant by a straight line, a segment of a line, and the length of a segment, let us take a straight line Λ, produced indefinitely in both directions, and a segment A0A1 of any length. We call A0 the origin, or the point 0, and A1 the point 1, and we regard these points as representing the numbers 0 and 1. In order to obtain a point which shall represent a positive rational number r = p/q, we choose the point Ar such that A0Ar/A0A1 = r, A0Ar being a stretch of the line extending in the same direction along the line as A0A1, a direction which we shall suppose to be from left to right when, as in Fig. 1, the line is drawn horizontally across the paper. In order to obtain a point to represent a negative rational number r = –s,A0 A1 AsA–1A–s Fig. 1. it is natural to regard length as a magnitude capable of sign, positive if the length is measured in one direction (that of A0A1), and negative if measured in the other, so that AB = –BA; and to take as the point representing r the point A–s such that A0A–s = –A–sA0 = –A0As.

We thus obtain a point Ar on the line corresponding to every rational value of r, positive or negative, and

such that A0Ar = r · A0A1; and if, as is natural, we take A0A1 as our unit of length, and write A0A1 = 1, then we have A0Ar = r. We shall call the points Ar the rational points of the line. 3. Irrational numbers. If the reader will mark off on the line all the points corresponding to the rational numbers whose denominators are 1, 2, 3, . . . in succession, he will readily convince himself that he can cover the line with rational points as closely as he likes. We can state this more precisely as follows: if we take any segment BC on Λ, we can find as many rational points as we please on BC. Suppose, for example, that BC falls within the segment A1A2. It is evident that if we choose a positive integer k so that k · BC > 1,* (1) and divide A1A2 into k equal parts, then at least one of the points of division (say P) must fall inside BC, without coinciding with either B or C. For if this were not so, BC would be entirely included in one of the k parts into which A1A2 has been divided, which contradicts the supposition (1). But P obviously corresponds to a rational number whose denominator is k. Thus at least one rational point P lies between B and C. But then we can find another such point Q between B and P , another between B and Q, and so on indefinitely; i.e., as we asserted above, we can find as many as we please. We may express this by saying that BC includes infinitely many rational points. *The assumption that this is possible is equivalent to the assumption of what is known as the Axiom of Archimedes. [I : 3] REAL VARIABLES 4 The meaning of such phrases as 'infinitely many' or 'an infinity of ', in such sentences as 'BC includes infinitely many rational points' or 'there are an infinity of rational points on BC' or 'there are an infinity of positive integers', will be considered more closely in Ch. IV. The assertion 'there are an infinity of positive integers' means 'given any positive integer n, however large, we can find more than n positive integers'. This is plainly true whatever n may be, e.g. for n = 100,000 or 100,000,000. The assertion means exactly the same as 'we can find as many positive integers as we please'. The reader will easily convince himself of the truth of the following assertion, which is substantially equivalent to what was proved in the second paragraph of this section: given any rational number r, and any positive integer n, we can find another rational number lying on either side of r and differing from r by less than 1/n. It is merely to express this differently to say that we can find a rational number lying on either side of r and differing from r by as little as we please. Again, given any two rational numbers r and s, we can interpolate between them a chain of rational numbers in which any two consecutive terms differ by as little as we please, that is to say by less than 1/n, where n is any positive integer assigned beforehand. From these considerations the reader might be tempted to infer that an adequate view of the nature of the line could be obtained by imagining it to be formed simply by the rational points which lie on it. And it is certainly the case that if we imagine the line to be made up solely of the rational points, and all other points (if there are any such) to be eliminated, the figure which remained would possess most of the properties which common sense attributes to the straight line, and would, to put the matter roughly, look and behave very much like a line. A little further consideration, however, shows that this view would involve us in serious difficulties. Let us look at the matter for a moment with the eye of common sense, and consider some of the properties which we may reasonably expect a straight line to possess if it is to satisfy the idea which we have formed of it in elementary geometry. The straight line must be composed of points, and any segment of it by all the points which lie between its end points. With any such segment [I : 3] REAL VARIABLES 5 must be associated a certain entity called its length, which must be a quantity capable of numerical measurement in terms of any standard or unit length, and these lengths must be capable of combination with one another, according to the ordinary rules of algebra, by means of addition or multiplication. Again, it must be possible to construct a line whose length is the sum or product of any two given lengths. If the length P Q, along a given line, is a, and the length QR, along the same straight line, is b, the length P R must be a + b. Moreover, if the lengths OP , OQ, along one straight line, are 1 and a, and the length OR along another straight line is b, and if we determine the length OS by Euclid's construction (Euc. vi. 12) for a fourth proportional to the lines OP , OQ, OR, this length must be ab, the algebraical fourth proportional to 1, a, b. And it is hardly necessary to remark that the sums and products thus defined must obey the ordinary 'laws of algebra'; viz. a + b = b + a, a + (b + c) = (a + b) + c, ab = ba, a(bc) = (ab)c, a(b + c) = ab + ac. The lengths of our lines must also obey a number of obvious laws concerning inequalities as well as equalities: thus if A, B, C are three points lying along Λ from left to right, we must have AB < AC, and so on. Moreover it must be possible, on our fundamental line Λ, to find a point P such that A0P is equal to any segment whatever taken along Λ or along any other straight line. All these properties of a line, and more, are involved in the presuppositions of our elementary geometry. Now it is very easy to see that the idea of a straight line as composed of a series of points, each corresponding to a rational number, cannot possibly satisfy all these requirements. There are various elementary geometrical constructions, for example, which purport to construct a length x such that x2 = 2. For instance, we may construct an isosceles right-angled tri- angle ABC such that AB = AC = 1. Then if BC = x, x2 = 2. Or we may determine the length x by means of Euclid's construction (Euc. vi. 13) for a mean proportional to 1 and 2, as indicated in the figure. Our require- ments therefore involve the existence of a length measured by a number x, [I : 3] REAL VARIABLES 6A B C 1 1 x L M N P 2 1 x Fig. 2. and a point P on Λ such that A0P = x, x2 = 2. But it is easy to see that there is no rational number such that its square is 2. In fact we may go further and say that there is no rational number whose square is m/n, where m/n is any positive fraction in its lowest terms, unless m and n are both perfect squares. For suppose, if possible, that p2/q2 = m/n, p having no factor in common with q, and m no factor in common with n.

Then np2 = mq2. Every factor of q2 must divide np2, and as p and q have no common factor, every factor of q2 must divide n. Hence n = λq2, where λ is an integer. But this involves m = λp2: and as m and n have no common factor, λ must be unity. Thus m = p2, n = q2, as was to be proved. In particular it follows, by taking n = 1, that an integer cannot be the square of a rational number, unless that rational number is itself integral. It appears then that our requirements involve the existence of a num- ber x and a point P , not one of the rational points already constructed, such that A0P = x, x2 = 2; and (as the reader will remember from ele- mentary algebra) we write x = √2. The following alternative proof that no rational number can have its square equal to 2 is interesting. [I : 4] REAL VARIABLES 7 Suppose, if possible, that p/q is a positive fraction, in its lowest terms, such that (p/q)2 = 2 or p2 = 2q2. It is easy to see that this involves (2q – p)2 = 2(p – q)2; and so (2q – p)/(p – q) is another fraction having the same property. But clearly q < p < 2q, and so p – q < q. Hence there is another fraction equal to p/q and having a smaller denominator, which contradicts the assumption that p/q is in its lowest terms. Examples II. 1. Show that no rational number can have its cube equal to 2. 2. Prove generally that a rational fraction p/q in its lowest terms cannot be the cube of a rational number unless p and q are both perfect cubes. 3. A more general proposition, which is due to Gauss and includes those which precede as particular cases, is the following: an algebraical equation xn + p1xn–1 + p2xn–2 + · · · + pn = 0, with integral coefficients, cannot have a rational but non-integral root. [For suppose that the equation has a root a/b, where a and b are integers without a common factor, and b is positive. Writing a/b for x, and multiplying by bn–1, we obtain – an b = p1an–1 + p2an–2b + · · · + pnbn–1, a fraction in its lowest terms equal to an integer, which is absurd. Thus b = 1, and the root is a. It is evident that a must be a divisor of pn.] 4. Show that if pn = 1 and neither of 1 + p1 + p2 + p3 + . . . , 1 – p1 + p2 – p3 + . . . is zero, then the equation cannot have a rational root. 5. Find the rational roots (if any) of x4 – 4x3 – 8x2 + 13x + 10 = 0. [The roots can only be integral, and so ±1, ±2, ±5, ±10 are the only possi- bilities: whether these are roots can be determined by trial. It is clear that we can in this way determine the rational roots of any such equation.] [I : 4] REAL VARIABLES 8 4. Irrational numbers (continued). The result of our geometrical representation of the rational numbers is therefore to suggest the desirabil- ity of enlarging our conception of ‘number’ by the introduction of further numbers of a new kind. The same conclusion might have been reached without the use of ge- ometrical language. One of the central problems of algebra is that of the solution of equations, such as x2 = 1, x2 = 2. The first equation has the two rational roots 1 and –1. But, if our con- ception of number is to be limited to the rational numbers, we can only say that the second equation has no roots; and the same is the case with such equations as x3 = 2, x4 = 7. These facts are plainly sufficient to make some generalisation of our idea of number desirable, if it should prove to be possible. Let us consider more closely the equation x2 = 2. We have already seen that there is no rational number x which satisfies this equation. The square of any rational number is either less than or greater than 2. We can therefore divide the rational numbers into two classes, one containing the numbers whose squares are less than 2, and the other those whose squares are greater than 2. We shall confine our attention to the positive rational numbers, and we shall call these two classes the class L, or the lower class, or the left-hand class, and the class R, or the upper class, or the right-hand class. It is obvious that every member of R is greater than all the members of L. Moreover it is easy to convince ourselves that we can find a member of the class L whose square, though less than 2, differs from 2 by as little as we please, and a member of R whose square, though greater than 2, also differs from 2 by as little as we please. In fact, if we carry out the ordinary arithmetical process for the extraction of the square root of 2, we obtain a series of rational numbers, viz. 1, 1.4, 1.41, 1.414, 1.4142, . . . whose squares 1, 1.96, 1.9881, 1.999 396, 1.999 961 64, . . . [I : 4] REAL VARIABLES 9 are all less than 2, but approach nearer and nearer to it; and by taking a sufficient number of the figures given by the process we can obtain as close an approximation as we want. And if we increase the last figure, in each of the approximations given above, by unity, we obtain a series of rational numbers 2, 1.5, 1.42, 1.415, 1.4143, . . . whose squares 4, 2.25, 2.0164, 2.002 225, 2.000 244 49, . . . are all greater than 2 but approximate to 2 as closely as we please. The reasoning which precedes, although it will probably convince the reader, is hardly of the precise character required by modern mathematics. We can supply a formal proof as follows. In the first place, we can find a member of L and a member of R, differing by as little as we please. For we saw in § 3 that, given any two rational numbers a and b, we can construct a chain of rational numbers, of which a and b are the first and last, and in which any two consecutive numbers differ by as little as we please. Let us then take a member x of L and a member y of R, and interpolate between them a chain of rational numbers of which x is the first and y the last, and in which any two consecutive numbers differ by less than δ, δ being any positive rational number as small as we please, such as .01 or .0001 or .000 001. In this chain there must be a last which belongs to L and a first which belongs to R, and these two numbers differ by less than δ. We can now prove that an x can be found in L and a y in R such that 2 – x2 and y2 – 2 are as small as we please, say less than δ. Substituting 1 4 δ for δ in the argument which precedes, we see that we can choose x and y so that y – x < 1 4 δ; and we may plainly suppose that both x and y are less than 2. Thus y + x < 4, y2 – x2 = (y – x)(y + x) < 4(y – x) < δ; and since x2 < 2 and y2 > 2 it follows a fortiori that 2 – x2 and y2 – 2 are each less than δ. It follows also that there can be no largest member of L or smallest member of R. For if x is any member of L, then x2 < 2. Suppose that x2 = 2 – δ. Then we can find a member x1 of L such that x2 1 differs from 2 by less than δ, and so x2 1 > x2 or x1 > x. Thus

there are larger members [I : 5] REAL VARIABLES 10 of L than x; and as x is any member of L, it follows that no member of L can be larger than all the rest. Hence L has no largest member, and similarly R has no smallest. 5. Irrational numbers (continued). We have thus divided the posi- tive rational numbers into two classes, L and R, such that (i) every member of R is greater than every member of L, (ii) we can find a member of L and a member of R whose difference is as small as we please, (iii) L has no greatest and R no least member. Our common-sense notion of the at- tributes of a straight line, the requirements of our elementary geometry and our elementary algebra, alike demand the existence of a number x greater than all the members of L and less than all the members of R, and of a cor- responding point P on Λ such that P divides the points which correspond to members of L from those which correspond to members of R.A0 P RL RL RL RL RL Fig. 3. Let us suppose for a moment that there is such a number x, and that it may be operated upon in accordance with the laws of algebra, so that, for example, x2 has a definite meaning. Then x2 cannot be either less than or greater than 2. For suppose, for example, that x2 is less than 2. Then it follows from what precedes that we can find a positive rational number ξ such that $\xi 2$ lies between x2 and 2. That is to say, we can find a member of L greater than x; and this contradicts the supposition that x divides the members of L from those of R. Thus x2 cannot be less than 2, and similarly it cannot be greater than 2. We are therefore driven to the conclusion that x2 = 2, and that x is the number which in algebra we denote by $\sqrt{2}$. And of course this number $\sqrt{2}$ is not rational, for no rational number has its [I : 5] REAL VARIABLES 11 square equal to 2. It is the simplest example of what is called an irrational number. But the preceding argument may be applied to equations other than x2 = 2, almost word for word; for example to x2 = N , where N is any integer which is not a perfect square, or to x3 = 3, x3 = 7, x4 = 23, or, as we shall see later on, to x3 = 3x+8. We are thus led to believe in the existence of irrational numbers x and points P on Λ such that x satisfies equations such as these, even when these lengths cannot (as $\sqrt{2}$ can) be constructed by means of elementary geometrical methods. The reader will no doubt remember that in treatises on elementary algebra the root of such an equation as xq = n is denoted by q $\sqrt{n}$ or n1/q, and that a meaning is attached to such symbols as np/q, n–p/q by means of the equations np/q = (n1/q)p, np/qn–p/q = 1. And he will remember how, in virtue of these definitions, the ‘laws of indices’ such as nr × ns = nr+s, (nr)s = nrs are extended so as to cover the case in which r and s are any rational numbers whatever. The reader may now follow one or other of two alternative courses. He may, if he pleases, be content to assume that ‘irrational numbers’ such as $\sqrt{2}$, 3 $\sqrt{3}$, . . . exist and are amenable to the algebraical laws with which he is familiar.* If he does this he will be able to avoid the more abstract discussions of the next few sections, and may pass on at once to §§ 13 et seq. If, on the other hand, he is not disposed to adopt so naive an attitude, he will be well advised to pay careful attention to the sections which follow, in which these questions receive fuller consideration. *This is the point of view which was adopted in the first edition of this book. In these sections I have borrowed freely from Appendix I of Bromwich’s Infinite Series. [I : 6] REAL VARIABLES 12 Examples III. 1. Find the difference between 2 and the squares of the decimals given in § 4 as approximations to $\sqrt{2}$. 2. Find the differences between 2 and the squares of 1 1 , 3 2 , 7 5 , 17 12 , 41 29 , 99 70 . 3. Show that if m/n is a good approximation to $\sqrt{2}$, then (m + 2n)/(m + n) is a better one, and that the errors in the two cases are in opposite directions. Apply this result to continue the series of approximations in the last example. 4. If x and y are approximations to $\sqrt{2}$, by defect and by excess respectively, and $2 - x2 < \delta$, $y2 - 2 < \delta$, then $y - x < \delta$. 5. The equation x2 = 4 is satisfied by x = 2. Examine how far the argument of the preceding sections applies to this equation (writing 4 for 2 throughout). [If we define the classes L, R as before, they do not include all rational numbers. The rational number 2 is an exception, since 22 is neither less than or greater than 4.] 6. Irrational numbers (continued). In § 4 we discussed a special mode of division of the positive rational numbers x into two classes, such that x2 < 2 for the members of one class and x2 > 2 for those of the others. Such a mode of division is called a section of the numbers in question. It is plain that we could equally well construct a section in which the numbers of the two classes were characterised by the inequalities x3 < 2 and x3 > 2, or x4 < 7 and x4 > 7. Let us now attempt to state the principles of the construction of such ‘sections’ of the positive rational numbers in quite general terms. Suppose that P and Q stand for two properties which are mutually exclusive and one of which must be possessed by every positive rational number. Further, suppose that every such number which possesses P is less than any such number which possesses Q. Thus P might be the property ‘x2 < 2’ and Q the property ‘x2 > 2.’ Then we call the numbers which possess P the lower or left-hand class L and those which possess Q the upper or right-hand class R. In general both classes will exist; but it may happen in special cases that one is non-existent and that every number belongs to the other. This would obviously happen, for example, if P [I : 7] REAL VARIABLES 13 (or Q) were the property of being rational, or of being positive. For the present, however, we shall confine ourselves to cases in which both classes do exist; and then it follows, as in § 4, that we can find a member of L and a member of R whose difference is as small as we please. In the particular case which we considered in § 4, L had no greatest member and R no least. This question of the existence of greatest or least members of the classes is of the utmost importance. We observe first that it is impossible in any case that L should have a greatest member and R a least. For if l were the greatest member of L, and r the least of R, so that l < r, then 1 2 (l + r) would be a positive rational number lying between l and r, and so could belong neither to L nor to R; and this contradicts our assumption that every such number belongs to one class or to the other. This being

so, there are but three possibilities, which are mutually exclusive. Either (i) L has a greatest member l, or (ii) R has a least member r, or (iii) L has no greatest member and R no least. The section of § 4 gives an example of the last possibility. An example of the first is obtained by taking P to be ‘x2 ■ 1’ and Q to be ‘x2 > 1’; here l = 1. If P is ‘x2 < 1’ and Q is ‘x2 ■ 1’, we have an example of the second possibility, with r = 1. It should be observed that we do not obtain a section at all by taking P to be ‘x2 < 1’ and Q to be ‘x2 > 1’; for the special number 1 escapes classification (cf. Ex. iii. 5). 7. Irrational numbers (continued). In the first two cases we say that the section corresponds to a positive rational number a, which is l in the one case and r in the other. Conversely, it is clear that to any such number a corresponds a section which we shall denote by α.* For we might take P and Q to be the properties expressed by x ■ a, x > a respectively, or by x < a and x ■ a. In the first case a would be the greatest member of L, and in the second case the least member of R. *It will be convenient to denote a section, corresponding to a rational number de- noted by an English letter, by the corresponding Greek letter. [I : 8] REAL VARIABLES 14 There are in fact just two sections corresponding to any positive rational number. In order to avoid ambiguity we select one of them; let us select that in which the number itself belongs to the upper class. In other words, let us agree that we will consider only sections in which the lower class L has no greatest number. There being this correspondence between the positive rational numbers and the sections defined by means of them, it would be perfectly legitimate, for mathematical purposes, to replace the numbers by the sections, and to regard the symbols which occur in our formulae as standing for the sections instead of for the numbers. Thus, for example, $\alpha > \alpha'$ would mean the same as a > a′, if α and α' are the sections which correspond to a and a′. But when we have in this way substituted sections of rational numbers for the rational numbers themselves, we are almost forced to a generali- sation of our number system. For there are sections (such as that of § 4) which do not correspond to any rational number. The aggregate of sec- tions is a larger aggregate than that of the positive rational numbers; it includes sections corresponding to all these numbers, and more besides. It is this fact which we make the basis of our generalisation of the idea of number. We accordingly frame the following definitions, which will how- ever be modified in the next section, and must therefore be regarded as temporary and provisional. A section of the positive rational numbers, in which both classes exist and the lower class has no greatest member, is called a positive real number. A positive real number which does not correspond to a positive rational number is called a positive irrational number. 8. Real numbers. We have confined ourselves so far to certain sec- tions of the positive rational numbers, which we have agreed provisionally to call ‘positive real numbers.’ Before we frame our final definitions, we must alter our point of view a little. We shall consider sections, or divisions into two classes, not merely of the positive rational numbers, but of all ra- tional numbers, including zero. We may then repeat all that we have said about sections of the positive rational numbers in §§ 6, 7, merely omitting [I : 8] REAL VARIABLES 15 the word positive occasionally. Definitions. A section of the rational numbers, in which both classes exist and the lower class has no greatest member, is called a real number, or simply a number. A real number which does not correspond to a rational number is called an irrational number. If the real number does correspond to a rational number, we shall use the term ‘rational’ as applying to the real number also. The term ‘rational number’ will, as a result of our definitions, be ambiguous; it may mean the rational number of § 1, or the corresponding real number. If we say that 1 2 > 1 3 , we may be asserting either of two different propositions, one a proposition of elementary arithmetic, the other a proposition concerning sections of the rational numbers. Ambiguities of this kind are common in mathematics, and are perfectly harmless, since the relations between different propositions are exactly the same whichever interpretation is attached to the propositions themselves. From 1 2 > 1 3 and 1 3 > 1 4 we can infer 1 2 > 1 4 ; the inference is in no way affected by any doubt as to whether 1 2 , 1 3 , and 1 4 are arithmetical fractions or real numbers. Sometimes, of course, the context in which (e.g.) ‘ 1 2 ’ occurs is sufficient to fix its interpretation. When we say (see § 9) that 1 2 < q 1 3 , we must mean by ‘ 1 2 ’ the real number 1 2 . The reader should observe, moreover, that no particular logical importance is to be attached to the precise form of definition of a ‘real number’ that we have adopted. We defined a ‘real number’ as being a section, i.e. a pair of classes. We might equally well have defined it as being the lower, or the upper, class; indeed it would be easy to define an infinity of classes of entities each of which would possess the properties of the class of real numbers. What is essential in math- ematics is that its symbols should be capable of some interpretation; generally they are capable of many, and then, so far as mathematics is concerned, it does not matter which we adopt. Mr Bertrand Russell has said that ‘mathematics is the science in which we do not know what we are talking about, and do not care whether what we say about it is true’, a remark which is expressed in the form of a paradox but which in reality embodies a number of important truths. It would take too long to analyse the meaning of Mr Russell’s epigram in detail, but one at any rate of its implications is this, that the symbols of mathematics [I : 9] REAL VARIABLES 16 are capable of varying interpretations, and that we are in general at liberty to adopt whichever we prefer. There are now three cases to distinguish. It may happen that all neg- ative rational numbers belong to the lower class and zero and all positive rational numbers to the upper. We describe this section as the real num- ber zero. Or again it may happen that the lower class includes some positive numbers. Such a section we describe as a positive real number. Finally it may happen that some negative numbers belong to the upper class. Such a section we describe as a negative real number.* The difference between our

present definition of a positive real number a and that of § 7 amounts to the addition to the lower class of zero and all the negative rational numbers. An example of a negative real number is given by taking the property P of § 6 to be x + 1 < 0 and Q to be x + 1 ■ 0. This section plainly corresponds to the negative rational number –1. If we took P to be x3 < –2 and Q to be x3 > –2, we should obtain a negative real number which is not rational. 9. Relations of magnitude between real numbers. It is plain that, now that we have extended our conception of number, we are bound to make corresponding extensions of our conceptions of equality, inequality, addition, multiplication, and so on. We have to show that these ideas can be applied to the new numbers, and that, when this extension of them is made, all the ordinary laws of algebra retain their validity, so that we can operate with real numbers in general in exactly the same way as with the rational numbers of § 1. To do all this systematically would occupy a *There are also sections in which every number belongs to the lower or to the upper class. The reader may be tempted to ask why we do not regard these sections also as defining numbers, which we might call the real numbers positive and negative infinity. There is no logical objection to such a procedure, but it proves to be inconvenient in practice. The most natural definitions of addition and multiplication do not work in a satisfactory way. Moreover, for a beginner, the chief difficulty in the elements of analysis is that of learning to attach precise senses to phrases containing the word 'infinity'; and experience seems to show that he is likely to be confused by any addition to their number. [I : 9] REAL VARIABLES 17 considerable space, and we shall be content to indicate summarily how a more systematic discussion would proceed. We denote a real number by a Greek letter such as α, β, γ, . . . ; the rational numbers of its lower and upper classes by the corresponding En- glish letters a, A; b, B; c, C; . . . . The classes themselves we denote by (a), (A), ... If α and β are two real numbers, there are three possibilities: (i) every a is a b and every A a B; in this case (a) is identical with (b) and (A) with (B); (ii) every a is a b, but not all A's are B's; in this case (a) is a proper part of (b),* and (B) a proper part of (A); (iii) every A is a B, but not all a's are b's. These three cases may be indicated graphically as in Fig. 4. In case (i) we write $\alpha = \beta$, in case (ii) $\alpha < \beta$, and in case (iii) $\alpha > \beta$. It is clear that, when α and β are both rational, these definitions agreeα β α β α β (i) (ii) (iii) Fig. 4. with the ideas of equality and inequality between rational numbers which we began by taking for granted; and that any positive number is greater than any negative number. It will be convenient to define at this stage the negative $-\alpha$ of a positive number α. If (a), (A) are the classes which constitute α, we can define another section of the rational numbers by putting all numbers –A in the lower class and all numbers –a in the upper. The real number thus defined, which is clearly negative, we denote by $-\alpha$. Similarly we can define $-\alpha$ *I.e. is included in but not identical with (b). [I : 10] REAL VARIABLES 18 when α is negative or zero; if α is negative, $-\alpha$ is positive. It is plain also that $-(-\alpha) = \alpha$. Of the two numbers α and $-\alpha$ one is always positive (unless $\alpha = 0$). The one which is positive we denote by $|\alpha|$ and call the modulus of α. Examples IV. 1. Prove that $0 = -0$. 2. Prove that $\beta = \alpha$, $\beta < \alpha$, or $\beta > \alpha$ according as $\alpha = \beta$, $\alpha > \beta$, or $\alpha < \beta$. 3. If $\alpha = \beta$ and $\beta = \gamma$, then $\alpha = \gamma$. 4. If α ■ β, $\beta < \gamma$, or $\alpha < \beta$, β ■ γ, then $\alpha < \gamma$. 5. Prove that $-\beta = -\alpha$, $-\beta < -\alpha$, or $-\beta > -\alpha$, according as $\alpha = \beta$, $\alpha < \beta$, or $\alpha > \beta$. 6. Prove that $\alpha > 0$ if α is positive, and $\alpha < 0$ if α is negative. 7. Prove that α ■ $|\alpha|$. 8. Prove that $1 < \sqrt{2} < \sqrt{3} < 2$. 9. Prove that, if α and β are two different real numbers, we can always find an infinity of rational numbers lying between α and β. [All these results are immediate consequences of our definitions.] 10. Algebraical operations with real numbers. We now proceed to define the meaning of the elementary algebraical operations such as addition, as applied to real numbers in general. (i) Addition. In order to define the sum of two numbers α and β, we consider the following two classes: (i) the class (c) formed by all sums c = a + b, (ii) the class (C) formed by all sums C = A + B. Plainly c < C in all cases. Again, there cannot be more than one rational number which does not belong either to (c) or to (C). For suppose there were two, say r and s, and let s be the greater. Then both r and s must be greater than every c and less than every C; and so C – c cannot be less than s – r. But C – c = (A – a) + (B – b); and we can choose a, b, A, B so that both A – a and B – b are as small as we like; and this plainly contradicts our hypothesis. [I : 10] REAL VARIABLES 19 If every rational number belongs to (c) or to (C), the classes (c), (C) form a section of the rational numbers, that is to say, a number γ. If there is one which does not, we add it to (C). We have now a section or real number γ, which must clearly be rational, since it corresponds to the least member of (C). In any case we call γ the sum of α and β, and write $\gamma = \alpha + \beta$. If both α and β are rational, they are the least members of the upper classes (A) and (B). In this case it is clear that $\alpha + \beta$ is the least member of (C), so that our definition agrees with our previous ideas of addition. (ii) Subtraction. We define $\alpha - \beta$ by the equation $\alpha - \beta = \alpha + (-\beta)$. The idea of subtraction accordingly presents no fresh difficulties. Examples V. 1. Prove that $\alpha + (-\alpha) = 0$. 2. Prove that $\alpha + 0 = 0 + \alpha = \alpha$. 3. Prove that $\alpha + \beta = \beta + \alpha$. [This follows at once from the fact that the classes (a + b) and (b + a), or (A + B) and (B + A), are the same, since, e.g., a + b = b + a when a and b are rational.] 4. Prove that $\alpha + (\beta + \gamma) = (\alpha + \beta) + \gamma$. 5. Prove that $\alpha - \alpha = 0$. 6. Prove that $\alpha - \beta = -(\beta - \alpha)$. 7. From the definition of subtraction, and Exs. 4, 1, and 2 above, it follows that $(\alpha - \beta) + \beta = \{\alpha + (-\beta)\} + \beta = \alpha + \{(-\beta) + \beta\} = \alpha + 0 = \alpha$. We might therefore define the difference $\alpha - \beta = \gamma$ by the equation $\gamma + \beta = \alpha$. 8. Prove that $\alpha - (\beta - \gamma) = \alpha - \beta + \gamma$. 9. Give a definition of subtraction which does not depend upon a previous definition of addition. [To define $\gamma = \alpha - \beta$, form the classes (c), (C) for which [I : 11] REAL VARIABLES 20 c = a – B, C = A – b. It is easy to show that this definition is equivalent to that which we adopted in the text.] 10. Prove that $|\alpha| - |\beta|$ ■ $|\alpha \pm \beta|$ ■ $|\alpha| + |\beta|$. 11. Algebraical operations with real numbers (continued). (iii) Multiplication. When we come to multiplication, it

is most con- venient to confine ourselves to positive numbers (among which we may include 0) in the first instance, and to go back for a moment to the sections of positive rational numbers only which we considered in §§ 4–7. We may then follow practically the same road as in the case of addition, taking (c) to be (ab) and (C) to be (AB). The argument is the same, except when we are proving that all rational numbers with at most one exception must belong to (c) or (C). This depends, as in the case of addition, on showing that we can choose a, A, b, and B so that C – c is as small as we please. Here we use the identity C – c = AB – ab = (A – a)B + a(B – b). Finally we include negative numbers within the scope of our definition by agreeing that, if α and β are positive, then $(-\alpha)\beta = -\alpha\beta$, $\alpha(-\beta) = -\alpha\beta$, $(-\alpha)(-\beta) = \alpha\beta$. (iv) Division. In order to define division, we begin by defining the reciprocal $1/\alpha$ of a number α (other than zero). Confining ourselves in the first instance to positive numbers and sections of positive rational numbers, we define the reciprocal of a positive number α by means of the lower class (1/A) and the upper class (1/a). We then define the reciprocal of a negative number $-\alpha$ by the equation $1/(-\alpha) = -(1/\alpha)$. Finally we define α/β by the equation $\alpha/\beta = \alpha \times (1/\beta)$. [I : 13] REAL VARIABLES 21 We are then in a position to apply to all real numbers, rational or irrational, the whole of the ideas and methods of elementary algebra. Nat- urally we do not propose to carry out this task in detail. It will be more profitable and more interesting to turn our attention to some special, but particularly important, classes of irrational numbers. Examples VI. Prove the theorems expressed by the following formulae: 1. $\alpha \times 0 = 0 \times \alpha = 0$. 2. $\alpha \times 1 = 1 \times \alpha = \alpha$. 3. $\alpha \times (1/\alpha) = 1$. 4. $\alpha\beta = \beta\alpha$. 5. $\alpha(\beta\gamma) = (\alpha\beta)\gamma$. 6. $\alpha(\beta + \gamma) = \alpha\beta + \alpha\gamma$. 7. $(\alpha + \beta)\gamma = \alpha\gamma + \beta\gamma$. 8. $|\alpha\beta| = |\alpha|\,|\beta|$. 12. The number $\sqrt{2}$. Let us now return for a moment to the partic- ular irrational number which we discussed in §§ 4–5. We there constructed a section by means of the inequalities $x^2 < 2$, $x^2 > 2$. This was a section of the positive rational numbers only; but we replace it (as was explained in § 8) by a section of all the rational numbers. We denote the section or number thus defined by the symbol $\sqrt{2}$. The classes by means of which the product of $\sqrt{2}$ by itself is defined are (i) (aa′), where a and a′ are positive rational numbers whose squares are less than 2, (ii) (AA′), where A and A′ are positive rational numbers whose squares are greater than 2. These classes exhaust all positive rational numbers save one, which can only be 2 itself. Thus $(\sqrt{2})^2 = \sqrt{2}\sqrt{2} = 2$. Again $(-\sqrt{2})^2 = (-\sqrt{2})(-\sqrt{2}) = \sqrt{2}\sqrt{2} = (\sqrt{2})^2 = 2$. Thus the equation $x^2 = 2$ has the two roots $\sqrt{2}$ and $-\sqrt{2}$. Similarly we could discuss the equations $x^2 = 3$, $x^3 = 7$, . . . and the corresponding irrational numbers $\sqrt{3}$, $-\sqrt{3}$, $\sqrt[3]{7}$, ... [I : 13] REAL VARIABLES 22 13. Quadratic surds. A number of the form $\pm\sqrt{a}$, where a is a positive rational number which is not the square of another rational num- ber, is called a pure quadratic surd. A number of the form $a \pm \sqrt{b}$, where a is rational, and $\sqrt{b}$ is a pure quadratic surd, is sometimes called a mixed quadratic surd. The two numbers $a \pm \sqrt{b}$ are the roots of the quadratic equation $x^2 - 2ax + a^2 - b = 0$. Conversely, the equation $x^2 + 2px + q = 0$, where p and q are rational, and $p^2 - q > 0$, has as its roots the two quadratic surds $-p \pm \sqrt{p^2 - q}$. The only kind of irrational numbers whose existence was suggested by the geometrical considerations of § 3 are these quadratic surds, pure and mixed, and the more complicated irrationals which may be expressed in a form involving the repeated extraction of square roots, such as $\sqrt{2 + q\sqrt{2 + r\sqrt{2 + q\sqrt{2}}}}$. It is easy to construct geometrically a line whose length is equal to any number of this form, as the reader will easily see for himself. That irrational numbers of these kinds only can be constructed by Euclidean methods (i.e. by geometrical constructions with ruler and compasses) is a point the proof of which must be deferred for the present.* This property of quadratic surds makes them especially interesting. Examples VII. 1. Give geometrical constructions for $\sqrt{2}$, $\sqrt{q\sqrt{2}}$, $\sqrt{r\sqrt{2 + q\sqrt{2}}}$. 2. The quadratic equation $ax^2 + 2bx + c = 0$ has two real roots if $b^2 - ac > 0$. *See Ch. II, Misc. Exs. 22. I.e. there are two values of x for which $ax^2 + 2bx + c = 0$. If $b^2 - ac < 0$ there are no such values of x. The reader will remember that in books on elementary algebra the equation is said to have two ‘complex’ roots. The meaning to be attached to this statement will be explained in Ch. III. When $b^2 = ac$ the equation has only one root. For the sake of uniformity it is generally said in this case to have ‘two equal’ roots, but this is a mere convention. [I : 14] REAL VARIABLES 23 Suppose a, b, c rational. Nothing is lost by taking all three to be integers, for we can multiply the equation by the least common multiple of their denominators. The reader will remember that the roots are $\{-b \pm \sqrt{b^2 - ac}\}/a$. It is easy to construct these lengths geometrically, first constructing $\sqrt{b^2 - ac}$. A much more elegant, though less straightforward, construction is the following. Draw a circle of unit radius, a diameter P Q, and the tangents at the ends of the diameters.Q′ Q XY P P ′ N M Fig. 5. Take $PP' = -2a/b$ and $QQ' = -c/2b$, having regard to sign.* Join P ′Q′, cutting the circle in M and N . Draw P M and P N , cutting QQ′ in X and Y . Then QX and QY are the roots of the equation with their proper signs. The proof is simple and we leave it as an exercise to the reader. Another, perhaps even simpler, construction is the following. Take a line AB of unit length. Draw $BC = -2b/a$ perpendicular to AB, and $CD = c/a$ perpendicular to BC and in the same direction as BA. On AD as diameter describe a circle cutting BC in X and Y . Then BX and BY are the roots. 3. If ac is positive P P ′ and QQ′ will be drawn in the same direction. Verify that P ′Q′ will not meet the circle if $b^2 < ac$, while if $b^2 = ac$ it will be a tangent. Verify also that if $b^2 = ac$ the circle in the second construction will touch BC. 4. Prove that $\sqrt{pq} = \sqrt{p} \times \sqrt{q}$, $\sqrt{p^2 q} = p\sqrt{q}$. *The figure is drawn to suit the case in which b and c have the same and a the opposite sign. The reader should draw figures for other cases. I have taken this construction from Klein’s Le¸cons sur certaines questions de g´eom´etrie ´el´ementaire (French translation by J. Griess, Paris, 1896). [I : 14] REAL VARIABLES 24 14. Some theorems concerning quadratic surds. Two pure quadratic surds are said to be similar if they can be expressed as

rational multiples of the same surd, and otherwise to be dissimilar. Thus √8 = 2√2, q25 2 = 5 2 √2, and so √8, q25 2 are similar surds. On the other hand, if M and N are integers which have no common factor, and neither of which is a perfect square, √M and √N are dissimilar surds. For suppose, if possible, √M = p q r t u, √N = r s r t u, where all the letters denote integers. Then √M N is evidently rational, and therefore (Ex. ii. 3) integral. Thus M N = P 2, where P is an integer. Let a, b, c, . . . be the prime factors of P , so that M N = a2αb2β c2γ . . . , where α, β, γ, . . . are positive integers. Then M N is divisible by a2α, and therefore either (1) M is divisible by a2α, or (2) N is divisible by a2α, or (3) M and N are both divisible by a. The last case may be ruled out, since M and N have no common factor. This argument may be applied to each of the factors a2α, b2β , c2γ , . . . , so that M must be divisible by some of these factors and N by the remainder. Thus M = P 2 1 , N = P 2 2 , where P 2 1 denotes the product of some of the factors a2α, b2β , c2γ , . . . and P 2 2 the product of the rest. Hence M and N are both perfect squares, which is contrary to our hypothesis. Theorem. If A, B, C, D are rational and A + √B = C + √D, then either (i) A = C, B = D or (ii) B and D are both squares of rational numbers. [I : 14] REAL VARIABLES 25 For B – D is rational, and so is √B – √D = C – A. If B is not equal to D (in which case it is obvious that A is also equal to C), it follows that √B + √D = (B – D)/(√B – √D) is also rational. Hence √B and √D are rational. Corollary. If A + √B = C + √D, then A – √B = C – √D (unless√B and √D are both rational). Examples VIII. 1. Prove ab initio that √2 and √3 are not similar surds. 2. Prove that √a and p1/a, where a is rational, are similar surds (unless both are rational). 3. If a and b are rational, then √a+√b cannot be rational unless √a and √b are rational. The same is true of √a – √b, unless a = b. 4. If √A + √B = √C + √D, then either (a) A = C and B = D, or (b) A = D and B = C, or (c) √A, √B,√C, √D are all rational or all similar surds. [Square the given equation and apply the theorem above.] 5. Neither (a + √b)3 nor (a – √b)3 can be rational unless √b is rational. 6. Prove that if x = p + √q, where p and q are rational, then xm, where m is any integer, can be expressed in the form P + Q√q, where P and Q are rational. For example, (p + √q)2 = p2 + q + 2p√q, (p + √q)3 = p3 + 3pq + (3p2 + q)√q. Deduce that any polynomial in x with rational coefficients (i.e. any expression of the form a0xn + a1xn–1 + · · · + an, where a0, . . . , an are rational numbers) can be expressed in the form P + Q√q. [I : 15] REAL VARIABLES 26 7. If a + √b, where b is not a perfect square, is the root of an algebraical equation with rational coefficients, then a – √b is another root of the same equation. 8. Express 1/(p+√q) in the form prescribed in Ex. 6. [Multiply numerator and denominator by p – √q.] 9. Deduce from Exs. 6 and 8 that any expression of the form G(x)/H(x), where G(x) and H(x) are polynomials in x with rational coefficients, can be expressed in the form P + Q√q, where P and Q are rational. 10. If p, q, and p2 – q are positive, we can express pp + √q in the form √x + √y, where x = 1 2 {p + pp2 – q}, y = 1 2 {p – pp2 – q}. 11. Determine the conditions that it may be possible to express pp + √q, where p and q are rational, in the form √x + √y, where x and y are rational. 12. If a2 – b is positive, the necessary and sufficient conditions that q a + √b + q a – √b should be rational are that a2 – b and 1 2 {a + √a2 – b} should both be squares of rational numbers. 15. The continuum. The aggregate of all real numbers, rational and irrational, is called the arithmetical continuum. It is convenient to suppose that the straight line Λ of § 2 is composed of points corresponding to all the numbers of the arithmetical continuum, and of no others.* The points of the line, the aggregate of which may be said to constitute the linear continuum, then supply us with a convenient image of the arithmetical continuum. We have considered in some detail the chief properties of a few classes of real numbers, such, for example, as rational numbers or quadratic surds. *This supposition is merely a hypothesis adopted (i) because it suffices for the purposes of our geometry and (ii) because it provides us with convenient geometrical illustrations of analytical processes. As we use geometrical language only for purposes of illustration, it is not part of our business to study the foundations of geometry. [I : 15] REAL VARIABLES 27 We add a few further examples to show how very special these particular classes of numbers are, and how, to put it roughly, they comprise only a minute fraction of the infinite variety of numbers which constitute the continuum. (i) Let us consider a more complicated surd expression such as z = 3 q 4 + √15 + 3 q 4 – √15. Our argument for supposing that the expression for z has a meaning might be as follows. We first show, as in § 12, that there is a number y = √15 such that y2 = 15, and we can then, as in § 10, define the numbers 4 + √15, 4 – √15. Now consider the equation in z1, z3 1 = 4 + √15. The right-hand side of this equation is not rational: but exactly the same rea- soning which leads us to suppose that there is a real number x such that x3 = 2 (or any other rational number) also leads us to the conclusion that there is a number z1 such that z3 1 = 4+√15. We thus define z1 = 3 p4 + √15, and similarly we can define z2 = 3 p4 – √15; and then, as in § 10, we define z = z1 + z2. Now it is easy to verify that z3 = 3z + 8. And we might have given a direct proof of the existence of a unique number z such that z3 = 3z + 8. It is easy to see that there cannot be two such numbers. For if z3 1 = 3z1 + 8 and z3 2 = 3z2 + 8, we find on subtracting and dividing by z1 – z2 that z2 1 + z1z2 + z2 2 = 3. But if z1 and z2 are positive z3 1 > 8, z3 2 > 8 and therefore z1 > 2, z2 > 2, z2 1 + z1z2 + z2 2 > 12, and so the equation just found is impossible. And it is easy to see that neither z1 nor z2 can be negative. For if z1 is negative and equal to –ζ, ζ is positive and ζ3 – 3ζ + 8 = 0, or 3 – ζ2 = 8/ζ. Hence 3 – ζ2 > 0, and so ζ < 2. But then 8/ζ > 4, and so 8/ζ cannot be equal to 3 – ζ2, which is less than 3. Hence there is at most one z such that z3 = 3z + 8. And it cannot be rational. For any rational root of this equation must be integral and a factor of 8 (Ex. ii. 3), and it is easy to verify that no one of 1, 2, 4, 8 is a root. Thus z3 = 3z + 8 has at most one root and that root, if it exists, is positive and not rational. We can now divide the positive rational numbers x into two [I :

15] REAL VARIABLES 28 classes L, R according as x3 < 3x + 8 or x3 > 3x + 8. It is easy to see that if x3 > 3x + 8 and y is any number greater than x, then also y3 > 3y + 8. For suppose if possible y3 ■ 3y + 8. Then since x3 > 3x + 8 we obtain on subtracting y3 – x3 < 3(y – x), or y2 + xy + x2 < 3, which is impossible; for y is positive and x > 2 (since x3 > 8). Similarly we can show that if x3 < 3x + 8 and y < x then also y3 < 3y + 8. Finally, it is evident that the classes L and R both exist; and they form a section of the positive rational numbers or positive real number z which satisfies the equation z3 = 3z + 8. The reader who knows how to solve cubic equations by Cardan's method will be able to obtain the explicit expression of z directly from the equation. (ii) The direct argument applied above to the equation x3 = 3x + 8 could be applied (though the application would be a little more difficult) to the equation x5 = x + 16, and would lead us to the conclusion that a unique positive real number exists which satisfies this equation. In this case, however, it is not possible to obtain a simple explicit expression for x composed of any combination of surds. It can in fact be proved (though the proof is difficult) that it is generally impossible to find such an expression for the root of an equation of higher degree than 4. Thus, besides irrational numbers which can be expressed as pure or mixed quadratic or other surds, or combinations of such surds, there are others which are roots of algebraical equations but cannot be so expressed. It is only in very special cases that such expressions can be found. (iii) But even when we have added to our list of irrational numbers roots of equations (such as x5 = x+16) which cannot be explicitly expressed as surds, we have not exhausted the different kinds of irrational numbers contained in the continuum. Let us draw a circle whose diameter is equal to A0A1, i.e. to unity. It is natural to suppose* that the circumference of such a circle has a length capable of numerical measurement. This length *A proof will be found in Ch. VII. [I : 16] REAL VARIABLES 29 is usually denoted by π. And it has been shown* (though the proof is unfortunately long and difficult) that this number π is not the root of any algebraical equation with integral coefficients, such, for example, as π2 = n, π3 = n, π5 = π + n, where n is an integer. In this way it is possible to define a number which is not rational nor yet belongs to any of the classes of irrational numbers which we have so far considered. And this number π is no isolated or ex- ceptional case. Any number of other examples can be constructed. In fact it is only special classes of irrational numbers which are roots of equations of this kind, just as it is only a still smaller class which can be expressed by means of surds. 16. The continuous real variable. The 'real numbers' may be re- garded from two points of view. We may think of them as an aggregate, the 'arithmetical continuum' defined in the preceding section, or individ- ually. And when we think of them individually, we may think either of a particular specified number (such as 1, –1 2 , √2, or π) or we may think of any number, an unspecified number, the number x. This last is our point of view when we make such assertions as 'x is a number', 'x is the mea- sure of a length', 'x may be rational or irrational'. The x which occurs in propositions such as these is called the continuous real variable: and the individual numbers are called the values of the variable. A 'variable', however, need not necessarily be continuous. Instead of considering the aggregate of all real numbers, we might consider some partial aggregate contained in the former aggregate, such as the aggregate of rational numbers, or the aggregate of positive integers. Let us take the last case. Then in statements about any positive integer, or an unspecified positive integer, such as 'n is either odd or even', n is called the variable, a positive integral variable, and the individual positive integers are its values. Naturally 'x' and 'n' are only examples of variables, the variable whose 'field of variation' is formed by all the real numbers, and that whose field is *See Hobson's Trigonometry (3rd edition), pp. 305 et seq., or the same writer's Squaring the Circle (Cambridge, 1913). [I : 17] REAL VARIABLES 30 formed by the positive integers. These are the most important examples, but we have often to consider other cases. In the theory of decimals, for instance, we may denote by x any figure in the expression of any number as a decimal. Then x is a variable, but a variable which has only ten different values, viz. 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. The reader should think of other examples of variables with different fields of variation. He will find interesting examples in ordinary life: policeman x, the driver of cab x, the year x, the xth day of the week. The values of these variables are naturally not numbers. 17. Sections of the real numbers. In §§ 4–7 we considered 'sec- tions' of the rational numbers, i.e. modes of division of the rational num- bers (or of the positive rational numbers only) into two classes L and R possessing the following characteristic properties: (i) that every number of the type considered belongs to one and only one of the two classes; (ii) that both classes exist; (iii) that any member of L is less than any member of R. It is plainly possible to apply the same idea to the aggregate of all real numbers, and the process is, as the reader will find in later chapters, of very great importance. Let us then suppose* that P and Q are two properties which are mutu- ally exclusive, and one of which is possessed by every real number. Further let us suppose that any number which possesses P is less than any which possesses Q. We call the numbers which possess P the lower or left-hand class L, and those which possess Q the upper or right-hand class R. Thus P might be x ■ √2 and Q be x > √2. It is important to observe that a pair of properties which suffice to define a section of the rational numbers *The discussion which follows is in many ways similar to that of § 6. We have not attempted to avoid a certain amount of repetition. The idea of a 'section,' first brought into prominence in Dedekind's famous pamphlet Stetigkeit und irrationale Zahlen, is one which can, and indeed must, be grasped by every reader of this book, even if he be one of those who prefer to omit the discussion of the notion of an irrational number contained in §§ 6–12. [I : 17] REAL VARIABLES 31 may not suffice to define one of the real numbers. This is so, for example, with the pair 'x < √2' and 'x > √2' or (if we

confine ourselves to positive numbers) with ‘x2 < 2’ and ‘x2 > 2’. Every rational number possesses one or other of the properties, but not every real number, since in either case √2 escapes classification. There are now two possibilities.* Either L has a greatest member l, or R has a least member r. Both of these events cannot occur. For if L had a greatest member l, and R a least member r, the number 1 2 (l + r) would be greater than all members of L and less than all members of R, and so could not belong to either class. On the other hand one event must occur. For let L1 and R1 denote the classes formed from L and R by taking only the rational members of L and R. Then the classes L1 and R1 form a section of the rational numbers. There are now two cases to distinguish. It may happen that L1 has a greatest member α. In this case α must be also the greatest member of L. For if not, we could find a greater, say β. There are rational numbers lying between α and β, and these, being less than β, belong to L, and therefore to L1; and this is plainly a contradiction. Hence α is the greatest member of L. On the other hand it may happen that L1 has no greatest member. In this case the section of the rational numbers formed by L1 and R1 is a real number α. This number α must belong to L or to R. If it belongs to L we can show, precisely as before, that it is the greatest member of L, and similarly, if it belongs to R, it is the least member of R. Thus in any case either L has a greatest member or R a least. Any section of the real numbers therefore ‘corresponds’ to a real number in the sense in which a section of the rational numbers sometimes, but not always, corresponds to a rational number. This conclusion is of very great importance; for it shows that the consideration of sections of all the real numbers does not lead to any further generalisation of our idea of number. Starting from the rational numbers, we found that the idea of a section of the rational numbers led us to a new conception of a number, that of a real number, more general than that of a rational number; and it might have *There were three in § 6. This was not the case in § 6. [I : 18] REAL VARIABLES 32 been expected that the idea of a section of the real numbers would have led us to a conception more general still. The discussion which precedes shows that this is not the case, and that the aggregate of real numbers, or the continuum, has a kind of completeness which the aggregate of the rational numbers lacked, a completeness which is expressed in technical language by saying that the continuum is closed. The result which we have just proved may be stated as follows: Dedekind’s Theorem. If the real numbers are divided into two classes L and R in such a way that (i) every number belongs to one or other of the two classes, (ii) each class contains at least one number, (iii) any member of L is less than any member of R, then there is a number α, which has the property that all the numbers less than it belong to L and all the numbers greater than it to R. The number α itself may belong to either class. In applications we have often to consider sections not of all numbers but of all those contained in an interval [β, γ], that is to say of all numbers x such that β ■ x ■ γ. A ‘section’ of such numbers is of course a division of them into two classes possessing the properties (i), (ii), and (iii). Such a section may be converted into a section of all numbers by adding to L all numbers less than β and to R all numbers greater than γ. It is clear that the conclusion stated in Dedekind’s Theorem still holds if we substitute ‘the real numbers of the interval [β, γ]’ for ‘the real numbers’, and that the number α in this case satisfies the inequalities β ■ α ■ γ. 18. Points of accumulation. A system of real numbers, or of the points on a straight line corresponding to them, defined in any way what- ever, is called an aggregate or set of numbers or points. The set might consist, for example, of all the positive integers, or of all the rational points. It is most convenient here to use the language of geometry.* Suppose *The reader will hardly require to be reminded that this course is adopted solely for reasons of linguistic convenience. [I : 18] REAL VARIABLES 33 then that we are given a set of points, which we will denote by S. Take any point ξ, which may or may not belong to S. Then there are two possibilities. Either (i) it is possible to choose a positive number δ so that the interval [ξ –δ, ξ +δ] does not contain any point of S, other than ξ itself,* or (ii) this is not possible. Suppose, for example, that S consists of the points corresponding to all the positive integers. If ξ is itself a positive integer, we can take δ to be any number less than 1, and (i) will be true; or, if ξ is halfway between two positive integers, we can take δ to be any number less than 1 2 . On the other hand, if S consists of all the rational points, then, whatever the value of ξ, (ii) is true; for any interval whatever contains an infinity of rational points. Let us suppose that (ii) is true. Then any interval [ξ – δ, ξ + δ], however small its length, contains at least one point ξ1 which belongs to S and does not coincide with ξ; and this whether ξ itself be a member of S or not. In this case we shall say that ξ is a point of accumulation of S. It is easy to see that the interval [ξ – δ, ξ + δ] must contain, not merely one, but infinitely many points of S. For, when we have determined ξ1, we can take an interval [ξ – δ1, ξ + δ1] surrounding ξ but not reaching as far as ξ1. But this interval also must contain a point, say ξ2, which is a member of S and does not coincide with ξ. Obviously we may repeat this argument, with ξ2 in the place of ξ1; and so on indefinitely. In this way we can determine as many points ξ1, ξ2, ξ3, . . . as we please, all belonging to S, and all lying inside the interval [ξ –δ, ξ +δ]. A point of accumulation of S may or may not be itself a point of S. The examples which follow illustrate the various possibilities. Examples IX. 1. If S consists of the points corresponding to the posi- tive integers, or all the integers, there are no points of accumulation. 2. If S consists of all the rational points, every point of the line is a point of accumulation. *This clause is of course unnecessary if ξ does not itself belong to S. [I : 19] REAL VARIABLES 34 3. If S consists of the points 1, 1 2 , 1 3 , . . . , there is one point of accumulation, viz. the origin. 4. If S consists of all the positive rational points, the points of accumulation are the origin and all positive points of the line. 19. Weierstrass’s Theorem. The general theory of sets of

points is of the utmost interest and importance in the higher branches of analysis; but it is for the most part too difficult to be included in a book such as this. There is however one fundamental theorem which is easily deduced from Dedekind's Theorem and which we shall require later. Theorem. If a set S contains infinitely many points, and is entirely situated in an interval [α, β], then at least one point of the interval is a point of accumulation of S. We divide the points of the line Λ into two classes in the following man- ner. The point P belongs to L if there are an infinity of points of S to the right of P , and to R in the contrary case. Then it is evident that conditions (i) and (iii) of Dedekind's Theorem are satisfied; and since α belongs to L and β to R, condition (ii) is satisfied also. Hence there is a point ξ such that, however small be δ, ξ – δ belongs to L and ξ + δ to R, so that the interval [ξ – δ, ξ + δ] contains an infinity of points of S. Hence ξ is a point of accumulation of S. This point may of course coincide with α or β, as for instance when α = 0, β = 1, and S consists of the points 1, 1 2 , 1 3 , ... In this case 0 is the sole point of accumulation. MISCELLANEOUS EXAMPLES ON CHAPTER I. 1. What are the conditions that ax + by + cz = 0, (1) for all values of x, y, z; (2) for all values of x, y, z subject to αx + βy + γz = 0; (3) for all values of x, y, z subject to both αx + βy + γz = 0 and Ax + By + Cz = 0? 2. Any positive rational number can be expressed in one and only one way in the form a1 + a2 1 · 2 + a3 1 · 2 · 3 + · · · + ak 1 · 2 · 3 . . . k , [I : 19] REAL VARIABLES 35 where a1, a2, . . . , ak are integers, and 0 ■ a1, 0 ■ a2 < 2, 0 ■ a3 < 3, . . . 0 < ak < k. 3. Any positive rational number can be expressed in one and one way only as a simple continued fraction a1 + 1 a2 + 1 a3 + 1 · · · + 1 an , where a1, a2, . . . are positive integers, of which the first only may be zero. [Accounts of the theory of such continued fractions will be found in text- books of algebra. For further information as to modes of representation of rational and irrational numbers, see Hobson, Theory of Functions of a Real Variable, pp. 45–49.] 4. Find the rational roots (if any) of 9x3 – 6x2 + 15x – 10 = 0. 5. A line AB is divided at C in aurea sectione (Euc. ii. 11)—i.e. so that AB · AC = BC2. Show that the ratio AC/AB is irrational. [A direct geometrical proof will be found in Bromwich's Infinite Series, § 143, p. 363.] 6. A is irrational. In what circumstances can aA + b cA + d , where a, b, c, d are rational, be rational? 7. Some elementary inequalities. In what follows a1, a2, . . . denote positive numbers (including zero) and p, q, . . . positive integers. Since ap 1 – ap 2 and aq 1 – aq 2 have the same sign, we have (ap 1 – ap 2)(aq 1 – aq 2) ■ 0, or ap+q 1 + ap+q 2 ■ ap 1aq 2 + aq 1ap 2, (1) an inequality which may also be written in the form ap+q 1 + ap+q 2 2 ■ ap 1 + ap 2 2 aq 1 + aq 2 2

. (2) By repeated application of this formula we obtain ap+q+r+... 1 + ap+q+r+... 2 2 ■ ap 1 + ap 2 2 aq 1 + aq 2 2 ar 1 + ar 2 2

. . . , (3) [I : 19] REAL VARIABLES 36 and in particular ap 1 + ap 2 2 ■ a1 + a2 2 p . (4) When p = q = 1 in (1), or p = 2 in (4), the inequalities are merely different forms of the inequality a2 1 + a2 2 ■ 2a1a2, which expresses the fact that the arithmetic mean of two positive numbers is not less than their geometric mean. 8. Generalisations for n numbers. If we write down the 1 2 n(n – 1) inequalities of the type (1) which can be formed with n numbers a1, a2, . . . , an, and add the results, we obtain the inequality nPap+q ■ PapPaq, (5) or Pap+q /n ■ {(Pap) /n} {(Paq) /n} . (6) Hence we can deduce an obvious extension of (3) which the reader may formulate for himself, and in particular the inequality (Pap) /n ■ {(Pa) /n}p . (7) 9. The general form of the theorem concerning the arithmetic and geometric means. An inequality of a slightly different character is that which asserts that the arithmetic mean of a1, a2, . . . , an is not less than their geometric mean. Suppose that ar and as are the greatest and least of the a's (if there are several greatest or least a's we may choose any of them indifferently), and let G be their geometric mean. We may suppose G > 0, as the truth of the proposition is obvious when G = 0. If now we replace ar and as by a′ r = G, a′ s = aras/G, we do not alter the value of the geometric mean; and, since a′ r + a′ s – ar – as = (ar – G)(as – G)/G ■ 0, we certainly do not increase the arithmetic mean. It is clear that we may repeat this argument until we have replaced each of a1, a2, . . . , an by G; at most n repetitions will be necessary. As the final value of the arithmetic mean is G, the initial value cannot have been less. [I : 19] REAL VARIABLES 37 10. Schwarz's inequality. Suppose that a1, a2, . . . , an and b1, b2, . . . , bn are any two sets of numbers positive or negative. It is easy to verify the identity (Parbr)2 = Pa2 r Pa2 s – P(arbs – asbr)2, where r and s assume the values 1, 2, . . . , n. It follows that (Parbr)2 ■ Pa2 r Pb2 r , an inequality usually known as Schwarz's (though due originally to Cauchy). 11. If a1, a2, . . . , an are all positive, and sn = a1 + a2 + · · · + an, then (1 + a1)(1 + a2) . . . (1 + an) ■ 1 + sn + s2 n 2! + · · · + sn n n! . (Math. Trip. 1909.) 12. If a1, a2, . . . , an and b1, b2, . . . , bn are two sets of positive numbers, arranged in descending order of magnitude, then (a1 + a2 + · · · + an)(b1 + b2 + · · · + bn) ■ n(a1b1 + a2b2 + · · · + anbn). 13. If a, b, c, . . . k and A, B, C, . . . K are two sets of numbers, and all of the first set are positive, then aA + bB + · · · + kK a + b + · · · + k lies between the algebraically least and greatest of A, B, . . . , K. 14. If √p, √q are dissimilar surds, and a + b√p + c√q + d√pq = 0, where a, b, c, d are rational, then a = 0, b = 0, c = 0, d = 0. [Express √p in the form M + N √q, where M and N are rational, and apply the theorem of § 14.] 15. Show that if a√2 + b√3 + c√5 = 0, where a, b, c are rational numbers, then a = 0, b = 0, c = 0. 16. Any polynomial in √p and √q, with rational coefficients (i.e. any sum of a finite number of terms of the form A(√p)m(√q)n, where m and n are integers, and A rational), can be expressed in the form a + b√p + c√q + d√pq, [I : 19] REAL VARIABLES 38 where a, b, c, d are rational. 17. Express a + b√p + c√q d + e√p + f √q , where a, b, etc. are rational, in the form A + B√p + C√q + D√pq, where A, B, C, D are rational. [Evidently a + b√p + c√q d + e√p + f √q = (a + b√p +

c√q)(d + e√p – f √q) (d + e√p)2 – f 2q = α + β√p + γ√q + δ√pq ■ + ζ√p , where α, β, etc. are rational numbers which can easily be found. The required reduction may now be easily completed by multiplication of numerator and denominator by ■ – ζ√p. For example, prove that 1 1 + √2 + √3 = 1 2 + 1 4 √2 – 1 4 √6.] 18. If a, b, x, y are rational numbers such that (ay – bx)2 + 4(a – x)(b – y) = 0, then either (i) x = a, y = b or (ii) 1 – ab and 1 – xy are squares of rational numbers. (Math. Trip. 1903.) 19. If all the values of x and y given by ax2 + 2hxy + by2 = 1, a′x2 + 2h′xy + b′y2 = 1 (where a, h, b, a′, h′, b′ are rational) are rational, then (h – h′)2 – (a – a′)(b – b′), (ab′ – a′b)2 + 4(ah′ – a′h)(bh′ – b′h) are both squares of rational numbers. (Math. Trip. 1899.) 20. Show that √2 and √3 are cubic functions of √2 + √3, with rational coefficients, and that √2 – √6 + 3 is the ratio of two linear functions of √2 + √3. (Math. Trip. 1905.) [I : 19] REAL VARIABLES 39 21. The expression q a + 2mpa – m2 + q a – 2mpa – m2 is equal to 2m if 2m2 > a > m2, and to 2√a – m2 if a > 2m2. 22. Show that any polynomial in 3 √2, with rational coefficients, can be ex- pressed in the form a + b 3 √2 + c 3 √4, where a, b, c are rational. More generally, if p is any rational number, any polynomial in m √p with rational coefficients can be expressed in the form a0 + a1α + a2α2 + · · · + am–1αm–1, where a0, a1, . . . are rational and α = m √p. For any such polynomial is of the form b0 + b1α + b2α2 + · · · + bkαk, where the b's are rational. If k ■ m – 1, this is already of the form required. If k > m–1, let αr be any power of α higher than the (m–1)th. Then r = λm+s, where λ is an integer and 0 ■ s ■ m – 1; and αr = αλm+s = pλαs. Hence we can get rid of all powers of α higher than the (m – 1)th. 23. Express (3 √2 – 1)5 and (3 √2 – 1)/(3 √2 + 1) in the form a + b 3 √2 + c 3 √4, where a, b, c are rational. [Multiply numerator and denominator of the second expression by 3 √4 – 3 √2 + 1.] 24. If a + b 3 √2 + c 3 √4 = 0, where a, b, c are rational, then a = 0, b = 0, c = 0. [Let y = 3 √2. Then y3 = 2 and cy2 + by + a = 0. Hence 2cy2 + 2by + ay3 = 0 or ay2 + 2cy + 2b = 0. Multiplying these two quadratic equations by a and c and subtracting, we obtain (ab–2c2)y+a2 –2bc = 0, or y = –(a2 –2bc)/(ab–2c2), a rational number, which is impossible. The only alternative is that ab – 2c2 = 0, a2 – 2bc = 0. [I : 19] REAL VARIABLES 40 Hence ab = 2c2, a4 = 4b2c2. If neither a nor b is zero, we can divide the second equation by the first, which gives a3 = 2b3: and this is impossible, since 3 √2 cannot be equal to the rational number a/b. Hence ab = 0, c = 0, and it follows from the original equation that a, b, and c are all zero. As a corollary, if a + b 3 √2 + c 3 √4 = d + e 3 √2 + f 3 √4, then a = d, b = e, c = f . It may be proved, more generally, that if a0 + a1p1/m + · · · + am–1p(m–1)/m = 0, p not being a perfect mth power, then a0 = a1 = · · · = am–1 = 0; but the proof is less simple.] 25. If A + 3 √B = C + 3 √D, then either A = C, B = D, or B and D are both cubes of rational numbers. 26. If 3 √A + 3 √B + 3 √C = 0, then either one of A, B, C is zero, and the other two equal and opposite, or 3 √A, 3 √B, 3 √C are rational multiples of the same surd 3 √X. 27. Find rational numbers α, β such that 3 q 7 + 5√2 = α + β√2. 28. If (a – b3)b > 0, then 3 s a + 9b3 + a 3b r a – b3 3b + 3 s a – 9b3 + a 3b r a – b3 3b is rational. [Each of the numbers under a cube root is of the form (α + β r a – b3 3b)3 where α and β are rational.] 29. If α = n √p, any polynomial in α is the root of an equation of degree n, with rational coefficients. [We can express the polynomial (x say) in the form x = l1 + m1α + · · · + r1α(n–1), [I : 19] REAL VARIABLES 41 where l1, m1, . . . are rational, as in Ex. 22. Similarly x2 = l2 + m2a + . . . + r2a(n–1), ... xn = ln + mna + . . . + rna(n–1). Hence L1x + L2x2 + · · · + Lnxn = ∆, where ∆ is the determinant l1 m1 . . . r1 l2 m2 . . . r2 . . . . . ln mn . . . rn and L1, L2, . . . the minors of l1, l2, ...] 30. Apply this process to x = p + √q, and deduce the theorem of § 14. 31. Show that y = a + bp1/3 + cp2/3 satisfies the equation y3 – 3ay2 + 3y(a2 – bcp) – a3 – b3p – c3p2 + 3abcp = 0. 32. Algebraical numbers. We have seen that some irrational numbers (such as √2) are roots of equations of the type a0xn + a1xn–1 + · · · + an = 0, where a0, a1, . . . , an are integers. Such irrational numbers are called algebraical numbers: all other irrational numbers, such as π (§ 15), are called transcendental numbers. Show that if x is an algebraical number, then so are kx, where k is any rational number, and xm/n, where m and n are any integers. 33. If x and y are algebraical numbers, then so are x + y, x – y, xy and x/y. [We have equations a0xm + a1xm–1 + . . . + am = 0, b0yn + b1yn–1 + . . . + bn = 0, [I : 19] REAL VARIABLES 42 where the a's and b's are integers. Write x + y = z, y = z – x in the second, and eliminate x. We thus get an equation of similar form c0zp + c1zp–1 + · · · + cp = 0, satisfied by z. Similarly for the other cases.] 34. If a0xn + a1xn–1 + · · · + an = 0, where a0, a1, . . . , an are any algebraical numbers, then x is an algebraical number. [We have n + 1 equations of the type a0,ramr r + a1,ramr –1 r + · · · + amr ,r = 0 (r = 0, 1, . . . , n), in which the coefficients a0,r, a1,r, . . . are integers. Eliminate a0, a1, . . . , an between these and the original equation for x.] 35. Apply this process to the equation x2 – 2x√2 + √3 = 0. [The result is x8 – 16x6 + 58x4 – 48x2 + 9 = 0.] 36. Find equations, with rational coefficients, satisfied by 1 + √2 + √3, √3 + √2 √3 – √2 , q√3 + √2 + q√3 – √2, 3 √2 + 3 √3. 37. If x3 = x + 1, then x3n = anx + bn + cn/x, where an+1 = an + bn, bn+1 = an + bn + cn, cn+1 = an + cn. 38. If x6 + x5 – 2x4 – x3 + x2 + 1 = 0 and y = x4 – x2 + x – 1, then y satisfies a quadratic equation with rational coefficients. (Math. Trip. 1903.) [It will be found that y2 + y + 1 = 0.] CHAPTER II FUNCTIONS OF REAL VARIABLES 20. The idea of a function. Suppose that x and y are two contin- uous real variables, which we may suppose to be represented geometrically by distances A0P = x, B0Q = y measured from fixed points A0, B0 along two straight lines Λ, M. And let us suppose that the positions of the points P and Q are not independent, but connected by a relation which we can imagine to be expressed as a relation between x and y: so that, when P and x are known, Q and y are also known. We might, for example, suppose that y = x, or y = 2x, or 1 2 x, or x2 + 1. In all of these cases the value of x determines that of y. Or again, we might suppose that the relation between x and y is given, not by means of an explicit formula for

y in terms of x, but by means of a geometrical construction which enables us to determine Q when P is known. In these circumstances y is said to be a function of x. This notion of functional dependence of one variable upon another is perhaps the most important in the whole range of higher mathematics. In order to enable the reader to be certain that he understands it clearly, we shall, in this chapter, illustrate it by means of a large number of examples. But before we proceed to do this, we must point out that the simple examples of functions mentioned above possess three characteristics which are by no means involved in the general idea of a function, viz.: (1) y is determined for every value of x; (2) to each value of x for which y is given corresponds one and only one value of y; (3) the relation between x and y is expressed by means of an analytical formula, from which the value of y corresponding to a given value of x can be calculated by direct substitution of the latter. It is indeed the case that these particular characteristics are possessed by many of the most important functions. But the consideration of the following examples will make it clear that they are by no means essential to a function. All that is essential is that there should be some relation between x and y such that to some values of x at any rate correspond 43 [II : 20] FUNCTIONS OF REAL VARIABLES 44 values of y. Examples X. 1. Let y = x or 2x or 1 2 x or x2 + 1. Nothing further need be said at present about cases such as these. 2. Let y = 0 whatever be the value of x. Then y is a function of x, for we can give x any value, and the corresponding value of y (viz. 0) is known. In this case the functional relation makes the same value of y correspond to all values of x. The same would be true were y equal to 1 or – 1 2 or $\sqrt{2}$ instead of 0. Such a function of x is called a constant. 3. Let y2 = x. Then if x is positive this equation defines two values of y corresponding to each value of x, viz. $\pm\sqrt{x}$. If x = 0, y = 0. Hence to the particular value 0 of x corresponds one and only one value of y. But if x is negative there is no value of y which satisfies the equation. That is to say, the function y is not defined for negative values of x. This function therefore possesses the characteristic (3), but neither (1) nor (2). 4. Consider a volume of gas maintained at a constant temperature and contained in a cylinder closed by a sliding piston.* Let A be the area of the cross section of the piston and W its weight. The gas, held in a state of compression by the piston, exerts a certain pressure p0 per unit of area on the piston, which balances the weight W , so that W = Ap0. Let v0 be the volume of the gas when the system is thus in equilibrium. If additional weight is placed upon the piston the latter is forced downwards. The volume (v) of the gas diminishes; the pressure (p) which it exerts upon unit area of the piston increases. Boyle's experimental law asserts that the product of p and v is very nearly constant, a correspondence which, if exact, would be represented by an equation of the type pv = a, (i) where a is a number which can be determined approximately by experiment. Boyle's law, however, only gives a reasonable approximation to the facts pro- vided the gas is not compressed too much. When v is decreased and p increased *I borrow this instructive example from Prof. H. S. Carslaw's Introduction to the Calculus. [II : 20] FUNCTIONS OF REAL VARIABLES 45 beyond a certain point, the relation between them is no longer expressed with tolerable exactness by the equation (i). It is known that a much better approx- imation to the true relation can then be found by means of what is known as 'van der Waals' law', expressed by the equation

$$p + \alpha\, v2$$

$(v - \beta) = \gamma$, (ii) where α, β, γ are numbers which can also be determined approximately by experiment. Of course the two equations, even taken together, do not give anything like a complete account of the relation between p and v. This relation is no doubt in reality much more complicated, and its form changes, as v varies, from a form nearly equivalent to (i) to a form nearly equivalent to (ii). But, from a mathematical point of view, there is nothing to prevent us from contemplating an ideal state of things in which, for all values of v not less than a certain value V , (i) would be exactly true, and (ii) exactly true for all values of v less than V . And then we might regard the two equations as together defining p as a function of v. It is an example of a function which for some values of v is defined by one formula and for other values of v is defined by another. This function possesses the characteristic (2); to any value of v only one value of p corresponds: but it does not possess (1). For p is not defined as a function of v for negative values of v; a 'negative volume' means nothing, and so negative values of v do not present themselves for consideration at all. 5. Suppose that a perfectly elastic ball is dropped (without rotation) from a height 1 2 gτ 2 on to a fixed horizontal plane, and rebounds continually. The ordinary formulae of elementary dynamics, with which the reader is probably familiar, show that h = 1 2 gt2 if 0 ■ t ■ τ , h = 1 2 g(2τ –t)2 if τ ■ t ■ 3τ , and generally h = 1 2 g(2nτ – t)2 if (2n – 1)τ ■ t ■ (2n + 1)τ , h being the depth of the ball, at time t, below its original position. Obviously h is a function of t which is only defined for positive values of t. 6. Suppose that y is defined as being the largest prime factor of x. This is an instance of a definition which only applies to a particular class of values of x, viz. integral values. 'The largest prime factor of 11 3 or of $\sqrt{2}$ or of π' means nothing, and so our defining relation fails to define for such values of x as these. [II : 21] FUNCTIONS OF REAL VARIABLES 46 Thus this function does not possess the characteristic (1). It does possess (2), but not (3), as there is no simple formula which expresses y in terms of x. 7. Let y be defined as the denominator of x when x is expressed in its lowest terms. This is an example of a function which is defined if and only if x is rational. Thus y = 7 if x = –11/7: but y is not defined for x = $\sqrt{2}$, 'the denominator of $\sqrt{2}$' being a meaningless form of words. 8. Let y be defined as the height in inches of policeman Cx, in the Metropolitan Police, at 5.30 p.m. on 8 Aug. 1907. Then y is defined for a certain number of integral values of x,

viz. 1, 2, . . . , N , where N is the total number of policemen in division C at that particular moment of time. 21. The graphical representation of functions. Suppose that the variable y is a function of the variable x. It will generally be open to us also to regard x as a function of y, in virtue of the functional relation between x and y. But for the present we shall look at this relation from the first point of view. We shall then call x the independent variable and y the dependent variable; and, when the particular form of the functional relation is not specified, we shall express it by writing y = f (x) (or F (x), φ(x), ψ(x), . . . , as the case may be). The nature of particular functions may, in very many cases, be illus- trated and made easily intelligible as follows. Draw two lines OX, OY at right angles to one another and produced indefinitely in both directions. We can represent values of x and y by distances measured from O along the lines OX, OY respectively, regard being paid, of course, to sign, and the positive directions of measurement being those indicated by arrows in Fig. 6. Let a be any value of x for which y is defined and has (let us suppose) the single value b. Take OA = a, OB = b, and complete the rectangle OAP B. Imagine the point P marked on the diagram. This marking of the point P may be regarded as showing that the value of y for x = a is b. If to the value a of x correspond several values of y (say b, b′, b″), we have, instead of the single point P , a number of points P , P ′, P ″. [II : 21] FUNCTIONS OF REAL VARIABLES 47O A X Y a b B P B′ P ′ B″ P ″ Fig. 6. We shall call P the point (a, b); a and b the coordinates of P referred to the axes OX, OY ; a the abscissa, b the ordinate of P ; OX and OY the axis of x and the axis of y, or together the axes of coordinates, and O the origin of coordinates, or simply the origin. Let us now suppose that for all values a of x for which y is defined, the value b (or values b, b′, b″, . . .) of y, and the corresponding point P (or points P , P ′, P ″, . . .), have been determined. We call the aggregate of all these points the graph of the function y. To take a very simple example, suppose that y is defined as a function of x by the equation Ax + By + C = 0, (1) where A, B, C are any fixed numbers.* Then y is a function of x which possesses all the characteristics (1), (2), (3) of § 20. It is easy to show that the graph of y is a straight line. The reader is in all probability familiar with one or other of the various proofs of this proposition which are given in text-books of Analytical Geometry. We shall sometimes use another mode of expression. We shall say that *If B = 0, y does not occur in the equation. We must then regard y as a function of x defined for one value only of x, viz. x = –C/A, and then having all values. [II : 22] FUNCTIONS OF REAL VARIABLES 48 when x and y vary in such a way that equation (1) is always true, the locus of the point (x, y) is a straight line, and we shall call (1) the equation of the locus, and say that the equation represents the locus. This use of the terms ‘locus’, ‘equation of the locus’ is quite general, and may be applied whenever the relation between x and y is capable of being represented by an analytical formula. The equation Ax+By +C = 0 is the general equation of the first degree, for Ax + By + C is the most general polynomial in x and y which does not involve any terms of degree higher than the first in x and y. Hence the general equation of the first degree represents a straight line. It is equally easy to prove the converse proposition that the equation of any straight line is of the first degree. We may mention a few further examples of interesting geometrical loci defined by equations. An equation of the form (x – α)2 + (y – β)2 = ρ2, or x2 + y2 + 2Gx + 2F y + C = 0, where G2 + F 2 – C > 0, represents a circle. The equation Ax2 + 2Hxy + By2 + 2Gx + 2F y + C = 0 (the general equation of the second degree) represents, assuming that the coefficients satisfy certain inequalities, a conic section, i.e. an ellipse, parabola, or hyperbola. For further discussion of these loci we must refer to books on Analytical Geometry. 22. Polar coordinates. In what precedes we have determined the position of P by the lengths of its coordinates OM = x, M P = y. If OP = r and M OP = θ, θ being an angle between 0 and 2π (measured in the positive direction), it is evident that x = r cos θ, y = r sin θ, r = px2 + y2, cos θ : sin θ : 1 :: x : y : r, [II : 23] FUNCTIONS OF REAL VARIABLES 49 and that the position of P is equally well determined by a knowledge of r and θ. We call r and θ the polar coordinates of P . The former, it should be observed, is essentially positive.*O Mx r y θ N P Fig. 7. If P moves on a locus there will be some relation between r and θ, say r = f (θ) or θ = F (r). This we call the polar equation of the locus. The polar equation may be deduced from the (x, y) equation (or vice versa) by means of the formulae above. Thus the polar equation of a straight line is of the form r cos(θ – α) = p, where p and α are constants. The equation r = 2a cos θ represents a circle passing through the origin; and the general equation of a circle is of the form r2 + c2 – 2rc cos(θ – α) = A2, where A, c, and α are constants. *Polar coordinates are sometimes defined so that r may be positive or negative. In this case two pairs of coordinates—e.g. (1, 0) and (–1, π)—correspond to the same point. The distinction between the two systems may be illustrated by means of the equation l/r = 1 – e cos θ, where l > 0, e > 1. According to our definitions r must be positive and therefore cos θ < 1/e: the equation represents one branch only of a hyperbola, the other having the equation –l/r = 1 – e cos θ. With the system of coordinates which admits negative values of r, the equation represents the whole hyperbola. [II : 23] FUNCTIONS OF REAL VARIABLES 50 23. Further examples of functions and their graphical rep- resentation. The examples which follow will give the reader a better notion of the infinite variety of possible types of functions. A. Polynomials. A polynomial in x is a function of the form a0xm + a1xm–1 + · · · + am, where a0, a1, . . . , am are constants. The simplest polynomials are the simple powers y = x, x2, x3, . . . , xm, ... The graph of the function xm is of two distinct types, according as m is even or odd. First let m = 2. Then three points on the graph are (0, 0), (1, 1), (–1, 1). Any number of additional points on the graph may be found by assigning other special values to x: thus the values x = 1 2 , 2, 3, –1 2 , –2, 3 give y = 1 4 , 4, 9, 1 4 , 4, 9. If the reader will plot off a fair number of points on the

graph, he will be led to conjecture that the form of the graph is something like that shown in Fig. 8. If he draws a curve through the special points which he has proved to lie on the graph and then tests its accuracy by giving x new values, and calculating the corresponding values of y, he will find that they lie as near to the curve as it is reasonable to expect, when the inevitable inaccuracies of drawing are considered. The curve is of course a parabola. There is, however, one fundamental question which we cannot answer adequately at present. The reader has no doubt some notion as to what is meant by a continuous curve, a curve without breaks or jumps; such a curve, in fact, as is roughly represented in Fig. 8. The question is whether the graph of the function y = x2 is in fact such a curve. This cannot be proved by merely constructing any number of isolated points on the curve, although the more such points we construct the more probable it will appear. [II : 23] FUNCTIONS OF REAL VARIABLES 51(–1, 1) (1, 1) (0, 0) P0 P1 N y = x2 Fig. 8. This question cannot be discussed properly until Ch. V. In that chapter we shall consider in detail what our common sense idea of continuity really means, and how we can prove that such graphs as the one now considered, and others which we shall consider later on in this chapter, are really continuous curves. For the present the reader may be content to draw his curves as common sense dictates. It is easy to see that the curve y = x2 is everywhere convex to the axis of x. Let P0, P1 (Fig. 8) be the points (x0, x2 0), (x1, x2 1). Then the coordinates of a point on the chord P0P1 are x = λx0 + μx1, y = λx2 0 + μx2 1, where λ and μ are positive numbers whose sum is 1. And y – x2 = (λ + μ)(λx2 0 + μx2 1) – (λx0 + μx1)2 = λμ(x1 – x0)2 ■ 0, so that the chord lies entirely above the curve. The curve y = x4 is similar to y = x2 in general appearance, but flatter near O, and steeper beyond the points A, A′ (Fig. 9), and y = xm, where m is even and greater than 4, is still more so. As m gets larger and larger the flatness and steepness grow more and more pronounced, until the curve is practically indistinguishable from the thick line in the figure. The reader should next consider the curves given by y = xm, when m is odd. The fundamental difference between the two cases is that whereas when m is even (–x)m = xm, so that the curve is symmetrical about OY , when m is odd (–x)m = –xm, so that y is negative when x is negative. [II : 23] FUNCTIONS OF REAL VARIABLES 52OM N AA′ y = x2 y = x4 Fig. 9.O A A′ y = x y = x3 Fig. 10. Fig. 10 shows the curves y = x, y = x3, and the form to which y = xm approximates for larger odd values of m. It is now easy to see how (theoretically at any rate) the graph of any polynomial may be constructed. In the first place, from the graph of y = xm we can at once derive that of Cxm, where C is a constant, by multiplying the ordinate of every point of the curve by C. And if we know the graphs of f (x) and F (x), we can find that of f (x) + F (x) by taking the ordinate of every point to be the sum of the ordinates of the corresponding points on the two original curves. The drawing of graphs of polynomials is however so much facilitated by the use of more advanced methods, which will be explained later on, that we shall not pursue the subject further here. Examples XI. 1. Trace the curves y = 7x4, y = 3x5, y = x10. [The reader should draw the curves carefully, and all three should be drawn in one figure.* He will then realise how rapidly the higher powers of x increase, *It will be found convenient to take the scale of measurement along the axis of y a good deal smaller than that along the axis of x, in order to prevent the figure becoming of an awkward size. [II : 24] FUNCTIONS OF REAL VARIABLES 53 as x gets larger and larger, and will see that, in such a polynomial as x10 + 3x5 + 7x4 (or even x10 + 30x5 + 700x4), it is the first term which is of really preponderant importance when x is fairly large. Thus even when x = 4, x10 > 1,000,000, while 30x5 < 35,000 and 700x4 < 180,000; while if x = 10 the preponderance of the first term is still more marked.] 2. Compare the relative magnitudes of x12, 1,000,000x6, 1,000,000,000,000x when x = 1, 10, 100, etc. [The reader should make up a number of examples of this type for himself. This idea of the relative rate of growth of different functions of x is one with which we shall often be concerned in the following chapters.] 3. Draw the graph of ax2 + 2bx + c. [Here y – {(ac – b2)/a} = a{x + (b/a)}2. If we take new axes parallel to the old and passing through the point x = –b/a, y = (ac – b2)/a, the new equation is y′ = ax′2. The curve is a parabola.] 4. Trace the curves y = x3 – 3x + 1, y = x2(x – 1), y = x(x – 1)2. 24. B. Rational Functions. The class of functions which ranks next to that of polynomials in simplicity and importance is that of rational functions. A rational function is the quotient of one polynomial by another: thus if P (x), Q(x) are polynomials, we may denote the general rational function by R(x) = P (x) Q(x). In the particular case when Q(x) reduces to unity or any other constant (i.e. does not involve x), R(x) reduces to a polynomial: thus the class of rational functions includes that of polynomials as a sub-class. The following points concerning the definition should be noticed. (1) We usually suppose that P (x) and Q(x) have no common factor x + a or xp + axp–1 + bxp–2 + · · · + k, all such factors being removed by division. (2) It should however be observed that this removal of common factors does as a rule change the function. Consider for example the function x/x, which is a rational function. On removing the common factor x we obtain 1/1 = 1. But the [II : 24] FUNCTIONS OF REAL VARIABLES 54 original function is not always equal to 1: it is equal to 1 only so long as x■ = 0. If x = 0 it takes the form 0/0, which is meaningless. Thus the function x/x is equal to 1 if x■ = 0 and is undefined when x = 0. It therefore differs from the function 1, which is always equal to 1. (3) Such a function as 1 x + 1 + 1 x – 1 1 x + 1 x – 2

may be reduced, by the ordinary rules of algebra, to the form x2(x – 2) (x – 1)2(x + 1) , which is a rational function of the standard form. But here again it must be noticed that the reduction is not always legitimate. In order to calculate the value of a function for a given value of x we must substitute the value for x in the function in the form in which it is given. In the case of this function the

values x = –1, 1, 0, 2 all lead to a meaningless expression, and so the function is not defined for these values. The same is true of the reduced form, so far as the values –1 and 1 are concerned. But x = 0 and x = 2 give the value 0. Thus once more the two functions are not the same. (4) But, as appears from the particular example considered under (3), there will generally be a certain number of values of x for which the function is not defined even when it has been reduced to a rational function of the standard form. These are the values of x (if any) for which the denominator vanishes. Thus (x2 – 7)/(x2 – 3x + 2) is not defined when x = 1 or 2. (5) Generally we agree, in dealing with expressions such as those considered in (2) and (3), to disregard the exceptional values of x for which such processes of simplification as were used there are illegitimate, and to reduce our function to the standard form of rational function. The reader will easily verify that (on this understanding) the sum, product, or quotient of two rational functions may themselves be reduced to rational functions of the standard type. And generally a rational function of a rational function is itself a rational function: i.e. if in z = P (y)/Q(y), where P and Q are polynomials, we substitute y = P1(x)/Q1(x), we obtain on simplification an equation of the form z = P2(x)/Q2(x). (6) It is in no way presupposed in the definition of a rational function that the constants which occur as coefficients should be rational numbers. The word [II : 25] FUNCTIONS OF REAL VARIABLES 55 rational has reference solely to the way in which the variable x appears in the function. Thus x2 + x + √3 x 3 √2 – π is a rational function. The use of the word rational arises as follows. The rational function P (x)/Q(x) may be generated from x by a finite number of operations upon x, including only multiplication of x by itself or a constant, addition of terms thus obtained and division of one function, obtained by such multiplications and additions, by another. In so far as the variable x is concerned, this procedure is very much like that by which all rational numbers can be obtained from unity, a procedure exemplified in the equation 5 3 = 1 + 1 + 1 + 1 + 1 1 + 1 + 1 . Again, any function which can be deduced from x by the elementary oper- ations mentioned above using at each stage of the process functions which have already been obtained from x in the same way, can be reduced to the stan- dard type of rational function. The most general kind of function which can be obtained in this way is sufficiently illustrated by the example x x2 + 1 + 2x + 7 x2 + 11x – 3√2 9x + 1 !, 17 + 2 x3

, which can obviously be reduced to the standard type of rational function. 25. The drawing of graphs of rational functions, even more than that of polynomials, is immensely facilitated by the use of methods depend- ing upon the differential calculus. We shall therefore content ourselves at present with a very few examples. Examples XII. 1. Draw the graphs of y = 1/x, y = 1/x2, y = 1/x3, ... [The figures show the graphs of the first two curves. It should be observed that since 1/0, 1/02, . . . are meaningless expressions, these functions are not defined for x = 0.] [II : 26] FUNCTIONS OF REAL VARIABLES 56y = 1/x (–1, –1) (1, 1) Fig. 11.y = 1/x2 Fig. 12. 2. Trace y = x + (1/x), x – (1/x), x2 + (1/x2), x2 – (1/x2) and ax + (b/x) taking various values, positive and negative, for a and b. 3. Trace y = x + 1 x – 1 , x + 1 x – 1 2 , 1 (x – 1)2 , x2 + 1 x2 – 1 . 4. Trace y = 1/(x – a)(x – b), 1/(x – a)(x – b)(x – c), where a < b < c. 5. Sketch the general form assumed by the curves y = 1/xm as m becomes larger and larger, considering separately the cases in which m is odd or even. 26. C. Explicit Algebraical Functions. The next important class of functions is that of explicit algebraical functions. These are func- tions which can be generated from x by a finite number of operations such as those used in generating rational functions, together with a finite num- ber of operations of root extraction. Thus √1 + x – 3 √1 – x √1 + x + 3 √1 – x , √x + q x + √x, x2 + x + √3 x 3 √2 – π !2 3 are explicit algebraical functions, and so is xm/n (i.e. n √xm), where m and n are any integers. [II : 27] FUNCTIONS OF REAL VARIABLES 57 It should be noticed that there is an ambiguity of notation involved in such an equation as y = √x. We have, up to the present, regarded (e.g.) √2 as denoting the positive square root of 2, and it would be natural to denote by √x, where x is any positive number, the positive square root of x, in which case y = √x would be a one-valued function of x. It is however often more convenient to regard √x as standing for the two-valued function whose two values are the positive and negative square roots of x. The reader will observe that, when this course is adopted, the func- tion √x differs fundamentally from rational functions in two respects. In the first place a rational function is always defined for all values of x with a certain number of isolated exceptions. But √x is undefined for a whole range of values of x (i.e. all negative values). Secondly the function, when x has a value for which it is defined, has generally two values of opposite signs. The function 3 √x, on the other hand, is one-valued and defined for all values of x. Examples XIII. 1. p(x – a)(b – x), where a < b, is defined only for a ■ x ■ b. If a < x < b it has two values: if x = a or b only one, viz. 0. 2. Consider similarly p(x – a)(x – b)(x – c) (a < b < c), px(x2 – a2), 3 p(x – a)2(b – x) (a < b), √1 + x – √1 – x √1 + x + √1 – x , q x + √x. 3. Trace the curves y2 = x, y3 = x, y2 = x3. 4. Draw the graphs of the functions y = pa2 – x2, y = bp1 – (x2/a2). 27. D. Implicit Algebraical Functions. It is easy to verify that if y = √1 + x – 3 √1 – x √1 + x + 3 √1 – x , [II : 27] FUNCTIONS OF REAL VARIABLES 58 then 1 + y 1 – y 6 = (1 + x)3 (1 – x)2 ; or if y = √x + q x + √x, then y4 – (4y2 + 4y + 1)x = 0. Each of these equations may be expressed in the form ym + R1ym–1 + · · · + Rm = 0, (1) where R1, R2, . . . , Rm are rational functions of x: and the reader will easily verify that, if y is any one of the functions considered in the last set of examples, y satisfies an equation of this form. It is naturally suggested that the same is true of any explicit algebraic function. And this is in fact true, and indeed not difficult to prove, though we shall not delay to write out a formal proof here. An example should make clear to the reader the lines on which such a proof would proceed. Let y = x + √x + px + √x + 3 √1 + x x – √x + px + √x – 3 √1 + x. Then we have the

equations y = x + u + v + w x – u + v – w , u2 = x, v2 = x + u, w3 = 1 + x, and we have only to eliminate u, v, w between these equations in order to obtain an equation of the form desired. We are therefore led to give the following definition: a function y = f (x) will be said to be an algebraical function of x if it is the root of an equation such as (1), i.e. the root of an equation of the mth degree in y, whose coefficients are rational functions of x. There is plainly no loss of generality in supposing the first coefficient to be unity. [II : 27] FUNCTIONS OF REAL VARIABLES 59 This class of functions includes all the explicit algebraical functions considered in § 26. But it also includes other functions which cannot be expressed as explicit algebraical functions. For it is known that in general such an equation as (1) cannot be solved explicitly for y in terms of x, when m is greater than 4, though such a solution is always possible if m = 1, 2, 3, or 4 and in special cases for higher values of m. The definition of an algebraical function should be compared with that of an algebraical number given in the last chapter (Misc. Exs. 32). Examples XIV. 1. If m = 1, y is a rational function. 2. If m = 2, the equation is y2 + R1y + R2 = 0, so that y = 1 2 {–R1 ± q R2 1 – 4R2}. This function is defined for all values of x for which R2 1 ■ 4R2. It has two values if R2 1 > 4R2 and one if R2 1 = 4R2. If m = 3 or 4, we can use the methods explained in treatises on Algebra for the solution of cubic and biquadratic equations. But as a rule the process is complicated and the results inconvenient in form, and we can generally study the properties of the function better by means of the original equation. 3. Consider the functions defined by the equations y2 – 2y – x2 = 0, y2 – 2y + x2 = 0, y4 – 2y2 + x2 = 0, in each case obtaining y as an explicit function of x, and stating for what values of x it is defined. 4. Find algebraical equations, with coefficients rational in x, satisfied by each of the functions √x + p1/x, 3 √x + 3 p1/x, q x + √x, r x + q x + √x. 5. Consider the equation y4 = x2. [Here y2 = ±x. If x is positive, y = √x: if negative, y = √–x. Thus the function has two values for all values of x save x = 0.] 6. An algebraical function of an algebraical function of x is itself an alge- braical function of x. [II : 28] FUNCTIONS OF REAL VARIABLES 60 [For we have ym + R1(z)ym–1 + . . . + Rm(z) = 0, where zn + S1(x)zn–1 + . . . + Sn(x) = 0. Eliminating z we find an equation of the form yp + T1(x)yp–1 + . . . + Tp(x) = 0. Here all the capital letters denote rational functions.] 7. An example should perhaps be given of an algebraical function which cannot be expressed in an explicit algebraical form. Such an example is the function y defined by the equation y5 – y – x = 0. But the proof that we cannot find an explicit algebraical expression for y in terms of x is difficult, and cannot be attempted here. 28. Transcendental functions. All functions of x which are not rational or even algebraical are called transcendental functions. This class of functions, being defined in so purely negative a manner, naturally in- cludes an infinite variety of whole kinds of functions of varying degrees of simplicity and importance. Among these we can at present distinguish two kinds which are particularly interesting. E. The direct and inverse trigonometrical or circular func- tions. These are the sine and cosine functions of elementary trigonometry, and their inverses, and the functions derived from them. We may assume provisionally that the reader is familiar with their most important proper- ties.* *The definitions of the circular functions given in elementary trigonometry presup- pose that any sector of a circle has associated with it a definite number called its area. How this assumption is justified will appear in Ch. VII. [II : 28] FUNCTIONS OF REAL VARIABLES 61 Examples XV. 1. Draw the graphs of cos x, sin x, and a cos x + b sin x. [Since a cos x + b sin x = β cos(x – α), where β = √a2 + b2, and α is an angle whose cosine and sine are a/√a2 + b2 and b/√a2 + b2, the graphs of these three functions are similar in character.] 2. Draw the graphs of cos2 x, sin2 x, a cos2 x + b sin2 x. 3. Suppose the graphs of f (x) and F (x) drawn. Then the graph of f (x) cos2 x + F (x) sin2 x is a wavy curve which oscillates between the curves y = f (x), y = F (x). Draw the graph when f (x) = x, F (x) = x2. 4. Show that the graph of cos px+cos qx lies between those of 2 cos 1 2 (p–q)x and –2 cos 1 2 (p+q)x, touching each in turn. Sketch the graph when (p–q)/(p+q) is small. (Math. Trip. 1908.) 5. Draw the graphs of x + sin x, (1/x) + sin x, x sin x, (sin x)/x. 6. Draw the graph of sin(1/x). [If y = sin(1/x), then y = 0 when x = 1/mπ, where m is any integer. Similarly y = 1 when x = 1/(2m + 1 2)π and y = –1 when x = 1/(2m – 1 2)π. The curve is entirely comprised between the lines y = –1 and y = 1 (Fig. 13). It oscillates up and down, the rapidity of the oscillations becoming greater and greater as x approaches 0. For x = 0 the function is undefined. When x is large y is small.* The negative half of the curve is similar in character to the positive half.] 7. Draw the graph of x sin(1/x). [This curve is comprised between the lines y = –x and y = x just as the last curve is comprised between the lines y = –1 and y = 1 (Fig. 14).] 8. Draw the graphs of x2 sin(1/x), (1/x) sin(1/x), sin2(1/x), {x sin(1/x)}2, a cos2(1/x) + b sin2(1/x), sin x + sin(1/x), sin x sin(1/x). 9. Draw the graphs of cos x2, sin x2, a cos x2 + b sin x2. 10. Draw the graphs of arc cos x and arc sin x. [If y = arc cos x, x = cos y. This enables us to draw the graph of x, considered as a function of y, and the same curve shows y as a function of x. It is clear that y is only defined for –1 ■ x ■ 1, and is infinitely many-valued for these values of x. As the reader no doubt remembers, there is, when –1 < x < 1, a *See Chs. IV and V for explanations as to the precise meaning of this phrase. [II : 28] FUNCTIONS OF REAL VARIABLES 62 Fig. 13. Fig. 14. value of y between 0 and π, say α, and the other values of y are given by the formula 2nπ ± α, where n is any integer, positive or negative.] 11. Draw the graphs of tan x, cot x, sec x, cosec x, tan2 x, cot2 x, sec2 x, cosec2 x. 12. Draw the graphs of arc tan x, arc cot x, arc sec x, arc cosec x. Give for- mulae (as in Ex. 10) expressing all the values of each of these functions in terms of any particular value. 13. Draw the graphs of tan(1/x), cot(1/x), sec(1/x), cosec(1/x). 14. Show that cos x and sin x are not rational functions of x. [A function is said to be periodic, with period a, if f (x) = f (x + a) for all values of x for which f (x) is defined. Thus cos x and sin x have the period 2π. It is easy to see that no periodic

function can be a rational function, unless it is a constant. For suppose that f (x) = P (x)/Q(x), where P and Q are polynomials, and that f (x) = f (x+a), each of these equations holding for all values of x. Let f (0) = k. Then the equation P (x) – kQ(x) = 0 is satisfied by an infinite number of values of x, viz. x = 0, a, 2a, etc., and therefore for all values of x. Thus f (x) = k for all values of x, i.e. f (x) is a constant.] 15. Show, more generally, that no function with a period can be an alge- braical function of x. [II : 29] FUNCTIONS OF REAL VARIABLES 63 [Let the equation which defines the algebraical function be ym + R1ym–1 + · · · + Rm = 0 (1) where R1, . . . are rational functions of x. This may be put in the form P0ym + P1ym–1 + · · · + Pm = 0, where P0, P1, . . . are polynomials in x. Arguing as above, we see that P0km + P1km–1 + · · · + Pm = 0 for all values of x. Hence y = k satisfies the equation (1) for all values of x, and one set of values of our algebraical function reduces to a constant. Now divide (1) by y – k and repeat the argument. Our final conclusion is that our algebraical function has, for any value of x, the same set of values k, k′, . . . ; i.e. it is composed of a certain number of constants.] 16. The inverse sine and inverse cosine are not rational or algebraical func- tions. [This follows from the fact that, for any value of x between –1 and +1, arc sin x and arc cos x have infinitely many values.] 29. F. Other classes of transcendental functions. Next in importance to the trigonometrical functions come the exponential and log- arithmic functions, which will be discussed in Chs. IX and X. But these functions are beyond our range at present. And most of the other classes of transcendental functions whose properties have been studied, such as the el- liptic functions, Bessel's and Legendre's functions, Gamma-functions, and so forth, lie altogether beyond the scope of this book. There are however some elementary types of functions which, though of much less importance theoretically than the rational, algebraical, or trigonometrical functions, are particularly instructive as illustrations of the possible varieties of the functional relation. Examples XVI. 1. Let y = [x], where [x] denotes the greatest integer not greater than x. The graph is shown in Fig. 15a. The left-hand end points of the thick lines, but not the right-hand ones, belong to the graph. 2. y = x – [x]. (Fig. 15b.) [II : 29] FUNCTIONS OF REAL VARIABLES 640 1 2 Fig. 15a.0 1 2 Fig. 15b. 3. y = px – [x]. (Fig. 15c.) 4. y = [x] + px – [x]. (Fig. 15d.) 5. y = (x – [x])2, [x] + (x – [x])2. 6. y = [√x], [x2], √x – [√x], x2 – [x2], [1 – x2].0 1 2 Fig. 15c.0 1 2 Fig. 15d. 7. Let y be defined as the largest prime factor of x (cf. Exs. x. 6). Then [II : 29] FUNCTIONS OF REAL VARIABLES 65 y is defined only for integral values of x. If x = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, . . . , then y = 1, 2, 3, 2, 5, 3, 7, 2, 3, 5, 11, 3, 13, ... The graph consists of a number of isolated points. 8. Let y be the denominator of x (Exs. x. 7). In this case y is defined only for rational values of x. We can mark off as many points on the graph as we please, but the result is not in any ordinary sense of the word a curve, and there are no points corresponding to any irrational values of x. Draw the straight line joining the points (N – 1, N), (N, N), where N is a positive integer. Show that the number of points of the locus which lie on this line is equal to the number of positive integers less than and prime to N . 9. Let y = 0 when x is an integer, y = x when x is not an integer. The graph is derived from the straight line y = x by taking out the points . . . (–1, –1), (0, 0), (1, 1), (2, 2), . . . and adding the points (–1, 0), (0, 0), (1, 0), . . . on the axis of x. The reader may possibly regard this as an unreasonable function. Why, he may ask, if y is equal to x for all values of x save integral values, should it not be equal to x for integral values too? The answer is simply, why should it? The function y does in point of fact answer to the definition of a function: there is a relation between x and y such that when x is known y is known. We are perfectly at liberty to take this relation to be what we please, however arbitrary and apparently futile. This function y is, of course, a quite different function from that one which is always equal to x, whatever value, integral or otherwise, x may have. 10. Let y = 1 when x is rational, but y = 0 when x is irrational. The graph consists of two series of points arranged upon the lines y = 1 and y = 0. To the eye it is not distinguishable from two continuous straight lines, but in reality an infinite number of points are missing from each line. 11. Let y = x when x is irrational and y = p(1 + p2)/(1 + q2) when x is a rational fraction p/q. [II : 29] FUNCTIONS OF REAL VARIABLES 66 Fig. 16. The irrational values of x contribute to the graph a curve in reality discon- tinuous, but apparently not to be distinguished from the straight line y = x. Now consider the rational values of x. First let x be positive. Thenp(1 + p2)/(1 + q2) cannot be equal to p/q unless p = q, i.e. x = 1. Thus all the points which correspond to rational values of x lie off the line, ex- cept the one point (1, 1). Again, if p < q, p(1 + p2)/(1 + q2) > p/q; if p > q,p(1 + p2)/(1 + q2) < p/q. Thus the points lie above the line y = x if 0 < x < 1, below if x > 1. If p and q are large, p(1 + p2)/(1 + q2) is nearly equal to p/q. Near any value of x we can find any number of rational fractions with large numerators and denominators. Hence the graph contains a large number of points which crowd round the line y = x. Its general appearance (for positive values of x) is that of a line surrounded by a swarm of isolated points which gets denser and denser as the points approach the line. The part of the graph which corresponds to negative values of x consists of the rest of the discontinuous line together with the reflections of all these [II : 30] FUNCTIONS OF REAL VARIABLES 67 isolated points in the axis of y. Thus to the left of the axis of y the swarm of points is not round y = x but round y = –x, which is not itself part of the graph. See Fig. 16. 30. Graphical solution of equations containing a single un- known number. Many equations can be expressed in the form f (x) = φ(x), (1) where f (x) and φ(x) are functions whose graphs are easy to draw. And if the curves y = f (x), y = φ(x) intersect in a point P whose abscissa is ξ, then ξ is a root of the equa- tion (1). Examples XVII. 1. The quadratic equation ax2 + 2bx + c = 0. This may be solved graphically in a variety of ways. For instance we may draw the graphs of y = ax + 2b, y = –c/x, whose intersections, if any, give the roots. Or we may take y =

x2, y = –(2bx + c)/a. But the most elementary method is probably to draw the circle a(x2 + y2) + 2bx + c = 0, whose centre is (–b/a, 0) and radius {√b2 – ac}/a. The abscissae of its inter- sections with the axis of x are the roots of the equation. 2. Solve by any of these methods x2 + 2x – 3 = 0, x2 – 7x + 4 = 0, 3x2 + 2x – 2 = 0. 3. The equation xm + ax + b = 0. This may be solved by constructing the curves y = xm, y = –ax – b. Verify the following table for the number of [II : 31] FUNCTIONS OF REAL VARIABLES 68 roots of xm + ax + b = 0 : (a) m even (b positive, two or none, b negative, two; (b) m odd (a positive, one, a negative, three or one. Construct numerical examples to illustrate all possible cases. 4. Show that the equation tan x = ax + b has always an infinite number of roots. 5. Determine the number of roots of sin x = x, sin x = 1 3 x, sin x = 1 8 x, sin x = 1 120 x. 6. Show that if a is small and positive (e.g. a = .01), the equation x – a = 1 2 π sin2 x has three roots. Consider also the case in which a is small and negative. Explain how the number of roots varies as a varies. 31. Functions of two variables and their graphical represen- tation. In § 20 we considered two variables connected by a relation. We may similarly consider three variables (x, y, and z) connected by a rela- tion such that when the values of x and y are both given, the value or values of z are known. In this case we call z a function of the two variables x and y; x and y the independent variables, z the dependent variable; and we express this dependence of z upon x and y by writing z = f (x, y). The remarks of § 20 may all be applied, mutatis mutandis, to this more complicated case. The method of representing such functions of two variables graphically is exactly the same in principle as in the case of functions of a single vari- able. We must take three axes, OX, OY , OZ in space of three dimensions, [II : 32] FUNCTIONS OF REAL VARIABLES 69 each axis being perpendicular to the other two. The point (a, b, c) is the point whose distances from the planes Y OZ, ZOX, XOY , measured par- allel to OX, OY , OZ, are a, b, and c. Regard must of course be paid to sign, lengths measured in the directions OX, OY , OZ being regarded as positive. The definitions of coordinates, axes, origin are the same as before. Now let z = f (x, y). As x and y vary, the point (x, y, z) will move in space. The aggregate of all the positions it assumes is called the locus of the point (x, y, z) or the graph of the function z = f (x, y). When the relation between x, y, and z which defines z can be expressed in an analytical formula, this formula is called the equation of the locus. It is easy to show, for example, that the equation Ax + By + Cz + D = 0 (the general equation of the first degree) represents a plane, and that the equation of any plane is of this form. The equation (x – α)2 + (y – β)2 + (z – γ)2 = ρ2, or x2 + y2 + z2 + 2F x + 2Gy + 2Hz + C = 0, where F 2 + G2 + H2 – C > 0, represents a sphere; and so on. For proofs of these propositions we must again refer to text-books of Analytical Ge- ometry. 32. Curves in a plane. We have hitherto used the notation y = f (x) (1) to express functional dependence of y upon x. It is evident that this no- tation is most appropriate in the case in which y is expressed explicitly in terms of x by means of a formula, as when for example y = x2, sin x, a cos2 x + b sin2 x. [II : 32] FUNCTIONS OF REAL VARIABLES 70 We have however very often to deal with functional relations which it is impossible or inconvenient to express in this form. If, for example, y5 – y – x = 0 or x5 + y5 – ay = 0, it is known to be impossible to express y explicitly as an algebraical function of x. If x2 + y2 + 2Gx + 2F y + C = 0, y can indeed be so expressed, viz. by the formula y = –F + √F 2 – x2 – 2Gx – C; but the functional dependence of y upon x is better and more simply expressed by the original equation. It will be observed that in these two cases the functional relation is fully expressed by equating a function of the two variables x and y to zero, i.e. by means of an equation f (x, y) = 0. (2) We shall adopt this equation as the standard method of expressing the functional relation. It includes the equation (1) as a special case, since y – f (x) is a special form of a function of x and y. We can then speak of the locus of the point (x, y) subject to f (x, y) = 0, the graph of the function y defined by f (x, y) = 0, the curve or locus f (x, y) = 0, and the equation of this curve or locus. There is another method of representing curves which is often useful. Suppose that x and y are both functions of a third variable t, which is to be regarded as essentially auxiliary and devoid of any particular geometrical significance. We may write x = f (t), y = F (t). (3) If a particular value is assigned to t, the corresponding values of x and of y are known. Each pair of such values defines a point (x, y). If we construct all the points which correspond in this way to different values [II : 33] FUNCTIONS OF REAL VARIABLES 71 of t, we obtain the graph of the locus defined by the equations (3). Suppose for example x = a cos t, y = a sin t. Let t vary from 0 to 2π. Then it is easy to see that the point (x, y) describes the circle whose centre is the origin and whose radius is a. If t varies beyond these limits, (x, y) describes the circle over and over again. We can in this case at once obtain a direct relation between x and y by squaring and adding: we find that x2 + y2 = a2, t being now eliminated. Examples XVIII. 1. The points of intersection of the two curves whose equations are f (x, y) = 0, φ(x, y) = 0, where f and φ are polynomials, can be determined if these equations can be solved as a pair of simultaneous equations in x and y. The solution generally consists of a finite number of pairs of values of x and y. The two equations therefore generally represent a finite number of isolated points. 2. Trace the curves (x + y)2 = 1, xy = 1, x2 – y2 = 1. 3. The curve f (x, y) + λφ(x, y) = 0 represents a curve passing through the points of intersection of f = 0 and φ = 0. 4. What loci are represented by (α) x = at + b, y = ct + d, (β) x/a = 2t/(1 + t2), y/a = (1 – t2)/(1 + t2), when t varies through all real values? 33. Loci in space. In space of three dimensions there are two fun- damentally different kinds of loci, of which the simplest examples are the plane and the straight line. A particle which moves along a straight line has only one degree of freedom. Its direction of motion is fixed; its position can be completely fixed by one measurement of position, e.g. by its distance from a fixed point on the line. If we take the line as our fundamental line Λ of

Chap. I, the position of any of its points is determined by a single coordinate x. A particle which moves in a plane, on the other hand, has two degrees of freedom; its position can only be fixed by the determination of two coordinates. [II : 33] FUNCTIONS OF REAL VARIABLES 72 A locus represented by a single equation z = f (x, y) plainly belongs to the second of these two classes of loci, and is called a surface. It may or may not (in the obvious simple cases it will) satisfy our common-sense notion of what a surface should be. The considerations of § 31 may evidently be generalised so as to give definitions of a function f (x, y, z) of three variables (or of functions of any number of variables). And as in § 32 we agreed to adopt f (x, y) = 0 as the standard form of the equation of a plane curve, so now we shall agree to adopt f (x, y, z) = 0 as the standard form of equation of a surface. The locus represented by two equations of the form z = f (x, y) or f (x, y, z) = 0 belongs to the first class of loci, and is called a curve. Thus a straight line may be represented by two equations of the type Ax + By + Cz + D = 0. A circle in space may be regarded as the intersection of a sphere and a plane; it may therefore be represented by two equations of the forms $(x - \alpha)2 + (y - \beta)2 + (z - \gamma)2 = \rho 2$, Ax + By + Cz + D = 0. Examples XIX. 1. What is represented by three equations of the type f (x, y, z) = 0? 2. Three linear equations in general represent a single point. What are the exceptional cases? 3. What are the equations of a plane curve f (x, y) = 0 in the plane XOY , when regarded as a curve in space? [f (x, y) = 0, z = 0.] 4. Cylinders. What is the meaning of a single equation f (x, y) = 0, considered as a locus in space of three dimensions? [All points on the surface satisfy f (x, y) = 0, whatever be the value of z. The curve f (x, y) = 0, z = 0 is the curve in which the locus cuts the plane XOY . The locus is the surface formed by drawing lines parallel to OZ through all points of this curve. Such a surface is called a cylinder.] [II : 33] FUNCTIONS OF REAL VARIABLES 73 5. Graphical representation of a surface on a plane. Contour Maps. It might seem to be impossible to represent a surface adequately by a drawing on a plane; and so indeed it is: but a very fair notion of the nature of the surface may often be obtained as follows. Let the equation of the surface be z = f (x, y). If we give z a particular value a, we have an equation f (x, y) = a, which we may regard as determining a plane curve on the paper. We trace this curve and mark it (a). Actually the curve (a) is the projection on the plane XOY of the section of the surface by the plane z = a. We do this for all values of a (practically, of course, for a selection of values of a). We obtain some such figure as is shown in Fig. 17. It will at once suggest a contoured Ordnance Survey map: and in fact this is the principle on which such maps are constructed. The contour line 1000 is the projection, on the plane of the sea level, of the section of the surface of the land by the plane parallel to the plane of the sea level and 1000 ft. above it.*1000 2000 3000 4000 5000 5000 Fig. 17. 6. Draw a series of contour lines to illustrate the form of the surface 2z = 3xy. 7. Right circular cones. Take the origin of coordinates at the vertex of *We assume that the effects of the earth's curvature may be neglected. [II : 33] FUNCTIONS OF REAL VARIABLES 74 the cone and the axis of z along the axis of the cone; and let α be the semi- vertical angle of the cone. The equation of the cone (which must be regarded as extending both ways from its vertex) is $x2 + y2 - z2 \tan 2 \alpha = 0$. 8. Surfaces of revolution in general. The cone of Ex. 7 cuts ZOX in two lines whose equations may be combined in the equation $x2 = z2 \tan 2 \alpha$. That is to say, the equation of the surface generated by the revolution of the curve y = 0, $x2 = z2 \tan 2 \alpha$ round the axis of z is derived from the second of these equations by changing x2 into x2 + y2. Show generally that the equation of the surface generated by the revolution of the curve y = 0, x = f (z), round the axis of z, is px2 + y2 = f (z). 9. Cones in general. A surface formed by straight lines passing through a fixed point is called a cone: the point is called the vertex. A particular case is given by the right circular cone of Ex. 7. Show that the equation of a cone whose vertex is O is of the form f (z/x, z/y) = 0, and that any equation of this form represents a cone. [If (x, y, z) lies on the cone, so must (λx, λy, λz), for any value of λ.] 10. Ruled surfaces. Cylinders and cones are special cases of surfaces composed of straight lines. Such surfaces are called ruled surfaces. The two equations x = az + b, y = cz + d, (1) represent the intersection of two planes, i.e. a straight line. Now suppose that a, b, c, d instead of being fixed are functions of an auxiliary variable t. For any particular value of t the equations (1) give a line. As t varies, this line moves and generates a surface, whose equation may be found by eliminating t between the two equations (1). For instance, in Ex. 7 the equations of the line which generates the cone are x = z tan α cos t, y = z tan α sin t, where t is the angle between the plane XOZ and a plane through the line and the axis of z. Another simple example of a ruled surface may be constructed as follows. Take two sections of a right circular cylinder perpendicular to the axis and at a distance l apart (Fig. 18a). We can imagine the surface of the cylinder to be [II : 33] FUNCTIONS OF REAL VARIABLES 75 made up of a number of thin parallel rigid rods of length l, such as P Q, the ends of the rods being fastened to two circular rods of radius a. Now let us take a third circular rod of the same radius and place it round the surface of the cylinder at a distance h from one of the first two rods (see Fig. 18a, where P q = h). Unfasten the end Q of the rod P Q and turn P Q about P until Q can be fastened to the third circular rod in the position Q′. The angle qOQ′ = α in the figure is evidently given by $l2 - h2 = qQ'2 = 2a \sin 1\ 2\ \alpha 2$. Let all the other rods of which the cylinder was composed be treated in the same way. We obtain a ruled surface whose form is indicated in Fig. 18b. It is entirely built up of straight lines; but the surface is curved everywhere, and is in general shape not unlike certain forms of table-napkin rings (Fig. 18c).P O q Q Q′ Fig. 18a. Fig. 18b. Fig. 18c. MISCELLANEOUS EXAMPLES ON CHAPTER II. 1. Show that if y = f (x) = (ax + b)/(cx – a) then x = f (y). 2. If f (x) = f (–x) for all values of x, f (x) is called an even function. If f (x) = –f (–x), it is called an odd function. Show that any function of x,

defined for all values of x, is the sum of an even and an odd function of x. [Use the identity f (x) = 1 2 {f (x) + f (–x)} + 1 2 {f (x) – f (–x)}.] [II : 33] FUNCTIONS OF REAL VARIABLES 76 3. Draw the graphs of the functions 3 sin x + 4 cos x, sin π √2 sin x

. (Math. Trip. 1896.) 4. Draw the graphs of the functions sin x(a cos2 x + b sin2 x), sin x x (a cos2 x + b sin2 x), sin x x 2 . 5. Draw the graphs of the functions x[1/x], [x]/x. 6. Draw the graphs of the functions (i) arc cos(2x2 – 1) – 2 arc cos x, (ii) arc tan a + x 1 – ax – arc tan a – arc tan x, where the symbols arc cos a, arc tan a denote, for any value of a, the least positive (or zero) angle, whose cosine or tangent is a. 7. Verify the following method of constructing the graph of f {φ(x)} by means of the line y = x and the graphs of f (x) and φ(x): take OA = x along OX, draw AB parallel to OY to meet y = φ(x) in B, BC parallel to OX to meet y = x in C, CD parallel to OY to meet y = f (x) in D, and DP parallel to OX to meet AB in P ; then P is a point on the graph required. 8. Show that the roots of x3 + px + q = 0 are the abscissae of the points of intersection (other than the origin) of the parabola y = x2 and the circle x2 + y2 + (p – 1)y + qx = 0. 9. The roots of x4 + nx3 + px2 + qx + r = 0 are the abscissae of the points of intersection of the parabola x2 = y – 1 2 nx and the circle x2 + y2 + (1 8 n2 – 1 2 pn + 1 2 n + q)x + (p – 1 – 1 4 n2)y + r = 0. 10. Discuss the graphical solution of the equation xm + ax2 + bx + c = 0 [II : 33] FUNCTIONS OF REAL VARIABLES 77 by means of the curves y = xm, y = –ax2 – bx – c. Draw up a table of the various possible numbers of roots. 11. Solve the equation sec θ + cosec θ = 2√2; and show that the equation sec θ + cosec θ = c has two roots between 0 and 2π if c2 < 8 and four if c2 > 8. 12. Show that the equation 2x = (2n + 1)π(1 – cos x), where n is a positive integer, has 2n + 3 roots and no more, indicating their localities roughly. (Math. Trip. 1896.) 13. Show that the equation 2 3 x sin x = 1 has four roots between –π and π. 14. Discuss the number and values of the roots of the equations (1) cot x + x – 3 2 π = 0, (2) x2 + sin2 x = 1, (3) tan x = 2x/(1 + x2), (4) sin x – x + 1 6 x3 = 0, (5) (1 – cos x) tan α – x + sin x = 0. 15. The polynomial of the second degree which assumes, when x = a, b, c the values α, β, γ is α (x – b)(x – c) (a – b)(a – c) + β (x – c)(x – a) (b – c)(b – a) + γ (x – a)(x – b) (c – a)(c – b) . Give a similar formula for the polynomial of the (n – 1)th degree which assumes, when x = a1, a2, . . . an, the values α1, α2, . . . αn. 16. Find a polynomial in x of the second degree which for the values 0, 1, 2 of x takes the values 1/c, 1/(c + 1), 1/(c + 2); and show that when x = c + 2 its value is 1/(c + 1). (Math. Trip. 1911.) 17. Show that if x is a rational function of y, and y is a rational function of x, then Axy + Bx + Cy + D = 0. 18. If y is an algebraical function of x, then x is an algebraical function of y. 19. Verify that the equation cos 1 2 πx = 1 – x2 x + (x – 1) r 2 – x 3 [II : 33] FUNCTIONS OF REAL VARIABLES 78 is approximately true for all values of x between 0 and 1. [Take x = 0, 1 6 , 1 3 , 1 2 , 2 3 , 5 6 , 1, and use tables. For which of these values is the formula exact?] 20. What is the form of the graph of the functions z = [x] + [y], z = x + y – [x] – [y]? 21. What is the form of the graph of the functions z = sin x + sin y, z = sin x sin y, z = sin xy, z = sin(x2 + y2)? 22. Geometrical constructions for irrational numbers. In Chapter I we indicated one or two simple geometrical constructions for a length equal to √2, starting from a given unit length. We also showed how to construct the roots of any quadratic equation ax2 + 2bx + c = 0, it being supposed that we can construct lines whose lengths are equal to any of the ratios of the coefficients a, b, c, as is certainly the case if a, b, c are rational. All these constructions were what may be called Euclidean constructions; they depended on the ruler and compasses only. It is fairly obvious that we can construct by these methods the length mea- sured by any irrational number which is defined by any combination of square roots, however complicated. Thus 4 v u u t s 17 + 3√11 17 – 3√11 – s 17 – 3√11 17 + 3√11 is a case in point. This expression contains a fourth root, but this is of course the square root of a square root. We should begin by constructing √11, e.g. as the mean between 1 and 11: then 17 + 3√11 and 17 – 3√11, and so on. Or these two mixed surds might be constructed directly as the roots of x2 –34x+190 = 0. Conversely, only irrationals of this kind can be constructed by Euclidean methods. Starting from a unit length we can construct any rational length. And hence we can construct the line Ax + By + C = 0, provided that the ratios of A, B, C are rational, and the circle (x – α)2 + (y – β)2 = ρ2 (or x2 + y2 + 2gx + 2f y + c = 0), provided that α, β, ρ are rational, a condition which implies that g, f , c are rational. [II : 33] FUNCTIONS OF REAL VARIABLES 79 Now in any Euclidean construction each new point introduced into the figure is determined as the intersection of two lines or circles, or a line and a circle. But if the coefficients are rational, such a pair of equations as Ax + By + C = 0, x2 + y2 + 2gx + 2f y + c = 0 give, on solution, values of x and y of the form m + n√p, where m, n, p are rational: for if we substitute for x in terms of y in the second equation we obtain a quadratic in y with rational coefficients. Hence the coordinates of all points obtained by means of lines and circles with rational coefficients are expressible by rational numbers and quadratic surds. And so the same is true of the distancep(x1 – x2)2 + (y1 – y2)2 between any two points so obtained. With the irrational distances thus constructed we may proceed to construct a number of lines and circles whose coefficients may now themselves involve quadratic surds. It is evident, however, that all the lengths which we can con- struct by the use of such lines and circles are still expressible by square roots only, though our surd expressions may now be of a more complicated form. And this remains true however often our constructions are repeated. Hence Euclidean methods will construct any surd expression involving square roots only, and no others. One of the famous problems of antiquity was that of the duplication of the cube, that is to say of the construction by Euclidean methods of a length measured by 3 √2. It can be shown that 3 √2 cannot be expressed by means of any finite combination of rational numbers and square roots, and so that the problem is an impossible one. See Hobson, Squaring the Circle, pp. 47 et seq.; the first stage of

the proof, viz. the proof that 3 √2 cannot be a root of a quadratic equation ax2 + 2bx + c = 0 with rational coefficients, was given in Ch. I (Misc. Exs. 24). 23. Approximate quadrature of the circle. Let O be the centre of a circle of radius R. On the tangent at A take AP = 11 5 R and AQ = 13 5 R, in the same direction. On AO take AN = OP and draw N M parallel to OQ and cutting AP in M . Show that AM/R = 13 25 √146, and that to take AM as being equal to the circumference of the circle would lead to a value of π correct to five places of decimals. If R is the earth's radius, the error in supposing AM to be its circumference is less than 11 yards. [II : 33] FUNCTIONS OF REAL VARIABLES 80 24. Show that the only lengths which can be constructed with the ruler only, starting from a given unit length, are rational lengths. 25. Constructions for 3 √2. O is the vertex and S the focus of the parabola y2 = 4x, and P is one of its points of intersection with the parabola x2 = 2y. Show that OP meets the latus rectum of the first parabola in a point Q such that SQ = 3 √2. 26. Take a circle of unit diameter, a diameter OA and the tangent at A. Draw a chord OBC cutting the circle at B and the tangent at C. On this line take OM = BC. Taking O as origin and OA as axis of x, show that the locus of M is the curve (x2 + y2)x – y2 = 0 (the Cissoid of Diocles). Sketch the curve. Take along the axis of y a length OD = 2. Let AD cut the curve in P and OP cut the tangent to the circle at A in Q. Show that AQ = 3 √2. CHAPTER III COMPLEX NUMBERS 34. Displacements along a line and in a plane. The 'real num- ber' x, with which we have been concerned in the two preceding chapters, may be regarded from many different points of view. It may be regarded as a pure number, destitute of geometrical significance, or a geometrical significance may be attached to it in at least three different ways. It may be regarded as the measure of a length, viz. the length A0P along the line Λ of Chap. I. It may be regarded as the mark of a point, viz. the point P whose distance from A0 is x. Or it may be regarded as the measure of a displacement or change of position on the line Λ. It is on this last point of view that we shall now concentrate our attention. Imagine a small particle placed at P on the line Λ and then displaced to Q. We shall call the displacement or change of position which is needed to transfer the particle from P to Q the displacement P Q. To specify a displacement completely three things are needed, its magnitude, its sense forwards or backwards along the line, and what may be called its point of application, i.e. the original position P of the particle. But, when we are thinking merely of the change of position produced by the displacement, it is natural to disregard the point of application and to consider all dis- placements as equivalent whose lengths and senses are the same. Then the displacement is completely specified by the length P Q = x, the sense of the displacement being fixed by the sign of x. We may therefore, without ambiguity, speak of the displacement [x],* and we may write P Q = [x]. We use the square bracket to distinguish the displacement [x] from the length or number x. If the coordinate of P is a, that of Q will be a + x; *It is hardly necessary to caution the reader against confusing this use of the sym- bol [x] and that of Chap. II (Exs. xvi. and Misc. Exs.). Strictly speaking we ought, by some similar difference of notation, to distinguish the actual length x from the number x which measures it. The reader will perhaps be inclined to consider such distinctions futile and pedantic. But increasing experience of mathematics will reveal to him the great importance of distinguishing clearly between things which, however intimately connected, are not the same. If cricket were a math- 81 [III : 34] COMPLEX NUMBERS 82 the displacement [x] therefore transfers a particle from the point a to the point a + x. We come now to consider displacements in a plane. We may define the displacement P Q as before. But now more data are required in order to specify it completely. We require to know: (i) the magnitude of the displacement, i.e. the length of the straight line P Q; (ii) the direction of the displacement, which is determined by the angle which P Q makes with some fixed line in the plane; (iii) the sense of the displacement; and (iv) its point of application. Of these requirements we may disregard the fourth, if we consider two displacements as equivalent if they are the sameA P Q R S B O X Y Fig. 19. in magnitude, direction, and sense. In other words, if P Q and RS are equal and parallel, and the sense of motion from P to Q is the same as that of motion from R to S, we regard the displacements P Q and RS as equivalent, and write P Q = RS. Now let us take any pair of coordinate axes in the plane (such as OX, OY in Fig. 19). Draw a line OA equal and parallel to P Q, the sense of motion from O to A being the same as that from P to Q. Then P Q and OA are equivalent displacements. Let x and y be the coordinates ematical science, it would be very important to distinguish between the motion of the batsman between the wickets, the run which he scores, and the mark which is put down in the score-book. [III : 35] COMPLEX NUMBERS 83 of A. Then it is evident that OA is completely specified if x and y are given. We call OA the displacement [x, y] and write OA = P Q = RS = [x, y]. 35. Equivalence of displacements. Multiplication of displace- ments by numbers. If ξ and η are the coordinates of P , and ξ′ and η′ those of Q, it is evident that x = ξ′ – ξ, y = η′ – η. The displacement from (ξ, η) to (ξ′, η′) is therefore [ξ′ – ξ, η′ – η]. It is clear that two displacements [x, y], [x′, y′] are equivalent if, and only if, x = x′, y = y′. Thus [x, y] = [x′, y′] if and only if x = x′, y = y′. (1) The reverse displacement QP would be [ξ – ξ′, η – η′], and it is natural to agree that [ξ – ξ′, η – η′] = –[ξ′ – ξ, η′ – η], QP = –P Q, these equations being really definitions of the meaning of the symbols –[ξ′ – ξ, η′ – η], –P Q. Having thus agreed that –[x, y] = [–x, –y], it is natural to agree further that α[x, y] = [αx, αy], (2) [III : 36] COMPLEX NUMBERS 84 where α is any real number, positive or negative. Thus (Fig. 19) if OB = –1 2 OA then OB = –1 2 OA = –1 2 [x, y] = [–1 2 x, –1 2 y]. The equations (1) and (2) define the first two important ideas connected with displacements, viz. equivalence of displacements, and multiplication of displacements by numbers. 36. Addition of displacements. We have not yet given any defi- nition which enables us to attach any meaning to the expressions P Q + P ′Q′, [x, y]

+ [x′, y′]. Common sense at once suggests that we should define the sum of two displacements as the displacement which is the result of the successive application of the two given displacements. In other words, it suggests that if QQ1 be drawn equal and parallel to P ′Q′, so that the result of successive displacements P Q, P ′Q′ on a particle at P is to transfer it first to Q and then to Q1 then we should define the sum of P Q and P ′Q′ as being P Q1. If then we draw OA equal and parallel to P Q, and OB equal and parallel to P ′Q′, and complete the parallelogram OACB, we have P Q + P ′Q′ = P Q1 = OA + OB = OC. Let us consider the consequences of adopting this definition. If the coordinates of B are x′, y′, then those of the middle point of AB are 1 2 (x + x′), 1 2 (y + y′), and those of C are x + x′, y + y′. Hence [x, y] + [x′, y′] = [x + x′, y + y′], (3) which may be regarded as the symbolic definition of addition of displace- ments. We observe that [x′, y′] + [x, y] = [x′ + x, y′ + y] = [x + x′, y + y′] = [x, y] + [x′, y′] [III : 36] COMPLEX NUMBERS 85P Q O A B C Q1 Q2 P ′ Q′ Fig. 20. In other words, addition of displacements obeys the commutative law ex- pressed in ordinary algebra by the equation a+b = b+a. This law expresses the obvious geometrical fact that if we move from P first through a dis- tance P Q2 equal and parallel to P ′Q′, and then through a distance equal and parallel to P Q, we shall arrive at the same point Q1 as before. In particular [x, y] = [x, 0] + [0, y]. (4) Here [x, 0] denotes a displacement through a distance x in a direction par- allel to OX. It is in fact what we previously denoted by [x], when we were considering only displacements along a line. We call [x, 0] and [0, y] the components of [x, y], and [x, y] their resultant. When we have once defined addition of two displacements, there is no further difficulty in the way of defining addition of any number. Thus, by [III : 36] COMPLEX NUMBERS 86 definition, [x, y] + [x′, y′] + [x″, y″] = ([x, y] + [x′, y′]) + [x″, y″] = [x + x′, y + y′] + [x″, y″] = [x + x′ + x″, y + y′ + y″]. We define subtraction of displacements by the equation [x, y] – [x′, y′] = [x, y] + (–[x′, y′]), (5) which is the same thing as [x, y] + [–x′, –y′] or as [x – x′, y – y′]. In particular [x, y] – [x, y] = [0, 0]. The displacement [0, 0] leaves the particle where it was; it is the zero displacement, and we agree to write [0, 0] = 0. Examples XX. 1. Prove that (i) $\alpha[\beta x, \beta y] = \beta[\alpha x, \alpha y] = [\alpha\beta x, \alpha\beta y]$, (ii) ([x, y] + [x′, y′]) + [x″, y″] = [x, y] + ([x′, y′] + [x″, y″]), (iii) [x, y] + [x′, y′] = [x′, y′] + [x, y], (iv) $(\alpha + \beta)[x, y] = \alpha[x, y] + \beta[x, y]$, (v) $\alpha\{[x, y] + [x', y']\} = \alpha[x, y] + \alpha[x', y']$. [We have already proved (iii). The remaining equations follow with equal ease from the definitions. The reader should in each case consider the geometrical significance of the equation, as we did above in the case of (iii).] 2. If M is the middle point of P Q, then OM = 1 2 (OP + OQ). More generally, if M divides P Q in the ratio $\mu : \lambda$, then OM = λ $\lambda + \mu$ OP + μ $\lambda + \mu$ OQ. 3. If G is the centre of mass of equal particles at P1, P2, . . . , Pn, then OG = (OP1 + OP2 + · · · + OPn)/n. [III : 36] COMPLEX NUMBERS 87 4. If P , Q, R are collinear points in the plane, then it is possible to find real numbers α, β, γ, not all zero, and such that $\alpha \cdot OP + \beta \cdot OQ + \gamma \cdot OR = 0$; and conversely. [This is really only another way of stating Ex. 2.] 5. If AB and AC are two displacements not in the same straight line, and $\alpha \cdot AB + \beta \cdot AC = \gamma \cdot AB + \delta \cdot AC$, then $\alpha = \gamma$ and $\beta = \delta$. [Take $AB1 = \alpha \cdot AB$, $AC1 = \beta \cdot AC$. Complete the parallelogram AB1P1C1. Then $AP1 = \alpha \cdot AB + \beta \cdot AC$. It is evident that AP1 can only be expressed in this form in one way, whence the theorem follows.] 6. ABCD is a parallelogram. Through Q, a point inside the parallelogram, RQS and T QU are drawn parallel to the sides. Show that RU , T S intersect on AC.A BT D CU R S Q Fig. 21. [Let the ratios AT : AB, AR : AD be denoted by α, β. Then $AT = \alpha \cdot AB$, $AR = \beta \cdot AD$, $AU = \alpha \cdot AB + AD$, $AS = AB + \beta \cdot AD$. Let RU meet AC in P . Then, since R, U , P are collinear, AP = λ $\lambda + \mu$ AR + μ $\lambda + \mu$ AU , [III : 37] COMPLEX NUMBERS 88 where μ/λ is the ratio in which P divides RU . That is to say AP = $\alpha\mu$ $\lambda + \mu$ AB + $\beta\lambda + \mu$ $\lambda + \mu$ AD. But since P lies on AC, AP is a numerical multiple of AC; say AP = k · AC = k · AB + k · AD. Hence (Ex. 5) $\alpha\mu = \beta\lambda + \mu = (\lambda + \mu)k$, from which we deduce $k = \alpha\beta$ $\alpha + \beta - 1$. The symmetry of this result shows that a similar argument would also give AP ′ = $\alpha\beta$ $\alpha + \beta - 1$ AC, if P ′ is the point where T S meets AC. Hence P and P ′ are the same point.] 7. ABCD is a parallelogram, and M the middle point of AB. Show that DM trisects and is trisected by AC.* 37. Multiplication of displacements. So far we have made no attempt to attach any meaning whatever to the notion of the product of two displacements. The only kind of multiplication which we have considered is that in which a displacement is multiplied by a number. The expression [x, y] × [x′, y′] so far means nothing, and we are at liberty to define it to mean anything we like. It is, however, fairly clear that if any definition of such a product is to be of any use, the product of two displacements must itself be a displacement. We might, for example, define it as being equal to [x + x′, y + y′]; *The two preceding examples are taken from Willard Gibbs' Vector Analysis. [III : 37] COMPLEX NUMBERS 89 in other words, we might agree that the product of two displacements was to be always equal to their sum. But there would be two serious objections to such a definition. In the first place our definition would be futile. We should only be introducing a new method of expressing something which we can perfectly well express without it. In the second place our definition would be inconvenient and misleading for the following reasons. If α is a real number, we have already defined $\alpha[x, y]$ as $[\alpha x, \alpha y]$. Now, as we saw in § 34, the real number α may itself from one point of view be regarded as a displacement, viz. the displacement $[\alpha]$ along the axis OX, or, in our later notation, the displacement $[\alpha, 0]$. It is therefore, if not absolutely necessary, at any rate most desirable, that our definition should be such that $[\alpha, 0][x, y] = [\alpha x, \alpha y]$, and the suggested definition does not give this result. A more reasonable definition might appear to be [x, y][x′, y′] = [xx′, yy′]. But this would give $[\alpha, 0][x, y] = [\alpha x, 0]$; and so this definition also would be open to the second objection. In fact, it is by no means obvious what is the best meaning to attach to the product [x, y][x′, y′]. All that is clear is (1) that, if our definition is to be of any use, this product must itself be a displacement whose coordinates depend on x and y, or in other

words that we must have [x, y][x′, y′] = [X, Y], where X and Y are functions of x, y, x′, and y′; (2) that the definition must be such as to agree with the equation [x, 0][x′, y′] = [xx′, xy′]; [III : 38] COMPLEX NUMBERS 90 and (3) that the definition must obey the ordinary commutative, distribu- tive, and associative laws of multiplication, so that [x, y][x′, y′] = [x′, y′][x, y], ([x, y] + [x′, y′])[x″, y″] = [x, y][x″, y″] + [x′, y′][x″, y″], [x, y]([x′, y′] + [x″, y″]) = [x, y][x′, y′] + [x, y][x″, y″], and [x, y]([x′, y′][x″, y″]) = ([x, y][x′, y′])[x″, y″]. 38. The right definition to take is suggested as follows. We know that, if OAB, OCD are two similar triangles, the angles corresponding in the order in which they are written, then OB/OA = OD/OC, or OB · OC = OA · OD. This suggests that we should try to define multiplication and division of displacements in such a way that OB/OA = OD/OC, OB · OC = OA · OD. Now let OB = [x, y], OC = [x′, y′], OD = [X, Y], and suppose that A is the point (1, 0), so that OA = [1, 0]. Then OA · OD = [1, 0][X, Y] = [X, Y], and so [x, y][x′, y′] = [X, Y]. The product OB · OC is therefore to be defined as OD, D being obtained by constructing on OC a triangle similar to OAB. In order to free this [III : 38] COMPLEX NUMBERS 91O A BC D′ D Fig. 22. definition from ambiguity, it should be observed that on OC we can de- scribe two such triangles, OCD and OCD′. We choose that for which the angle COD is equal to AOB in sign as well as in magnitude. We say that the two triangles are then similar in the same sense. If the polar coordinates of B and C are (ρ, θ) and (σ, φ), so that x = ρ cos θ, y = ρ sin θ, x′ = σ cos φ, y′ = σ sin φ, then the polar coordinates of D are evidently ρσ and θ + φ. Hence X = ρσ cos(θ + φ) = xx′ – yy′, Y = ρσ sin(θ + φ) = xy′ + yx′. The required definition is therefore [x, y][x′, y′] = [xx′ – yy′, xy′ + yx′]. (6) We observe (1) that if y = 0, then X = xx′, Y = xy′, as we desired; (2) that the right-hand side is not altered if we interchange x and x′, and y and y′, so that [x, y][x′, y′] = [x′, y′][x, y]; [III : 39] COMPLEX NUMBERS 92 and (3) that {[x, y] + [x′, y′]}[x″, y″] = [x + x′, y + y′][x″, y″] = [(x + x′)x″ – (y + y′)y″, (x + x′)y″ + (y + y′)x″] = [xx″ – yy″, xy″ + yx″] + [x′x″ – y′y″, x′y″ + y′x″] = [x, y][x″, y″] + [x′, y′][x″, y″]. Similarly we can verify that all the equations at the end of § 37 are satisfied. Thus the definition (6) fulfils all the requirements which we made of it in § 37. Example. Show directly from the geometrical definition given above that multiplication of displacements obeys the commutative and distributive laws. [Take the commutative law for example. The product OB · OC is OD (Fig. 22), COD being similar to AOB. To construct the product OC · OB we should have to construct on OB a triangle BOD1 similar to AOC; and so what we want to prove is that D and D1 coincide, or that BOD is similar to AOC. This is an easy piece of elementary geometry.] 39. Complex numbers. Just as to a displacement [x] along OX correspond a point (x) and a real number x, so to a displacement [x, y] in the plane correspond a point (x, y) and a pair of real numbers x, y. We shall find it convenient to denote this pair of real numbers x, y by the symbol x + yi. The reason for the choice of this notation will appear later. For the present the reader must regard x + yi as simply another way of writing [x, y]. The expression x + yi is called a complex number. We proceed next to define equivalence, addition, and multiplication of complex numbers. To every complex number corresponds a displacement. Two complex numbers are equivalent if the corresponding displacements are equivalent. The sum or product of two complex numbers is the complex [III : 39] COMPLEX NUMBERS 93 number which corresponds to the sum or product of the two corresponding displacements. Thus x + yi = x′ + y′i, (1) if and only if x = x′, y = y′; (x + yi) + (x′ + y′i) = (x + x′) + (y + y′)i; (2) (x + yi)(x′ + y′i) = xx′ – yy′ + (xy′ + yx′)i. (3) In particular we have, as special cases of (2) and (3), x + yi = (x + 0i) + (0 + yi), (x + 0i)(x′ + y′i) = xx′ + xy′i; and these equations suggest that there will be no danger of confusion if, when dealing with complex numbers, we write x for x + 0i and yi for 0 + yi, as we shall henceforth. Positive integral powers and polynomials of complex numbers are then defined as in ordinary algebra. Thus, by putting x = x′, y = y′ in (3), we obtain (x + yi)2 = (x + yi)(x + yi) = x2 – y2 + 2xyi. The reader will easily verify for himself that addition and multiplication of complex numbers obey the laws of algebra expressed by the equations (x + yi) + (x′ + y′i) = (x′ + y′i) + (x + yi), {(x + yi) + (x′ + y′i)} + (x″ + y″i) = (x + yi) + {(x′ + y′i) + (x″ + y″i)}, (x + yi)(x′ + y′i) = (x′ + y′i)(x + yi), (x + yi){(x′ + y′i) + (x″ + y″i)} = (x + yi)(x′ + y′i) + (x + yi)(x″ + y″i), {(x + yi) + (x′ + y′i)}(x″ + y″i) = (x + yi)(x″ + y″i) + (x′ + y′i)(x″ + y″i), (x + yi){(x′ + y′i)(x″ + y″i)} = {(x + yi)(x′ + y′i)}(x″ + y″i), the proofs of these equations being practically the same as those of the corresponding equations for the corresponding displacements. [III : 40] COMPLEX NUMBERS 94 Subtraction and division of complex numbers are defined as in ordinary algebra. Thus we may define (x + yi) – (x′ + y′i) as (x + yi) + {–(x′ + y′i)} = x + yi + (–x′ – y′i) = (x – x′) + (y – y′)i; or again, as the number ξ + ηi such that (x′ + y′i) + (ξ + ηi) = x + yi, which leads to the same result. And (x + yi)/(x′ + y′i) is defined as being the complex number ξ + ηi such that (x′ + y′i)(ξ + ηi) = x + yi, or x′ξ – y′η + (x′η + y′ξ)i = x + yi, or x′ξ – y′η = x, x′η + y′ξ = y. (4) Solving these equations for ξ and η, we obtain ξ = xx′ + yy′ x′2 + y′2 , η = yx′ – xy′ x′2 + y′2 . This solution fails if x′ and y′ are both zero, i.e. if x′ + y′i = 0. Thus subtraction is always possible; division is always possible unless the divisor is zero. Examples. (1) From a geometrical point of view, the problem of the divi- sion of the displacement OB by OC is that of finding D so that the triangles COB, AOD are similar, and this is evidently possible (and the solution unique) unless C coincides with 0, or OC = 0. (2) The numbers x + yi, x – yi are said to be conjugate. Verify that (x + yi)(x – yi) = x2 + y2, so that the product of two conjugate numbers is real, and that x + yi x′ + y′i = (x + yi)(x′ – y′i) (x′ + y′i)(x′ – y′i) = xx′ + yy′ + (x′y – xy′)i x′2 + y′2 . [III : 41] COMPLEX NUMBERS 95O A B C D Fig. 23. 40. One most important property of real numbers is that known as the factor theorem, which asserts that the product of two numbers cannot be zero unless one of the two is itself zero. To prove that this is also true of complex numbers we put x = 0, y = 0 in the equations (4) of the preceding section. Then x′ξ – y′η = 0, x′η + y′ξ = 0. These

equations give ξ = 0, η = 0, i.e. ξ + ηi = 0, unless x′ = 0 and y′ = 0, or x′ + y′i = 0. Thus x + yi cannot vanish unless either x′ + y′i or ξ + ηi vanishes. 41. The equation i2 = –1. We agreed to simplify our notation by writing x instead of x + 0i and yi instead of 0 + yi. The particular complex number 1i we shall denote simply by i. It is the number which corresponds to a unit displacement along OY . Also i2 = ii = (0 + 1i)(0 + 1i) = (0 · 0 – 1 · 1) + (0 · 1 + 1 · 0)i = –1. Similarly (–i)2 = –1. Thus the complex numbers i and –i satisfy the equation x2 = –1. [III : 43] COMPLEX NUMBERS 96 The reader will now easily satisfy himself that the upshot of the rules for addition and multiplication of complex numbers is this, that we oper- ate with complex numbers in exactly the same way as with real numbers, treating the symbol i as itself a number, but replacing the product ii = i2 by –1 whenever it occurs. Thus, for example, (x + yi)(x′ + y′i) = xx′ + xy′i + yx′i + yy′i2 = (xx′ – yy′) + (xy′ + yx′)i. 42. The geometrical interpretation of multiplication by i. Since (x + yi)i = –y + xi, it follows that if x + yi corresponds to OP , and OQ is drawn equal to OP and so that P OQ is a positive right angle, then (x + yi)i corresponds to OQ. In other words, multiplication of a complex number by i turns the corresponding displacement through a right angle. We might have developed the whole theory of complex numbers from this point of view. Starting with the ideas of x as representing a displace- ment along OX, and of i as a symbol of operation equivalent to turning x through a right angle, we should have been led to regard yi as a displace- ment of magnitude y along OY . It would then have been natural to define x + yi as in §§ 37 and 40, and (x + yi)i would have represented the dis- placement obtained by turning x + yi through a right angle, i.e. –y + xi. Finally, we should naturally have defined (x+yi)x′ as xx′ +yx′i, (x+yi)y′i as –yy′ + xy′i, and (x + yi)(x′ + y′i) as the sum of these displacements, i.e. as xx′ – yy′ + (xy′ + yx′)i. 43. The equations z2 + 1 = 0, az2 + 2bz + c = 0. There is no real number z such that z2 + 1 = 0; this is expressed by saying that the equation has no real roots. But, as we have just seen, the two complex numbers i and –i satisfy this equation. We express this by saying that the equation has the two complex roots i and –i. Since i satisfies z2 = –1, it is sometimes written in the form √–1. [III : 43] COMPLEX NUMBERS 97 Complex numbers are sometimes called imaginary.* The expression is by no means a happily chosen one, but it is firmly established and has to be accepted. It cannot, however, be too strongly impressed upon the reader that an ‘imaginary number’ is no more ‘imaginary’, in any ordinary sense of the word, than a ‘real’ number; and that it is not a number at all, in the sense in which the ‘real’ numbers are numbers, but, as should be clear from the preceding discussion, a pair of numbers (x, y), united symbolically, for purposes of technical convenience, in the form x + yi. Such a pair of numbers is no less ‘real’ than any ordinary number such as 1 2 , or than the paper on which this is printed, or than the Solar System. Thus i = 0 + 1i stands for the pair of numbers (0, 1), and may be represented geometrically by a point or by the displacement [0, 1]. And when we say that i is a root of the equation z2 + 1 = 0, what we mean is simply that we have defined a method of combining such pairs of numbers (or displacements) which we call ‘multiplication’, and which, when we so combine (0, 1) with itself, gives the result (–1, 0). Now let us consider the more general equation az2 + 2bz + c = 0, where a, b, c are real numbers. If b2 > ac, the ordinary method of solution gives two real roots {–b ± √b2 – ac}/a. If b2 < ac, the equation has no real roots. It may be written in the form {z + (b/a)}2 = –(ac – b2)/a2, an equation which is evidently satisfied if we substitute for z + (b/a) either of the complex numbers ±i√ac – b2/a. We express this by saying that the equation has the two complex roots {–b ± i√ac – b2}/a. *The phrase ‘real number’ was introduced as an antithesis to ‘imaginary number’. We shall sometimes write x + iy instead of x + yi for convenience in printing. [III : 43] COMPLEX NUMBERS 98 If we agree as a matter of convention to say that when b2 = ac (in which case the equation is satisfied by one value of x only, viz. –b/a), the equation has two equal roots, we can say that a quadratic equation with real coefficients has two roots in all cases, either two distinct real roots, or two equal real roots, or two distinct complex roots. The question is naturally suggested whether a quadratic equation may not, when complex roots are once admitted, have more than two roots. It is easy to see that this is not possible. Its impossibility may in fact be proved by precisely the same chain of reasoning as is used in elementary algebra to prove that an equation of the nth degree cannot have more than n real roots. Let us denote the complex number x + yi by the single letter z, a convention which we may express by writing z = x + yi. Let f (z) denote any polynomial in z, with real or complex coefficients. Then we prove in succession: (1) that the remainder, when f (z) is divided by z – a, a being any real or complex number, is f (a); (2) that if a is a root of the equation f (z) = 0, then f (z) is divisible by z – a; (3) that if f (z) is of the nth degree, and f (z) = 0 has the n roots a1, a2, . . . , an, then f (z) = A(z – a1)(z – a2) . . . (z – an), where A is a constant, real or complex, in fact the coefficient of zn in f (z). From the last result, and the theorem of § 40, it follows that f (z) cannot have more than n roots. We conclude that a quadratic equation with real coefficients has exactly two roots. We shall see later on that a similar theorem is true for an equation of any degree and with either real or complex coefficients: an equation of the nth degree has exactly n roots. The only point in the proof which presents any difficulty is the first, viz. the proof that any equation must have at least one root. This we must postpone for the present.* We may, however, at once call attention to one very interesting result of this *See Appendix I. [III : 43] COMPLEX NUMBERS 99 theorem. In the theory of number we start from the positive integers and from the ideas of addition and multiplication and the converse operations of subtraction and division. We find that these operations are not always possible unless we admit new kinds of numbers. We can only attach a meaning to 3 – 7 if we admit negative numbers, or to 3 7 if we admit rational fractions. When we extend our list of arithmetical operations so as to include

root extraction and the solution of equations, we find that some of them, such as that of the extraction of the square root of a number which (like 2) is not a perfect square, are not possible unless we widen our conception of a number, and admit the irrational numbers of Chap. I. Others, such as the extraction of the square root of –1, are not possible unless we go still further, and admit the complex numbers of this chapter. And it would not be unnatural to suppose that, when we come to consider equations of higher degree, some might prove to be insoluble even by the aid of complex numbers, and that thus we might be led to the considerations of higher and higher types of, so to say, hyper-complex numbers. The fact that the roots of any algebraical equation whatever are ordinary complex numbers shows that this is not the case. The application of any of the ordinary algebraical operations to complex numbers will yield only complex numbers. In technical language 'the field of the complex numbers is closed for algebraical operations'. Before we pass on to other matters, let us add that all theorems of elementary algebra which are proved merely by the application of the rules of addition and multiplication are true whether the numbers which occur in them are real or complex, since the rules referred to apply to complex as well as real numbers. For example, we know that, if α and β are the roots of az2 + 2bz + c = 0, then $\alpha + \beta = -(2b/a)$, $\alpha\beta = (c/a)$. Similarly, if α, β, γ are the roots of az3 + 3bz2 + 3cz + d = 0, [III : 44] COMPLEX NUMBERS 100 then $\alpha + \beta + \gamma = -(3b/a)$, $\beta\gamma + \gamma\alpha + \alpha\beta = (3c/a)$, $\alpha\beta\gamma = -(d/a)$. All such theorems as these are true whether a, b, . . . , α, β, . . . are real or complex. 44. Argand's diagram. Let P (Fig. 24) be the point (x, y), r the length OP , and θ the angle XOP , so that x = r cos θ, y = r sin θ, r = px2 + y2, cos θ : sin θ : 1 :: x : y : r. We denote the complex number x + yi by z, as in § 43, and we call z the complex variable. We call P the point z, or the point corresponding to z;O X Y x r y θ P Fig. 24. z the argument of P , x the real part, y the imaginary part, r the modulus, and θ the amplitude of z; and we write x = R(z), y = I(z), r = |z|, θ = am z. When y = 0 we say that z is real, when x = 0 that z is purely imag- inary. Two numbers x + yi, x – yi which differ only in the signs of their [III : 45] COMPLEX NUMBERS 101 imaginary parts, we call conjugate. It will be observed that the sum 2x of two conjugate numbers and their product x2 + y2 are both real, that they have the same modulus px2 + y2 and that their product is equal to the square of the modulus of either. The roots of a quadratic with real coefficients, for example, are conjugate, when not real. It must be observed that θ or am z is a many-valued function of x and y, having an infinity of values, which are angles differing by multiples of 2π.* A line originally lying along OX will, if turned through any of these angles, come to lie along OP . We shall describe that one of these angles which lies between $-\pi$ and π as the principal value of the amplitude of z. This definition is unambiguous except when one of the values is π, in which case $-\pi$ is also a value. In this case we must make some special provision as to which value is to be regarded as the principal value. In general, when we speak of the amplitude of z we shall, unless the contrary is stated, mean the principal value of the amplitude. Fig. 24 is usually known as Argand's diagram. 45. De Moivre's Theorem. The following statements follow im- mediately from the definitions of addition and multiplication. (1) The real (or imaginary) part of the sum of two complex numbers is equal to the sum of their real (or imaginary) parts. (2) The modulus of the product of two complex numbers is equal to the product of their moduli. (3) The amplitude of the product of two complex numbers is either equal to the sum of their amplitudes, or differs from it by 2π. It should be observed that it is not always true that the principal value of am(zz′) is the sum of the principal values of am z and am z′. For example, if z = z′ = –1 + i, then the principal values of the amplitudes of z and z′ are each 3 4 π. But zz′ = –2i, and the principal value of am(zz′) is – 1 2 π and not 3 2 π. *It is evident that |z| is identical with the polar coordinate r of P , and that the other polar coordinate θ is one value of am z. This value is not necessarily the principal value, as defined below, for the polar coordinate of § 22 lies between 0 and 2π, and the principal value between $-\pi$ and π. [III : 45] COMPLEX NUMBERS 102 The two last theorems may be expressed in the equation r(cos θ + i sin θ) × ρ(cos φ + i sin φ) = rρ{cos(θ + φ) + i sin(θ + φ)}, which may be proved at once by multiplying out and using the ordinary trigonometrical formulae for cos(θ + φ) and sin(θ + φ). More generally r1(cos θ1 + i sin θ1) × r2(cos θ2 + i sin θ2) × . . . × rn(cos θn + i sin θn) = r1r2 . . . rn{cos(θ1 + θ2 + · · · + θn) + i sin(θ1 + θ2 + · · · + θn)}. A particularly interesting case is that in which r1 = r2 = · · · = rn = 1, θ1 = θ2 = · · · = θn = θ. We then obtain the equation (cos θ + i sin θ)n = cos nθ + i sin nθ, where n is any positive integer: a result known as De Moivre's Theorem.* Again, if z = r(cos θ + i sin θ) then 1/z = (cos θ – i sin θ)/r. Thus the modulus of the reciprocal of z is the reciprocal of the modulus of z, and the amplitude of the reciprocal is the negative of the amplitude of z. We can now state the theorems for quotients which correspond to (2) and (3). (4) The modulus of the quotient of two complex numbers is equal to the quotient of their moduli. (5) The amplitude of the quotient of two complex numbers either is equal to the difference of their amplitudes, or differs from it by 2π. *It will sometimes be convenient, for the sake of brevity, to denote cos θ + i sin θ by Cis θ: in this notation, suggested by Profs. Harkness and Morley, De Moivre's theo- rem is expressed by the equation (Cis θ)n = Cis nθ. [III : 45] COMPLEX NUMBERS 103 Again (cos θ + i sin θ)–n = (cos θ – i sin θ)n = {cos(–θ) + i sin(–θ)}n = cos(–nθ) + i sin(–nθ). Hence De Moivre's Theorem holds for all integral values of n, positive or negative. To the theorems (1)–(5) we may add the following theorem, which is also of very great importance. (6) The modulus of the sum of any number of complex numbers is not greater than the sum of their moduli.O P Q R S T U P ′ P ″ P ‴ P (iv) P (v) Fig. 25. Let OP , OP ′, . . . be the displacements corresponding to the various complex numbers. Draw P Q equal and parallel to OP ′, QR equal and parallel to OP ″, and so on. Finally we reach a point U , such that OU = OP + OP ′ + OP ″ + ... [III : 46] COMPLEX

NUMBERS 104 The length OU is the modulus of the sum of the complex numbers, whereas the sum of their moduli is the total length of the broken line OP QR . . . U , which is not less than OU . A purely arithmetical proof of this theorem is outlined in Exs. xxi. 1. 46. We add some theorems concerning rational functions of complex numbers. A rational function of the complex variable z is defined exactly as is a rational function of a real variable x, viz. as the quotient of two polynomials in z. Theorem 1. Any rational function R(z) can be reduced to the form X + Y i, where X and Y are rational functions of x and y with real coeffi- cients. In the first place it is evident that any polynomial P (x + yi) can be reduced, in virtue of the definitions of addition and multiplication, to the form A + Bi, where A and B are polynomials in x and y with real coeffi- cients. Similarly Q(x + yi) can be reduced to the form C + Di. Hence R(x + yi) = P (x + yi)/Q(x + yi) can be expressed in the form (A + Bi)/(C + Di) = (A + Bi)(C – Di)/(C + Di)(C – Di) = AC + BD C2 + D2 + BC – AD C2 + D2 i, which proves the theorem. Theorem 2. If R(x + yi) = X + Y i, R denoting a rational function as before, but with real coefficients, then R(x – yi) = X – Y i. In the first place this is easily verified for a power (x+yi)n by actual ex- pansion. It follows by addition that the theorem is true for any polynomial with real coefficients. Hence, in the notation used above, R(x – yi) = A – Bi C – Di = AC + BD C2 + D2 – BC – AD C2 + D2 i, [III : 46] COMPLEX NUMBERS 105 the reduction being the same as before except that the sign of i is changed throughout. It is evident that results similar to those of Theorems 1 and 2 hold for functions of any number of complex variables. Theorem 3. The roots of an equation a0zn + a1zn–1 + · · · + an = 0, whose coefficients are real, may, in so far as they are not themselves real, be arranged in conjugate pairs. For it follows from Theorem 2 that if x + yi is a root then so is x – yi. A particular case of this theorem is the result (§ 43) that the roots of a quadratic equation with real coefficients are either real or conjugate. This theorem is sometimes stated as follows: in an equation with real coefficients complex roots occur in conjugate pairs. It should be compared with the result of Exs. viii. 7, which may be stated as follows: in an equation with rational coefficients irrational roots occur in conjugate pairs.* Examples XXI. 1. Prove theorem (6) of § 45 directly from the defini- tions and without the aid of geometrical considerations. [First, to prove that |z + z′| ■ |z| + |z′| is to prove that (x + x′)2 + (y + y′)2 ■ {px2 + y2 + px′2 + y′2}2. The theorem is then easily extended to the general case.] 2. The one and only case in which |z| + |z′| + · · · = |z + z′ + . . . |, is that in which the numbers z, z′, . . . have all the same amplitude. Prove this both geometrically and analytically. 3. The modulus of the sum of any number of complex numbers is not less than the sum of their real (or imaginary) parts. 4. If the sum and product of two complex numbers are both real, then the two numbers must either be real or conjugate. *The numbers a + √b, a – √b, where a, b are rational, are sometimes said to be ‘conjugate’. [III : 46] COMPLEX NUMBERS 106 5. If a + b√2 + (c + d√2)i = A + B√2 + (C + D√2)i, where a, b, c, d, A, B, C, D are real rational numbers, then a = A, b = B, c = C, d = D. 6. Express the following numbers in the form A + Bi, where A and B are real numbers: (1 + i)2, 1 + i 1 – i 2 , 1 – i 1 + i 2 , λ + μi λ – μi , λ + μi λ – μi 2 – λ – μi λ + μi 2 , where λ and μ are real numbers. 7. Express the following functions of z = x + yi in the form X + Y i, where X and Y are real functions of x and y: z2, z3, zn, 1/z, z+(1/z), (α+βz)/(γ+δz), where α, β, γ, δ are real numbers. 8. Find the moduli of the numbers and functions in the two preceding examples. 9. The two lines joining the points z = a, z = b and z = c, z = d will be perpendicular if am a – b c – d

= ± 1 2 π, i.e. if (a – b)/(c – d) is purely imaginary. What is the condition that the lines should be parallel? 10. The three angular points of a triangle are given by z = α, z = β, z = γ, where α, β, γ are complex numbers. Establish the following propositions: (i) the centre of gravity is given by z = 1 3 (α + β + γ); (ii) the circum-centre is given by |z – α| = |z – β| = |z – γ|; (iii) the three perpendiculars from the angular points on the opposite sides meet in a point given by R z – α β – γ

= R z – β γ – α

= R z – γ α – β

= 0; (iv) there is a point P inside the triangle such that CBP = ACP = BAP = ω, [III : 46] COMPLEX NUMBERS 107 and cot ω = cot A + cot B + cot C. [To prove (iii) we observe that if A, B, C are the vertices, and P any point z, then the condition that AP should be perpendicular to BC is (Ex. 9) that (z – α)/(β – γ) should be purely imaginary, or that R(z – α) R(β – γ) + I(z – α) I(β – γ) = 0. This equation, and the two similar equations obtained by permuting α, β, γ cyclically, are satisfied by the same value of z, as appears from the fact that the sum of the three left-hand sides is zero. To prove (iv), take BC parallel to the positive direction of the axis of x. Then* γ – β = a, α – γ = –b Cis(–C), β – α = –c Cis B. We have to determine z and ω from the equations (z – α)(β0 – α0) (z0 – α0)(β – α) = (z – β)(γ0 – β0) (z0 – β0)(γ – β) = (z – γ)(α0 – γ0) (z0 – γ0)(α – γ) = Cis 2ω, where z0, α0, β0, γ0 denote the conjugates of z, α, β, γ. Adding the numerators and denominators of the three equal fractions, and using the equation i cot ω = (1 + Cis 2ω)/(1 – Cis 2ω), we find that i cot ω = (β – γ)(β0 – γ0) + (γ – α)(γ0 – α0) + (α – β)(α0 – β0) βγ0 – β0γ + γα0 – γ0α + αβ0 – α0β . From this it is easily deduced that the value of cot ω is (a2 + b2 + c2)/4Δ, where Δ is the area of the triangle; and this is equivalent to the result given. To determine z, we multiply the numerators and denominators of the equal fractions by (γ0 – β0)/(β – α), (α0 – γ0)/(γ – β), (β0 – α0)/(α – γ), and add to form a new fraction. It will be found that z = aα Cis A + bβ Cis B + cγ Cis C a Cis A + b Cis B + c Cis C .]

*We suppose that as we go round the triangle in the direction ABC we leave it on our left. [III : 46] COMPLEX NUMBERS 108 11. The two triangles whose vertices are the points a, b, c and x, y, z re- spectively will be similar if 1 1 1 a b c x y z = 0 [The condition required is that AB/AC = XY /XZ (large letters denoting the points whose arguments are the corresponding small letters), or (b – a)/(c – a) = (y – x)/(z – x), which is the same as the condition given.] 12. Deduce from the last example that if the points x, y, z are collinear then we can find real numbers α, β, γ such that $\alpha + \beta + \gamma = 0$ and $\alpha x + \beta y + \gamma z = 0$, and conversely (cf. Exs. xx. 4). [Use the fact that in this case the triangle formed by x, y, z is similar to a certain line-triangle on the axis OX, and apply the result of the last example.] 13. The general linear equation with complex coefficients. The equa- tion $\alpha z + \beta = 0$ has the one solution $z = -(\beta/\alpha)$, unless $\alpha = 0$. If we put $\alpha = a + Ai$, $\beta = b + Bi$, $z = x + yi$, and equate real and imaginary parts, we obtain two equations to determine the two real numbers x and y. The equation will have a real root if y = 0, which gives ax + b = 0, Ax + B = 0, and the condition that these equations should be consistent is aB – bA = 0. 14. The general quadratic equation with complex coefficients. This equation is (a + Ai)z2 + 2(b + Bi)z + (c + Ci) = 0. Unless a and A are both zero we can divide through by a + iA. Hence we may consider z2 + 2(b + Bi)z + (c + Ci) = 0 (1) as the standard form of our equation. Putting z = x + yi and equating real and imaginary parts, we obtain a pair of simultaneous equations for x and y, viz. x2 – y2 + 2(bx – By) + c = 0, 2xy + 2(by + Bx) + C = 0. If we put x + b = ξ, y + B = η, b2 – B2 – c = h, 2bB – C = k, [III : 46] COMPLEX NUMBERS 109 these equations become ξ2 – η2 = h, 2$\xi\eta$ = k. Squaring and adding we obtain ξ2 + η2 = ph2 + k2, ξ = ± q 1 2 {ph2 + k2 + h}, η = ± q 1 2 {ph2 + k2 – h}. We must choose the signs so that $\xi\eta$ has the sign of k: i.e. if k is positive we must take like signs, if k is negative unlike signs. Conditions for equal roots. The two roots can only be equal if both the square roots above vanish, i.e. if h = 0, k = 0, or if c = b2 – B2, C = 2bB. These conditions are equivalent to the single condition c + Ci = (b + Bi)2, which obviously expresses the fact that the left-hand side of (1) is a perfect square. Condition for a real root. If x2 +2(b+Bi)x+(c+Ci) = 0, where x is real, then x2 + 2bx + c = 0, 2Bx + C = 0. Eliminating x we find that the required condition is C2 – 4bBC + 4cB2 = 0. Condition for a purely imaginary root. This is easily found to be C2 – 4bBC – 4b2c = 0. Conditions for a pair of conjugate complex roots. Since the sum and the product of two conjugate complex numbers are both real, b + Bi and c + Ci must both be real, i.e. B = 0, C = 0. Thus the equation (1) can have a pair of conjugate complex roots only if its coefficients are real. The reader should verify this conclusion by means of the explicit expressions of the roots. Moreover, if b2 ■ c, the roots will be real even in this case. Hence for a pair of conjugate roots we must have B = 0, C = 0, b2 < c. 15. The Cubic equation. Consider the cubic equation z3 + 3Hz + G = 0, where G and H are complex numbers, it being given that the equation has (a) a real root, (b) a purely imaginary root, (c) a pair of conjugate roots. If H = λ + μi, G = ρ + σi, we arrive at the following conclusions. [III : 46] COMPLEX NUMBERS 110 (a) Conditions for a real root. If μ is not zero, then the real root is $-\sigma/3\mu$, and σ3 + 27$\lambda\mu$2σ – 27μ3ρ = 0. On the other hand, if μ = 0 then we must also have σ = 0, so that the coefficients of the equation are real. In this case there may be three real roots. (b) Conditions for a purely imaginary root. If μ is not zero then the purely imaginary root is (ρ/3μ)i, and ρ3 – 27$\lambda\mu$2ρ – 27μ3σ = 0. If μ = 0 then also ρ = 0, and the root is yi, where y is given by the equation y3 – 3λy – σ = 0, which has real coefficients. In this case there may be three purely imaginary roots. (c) Conditions for a pair of conjugate complex roots. Let these be x+yi and x – yi. Then since the sum of the three roots is zero the third root must be –2x. From the relations between the coefficients and the roots of an equation we deduce y2 – 3x2 = 3H, 2x(x2 + y2) = G. Hence G and H must both be real. In each case we can either find a root (in which case the equation can be reduced to a quadratic by dividing by a known factor) or we can reduce the solution of the equation to the solution of a cubic equation with real coefficients. 16. The cubic equation x3 +a1x2 +a2x+a3 = 0, where a1 = A1 +A′ 1i, . . . , has a pair of conjugate complex roots. Prove that the remaining root is –A′ 1a3/A′ 3, unless A′ 3 = 0. Examine the case in which A′ 3 = 0. 17. Prove that if z3 + 3Hz + G = 0 has two complex roots then the equation 8α3 + 6αH – G = 0 has one real root which is the real part α of the complex roots of the original equation; and show that α has the same sign as G. 18. An equation of any order with complex coefficients will in general have no real roots nor pairs of conjugate complex roots. How many conditions must be satisfied by the coefficients in order that the equation should have (a) a real root, (b) a pair of conjugate roots? [III : 46] COMPLEX NUMBERS 111 19. Coaxal circles. In Fig. 26, let a, b, z be the arguments of A, B, P . Then am z – b z – a = AP B, if the principal value of the amplitude is chosen. If the two circles shown in the figure are equal, and z′, z1, z′ 1 are the arguments of P ′, P1, P ′ 1, and AP B = θ, it is easy to see that am z′ – b z′ – a = $\pi - \theta$, am z1 – b z1 – a = $-\theta$, and am z′ 1 – b z′ 1 – a = $-\pi + \theta$. The locus defined by the equation am z – b z – a = θ, where θ is constant, is the arc AP B. By writing $\pi - \theta$, $-\theta$, $-\pi + \theta$ for θ, we obtain the other three arcs shown. The system of equations obtained by supposing that θ is a parameter, varying from $-\pi$ to $+\pi$, represents the system of circles which can be drawn through the points A, B. It should however be observed that each circle has to be divided into two parts to which correspond different values of θ. 20. Now let us consider the equation z – b z – a = λ, (1) where λ is a constant. Let K be the point in which the tangent to the circle ABP at P meets AB. Then the triangles KP A, KBP are similar, and so AP/P B = P K/BK = KA/KP = λ. Hence KA/KB = λ2, and therefore K is a fixed point for all positions of P which satisfy the equation (1). Also KP 2 = KA · KB, and so is constant. Hence the locus of P is a circle whose centre is K. [III : 46] COMPLEX NUMBERS 112A B P P1 P ′ P ′ 1 Fig. 26. The system of equations obtained by

varying λ represents a system of circles, and every circle of this system cuts at right angles every circle of the system of Ex. 19. The system of Ex. 19 is called a system of coaxal circles of the common point kind. The system of Ex. 20 is called a system of coaxal circles of the limiting point kind, A and B being the limiting points of the system. If λ is very large or very small then the circle is a very small circle containing A or B in its interior. 21. Bilinear Transformations. Consider the equation z = Z + a, (1) where z = x + yi and Z = X + Y i are two complex variables which we may sup- pose to be represented in two planes xoy, XOY . To every value of z corresponds [III : 46] COMPLEX NUMBERS 113 one of Z, and conversely. If a = α + βi then x = X + α, y = Y + β, and to the point (x, y) corresponds the point (X, Y). If (x, y) describes a curve of any kind in its plane, (X, Y) describes a curve in its plane. Thus to any figure in one plane corresponds a figure in the other. A passage of this kind from a figure in the plane xoy to a figure in the plane XOY by means of a relation such as (1) between z and Z is called a transformation. In this particular case the relation between corresponding figures is very easily defined. The (X, Y) figure is the same in size, shape, and orientation as the (x, y) figure, but is shifted a distance α to the left, and a distance β downwards. Such a transformation is called a translation. Now consider the equation z = ρZ, (2) where ρ is real. This gives x = ρX, y = ρY . The two figures are similar and similarly situated about their respective origins, but the scale of the (x, y) figure is ρ times that of the (X, Y) figure. Such a transformation is called a magnification. Finally consider the equation z = (cos φ + i sin φ)Z. (3) It is clear that |z| = |Z| and that one value of am z is am Z + φ, and that the two figures differ only in that the (x, y) figure is the (X, Y) figure turned about the origin through an angle φ in the positive direction. Such a transformation is called a rotation. The general linear transformation z = aZ + b (4) is a combination of the three transformations (1), (2), (3). For, if |a| = ρ and am a = φ, we can replace (4) by the three equations z = z′ + b, z′ = ρZ′, Z′ = (cos φ + i sin φ)Z. Thus the general linear transformation is equivalent to the combination of a translation, a magnification, and a rotation. [III : 46] COMPLEX NUMBERS 114 Next let us consider the transformation z = 1/Z. (5) If |Z| = R and am Z = Θ, then |z| = 1/R and am z = –Θ, and to pass from the (x, y) figure to the (X, Y) figure we invert the former with respect to o, with unit radius of inversion, and then construct the image of the new figure in the axis ox (i.e. the symmetrical figure on the other side of ox). Finally consider the transformation z = aZ + b cZ + d . (6) This is equivalent to the combination of the transformations z = (a/c) + (bc – ad)(z′/c), z′ = 1/Z′, Z′ = cZ + d, i.e. to a certain combination of transformations of the types already considered. The transformation (6) is called the general bilinear transformation. Solving for Z we obtain Z = dz – b cz – a . The general bilinear transformation is the most general type of transforma- tion for which one and only one value of z corresponds to each value of Z, and conversely. 22. The general bilinear transformation transforms circles into circles. This may be proved in a variety of ways. We may assume the well-known theorem in pure geometry, that inversion transforms circles into circles (which may of course in particular cases be straight lines). Or we may use the results of Exs. 19 and 20. If, e.g., the (x, y) circle is |(z – σ)/(z – ρ)| = λ, and we substitute for z in terms of Z, we obtain |(Z – σ′)/(Z – ρ′)| = λ′, where σ′ = – b – σd a – σc , ρ′ = – b – ρd a – ρc , λ′ = a – ρc a – σc λ. [III : 46] COMPLEX NUMBERS 115 23. Consider the transformations z = 1/Z, z = (1 + Z)/(1 – Z), and draw the (X, Y) curves which correspond to (1) circles whose centre is the origin, (2) straight lines through the origin. 24. The condition that the transformation z = (aZ + b)/(cZ + d) should make the circle x2 + y2 = 1 correspond to a straight line in the (X, Y) plane is |a| = |c|. 25. Cross ratios. The cross ratio (z1, z2; z3, z4) is defined to be (z1 – z3)(z2 – z4) (z1 – z4)(z2 – z3) . If the four points z1, z2, z3, z4 are on the same line, this definition agrees with that adopted in elementary geometry. There are 24 cross ratios which can be formed from z1, z2, z3, z4 by permuting the suffixes. These consist of six groups of four equal cross ratios. If one ratio is λ, then the six distinct cross ratios are λ, 1 – λ, 1/λ, 1/(1 – λ), (λ – 1)/λ, λ/(λ – 1). The four points are said to be harmonic or harmonically related if any one of these is equal to –1. In this case the six ratios are –1, 2, –1, 1 2 , 2, 1 2 . If any cross ratio is real then all are real and the four points lie on a circle. For in this case am (z1 – z3)(z2 – z4) (z1 – z4)(z2 – z3) must have one of the three values –π, 0, π, so that am{(z1 – z3)/(z1 – z4)} and am{(z2 – z3)/(z2 – z4)} must either be equal or differ by π (cf. Ex. 19). If (z1, z2; z3, z4) = –1, we have the two equations am z1 – z3 z1 – z4 = ±π + am z2 – z3 z2 – z4 , z1 – z3 z1 – z4 = z2 – z3 z2 – z4 . The four points A1, A2, A3, A4 lie on a circle, A1 and A2 being separated by A3 and A4. Also A1A3/A1A4 = A2A3/A2A4. Let O be the middle point of A3A4. The equation (z1 – z3)(z2 – z4) (z1 – z4)(z2 – z3) = –1 may be put in the form (z1 + z2)(z3 + z4) = 2(z1z2 + z3z4), [III : 46] COMPLEX NUMBERS 116 or, what is the same thing, {z1 – 1 2 (z3 + z4)}{z2 – 1 2 (z3 + z4)} = { 1 2 (z3 – z4)}2. But this is equivalent to OA1 ·OA2 = OA3 2 = OA4 2. Hence OA1 and OA2 make equal angles with A3A4, and OA1 · OA2 = OA2 3 = OA2 4. It will be observed that the relation between the pairs A1, A2 and A3, A4 is symmetrical. Hence, if O′ is the middle point of A1A2, O′A3 and O′A4 are equally inclined to A1A2, and O′A3 · O′A4 = O′A2 1 = O′A2 2. 26. If the points A1, A2 are given by az2 +2bz +c = 0, and the points A3, A4 by a′z2 +2b′z +c′ = 0, and O is the middle point of A3A4, and ac′ +a′c–2bb′ = 0, then OA1, OA2 are equally inclined to A3A4 and OA1 · OA2 = OA2 3 = OA2 4. (Math. Trip. 1901.) 27. AB, CD are two intersecting lines in Argand's diagram, and P , Q their middle points. Prove that, if AB bisects the angle CP D and P A2 = P B2 = P C · P D, then CD bisects the angle AQB and QC2 = QD2 = QA · QB. (Math. Trip. 1909.) 28. The condition that four points should lie on a circle. A sufficient condition is that one (and therefore all) of the cross ratios should be real (Ex. 25); this condition is also necessary. Another form of the condition is that it

should be possible to choose real numbers α, β, γ such that 1 1 1 α β γ z1z4 + z2z3 z2z4 + z3z1 z3z4 + z1z2 = 0. [To prove this we observe that the transformation Z = 1/(z – z4) is equivalent to an inversion with respect to the point z4, coupled with a certain reflexion (Ex. 21). If z1, z2, z3 lie on a circle through z4, the corresponding points Z1 = 1/(z1 – z4), Z2 = 1/(z2 – z4), Z3 = 1/(z3 – z4) lie on a straight line. Hence (Ex. 12) we can find real numbers α′, β′, γ′ such that α′ + β′ + γ′ = 0 and α′/(z1 – z4) + β′/(z2 – z4) + γ′/(z3 – z4) = 0, and it is easy to prove that this is equivalent to the given condition.] 29. Prove the following analogue of De Moivre's Theorem for real numbers: if φ1, φ2, φ3, . . . is a series of positive acute angles such that tan φm+1 = tan φm sec φ1 + sec φm tan φ1, [III : 46] COMPLEX NUMBERS 117 then tan φm+n = tan φm sec φn + sec φm tan φn, sec φm+n = sec φm sec φn + tan φm tan φn, and tan φm + sec φm = (tan φ1 + sec φ1)m. [Use the method of mathematical induction.] 30. The transformation z = Zm. In this case r = Rm, and θ and mΘ differ by a multiple of 2π. If Z describes a circle round the origin then z describes a circle round the origin m times. The whole (x, y) plane corresponds to any one of m sectors in the (X, Y) plane, each of angle 2π/m. To each point in the (x, y) plane correspond m points in the (X, Y) plane. 31. Complex functions of a real variable. If f (t), φ(t) are two real functions of a real variable t defined for a certain range of values of t, we call z = f (t) + iφ(t) (1) a complex function of t. We can represent it graphically by drawing the curve x = f (t), y = φ(t); the equation of the curve may be obtained by eliminating t between these equa- tions. If z is a polynomial in t, or rational function of t, with complex coefficients, we can express it in the form (1) and so determine the curve represented by the function. (i) Let z = a + (b – a)t, where a and b are complex numbers. If a = α + α′i, b = β + β′i, then x = α + (β – α)t, y = α′ + (β′ – α′)t. The curve is the straight line joining the points z = a and z = b. The segment between the points corresponds to the range of values of t from 0 to 1. Find the values of t which correspond to the two produced segments of the line. [III : 48] COMPLEX NUMBERS 118 (ii) If z = c + ρ 1 + ti 1 – ti

, where ρ is positive, then the curve is the circle of centre c and radius ρ. As t varies through all real values z describes the circle once. (iii) In general the equation z = (a + bt)/(c + dt) represents a circle. This can be proved by calculating x and y and eliminating: but this process is rather cumbrous. A simpler method is obtained by using the result of Ex. 22. Let z = (a + bZ)/(c + dZ), Z = t. As t varies Z describes a straight line, viz. the axis of X. Hence z describes a circle. (iv) The equation z = a + 2bt + ct2 represents a parabola generally, a straight line if b/c is real. (v) The equation z = (a + 2bt + ct2)/(α + 2βt + γt2), where α, β, γ are real, represents a conic section. [Eliminate t from x = (A + 2Bt + Ct2)/(α + 2βt + γt2), y = (A′ + 2B′t + C′t2)/(α + 2βt + γt2), where A + A′i = a, B + B′i = b, C + C′i = c.] 47. Roots of complex numbers. We have not, up to the present, attributed any meaning to symbols such as n √a, am/n, when a is a complex number, and m and n integers. It is, however, natural to adopt the def- initions which are given in elementary algebra for real values of a. Thus we define n √a or a1/n, where n is a positive integer, as a number z which satisfies the equation zn = a; and am/n, where m is an integer, as (a1/n)m. These definitions do not prejudge the question as to whether there are or are not more than one (or any) roots of the equation. 48. Solution of the equation zn = a. Let a = ρ(cos φ + i sin φ), [III : 48] COMPLEX NUMBERS 119 where ρ is positive and φ is an angle such that –π < φ ■ π. If we put z = r(cos θ + i sin θ), the equation takes the form rn(cos nθ + i sin nθ) = ρ(cos φ + i sin φ); so that rn = ρ, cos nθ = cos φ, sin nθ = sin φ. (1) The only possible value of r is n √ρ, the ordinary arithmetical nth root of ρ; and in order that the last two equations should be satisfied it is necessary and sufficient that nθ = φ + 2kπ, where k is an integer, or θ = (φ + 2kπ)/n. If k = pn + q, where p and q are integers, and 0 ■ q < n, the value of θ is 2pπ + (φ + 2qπ)/n, and in this the value of p is a matter of indifference. Hence the equation zn = a = ρ(cos φ + i sin φ) has n roots and n only, given by z = r(cos θ + i sin θ), where r = n √ρ, θ = (φ + 2qπ)/n, (q = 0, 1, 2, . . . , n – 1). That these n roots are in reality all distinct is easily seen by plotting them on Argand's diagram. The particular root n √ρ{cos(φ/n) + i sin(φ/n)} is called the principal value of n √a. The case in which a = 1, ρ = 1, φ = 0 is of particular interest. The n roots of the equation xn = 1 are cos(2qπ/n) + i sin(2qπ/n), (q = 0, 1, . . . , n – 1). These numbers are called the nth roots of unity; the principal value is unity itself. If we write ωn for cos(2π/n) + i sin(2π/n), we see that the nth roots of unity are 1, ωn, ω2 n, . . . , ωn–1 n . [III : 48] COMPLEX NUMBERS 120 Examples XXII. 1. The two square roots of 1 are 1, –1; the three cube roots are 1, 1 2 (–1 + i√3), 1 2 (–1 – i√3); the four fourth roots are 1, i, –1, –i; and the five fifth roots are 1, 1 4 h √5 – 1 + i q 10 + 2√5 i , 1 4 h –√5 – 1 + i q 10 – 2√5 i , 1 4 h –√5 – 1 – i q 10 – 2√5 i , 1 4 h √5 – 1 – i q 10 + 2√5 i . 2. Prove that 1 + ωn + ω2 n + · · · + ωn–1 n = 0. 3. Prove that (x + yω3 + zω2 3)(x + yω2 3 + zω3) = x2 + y2 + z2 – yz – zx – xy. 4. The nth roots of a are the products of the nth roots of unity by the principal value of n √a. 5. It follows from Exs. xxi. 14 that the roots of z2 = α + βi are ± q 1 2 {pα2 + β2 + α} ± i q 1 2 {pα2 + β2 – α}, like or unlike signs being chosen according as β is positive or negative. Show that this result agrees with the result of § 48. 6. Show that (x2m – a2m)/(x2 – a2) is equal to

x2 – 2ax cos π m + a2 x2 – 2ax cos 2π m + a2 . . .

x2 – 2ax cos (m – 1)π m + a2 . [The factors of x2m – a2m are (x – a), (x – aω2m), (x – aω2 2m), . . . (x – aω2m–1 2m). The factor x – aωm 2m is x + a. The factors (x – aωs 2m), (x – aω2m–s 2m) taken together give a factor x2 – 2ax cos(sπ/m) + a2.] 7. Resolve x2m+1 – a2m+1, x2m + a2m, and x2m+1 + a2m+1 into factors in a similar way. [III : 49] COMPLEX NUMBERS 121 8. Show that

x2n – 2xnan cos θ + a2n is equal to

x2 – 2xa cos θ n + a2

x2 – 2xa cos θ + 2π n + a2

. . . . . .

x2 – 2xa cos θ + 2(n – 1)π n + a2

. [Use the formula x2n – 2xnan cos θ + a2n = {xn – an(cos θ + i sin θ)}{xn – an(cos θ – i sin θ)}, and split up each of the last two expressions into n factors.] 9. Find all the roots of the equation x6 – 2x3 + 2 = 0. (Math. Trip. 1910.) 10. The problem of finding the accurate value of ωn in a numerical form involving square roots only, as in the formula ω3 = 1 2 (–1+i√3), is the algebraical equivalent of the geometrical problem of inscribing a regular polygon of n sides in a circle of unit radius by Euclidean methods, i.e. by ruler and compasses. For this construction will be possible if and only if we can construct lengths measured by cos(2π/n) and sin(2π/n); and this is possible (Ch. II, Misc. Exs. 22) if and only if these numbers are expressible in a form involving square roots only. Euclid gives constructions for n = 3, 4, 5, 6, 8, 10, 12, and 15. It is evident that the construction is possible for any value of n which can be found from these by multiplication by any power of 2. There are other special values of n for which such constructions are possible, the most interesting being n = 17. 49. The general form of De Moivre's Theorem. It follows from the results of the last section that if q is a positive integer then one of the values of (cos θ + i sin θ)1/q is cos(θ/q) + i sin(θ/q). Raising each of these expressions to the power p (where p is any integer positive or negative), we obtain the theorem that one of the values of (cos θ + i sin θ)p/q is cos(pθ/q) + i sin(pθ/q), or that if α is any rational number then one of the values of (cos θ + i sin θ)α is cos αθ + i sin αθ. This is a generalised form of De Moivre's Theorem (§ 45). [III : 49] COMPLEX NUMBERS 122 MISCELLANEOUS EXAMPLES ON CHAPTER III. 1. The condition that a triangle (xyz) should be equilateral is that x2 + y2 + z2 – yz – zx – xy = 0. [Let XY Z be the triangle. The displacement ZX is Y Z turned through an angle 2 3 π in the positive or negative direction. Since Cis 2 3 π = ω3, Cis(– 2 3 π) = 1/ω3 = ω2 3 , we have x – z = (z – y)ω3 or x – z = (z – y)ω2 3 . Hence x + yω3 + zω2 3 = 0 or x + yω2 3 + zω3 = 0. The result follows from Exs. xxii. 3.] 2. If XY Z, X′Y ′Z′ are two triangles, and Y Z · Y ′Z′ = ZX · Z′X′ = XY · X′Y ′, then both triangles are equilateral. [From the equations (y – z)(y′ – z′) = (z – x)(z′ – x′) = (x – y)(x′ – y′) = κ2, say, we deduce P 1/(y′ – z′) = 0, or P x′2 – P y′z′ = 0. Now apply the result of the last example.] 3. Similar triangles BCX, CAY , ABZ are described on the sides of a triangle ABC. Show that the centres of gravity of ABC, XY Z are coincident. [We have (x – c)/(b – c) = (y – a)/(c – a) = (z – b)/(a – b) = λ, say. Express 1 3 (x + y + z) in terms of a, b, c.] 4. If X, Y , Z are points on the sides of the triangle ABC, such that BX/XC = CY /Y A = AZ/ZB = r, and if ABC, XY Z are similar, then either r = 1 or both triangles are equilateral. 5. If A, B, C, D are four points in a plane, then AD · BC ■ BD · CA + CD · AB. [Let z1, z2, z3, z4 be the complex numbers corresponding to A, B, C, D. Then we have identically (x1 – x4)(x2 – x3) + (x2 – x4)(x3 – x1) + (x3 – x4)(x1 – x2) = 0. [III : 49] COMPLEX NUMBERS 123 Hence |(x1 – x4)(x2 – x3)| = |(x2 – x4)(x3 – x1) + (x3 – x4)(x1 – x2)| ■ |(x2 – x4)(x3 – x1)| + |(x3 – x4)(x1 – x2)|.] 6. Deduce Ptolemy's Theorem concerning cyclic quadrilaterals from the fact that the cross ratios of four concyclic points are real. [Use the same identity as in the last example.] 7. If z2 +z′2 = 1, then the points z, z′ are ends of conjugate diameters of an ellipse whose foci are the points 1, –1. [If CP , CD are conjugate semi-diameters of an ellipse and S, H its foci, then CD is parallel to the external bisector of the angle SP H, and SP · HP = CD2.] 8. Prove that |a + b|2 + |a – b|2 = 2{|a|2 + |b|2}. [This is the analytical equivalent of the geometrical theorem that, if M is the middle point of P Q, then OP 2 + OQ2 = 2OM 2 + 2M P 2.] 9. Deduce from Ex. 8 that |a + pa2 – b2| + |a – pa2 – b2| = |a + b| + |a – b|. [If a + √a2 – b2 = z1, a – √a2 – b2 = z2, we have |z1|2 + |z2|2 = 1 2 |z1 + z2|2 + 1 2 |z1 – z2|2 = 2|a|2 + 2|a2 – b2|, and so (|z1| + |z2|)2 = 2{|a|2 + |a2 – b2| + |b|2} = |a + b|2 + |a – b|2 + 2|a2 – b2|. Another way of stating the result is: if z1 and z2 are the roots of αz2 + 2βz + γ = 0, then |z1| + |z2| = (1/|α|){(| – β + √αγ|) + (| – β – √αγ|)}.] 10. Show that the necessary and sufficient conditions that both the roots of the equation z2 + az + b = 0 should be of unit modulus are |a| ■ 2, |b| = 1, am b = 2 am a. [The amplitudes have not necessarily their principal values.] [III : 49] COMPLEX NUMBERS 124 11. If x4 + 4a1x3 + 6a2x2 + 4a3x + a4 = 0 is an equation with real coefficients and has two real and two complex roots, concyclic in the Argand diagram, then a2 3 + a2 1a4 + a3 2 – a2a4 – 2a1a2a3 = 0. 12. The four roots of a0x4+4a1x3+6a2x2+4a3x+a4 = 0 will be harmonically related if a0a2 3 + a2 1a4 + a3 2 – a0a2a4 – 2a1a2a3 = 0. [Express Z23,14Z31,24Z12,34, where Z23,14 = (z1 –z2)(z3 –z4)+(z1 –z3)(z2 –z4) and z1, z2, z3, z4 are the roots of the equation, in terms of the coefficients.] 13. Imaginary points and straight lines. Let ax + by + c = 0 be an equation with complex coefficients (which of course may be real in special cases). If we give x any particular real or complex value, we can find the correspond- ing value of y. The aggregate of pairs of real or complex values of x and y which satisfy the equation is called an imaginary straight line; the pairs of values are called imaginary points, and are said to lie on the line. The values of x and y are called the coordinates of the point (x, y). When x and y are real, the point is called a real point: when a, b, c are all real (or can be made all real by division by a common factor), the line is called a real line. The points x = α + βi, y = γ + δi and x = α – βi, y = γ –

δi are said to be conjugate; and so are the lines (A + A′i)x + (B + B′i)y + C + C′i = 0, (A – A′i)x + (B – B′i)y + C – C′i = 0. Verify the following assertions:—every real line contains infinitely many pairs of conjugate imaginary points; an imaginary line in general contains one and only one real point; an imaginary line cannot contain a pair of conjugate imaginary points:—and find the conditions (a) that the line joining two given imaginary points should be real, and (b) that the point of intersection of two imaginary lines should be real. 14. Prove the identities (x + y + z)(x + yω3 + zω2 3)(x + yω2 3 + zω3) = x3 + y3 + z3 – 3xyz, (x + y + z)(x + yω5 + zω4 5)(x + yω2 5 + zω3 5)(x + yω3 5 + zω2 5)(x + yω4 5 + zω5) = x5 + y5 + z5 – 5x3yz + 5xy2z2. [III : 49] COMPLEX NUMBERS 125 15. Solve the equations x3 – 3ax + (a3 + 1) = 0, x5 – 5ax3 + 5a2x + (a5 + 1) = 0. 16. If f (x) = a0 + a1x + · · · + akxk, then {f (x) + f (ωx) + · · · + f (ωn–1x)}/n = a0 + anxn + a2nx2n + · · · + aλnxλn, ω being any root of xn = 1 (except x = 1), and λn the greatest multiple of n contained in k. Find a similar formula for aμ + aμ+nxn + aμ+2nx2n + ... 17. If (1 + x)n = p0 + p1x + p2x2 + . . . , n being a positive integer, then p0 – p2 + p4 – · · · = 2 1 2 n cos 1 4 nπ, p1 – p3 + p5 – · · · = 2 1 2 n sin 1 4 nπ. 18. Sum the series x 2!(n – 2)! + x2 5!(n – 5)! + x3 8!(n – 8)! + · · · + xn/3 (n – 1)! , n being a multiple of 3. (Math. Trip. 1899.) 19. If t is a complex number such that |t| = 1, then the point x = (at + b)/(t – c) describes a circle as t varies, unless |c| = 1, when it describes a straight line. 20. If t varies as in the last example then the point x = 1 2 {at + (b/t)} in general describes an ellipse whose foci are given by x2 = ab, and whose axes are |a| + |b| and |a| – |b|. But if |a| = |b| then x describes the finite straight line joining the points –√ab, √ab. 21. Prove that if t is real and z = t2 – 1 + √t4 – t2, then, when t2 < 1, z is represented by a point which lies on the circle x2 + y2 + x = 0. Assuming that, when t2 > 1, √t4 – t2 denotes the positive square root of t4 – t2, discuss the motion of the point which represents z, as t diminishes from a large positive value to a large negative value. (Math. Trip. 1912.) 22. The coefficients of the transformation z = (aZ + b)/(cZ + d) are subject to the condition ad – bc = 1. Show that, if c■ = 0, there are two fixed points α, β, i.e. points unaltered by the transformation, except when (a + d)2 = 4, when [III : 49] COMPLEX NUMBERS 126 there is only one fixed point α; and that in these two cases the transformation may be expressed in the forms z – α z – β = K Z – α Z – β , 1 z – α = 1 Z – α + K. Show further that, if c = 0, there will be one fixed point α unless a = d, and that in these two cases the transformation may be expressed in the forms z – α = K(Z – α), z = Z + K. Finally, if a, b, c, d are further restricted to positive integral values (including zero), show that the only transformations with less than two fixed points are of the forms (1/z) = (1/Z) + K, z = Z + K. (Math. Trip. 1911.) 23. Prove that the relation z = (1 + Zi)/(Z + i) transforms the part of the axis of x between the points z = 1 and z = –1 into a semicircle passing through the points Z = 1 and Z = –1. Find all the figures that can be obtained from the originally selected part of the axis of x by successive applications of the transformation. (Math. Trip. 1912.) 24. If z = 2Z + Z2 then the circle |Z| = 1 corresponds to a cardioid in the plane of z. 25. Discuss the transformation z = 1 2 {Z +(1/Z)}, showing in particular that to the circles X2 + Y 2 = α2 correspond the confocal ellipses x2 1 2

α + 1 α 2 + y2 1 2

α – 1 α 2 = 1. 26. If (z + 1)2 = 4/Z then the unit circle in the z-plane corresponds to the parabola R cos2 1 2 Θ = 1 in the Z-plane, and the inside of the circle to the outside of the parabola. 27. Show that, by means of the transformation z = {(Z – ci)/(Z + ci)}2, the upper half of the z-plane may be made to correspond to the interior of a certain semicircle in the Z-plane. 28. If z = Z2 –1, then as z describes the circle |z| = κ, the two corresponding positions of Z each describe the Cassinian oval ρ1ρ2 = κ, where ρ1, ρ2 are the distances of Z from the points –1, 1. Trace the ovals for different values of κ. [III : 49] COMPLEX NUMBERS 127 29. Consider the relation az2 + 2hzZ + bZ2 + 2gz + 2f Z + c = 0. Show that there are two values of Z for which the corresponding values of z are equal, and vice versa. We call these the branch points in the Z and z-planes respectively. Show that, if z describes an ellipse whose foci are the branch points, then so does Z. [We can, without loss of generality, take the given relation in the form z2 + 2zZ cos ω + Z2 = 1 : the reader should satisfy himself that this is the case. The branch points in either plane are cosec ω and – cosec ω. An ellipse of the form specified is given by |z + cosec ω| + |z – cosec ω| = C, where C is a constant. This is equivalent (Ex. 9) to |z + pz2 – cosec2 ω| + |z – pz2 – cosec2 ω| = C. Express this in terms of Z.] 30. If z = aZm + bZn, where m, n are positive integers and a, b real, then as Z describes the unit circle, z describes a hypo- or epi-cycloid. 31. Show that the transformation z = (a + di)Z0 + b cZ0 – (a – di) , where a, b, c, d are real and a2 + d2 + bc > 0, and Z0 denotes the conjugate of Z, is equivalent to an inversion with respect to the circle c(x2 + y2) – 2ax – 2dy – b = 0. What is the geometrical interpretation of the transformation when a2 + d2 + bc < 0? 32. The transformation 1 – z 1 + z = 1 – Z 1 + Z c , where c is rational and 0 < c < 1, transforms the circle |z| = 1 into the boundary of a circular lune of angle π/c. CHAPTER IV LIMITS OF FUNCTIONS OF A POSITIVE INTEGRAL VARIABLE 50. Functions of a positive integral variable. In Chapter II we discussed the notion of a function of a real variable x, and illustrated the discussion by a large number of examples of such functions. And the reader will remember that there was one important particular with regard to which the functions which we took as illustrations differed very widely. Some were defined for all values of x, some for rational values only, some for integral values only, and so on. Consider, for example, the following functions: (i) x, (ii) √x, (iii) the de- nominator of x, (iv) the square root of the product of the numerator and the denominator of x, (v) the largest prime factor of x,

(vi) the product of √x and the largest prime factor of x, (vii) the xth prime number, (viii) the height measured in inches of convict x in Dartmoor prison. Then the aggregates of values of x for which these functions are defined or, as we may say, the fields of definition of the functions, consist of (i) all values of x, (ii) all positive values of x, (iii) all rational values of x, (iv) all positive rational values of x, (v) all integral values of x, (vi), (vii) all positive integral values of x, (viii) a certain number of positive integral values of x, viz., 1, 2, . . . , N , where N is the total number of convicts at Dartmoor at a given moment of time.* Now let us consider a function, such as (vii) above, which is defined for all positive integral values of x and no others. This function may be regarded from two slightly different points of view. We may consider it, as has so far been our custom, as a function of the real variable x defined for some only of the values of x, viz. positive integral values, and say that for all other values of x the definition fails. Or we may leave values of x *In the last case N depends on the time, and convict x, where x has a definite value, is a different individual at different moments of time. Thus if we take different moments of time into consideration we have a simple example of a function y = F (x, t) of two variables, defined for a certain range of values of t, viz. from the time of the establishment of Dartmoor prison to the time of its abandonment, and for a certain number of positive integral values of x, this number varying with t. 128 [IV : 51] POSITIVE INTEGRAL VARIABLE 129 other than positive integral values entirely out of account, and regard our function as a function of the positive integral variable n, whose values are the positive integers 1, 2, 3, 4, ... In this case we may write y = φ(n) and regard y now as a function of n defined for all values of n. It is obvious that any function of x defined for all values of x gives rise to a function of n defined for all values of n. Thus from the function y = x2 we deduce the function y = n2 by merely omitting from consideration all values of x other than positive integers, and the corresponding values of y. On the other hand from any function of n we can deduce any number of functions of x by merely assigning values to y, corresponding to values of x other than positive integral values, in any way we please. 51. Interpolation. The problem of determining a function of x which shall assume, for all positive integral values of x, values agreeing with those of a given function of n, is of extreme importance in higher mathematics. It is called the problem of functional interpolation. Were the problem however merely that of finding some function of x to fulfil the condition stated, it would of course present no difficulty whatever. We could, as explained above, simply fill in the missing values as we pleased: we might indeed simply regard the given values of the function of n as all the values of the function of x and say that the definition of the latter function failed for all other values of x. But such purely theoretical solutions are obviously not what is usually wanted. What is usually wanted is some formula involving x (of as simple a kind as possible) which assumes the given values for x = 1, 2, ... In some cases, especially when the function of n is itself defined by a formula, there is an obvious solution. If for example y = φ(n), where φ(n) is a function of n, such as n2 or cos nπ, which would have a meaning even were n not a positive integer, we naturally take our function of x to be y = φ(x). But even in this very simple case it is easy to write down other almost equally obvious solutions of the problem. For example y = φ(x) + sin xπ [IV : 52] LIMITS OF FUNCTIONS OF A 130 assumes the value φ(n) for x = n, since sin nπ = 0. In other cases φ(n) may be defined by a formula, such as (–1)n, which ceases to define for some values of x (as here in the case of fractional values of x with even denominators, or irrational values). But it may be possible to transform the formula in such a way that it does define for all values of x. In this case, for example, (–1)n = cos nπ, if n is an integer, and the problem of interpolation is solved by the func- tion cos xπ. In other cases φ(x) may be defined for some values of x other than positive integers, but not for all. Thus from y = nn we are led to y = xx. This expression has a meaning for some only of the remaining values of x. If for simplicity we confine ourselves to positive values of x, then xx has a meaning for all rational values of x, in virtue of the definitions of fractional powers adopted in elementary algebra. But when x is irrational xx has (so far as we are in a position to say at the present moment) no meaning at all. Thus in this case the problem of interpolation at once leads us to consider the question of extending our definitions in such a way that xx shall have a meaning even when x is irrational. We shall see later on how the desired extension may be effected. Again, consider the case in which y = 1 · 2 . . . n = n!. In this case there is no obvious formula in x which reduces to n! for x = n, as x! means nothing for values of x other than the positive integers. This is a case in which attempts to solve the problem of interpolation have led to important advances in mathematics. For mathematicians have succeeded in discovering a function (the Gamma-function) which possesses the desired property and many other interesting and important properties besides. 52. Finite and infinite classes. Before we proceed further it is necessary to make a few remarks about certain ideas of an abstract and logical nature which are of constant occurrence in Pure Mathematics. In the first place, the reader is probably familiar with the notion of a class. It is unnecessary to discuss here any logical difficulties which may be involved in the notion of a ‘class’: roughly speaking we may say that [IV : 53] POSITIVE INTEGRAL VARIABLE 131 a class is the aggregate or collection of all the entities or objects which possess a certain property, simple or complex. Thus we have the class of British subjects, or members of Parliament, or positive integers, or real numbers. Moreover, the reader has probably an idea of what is meant by a finite or infinite class. Thus the class of British subjects is a finite class: the aggregate of all British subjects, past, present, and future, has a finite number n, though of course we cannot tell at present the actual value of n. The class of present British subjects, on the other hand, has a number n which could be ascertained by counting, were the methods of the census

effective enough. On the other hand the class of positive integers is not finite but infinite. This may be expressed more precisely as follows. If n is any positive integer, such as 1000, 1,000,000 or any number we like to think of, then there are more than n positive integers. Thus, if the number we think of is 1,000,000, there are obviously at least 1,000,001 positive integers. Similarly the class of rational numbers, or of real numbers, is infinite. It is convenient to express this by saying that there are an infinite number of positive integers, or rational numbers, or real numbers. But the reader must be careful always to remember that by saying this we mean simply that the class in question has not a finite number of members such as 1000 or 1,000,000. 53. Properties possessed by a function of n for large values of n. We may now return to the 'functions of n' which we were discussing in §§ 50–51. They have many points of difference from the functions of x which we discussed in Chap. II. But there is one fundamental character- istic which the two classes of functions have in common: the values of the variable for which they are defined form an infinite class. It is this fact which forms the basis of all the considerations which follow and which, as we shall see in the next chapter, apply, mutatis mutandis, to functions of x as well. Suppose that $\varphi(n)$ is any function of n, and that P is any property which $\varphi(n)$ may or may not have, such as that of being a positive integer [IV : 53] LIMITS OF FUNCTIONS OF A 132 or of being greater than 1. Consider, for each of the values n = 1, 2, 3, . . . , whether $\varphi(n)$ has the property P or not. Then there are three possibilities:— (a) $\varphi(n)$ may have the property P for all values of n, or for all values of n except a finite number N of such values: (b) $\varphi(n)$ may have the property for no values of n, or only for a finite number N of such values: (c) neither (a) nor (b) may be true. If (b) is true, the values of n for which $\varphi(n)$ has the property form a finite class. If (a) is true, the values of n for which $\varphi(n)$ has not the property form a finite class. In the third case neither class is finite. Let us consider some particular cases. (1) Let $\varphi(n) = n$, and let P be the property of being a positive integer. Then $\varphi(n)$ has the property P for all values of n. If on the other hand P denotes the property of being a positive integer greater than or equal to 1000, then $\varphi(n)$ has the property for all values of n except a finite number of values of n, viz. 1, 2, 3, . . . , 999. In either of these cases (a) is true. (2) If $\varphi(n) = n$, and P is the property of being less than 1000, then (b) is true. (3) If $\varphi(n) = n$, and P is the property of being odd, then (c) is true. For $\varphi(n)$ is odd if n is odd and even if n is even, and both the odd and the even values of n form an infinite class. Example. Consider, in each of the following cases, whether (a), (b), or (c) is true: (i) $\varphi(n) = n$, P being the property of being a perfect square, (ii) $\varphi(n) = p_n$, where p_n denotes the nth prime number, P being the property of being odd, (iii) $\varphi(n) = p_n$, P being the property of being even, (iv) $\varphi(n) = p_n$, P being the property $\varphi(n) > n$, (v) $\varphi(n) = 1 - (-1)^n(1/n)$, P being the property $\varphi(n) < 1$, (vi) $\varphi(n) = 1 - (-1)^n(1/n)$, P being the property $\varphi(n) < 2$, (vii) $\varphi(n) = 1000\{1 + (-1)^n\}/n$, P being the property $\varphi(n) < 1$, [IV : 54] POSITIVE INTEGRAL VARIABLE 133 (viii) $\varphi(n) = 1/n$, P being the property $\varphi(n) < .001$, (ix) $\varphi(n) = (-1)^n/n$, P being the property $|\varphi(n)| < .001$, (x) $\varphi(n) = 10{,}000/n$, or $(-1)^n 10{,}000/n$, P being either of the properties $\varphi(n) < .001$ or $|\varphi(n)| < .001$, (xi) $\varphi(n) = (n - 1)/(n + 1)$, P being the property $1 - \varphi(n) < .0001$. 54. Let us now suppose that $\varphi(n)$ and P are such that the asser- tion (a) is true, i.e. that $\varphi(n)$ has the property P , if not for all values of n, at any rate for all values of n except a finite number N of such values. We may denote these exceptional values by $n_1, n_2, \ldots, n_N$. There is of course no reason why these N values should be the first N values 1, 2, . . . , N , though, as the preceding examples show, this is frequently the case in practice. But whether this is so or not we know that $\varphi(n)$ has the property P if $n > n_N$. Thus the nth prime is odd if $n > 2$, n = 2 being the only exception to the statement; and $1/n < .001$ if $n > 1000$, the first 1000 values of n being the exceptions; and $1000\{1 + (-1)^n\}/n < 1$ if $n > 2000$, the exceptional values being 2, 4, 6, . . . , 2000. That is to say, in each of these cases the property is possessed for all values of n from a definite value onwards. We shall frequently express this by saying that $\varphi(n)$ has the property for large, or very large, or all sufficiently large values of n. Thus when we say that $\varphi(n)$ has the property P (which will as a rule be a property expressed by some relation of inequality) for large values of n, what we mean is that we can determine some definite number, n_0 say, such that $\varphi(n)$ has the property for all values of n greater than or equal to n_0. This number n_0, in the examples considered above, may be taken to be any number greater than n_N , the greatest of the exceptional numbers: it is most natural to take it to be $n_N + 1$. [IV : 55] LIMITS OF FUNCTIONS OF A 134 Thus we may say that 'all large primes are odd', or that '1/n is less than .001 for large values of n'. And the reader must make himself familiar with the use of the word large in statements of this kind. Large is in fact a word which, standing by itself, has no more absolute meaning in mathematics than in the language of common life. It is a truism that in common life a number which is large in one connection is small in another; 6 goals is a large score in a football match, but 6 runs is not a large score in a cricket match; and 400 runs is a large score, but £400 is not a large income: and so of course in mathematics large generally means large enough, and what is large enough for one purpose may not be large enough for another. We know now what is meant by the assertion '$\varphi(n)$ has the property P for large values of n'. It is with assertions of this kind that we shall be concerned throughout this chapter. 55. The phrase 'n tends to infinity'. There is a somewhat dif- ferent way of looking at the matter which it is natural to adopt. Suppose that n assumes successively the values 1, 2, 3, ... The word 'successively' naturally suggests succession in time, and we may suppose n, if we like, to assume these values at successive moments of time (e.g. at the beginnings of successive seconds). Then as the seconds pass n gets larger and larger and there is no limit to the extent of its increase. However large a number we may think of (e.g. 2,147,483,647), a time will come when n has become larger than this

number. It is convenient to have a short phrase to express this unending growth of n, and we shall say that n tends to infinity, or n → ∞, this last symbol being usually employed as an abbreviation for ‘infinity’. The phrase ‘tends to’ like the word ‘successively’ naturally suggests the idea of change in time, and it is convenient to think of the variation of n as accomplished in time in the manner described above. This however is a mere matter of convenience. The variable n is a purely logical entity which has in itself nothing to do with time. The reader cannot too strongly impress upon himself that when we say that n ‘tends to ∞’ we mean simply that n is supposed to assume a series of values which increase continually and without limit. There is no [IV : 56] POSITIVE INTEGRAL VARIABLE 135 number ‘infinity’: such an equation as n = ∞ is as it stands absolutely meaningless: n cannot be equal to ∞, because ‘equal to ∞’ means nothing. So far in fact the symbol ∞ means nothing at all except in the one phrase ‘tends to ∞’, the meaning of which we have explained above. Later on we shall learn how to attach a meaning to other phrases involving the symbol ∞, but the reader will always have to bear in mind (1) that ∞ by itself means nothing, although phrases containing it sometimes mean something, (2) that in every case in which a phrase containing the symbol ∞ means something it will do so simply because we have previously attached a meaning to this particular phrase by means of a special definition. Now it is clear that if φ(n) has the property P for large values of n, and if n ‘tends to ∞’, in the sense which we have just explained, then n will ultimately assume values large enough to ensure that φ(n) has the property P . And so another way of putting the question ‘what properties has φ(n) for sufficiently large values of n?’ is ‘how does φ(n) behave as n tends to ∞?’ 56. The behaviour of a function of n as n tends to infinity. We shall now proceed, in the light of the remarks made in the preceding sections, to consider the meaning of some kinds of statements which are perpetually occurring in higher mathematics. Let us consider, for example, the two following statements: (a) 1/n is small for large values of n, (b) 1 – (1/n) is nearly equal to 1 for large values of n. Obvious as they may seem, there is a good deal in them which will repay the reader’s attention. Let us take (a) first, as being slightly the simpler. We have already considered the statement ‘1/n is less than .01 for large values of n’. This, we saw, means that the inequality 1/n < .01 is true for all values of n greater than some definite value, in fact greater than 100. Similarly it is true that ‘1/n is less than .0001 for large values of n’: in [IV : 56] LIMITS OF FUNCTIONS OF A 136 fact 1/n < .0001 if n > 10,000. And instead of .01 or .0001 we might take .000 001 or .000 000 01, or indeed any positive number we like. It is obviously convenient to have some way of expressing the fact that any such statement as ‘1/n is less than .01 for large values of n’ is true, when we substitute for .01 any smaller number, such as .0001 or .000 001 or any other number we care to choose. And clearly we can do this by saying that ‘however small ■ may be (provided of course it is positive), then 1/n < ■ for sufficiently large values of n’. That this is true is obvious. For 1/n < ■ if n > 1/■, so that our ‘sufficiently large’ values of n need only all be greater than 1/■. The assertion is however a complex one, in that it really stands for the whole class of assertions which we obtain by giving to ■ special values such as .01. And of course the smaller ■ is, and the larger 1/■, the larger must be the least of the ‘sufficiently large’ values of n: values which are sufficiently large when ■ has one value are inadequate when it has a smaller. The last statement italicised is what is really meant by the state- ment (a), that 1/n is small when n is large. Similarly (b) really means “if φ(n) = 1 – (1/n), then the statement ‘1 – φ(n) < ■ for sufficiently large values of n’ is true whatever positive value (such as .01 or .0001) we attribute to ■”. That the statement (b) is true is obvious from the fact that 1 – φ(n) = 1/n. There is another way in which it is common to state the facts expressed by the assertions (a) and (b). This is suggested at once by § 55. Instead of saying ‘1/n is small for large values of n’ we say ‘1/n tends to 0 as n tends to ∞’. Similarly we say that ‘1 – (1/n) tends to 1 as n tends to ∞’: and these statements are to be regarded as precisely equivalent to (a) and (b). Thus the statements ‘1/n is small when n is large’, ‘1/n tends to 0 as n tends to ∞’, are equivalent to one another and to the more formal statement ‘if ■ is any positive number, however small, then 1/n < ■ for sufficiently large values of n’, [IV : 57] POSITIVE INTEGRAL VARIABLE 137 or to the still more formal statement ‘if ■ is any positive number, however small, then we can find a number n0 such that 1/n < ■ for all values of n greater than or equal to n0’. The number n0 which occurs in the last statement is of course a function of ■. We shall sometimes emphasize this fact by writing n0 in the form n0(■). The reader should imagine himself confronted by an opponent who questions the truth of the statement. He would name a series of numbers growing smaller and smaller. He might begin with .001. The reader would reply that 1/n < .001 as soon as n > 1000. The opponent would be bound to admit this, but would try again with some smaller number, such as .000 000 1. The reader would reply that 1/n < .000 000 1 as soon as n > 10,000,000: and so on. In this simple case it is evident that the reader would always have the better of the argument. We shall now introduce yet another way of expressing this property of the function 1/n. We shall say that ‘the limit of 1/n as n tends to ∞ is 0’, a statement which we may express symbolically in the form lim n→∞ 1 n = 0, or simply lim(1/n) = 0. We shall also sometimes write ‘1/n → 0 as n → ∞’, which may be read ‘1/n tends to 0 as n tends to ∞’; or simply ‘1/n → 0’. In the same way we shall write lim n→∞

1 – 1 n

= 1, lim

1 – 1 n

= 1, or 1 – (1/n) → 1. 57. Now let us consider a different example: let φ(n) = n2. Then ‘n2 is large when n is large’. This statement is equivalent to the more formal statements [IV : 58] LIMITS OF FUNCTIONS OF A 138 ‘if Δ is any positive number, however large, then n2 > Δ for sufficiently large values of n’, ‘we can find a number n0(Δ) such that n2 > Δ for all values of n greater than or equal to n0(Δ)’. And it is natural in this case to say that ‘n2 tends to ∞ as n tends to ∞’, or ‘n2 tends to ∞ with n’, and to write n2 → ∞. Finally consider the function φ(n) = –n2. In this case φ(n) is large, but negative, when n is large, and we naturally say that ‘–n2 tends to –∞ as n tends to ∞’ and write –n2 → –∞. And the use of the symbol –∞ in this sense suggests that it will sometimes be convenient to write n2 → +∞ for n2 → ∞ and generally to use +∞ instead of ∞, in order to secure greater uniformity of notation. But we must once more repeat that in all these statements the symbols ∞, +∞, –∞ mean nothing whatever by themselves, and only acquire a meaning when they occur in certain special connections in virtue of the explanations which we have just given. 58. Definition of a limit. After the discussion which precedes the reader should be in a position to appreciate the general notion of a limit. Roughly we may say that φ(n) tends to a limit l as n tends to ∞ if φ(n) is nearly equal to l when n is large. But although the meaning of this state- ment should be clear enough after the preceding explanations, it is not, as it stands, precise enough to serve as a strict mathematical definition. It is, in fact, equivalent to a whole class of statements of the type ‘for sufficiently large values of n, φ(n) differs from l by less than ■’. This statement has to be true for ■ = .01 or .0001 or any positive number; and for any such value of ■ it has to be true for any value of n after a certain definite value n0(■), though the smaller ■ is the larger, as a rule, will be this value n0(■). [IV : 59] POSITIVE INTEGRAL VARIABLE 139 We accordingly frame the following formal definition: Definition I. The function φ(n) is said to tend to the limit l as n tends to ∞, if, however small be the positive number ■, φ(n) differs from l by less than ■ for sufficiently large values of n; that is to say if, however small be the positive number ■, we can determine a number n0(■) corresponding to ■, such that φ(n) differs from l by less than ■ for all values of n greater than or equal to n0(■). It is usual to denote the difference between φ(n) and l, taken positively, by |φ(n)–l|. It is equal to φ(n)–l or to l –φ(n), whichever is positive, and agrees with the definition of the modulus of φ(n) – l, as given in Chap. III, though at present we are only considering real values, positive or negative. With this notation the definition may be stated more shortly as follows: ‘if, given any positive number, ■, however small, we can find n0(■) so that |φ(n) – l| < ■ when n ■ n0(■), then we say that φ(n) tends to the limit l as n tends to ∞, and write lim n→∞ φ(n) = l’. Sometimes we may omit the ‘n → ∞’; and sometimes it is convenient, for brevity, to write φ(n) → l. The reader will find it instructive to work out, in a few simple cases, the explicit expression of n0 as a function of ■. Thus if φ(n) = 1/n then l = 0, and the condition reduces to 1/n < ■ for n ■ n0, which is satisfied if n0 = 1 + [1/■].* There is one and only one case in which the same n0 will do for all values of ■. If, from a certain value N of n onwards, φ(n) is constant, say equal to C, then it is evident that φ(n) – C = 0 for n ■ N , so that the inequality |φ(n) – C| < ■ is satisfied for n ■ N and all positive values of ■. And if |φ(n) – l| < ■ for n ■ N and all positive values of ■, then it is evident that φ(n) = l when n ■ N , so that φ(n) is constant for all such values of n. *Here and henceforward we shall use [x] in the sense of Chap. II, i.e. as the greatest integer not greater than x. [IV : 60] LIMITS OF FUNCTIONS OF A 140 59. The definition of a limit may be illustrated geometrically as fol- lows. The graph of φ(n) consists of a number of points corresponding to the values n = 1, 2, 3, ... Draw the line y = l, and the parallel lines y = l – ■, y = l + ■ at distance ■ from it. Then lim n→∞ φ(n) = l, if, when once these lines have been drawn, no matter how close they may1 2 3O X Y n0 y = l – ■ y = l + ■ Fig. 27. be together, we can always draw a line x = n0, as in the figure, in such a way that the point of the graph on this line, and all points to the right of it, lie between them. We shall find this geometrical way of looking at our definition particularly useful when we come to deal with functions defined for all values of a real variable and not merely for positive integral values. 60. So much for functions of n which tend to a limit as n tends to ∞. We must now frame corresponding definitions for functions which, like the functions n2 or –n2, tend to positive or negative infinity. The reader should by now find no difficulty in appreciating the point of Definition II. The function φ(n) is said to tend to +∞ (positive infinity) with n, if, when any number Δ, however large, is assigned, we [IV : 61] POSITIVE INTEGRAL VARIABLE 141 can determine n0(Δ) so that φ(n) > Δ when n ■ n0(Δ); that is to say if, however large Δ may be, φ(n) > Δ for sufficiently large values of n. Another, less precise, form of statement is ‘if we can make φ(n) as large as we please by sufficiently increasing n’. This is open to the objection that it obscures a fundamental point, viz. that φ(n) must be greater than Δ for all values of n such that n ■ n0(Δ), and not merely for some such values. But there is no harm in using this form of expression if we are clear what it means. When φ(n) tends to +∞ we write φ(n) → +∞. We may leave it to the reader to frame the corresponding definition for functions which tend to negative infinity. 61. Some points concerning the definitions. The reader should be careful to observe the following points. (1) We may obviously alter the values of φ(n) for any finite number of values of n, in any way we please, without in the least affecting the behaviour of φ(n) as n tends to ∞. For example 1/n tends to 0 as n tends to ∞. We may deduce any number of new functions from 1/n by altering a finite number of its values. For instance we may consider the function φ(n) which is equal to 3 for n = 1, 2, 7, 11, 101, 107, 109, 237 and equal to 1/n for all other values of n. For this function, just as for the original function 1/n, lim φ(n) = 0. Similarly, for the function φ(n) which is equal to 3 if n = 1, 2, 7, 11, 101, 107, 109, 237, and to n2 otherwise, it is true that φ(n) → +∞. (2) On the other hand we cannot as a rule alter an

infinite number of the values of φ(n) without affecting fundamentally its behaviour as n tends to ∞. If for example we altered the function 1/n by changing its value to 1 whenever n is a multiple of 100, it would no longer be true that lim φ(n) = 0. So long as a finite number of values only were affected we could always choose the number n0 of the definition so as to be greater than the greatest of the values of n for which φ(n) was altered. In the examples above, for instance, we could always take n0 > 237, and indeed [IV : 61] LIMITS OF FUNCTIONS OF A 142 we should be compelled to do so as soon as our imaginary opponent of § 56 had assigned a value of ■ as small as 3 (in the first example) or a value of Δ as great as 3 (in the second). But now however large n0 may be there will be greater values of n for which φ(n) has been altered. (3) In applying the test of Definition I it is of course absolutely essential that we should have |φ(n)–l| < ■ not merely when n = n0 but when n ■ n0, i.e. for n0 and for all larger values of n. It is obvious, for example, that, if φ(n) is the function last considered, then given ■ we can choose n0 so that |φ(n)| < ■ when n = n0: we have only to choose a sufficiently large value of n which is not a multiple of 100. But, when n0 is thus chosen, it is not true that |φ(n)| < ■ when n ■ n0: all the multiples of 100 which are greater than n0 are exceptions to this statement. (4) If φ(n) is always greater than l, we can replace |φ(n)–l| by φ(n)–l. Thus the test whether 1/n tends to the limit 0 as n tends to ∞ is simply whether 1/n < ■ when n ■ n0. If however φ(n) = (–1)n/n, then l is again 0, but φ(n) – l is sometimes positive and sometimes negative. In such a case we must state the condition in the form |φ(n) – l| < ■, for example, in this particular case, in the form |φ(n)| < ■. (5) The limit l may itself be one of the actual values of φ(n). Thus if φ(n) = 0 for all values of n, it is obvious that lim φ(n) = 0. Again, if we had, in (2) and (3) above, altered the value of the function, when n is a multiple of 100, to 0 instead of to 1, we should have obtained a function φ(n) which is equal to 0 when n is a multiple of 100 and to 1/n otherwise. The limit of this function as n tends to ∞ is still obviously zero. This limit is itself the value of the function for an infinite number of values of n, viz. all multiples of 100. On the other hand the limit itself need not (and in general will not) be the value of the function for any value of n. This is sufficiently obvious in the case of φ(n) = 1/n. The limit is zero; but the function is never equal to zero for any value of n. The reader cannot impress these facts too strongly on his mind. A limit is not a value of the function: it is something quite distinct from these values, though it is defined by its relations to them and may possibly [IV : 61] POSITIVE INTEGRAL VARIABLE 143 be equal to some of them. For the functions φ(n) = 0, 1, the limit is equal to all the values of φ(n): for φ(n) = 1/n, (–1)n/n, 1 + (1/n), 1 + {(–1)n/n} it is not equal to any value of φ(n): for φ(n) = (sin 1 2 nπ)/n, 1 + {(sin 1 2 nπ)/n} (whose limits as n tends to ∞ are easily seen to be 0 and 1, since sin 1 2 nπ is never numerically greater than 1) the limit is equal to the value which φ(n) assumes for all even values of n, but the values assumed for odd values of n are all different from the limit and from one another. (6) A function may be always numerically very large when n is very large without tending either to +∞ or to –∞. A sufficient illustration of this is given by φ(n) = (–1)nn. A function can only tend to +∞ or to –∞ if, after a certain value of n, it maintains a constant sign. Examples XXIII. Consider the behaviour of the following functions of n as n tends to ∞: 1. φ(n) = nk, where k is a positive or negative integer or rational fraction. If k is positive, then nk tends to +∞ with n. If k is negative, then lim nk = 0. If k = 0, then nk = 1 for all values of n. Hence lim nk = 1. The reader will find it instructive, even in so simple a case as this, to write down a formal proof that the conditions of our definitions are satisfied. Take for instance the case of k > 0. Let Δ be any assigned number, however large. We wish to choose n0 so that nk > Δ when n ■ n0. We have in fact only to take for n0 any number greater than k √Δ. If e.g. k = 4, then n4 > 10,000 when n ■ 11, n4 > 100,000,000 when n ■ 101, and so on. 2. φ(n) = pn, where pn is the nth prime number. If there were only a finite number of primes then φ(n) would be defined only for a finite number of values of n. There are however, as was first shown by Euclid, infinitely many primes. Euclid's proof is as follows. If there are only a finite number of primes, let them [IV : 62] LIMITS OF FUNCTIONS OF A 144 be 1, 2, 3, 5, 7, 11, . . . N . Consider the number 1 + (1 · 2 · 3 · 5 · 7 · 11 . . . N). This number is evidently not divisible by any of 2, 3, 5, . . . N , since the remainder when it is divided by any of these numbers is 1. It is therefore not divisible by any prime save 1, and is therefore itself prime, which is contrary to our hypothesis. It is moreover obvious that φ(n) > n for all values of n (save n = 1, 2, 3). Hence φ(n) → +∞. 3. Let φ(n) be the number of primes less than n. Here again φ(n) → +∞. 4. φ(n) = [αn], where α is any positive number. Here φ(n) = 0 (0 ■ n < 1/α), φ(n) = 1 (1/α ■ n < 2/α), and so on; and φ(n) → +∞. 5. If φ(n) = 1,000,000/n, then lim φ(n) = 0: and if ψ(n) = n/1,000,000, then ψ(n) → +∞. These conclusions are in no way affected by the fact that at first φ(n) is much larger than ψ(n), being in fact larger until n = 1,000,000. 6. φ(n) = 1/{n–(–1)n}, n–(–1)n, n{1–(–1)n}. The first function tends to 0, the second to +∞, the third does not tend either to a limit or to +∞. 7. φ(n) = (sin nθπ)/n, where θ is any real number. Here |φ(n)| < 1/n, since | sin nθπ| ■ 1, and lim φ(n) = 0. 8. φ(n) = (sin nθπ)/√n, (a cos2 nθ + b sin2 nθ)/n, where a and b are any real numbers. 9. φ(n) = sin nθπ. If θ is integral then φ(n) = 0 for all values of n, and therefore lim φ(n) = 0. Next let θ be rational, e.g. θ = p/q, where p and q are positive integers. Let n = aq + b where a is the quotient and b the remainder when n is divided by q. Then sin(npπ/q) = (–1)ap sin(bpπ/q). Suppose, for example, p even; then, as n increases from 0 to q – 1, φ(n) takes the values 0, sin(pπ/q), sin(2pπ/q), . . . sin{(q – 1)pπ/q}. When n increases from q to 2q – 1 these values are repeated; and so also as n goes from 2q to 3q – 1, 3q to 4q – 1, and so on. Thus the values of φ(n) form a perpetual cyclic repetition of a finite series of different values. It is evident that when this is the case φ(n) cannot tend to a limit, nor to +∞, nor to –∞, as n tends to infinity. The case in which θ is irrational is a little more difficult. It is

discussed in the next set of examples. [IV : 62] POSITIVE INTEGRAL VARIABLE 145 62. Oscillating Functions. Definition. When φ(n) does not tend to a limit, nor to +∞, nor to –∞, as n tends to ∞, we say that φ(n) oscillates as n tends to ∞. A function φ(n) certainly oscillates if its values form, as in the case considered in the last example above, a continual repetition of a cycle of values. But of course it may oscillate without possessing this peculiarity. Oscillation is defined in a purely negative manner: a function oscillates when it does not do certain other things. The simplest example of an oscillatory function is given by φ(n) = (–1)n, which is equal to +1 when n is even and to –1 when n is odd. In this case the values recur cyclically. But consider φ(n) = (–1)n + (1/n), the values of which are –1 + 1, 1 + (1/2), – 1 + (1/3), 1 + (1/4), – 1 + (1/5), ... When n is large every value is nearly equal to +1 or –1, and obviously φ(n) does not tend to a limit or to +∞ or to –∞, and therefore it oscillates: but the values do not recur. It is to be observed that in this case every value of φ(n) is numerically less than or equal to 3/2. Similarly φ(n) = (–1)n100 + (1000/n) oscillates. When n is large, every value is nearly equal to 100 or to –100. The numerically greatest value is 900 (for n = 1). But now consider φ(n) = (–1)nn, the values of which are –1, 2, –3, 4, –5, ... This function oscillates, for it does not tend to a limit, nor to +∞, nor to –∞. And in this case we cannot assign any limit beyond which the numerical value of the terms does not rise. The distinction between these two examples suggests a further definition. Definition. If φ(n) oscillates as n tends to ∞, then φ(n) will be said to oscillate finitely or infinitely according as it is or is not possible to [IV : 62] LIMITS OF FUNCTIONS OF A 146 assign a number K such that all the values of φ(n) are numerically less than K, i.e. |φ(n)| < K for all values of n. These definitions, as well as those of §§ 58 and 60, are further illustrated in the following examples. Examples XXIV. Consider the behaviour as n tends to ∞ of the following functions: 1. (–1)n, 5 + 3(–1)n, (1,000,000/n) + (–1)n, 1,000,000(–1)n + (1/n). 2. (–1)nn, 1,000,000 + (–1)nn. 3. 1,000,000 – n, (–1)n(1,000,000 – n). 4. n{1 + (–1)n}. In this case the values of φ(n) are 0, 4, 0, 8, 0, 12, 0, 16, ... The odd terms are all zero and the even terms tend to +∞: φ(n) oscillates infinitely. 5. n2 + (–1)n2n. The second term oscillates infinitely, but the first is very much larger than the second when n is large. In fact φ(n) ■ n2 – 2n and n2 – 2n = (n – 1)2 – 1 is greater than any assigned value Δ if n > 1 + √Δ + 1. Thus φ(n) → +∞. It should be observed that in this case φ(2k + 1) is always less than φ(2k), so that the function progresses to infinity by a continual series of steps forwards and backwards. It does not however ‘oscillate’ according to our definition of the term. 6. n2{1 + (–1)n}, (–1)nn2 + n, n3 + (–1)nn2. 7. sin nθπ. We have already seen (Exs. xxiii. 9) that φ(n) oscillates finitely when θ is rational, unless θ is an integer, when φ(n) = 0, φ(n) → 0. The case in which θ is irrational is a little more difficult. But it is not difficult to see that φ(n) still oscillates finitely. We can without loss of generality suppose 0 < θ < 1. In the first place |φ(n)| < 1. Hence φ(n) must oscillate finitely or tend to a limit. We shall consider whether the second alternative is really possible. Let us suppose that lim sin nθπ = l. Then, however small ■ may be, we can choose n0 so that sin nθπ lies between l – ■ and l + ■ for all values of n greater than or equal to n0. Hence sin(n + 1)θπ – sin nθπ is numerically less than 2■ for all such values of n, and so | sin 1 2 θπ cos(n + 1 2)θπ| < ■. [IV : 62] POSITIVE INTEGRAL VARIABLE 147 Hence cos(n + 1 2)θπ = cos nθπ cos 1 2 θπ – sin nθπ sin 1 2 θπ must be numerically less than ■/| sin 1 2 θπ|. Similarly cos(n – 1 2)θπ = cos nθπ cos 1 2 θπ + sin nθπ sin 1 2 θπ must be numerically less than ■/| sin 1 2 θπ|; and so each of cos nθπ cos 1 2 θπ, sin nθπ sin 1 2 θπ must be numerically less than ■/| sin 1 2 θπ|. That is to say, cos nθπ cos 1 2 θπ is very small if n is large, and this can only be the case if cos nθπ is very small. Similarly sin nθπ must be very small, so that l must be zero. But it is impossible that cos nθπ and sin nθπ can both be very small, as the sum of their squares is unity. Thus the hypothesis that sin nθπ tends to a limit l is impossible, and therefore sin nθπ oscillates as n tends to ∞. The reader should consider with particular care the argument ‘cos nθπ cos 1 2 θπ is very small, and this can only be the case if cos nθπ is very small’. Why, he may ask, should it not be the other factor cos 1 2 θπ which is ‘very small’ ? The answer is to be found, of course, in the meaning of the phrase ‘very small’ as used in this connection. When we say ‘φ(n) is very small’ for large values of n, we mean that we can choose n0 so that φ(n) is numerically smaller than any assigned number, if n ■ n0. Such an assertion is palpably absurd when made of a fixed number such as cos 1 2 θπ, which is not zero. Prove similarly that cos nθπ oscillates finitely, unless θ is an even integer. 8. sin nθπ + (1/n), sin nθπ + 1, sin nθπ + n, (–1)n sin nθπ. 9. a cos nθπ + b sin nθπ, sin2 nθπ, a cos2 nθπ + b sin2 nθπ. 10. a + bn + (–1)n(c + dn) + e cos nθπ + f sin nθπ. 11. n sin nθπ. If θ is integral, then φ(n) = 0, φ(n) → 0. If θ is rational but not integral, or irrational, then φ(n) oscillates infinitely. 12. n(a cos2 nθπ + b sin2 nθπ). In this case φ(n) tends to +∞ if a and b are both positive, but to –∞ if both are negative. Consider the special cases in which a = 0, b > 0, or a > 0, b = 0, or a = 0, b = 0. If a and b have opposite signs φ(n) generally oscillates infinitely. Consider any exceptional cases. 13. sin(n2θπ). If θ is integral, then φ(n) → 0. Otherwise φ(n) oscillates finitely, as may be shown by arguments similar to though more complex than those used in Exs. xxiii. 9 and xxiv. 7.* *See Bromwich’s Infinite Series, p. 485. [IV : 62] LIMITS OF FUNCTIONS OF A 148 14. sin(n! θπ). If θ has a rational value p/q, then n! θ is certainly integral for all values of n greater than or equal to q. Hence φ(n) → 0. The case in which θ is irrational cannot be dealt with without the aid of considerations of a much more difficult character. 15. cos(n! θπ), a cos2(n! θπ) + b sin2(n! θπ), where θ is rational. 16. an – [bn], (–1)n(an – [bn]). 17. [√n], (–1)n[√n], √n – [√n]. 18. The smallest prime factor of n. When n is a prime, φ(n) = n. When n is even, φ(n) = 2. Thus φ(n) oscillates infinitely. 19. The largest prime factor of n. 20. The number of days in the year n a.d. Examples XXV. 1. If φ(n) → +∞ and ψ(n) ■ φ(n) for all values of n, then ψ(n) → +∞.

2. If φ(n) → 0, and |ψ(n)| ■ |φ(n)| for all values of n, then ψ(n) → 0. 3. If lim |φ(n)| = 0, then lim φ(n) = 0. 4. If φ(n) tends to a limit or oscillates finitely, and |ψ(n)| ■ |φ(n)| when n ■ n0, then ψ(n) tends to a limit or oscillates finitely. 5. If φ(n) tends to +∞, or to –∞, or oscillates infinitely, and |ψ(n)| ■ |φ(n)| when n ■ n0, then ψ(n) tends to +∞ or to –∞ or oscillates infinitely. 6. 'If φ(n) oscillates and, however great be n0, we can find values of n greater than n0 for which ψ(n) > φ(n), and values of n greater than n0 for which ψ(n) < φ(n), then ψ(n) oscillates'. Is this true? If not give an example to the contrary. 7. If φ(n) → l as n → ∞, then also φ(n + p) → l, p being any fixed integer. [This follows at once from the definition. Similarly we see that if φ(n) tends to +∞ or –∞ or oscillates so also does φ(n + p).] 8. The same conclusions hold (except in the case of oscillation) if p varies with n but is always numerically less than a fixed positive integer N ; or if p varies with n in any way, so long as it is always positive. 9. Determine the least value of n0 for which it is true that (a) n2 + 2n > 999,999 (n ■ n0), (b) n2 + 2n > 1,000,000 (n ■ n0). [IV : 63] POSITIVE INTEGRAL VARIABLE 149 10. Determine the least value of n0 for which it is true that (a) n + (–1)n > 1000 (n ■ n0), (b) n + (–1)n > 1,000,000 (n ■ n0). 11. Determine the least value of n0 for which it is true that (a) n2 + 2n > Δ (n ■ n0), (b) n + (–1)n > Δ (n ■ n0), Δ being any positive number. [(a) n0 = [√Δ + 1]: (b) n0 = 1 + [Δ] or 2 + [Δ], according as [Δ] is odd or even, i.e. n0 = 1 + [Δ] + 1 2 {1 + (–1)[Δ]}.] 12. Determine the least value of n0 such that (a) n/(n2 + 1) < .0001, (b) (1/n) + {(–1)n/n2} < .000 01, when n ■ n0. [Let us take the latter case. In the first place (1/n) + {(–1)n/n2} ■ (n + 1)/n2, and it is easy to see that the least value of n0, such that (n + 1)/n2 < .000 001 when n ■ n0, is 1,000,002. But the inequality given is satisfied by n = 1,000,001, and this is the value of n0 required.] 63. Some general theorems with regard to limits. A. The behaviour of the sum of two functions whose behaviour is known. Theorem I. If φ(n) and ψ(n) tend to limits a, b, then φ(n) + ψ(n) tends to the limit a + b. This is almost obvious.* The argument which the reader will at once form in his mind is roughly this: 'when n is large, φ(n) is nearly equal to a *There is a certain ambiguity in this phrase which the reader will do well to notice. When one says 'such and such a theorem is almost obvious' one may mean one or other of two things. One may mean 'it is difficult to doubt the truth of the theorem', 'the theorem is such as common-sense instinctively accepts', as it accepts, for example, the truth of the propositions '2 + 2 = 4' or 'the base-angles of an isosceles triangle are equal'. That a theorem is 'obvious' in this sense does not prove that it is true, since the most confident of the intuitive judgments of common sense are often found to be mistaken; and even if the theorem is true, the fact that it is also 'obvious' is no reason for not proving it, if a proof can be found. The object of mathematics is to prove that [IV : 63] LIMITS OF FUNCTIONS OF A 150 and ψ(n) to b, and therefore their sum is nearly equal to a + b'. It is well to state the argument quite formally, however. Let ■ be any assigned positive number (e.g. .001, .000 000 1, . . .). We require to show that a number n0 can be found such that |φ(n) + ψ(n) – a – b| < ■, (1) when n ■ n0. Now by a proposition proved in Chap. III (more generally indeed than we need here) the modulus of the sum of two numbers is less than or equal to the sum of their moduli. Thus |φ(n) + ψ(n) – a – b| ■ |φ(n) – a| + |ψ(n) – b|. It follows that the desired condition will certainly be satisfied if n0 can be so chosen that |φ(n) – a| + |ψ(n) – b| < ■, (2) when n ■ n0. But this is certainly the case. For since lim φ(n) = a we can, by the definition of a limit, find n1 so that |φ(n) – a| < ■′ when n ■ n1, and this however small ■′ may be. Nothing prevents our taking ■′ = 1 2 ■, so that |φ(n) – a| < 1 2 ■ when n ■ n1. Similarly we can find n2 so that |ψ(n) – b| < 1 2 ■ when n ■ n2. Now take n0 to be the greater of the two numbers n1, n2. Then |φ(n) – a| < 1 2 ■ and |ψ(n) – b| < 1 2 ■ when n ■ n0, and therefore (2) is satisfied and the theorem is proved. The argument may be concisely stated thus: since lim φ(n) = a and lim ψ(n) = b, we can choose n1, n2 so that |φ(n) – a| < 1 2 ■ (n ■ n1), |ψ(n) – b| < 1 2 ■ (n ■ n2); certain premises imply certain conclusions; and the fact that the conclusions may be as 'obvious' as the premises never detracts from the necessity, and often not even from the interest of the proof. But sometimes (as for example here) we mean by 'this is almost obvious' something quite different from this. We mean 'a moment's reflection should not only convince the reader of the truth of what is stated, but should also suggest to him the general lines of a rigorous proof'. And often, when a statement is 'obvious' in this sense, one may well omit the proof, not because the proof is in any sense unnecessary, but because it is a waste of time and space to state in detail what the reader can easily supply for himself. [IV : 64] POSITIVE INTEGRAL VARIABLE 151 and then, if n is not less than either n1 or n2, |φ(n) + ψ(n) – a – b| ■ |φ(n) – a| + |ψ(n) – b| < ■; and therefore lim{φ(n) + ψ(n)} = a + b. 64. Results subsidiary to Theorem I. The reader should have no difficulty in verifying the following subsidiary results. 1. If φ(n) tends to a limit, but ψ(n) tends to +∞ or to –∞ or oscil- lates finitely or infinitely, then φ(n) + ψ(n) behaves like ψ(n). 2. If φ(n) → +∞, and ψ(n) → +∞ or oscillates finitely, then φ(n) + ψ(n) → +∞. In this statement we may obviously change +∞ into –∞ throughout. 3. If φ(n) → +∞ and ψ(n) → –∞, then φ(n) + ψ(n) may tend either to a limit or to +∞ or to –∞ or may oscillate either finitely or infinitely. These five possibilities are illustrated in order by (i) φ(n) = n, ψ(n) = –n, (ii) φ(n) = n2, ψ(n) = –n, (iii) φ(n) = n, ψ(n) = –n2, (iv) φ(n) = n + (–1)n, ψ(n) = –n, (v) φ(n) = n2 + (–1)nn, ψ(n) = –n2. The reader should construct additional examples of each case. 4. If φ(n) → +∞ and ψ(n) oscillates infinitely, then φ(n) + ψ(n) may tend to +∞ or oscillate infinitely, but cannot tend to a limit, or to –∞, or oscillate finitely. For ψ(n) = {φ(n) + ψ(n)} – φ(n); and, if φ(n) + ψ(n) behaved in any of the three last ways, it would follow, from the previous results, that ψ(n) → –∞, which is not the case. As examples of the two cases which are possible, consider (i) φ(n) = n2, ψ(n) = (–1)nn, (ii) φ(n) = n, ψ(n) = (–1)nn2. Here again the signs of +∞ and –∞ may be permuted throughout. 5. If φ(n) and ψ(n) both oscillate finitely, then φ(n) + ψ(n) must tend to a

limit or oscillate finitely. As examples take (i) φ(n) = (–1)n, ψ(n) = (–1)n+1, (ii) φ(n) = ψ(n) = (–1)n. [IV : 65] LIMITS OF FUNCTIONS OF A 152 6. If φ(n) oscillates finitely, and ψ(n) infinitely, then φ(n) + ψ(n) oscillates infinitely. For φ(n) is in absolute value always less than a certain constant, say K. On the other hand ψ(n), since it oscillates infinitely, must assume values numerically greater than any assignable number (e.g. 10K, 100K, . . .). Hence φ(n) + ψ(n) must assume values numerically greater than any assignable number (e.g. 9K, 99K, . . .). Hence φ(n) + ψ(n) must either tend to +∞ or –∞ or oscillate infinitely. But if it tended to +∞ then ψ(n) = {φ(n) + ψ(n)} – φ(n) would also tend to +∞, in virtue of the preceding results. Thus φ(n) + ψ(n) cannot tend to +∞, nor, for similar reasons, to –∞: hence it oscillates infinitely. 7. If both φ(n) and ψ(n) oscillate infinitely, then φ(n)+ψ(n) may tend to a limit, or to +∞, or to –∞, or oscillate either finitely or infinitely. Suppose, for instance, that φ(n) = (–1)nn, while ψ(n) is in turn each of the functions (–1)n+1n, {1 + (–1)n+1}n, –{1 + (–1)n}n, (–1)n+1(n + 1), (–1)nn. We thus obtain examples of all five possibilities. The results 1–7 cover all the cases which are really distinct. Before passing on to consider the product of two functions, we may point out that the result of Theorem I may be immediately extended to the sum of three or more functions which tend to limits as n → ∞. 65. B. The behaviour of the product of two functions whose behaviour is known. We can now prove a similar set of theorems concerning the product of two functions. The principal result is the following. Theorem II. If lim φ(n) = a and lim ψ(n) = b, then lim φ(n)ψ(n) = ab. Let φ(n) = a + φ1(n), ψ(n) = b + ψ1(n), [IV : 65] POSITIVE INTEGRAL VARIABLE 153 so that lim φ1(n) = 0 and lim ψ1(n) = 0. Then φ(n)ψ(n) = ab + aψ1(n) + bφ1(n) + φ1(n)ψ1(n). Hence the numerical value of the difference φ(n)ψ(n) – ab is certainly not greater than the sum of the numerical values of aψ1(n), bφ1(n), φ1(n)ψ1(n). From this it follows that lim{φ(n)ψ(n) – ab} = 0, which proves the theorem. The following is a strictly formal proof. We have |φ(n)ψ(n) – ab| ■ |aψ1(n)| + |bφ1(n)| + |φ1(n)||ψ1(n)|. Assuming that neither a nor b is zero, we may choose n0 so that |φ1(n)| < 1 3 ■/|b|, |ψ1(n)| < 1 3 ■/|a|, when n ■ n0. Then |φ(n)ψ(n) – ab| < 1 3 ■ + 1 3 ■ + { 1 9 ■2/(|a||b|)}, which is certainly less than ■ if ■ < 1 3 |a||b|. That is to say we can choose n0 so that |φ(n)ψ(n) – ab| < ■ when n ■ n0, and so the theorem follows. The reader should supply a proof for the case in which at least one of a and b is zero. We need hardly point out that this theorem, like Theorem I, may be immediately extended to the product of any number of functions of n. There is also a series of subsidiary theorems concerning products analogous to those stated in § 64 for sums. We must distinguish now six different ways in which φ(n) may behave as n tends to ∞. It may (1) tend to a limit other than zero, (2) tend to zero, (3a) tend to +∞, (3b) tend to –∞, (4) oscillate finitely, (5) oscillate infinitely. It is not necessary, as a rule, to take account separately of (3a) and (3b), as the results for one case may be deduced from those for the other by a change of sign. To state these subsidiary theorems at length would occupy more space than we can afford. We select the two which follow as examples, leaving the verifica- tion of them to the reader. He will find it an instructive exercise to formulate some of the remaining theorems himself. [IV : 66] LIMITS OF FUNCTIONS OF A 154 (i) If φ(n) → +∞ and ψ(n) oscillates finitely, then φ(n)ψ(n) must tend to +∞ or to –∞ or oscillate infinitely. Examples of these three possibilities may be obtained by taking φ(n) to be n and ψ(n) to be one of the three functions 2 + (–1)n, –2 – (–1)n, (–1)n. (ii) If φ(n) and ψ(n) oscillate finitely, then φ(n)ψ(n) must tend to a limit (which may be zero) or oscillate finitely. For examples, take (a) φ(n) = ψ(n) = (–1)n, (b) φ(n) = 1 + (–1)n, ψ(n) = 1 – (–1)n, and (c) φ(n) = cos 1 3 nπ, ψ(n) = sin 1 3 nπ. A particular case of Theorem II which is important is that in which ψ(n) is constant. The theorem then asserts simply that lim kφ(n) = ka if lim φ(n) = a. To this we may join the subsidiary theorem that if φ(n) → +∞ then kφ(n) → +∞ or kφ(n) → –∞, according as k is positive or negative, unless k = 0, when of course kφ(n) = 0 for all values of n and lim kφ(n) = 0. And if φ(n) oscillates finitely or infinitely, then so does kφ(n), unless k = 0. 66. C. The behaviour of the difference or quotient of two functions whose behaviour is known. There is, of course, a similar set of theorems for the difference of two given functions, which are obvious corollaries from what precedes. In order to deal with the quotient φ(n) ψ(n), we begin with the following theorem. Theorem III. If lim φ(n) = a, and a is not zero, then lim 1 φ(n) = 1 a. Let φ(n) = a + φ1(n), so that lim φ1(n) = 0. Then 1 φ(n) – 1 a = |φ1(n)| |a||a + φ1(n)|, [IV : 68] POSITIVE INTEGRAL VARIABLE 155 and it is plain, since lim φ1(n) = 0, that we can choose n0 so that this is smaller than any assigned number ■ when n ■ n0. From Theorems II and III we can at once deduce the principal theorem for quotients, viz. Theorem IV. If lim φ(n) = a and lim ψ(n) = b, and b is not zero, then lim φ(n) ψ(n) = a b . The reader will again find it instructive to formulate, prove, and il- lustrate by examples some of the ‘subsidiary theorems’ corresponding to Theorems III and IV. 67. Theorem V. If R{φ(n), ψ(n), χ(n), . . . } is any rational function of φ(n), ψ(n), χ(n), . . . , i.e. any function of the form P {φ(n), ψ(n), χ(n), . . . }/Q{φ(n), ψ(n), χ(n), . . . }, where P and Q denote polynomials in φ(n), ψ(n), χ(n), . . . : and if lim φ(n) = a, lim ψ(n) = b, lim χ(n) = c, . . . , and Q(a, b, c, . . .)■ = 0; then lim R{φ(n), ψ(n), χ(n), . . . } = R(a, b, c, . . .). For P is a sum of a finite number of terms of the type A{φ(n)}p{ψ(n)}q . . . , where A is a constant and p, q, . . . positive integers. This term, by Theorem II (or rather by its obvious extension to the product of any number of functions) tends to the limit Aapbq . . . , and so P tends to the limit P (a, b, c, . . .), by the similar extension of Theorem I. Similarly Q tends to Q(a, b, c, . . .); and the result then follows from Theorem IV. [IV : 68] LIMITS OF FUNCTIONS OF A 156 68. The preceding general theorem may be applied to the following very important particular problem: what is the behaviour of the most gen- eral rational function of n, viz. S(n) = a0np + a1np–1 + · · · + ap b0nq + b1nq–1 + · · · + bq , as n tends to ∞? * In order to apply the theorem we transform S(n) by writing it in the form np–q

a0 + a1 n + · · · + ap np

b0 + b1 n + · · · + bq nq

. The function in curly brackets is of the form R{φ(n)}, where φ(n) = 1/n, and therefore tends, as n tends to ∞, to the limit R(0) = a0/b0. Now np–q → 0 if p < q; np–q = 1 and np–q → 1 if p = q; and np–q → +∞ if p > q. Hence, by Theorem II, lim S(n) = 0 (p < q), lim S(n) = a0/b0 (p = q), S(n) → +∞ (p > q, a0/b0 positive), S(n) → –∞ (p > q, a0/b0 negative). Examples XXVI. 1. What is the behaviour of the functions n – 1 n + 1 2 , (–1)n n – 1 n + 1 2 , n2 + 1 n , (–1)n n2 + 1 n , as n → ∞? 2. Which (if any) of the functions 1/(cos2 1 2 nπ + n sin2 1 2 nπ), 1/{n(cos2 1 2 nπ + n sin2 1 2 nπ)}, (n cos2 1 2 nπ + sin2 1 2 nπ)/{n(cos2 1 2 nπ + n sin2 1 2 nπ)} tend to a limit as n → ∞? *We naturally suppose that neither a0 nor b0 is zero. [IV : 69] POSITIVE INTEGRAL VARIABLE 157 3. Denoting by S(n) the general rational function of n considered above, show that in all cases lim S(n + 1) S(n) = 1, lim S{n + (1/n)} S(n) = 1. 69. Functions of n which increase steadily with n. A special but particularly important class of functions of n is formed by those whose variation as n tends to ∞ is always in the same direction, that is to say those which always increase (or always decrease) as n increases. Since –φ(n) always increases if φ(n) always decreases, it is not necessary to consider the two kinds of functions separately; for theorems proved for one kind can at once be extended to the other. Definition. The function φ(n) will be said to increase steadily with n if φ(n + 1) ■ φ(n) for all values of n. It is to be observed that we do not exclude the case in which φ(n) has the same value for several values of n; all we exclude is possible decrease. Thus the function φ(n) = 2n + (–1)n, whose values for n = 0, 1, 2, 3, 4, . . . are 1, 1, 5, 5, 9, 9, . . . is said to increase steadily with n. Our definition would indeed include even functions which remain constant from some value of n onwards; thus φ(n) = 1 steadily increases according to our definition. However, as these functions are extremely special ones, and as there can be no doubt as to their behaviour as n tends to ∞, this apparent incongruity in the definition is not a serious defect. There is one exceedingly important theorem concerning functions of this class. Theorem. If φ(n) steadily increases with n, then either (i) φ(n) tends to a limit as n tends to ∞, or (ii) φ(n) → +∞. That is to say, while there are in general five alternatives as to the behaviour of a function, there are two only for this special kind of function. [IV : 69] LIMITS OF FUNCTIONS OF A 158 This theorem is a simple corollary of Dedekind's Theorem (§ 17). We divide the real numbers ξ into two classes L and R, putting ξ in L or R according as φ(n) ■ ξ for some value of n (and so of course for all greater values), or φ(n) < ξ for all values of n. The class L certainly exists; the class R may or may not. If it does not, then, given any number Δ, however large, φ(n) > Δ for all sufficiently large values of n, and so φ(n) → +∞. If on the other hand R exists, the classes L and R form a section of the real numbers in the sense of § 17. Let a be the number corresponding to the section, and let ■ be any positive number. Then φ(n) < a + ■ for all values of n, and so, since ■ is arbitrary, φ(n) ■ a. On the other hand φ(n) > a – ■ for some value of n, and so for all sufficiently large values. Thus a – ■ < φ(n) ■ a for all sufficiently large values of n; i.e. φ(n) → a. It should be observed that in general φ(n) < a for all values of n; for if φ(n) is equal to a for any value of n it must be equal to a for all greater values of n. Thus φ(n) can never be equal to a except in the case in which the values of φ(n) are ultimately all the same. If this is so, a is the largest member of L; otherwise L has no largest member. Cor 1. If φ(n) increases steadily with n, then it will tend to a limit or to +∞ according as it is or is not possible to find a number K such that φ(n) < K for all values of n. We shall find this corollary exceedingly useful later on. Cor 2. If φ(n) increases steadily with n, and φ(n) < K for all values of n, then φ(n) tends to a limit and this limit is less than or equal to K. It should be noticed that the limit may be equal to K: if e.g. φ(n) = 3 – (1/n), then every value of φ(n) is less than 3, but the limit is equal to 3. [IV : 71] POSITIVE INTEGRAL VARIABLE 159 Cor 3. If φ(n) increases steadily with n, and tends to a limit, then φ(n) ■ lim φ(n) for all values of n. The reader should write out for himself the corresponding theorems and corollaries for the case in which φ(n) decreases as n increases. 70. The great importance of these theorems lies in the fact that they give us (what we have so far been without) a means of deciding, in a great many cases, whether a given function of n does or does not tend to a limit as n → ∞, without requiring us to be able to guess or otherwise infer beforehand what the limit is. If we know what the limit, if there is one, must be, we can use the test |φ(n) – l| < ■ (n ■ n0) : as for example in the case of φ(n) = 1/n, where it is obvious that the limit can only be zero. But suppose we have to determine whether φ(n) =

1 + 1 n n tends to a limit. In this case it is not obvious what the limit, if there is one, will be: and it is evident that the test above, which involves l, cannot be used, at any rate directly, to decide whether l exists or not. Of course the test can sometimes be used indirectly, to prove by means of a reductio ad absurdum that l cannot exist. If e.g. φ(n) = (–1)n, it is clear that l would have to be equal to 1 and also equal to –1, which is obviously impossible. 71. Alternative proof of Weierstrass's Theorem of § 19. The results of § 69 enable us to give an alternative proof of the important theorem proved in § 19. If we divide P Q into two equal parts, one at least of them must contain infinitely many points of S. We select the one which does, or, if both do, we [IV : 72] LIMITS OF FUNCTIONS OF A 160P P1 Q2 Q1 QP2 P3 Q4 Q3 P4 T Fig. 28. select the left-hand half; and we denote the selected half by P1Q1 (Fig. 28). If P1Q1 is the left-hand half, P1 is the same point as P . Similarly, if we divide P1Q1 into two halves, one at least of

them must contain infinitely many points of S. We select the half P2Q2 which does so, or, if both do so, we select the left-hand half. Proceeding in this way we can define a sequence of intervals P Q, P1Q1, P2Q2, P3Q3, . . . , each of which is a half of its predecessor, and each of which contains infinitely many points of S. The points P , P1, P2, . . . progress steadily from left to right, and so Pn tends to a limiting position T . Similarly Qn tends to a limiting position T ′. But T T ′ is plainly less than PnQn, whatever the value of n; and PnQn, being equal to P Q/2n, tends to zero. Hence T ′ coincides with T , and Pn and Qn both tend to T . Then T is a point of accumulation of S. For suppose that ξ is its coordinate, and consider any interval of the type [ξ – ■, ξ + ■]. If n is sufficiently large, PnQn will lie entirely inside this interval.* Hence [ξ – ■, ξ + ■] contains infinitely many points of S. 72. The limit of xn as n tends to ∞. Let us apply the results of § 69 to the particularly important case in which φ(n) = xn. If x = 1 then φ(n) = 1, lim φ(n) = 1, and if x = 0 then φ(n) = 0, lim φ(n) = 0, so that these special cases need not detain us. First, suppose x positive. Then, since φ(n + 1) = xφ(n), φ(n) increases with n if x > 1, decreases as n increases if x < 1. *This will certainly be the case as soon as P Q/2n < ■. [IV : 72] POSITIVE INTEGRAL VARIABLE 161 If x > 1, then xn must tend either to a limit (which must obviously be greater than 1) or to +∞. Suppose it tends to a limit l. Then lim φ(n + 1) = lim φ(n) = l, by Exs. xxv. 7; but lim φ(n + 1) = lim xφ(n) = x lim φ(n) = xl, and therefore l = xl: and as x and l are both greater than 1, this is impossible. Hence xn → +∞ (x > 1). Example. The reader may give an alternative proof, showing by the bino- mial theorem that xn > 1 + nδ if δ is positive and x = 1 + δ, and so that xn → +∞. On the other hand xn is a decreasing function if x < 1, and must there- fore tend to a limit or to –∞. Since xn is positive the second alternative may be ignored. Thus lim xn = l, say, and as above l = xl, so that l must be zero. Hence lim xn = 0 (0 < x < 1). Example. Prove as in the preceding example that (1/x)n tends to +∞ if 0 < x < 1, and deduce that xn tends to 0. We have finally to consider the case in which x is negative. If –1 < x < 0 and x = –y, so that 0 < y < 1, then it follows from what precedes that lim yn = 0 and therefore lim xn = 0. If x = –1 it is obvious that xn oscillates, taking the values –1, 1 alternatively. Finally if x < –1, and x = –y, so that y > 1, then yn tends to +∞, and therefore xn takes values, both positive and negative, numerically greater than any assigned [IV : 72] LIMITS OF FUNCTIONS OF A 162 number. Hence xn oscillates infinitely. To sum up: φ(n) = xn → +∞ (x > 1), lim φ(n) = 1 (x = 1), lim φ(n) = 0 (–1 < x < 1), φ(n) oscillates finitely (x = –1), φ(n) oscillates infinitely (x < –1). Examples XXVII.* 1. If φ(n) is positive and φ(n+1) > Kφ(n), where K > 1, for all values of n, then φ(n) → +∞. [For φ(n) > Kφ(n – 1) > K2φ(n – 2) · · · > Kn–1φ(1), from which the conclusion follows at once, as Kn → ∞.] 2. The same result is true if the conditions above stated are satisfied only when n ■ n0. 3. If φ(n) is positive and φ(n + 1) < Kφ(n), where 0 < K < 1, then lim φ(n) = 0. This result also is true if the conditions are satisfied only when n ■ n0. 4. If |φ(n + 1)| < K|φ(n)| when n ■ n0, and 0 < K < 1, then lim φ(n) = 0. 5. If φ(n) is positive and lim{φ(n + 1)}/{φ(n)} = l > 1, then φ(n) → +∞. [For we can determine n0 so that {φ(n + 1)}/{φ(n)} > K > 1 when n ■ n0: we may, e.g., take K halfway between 1 and l. Now apply Ex. 1.] 6. If lim{φ(n + 1)}/{φ(n)} = l, where l is numerically less than unity, then lim φ(n) = 0. [This follows from Ex. 4 as Ex. 5 follows from Ex. 1.] 7. Determine the behaviour, as n → ∞, of φ(n) = nrxn, where r is any positive integer. [If x = 0 then φ(n) = 0 for all values of n, and φ(n) → 0. In all other cases φ(n + 1) φ(n) = n + 1 n r x → x. First suppose x positive. Then φ(n) → +∞ if x > 1 (Ex. 5) and φ(n) → 0 if x < 1 (Ex. 6). If x = 1, then φ(n) = nr → +∞. Next suppose x negative. Then *These examples are particularly important and several of them will be made use of later in the text. They should therefore be studied very carefully. [IV : 73] POSITIVE INTEGRAL VARIABLE 163 |φ(n)| = nr|x|n tends to +∞ if |x| ■ 1 and to 0 if |x| < 1. Hence φ(n) oscillates infinitely if x ■ –1 and φ(n) → 0 if –1 < x < 0.] 8. Discuss n–rxn in the same way. [The results are the same, except that φ(n) → 0 when x = 1 or –1.] 9. Draw up a table to show how nkxn behaves as n → ∞, for all real values of x, and all positive and negative integral values of k. [The reader will observe that the value of k is immaterial except in the special cases when x = 1 or –1. Since lim{(n + 1)/n}k = 1, whether k be positive or negative, the limit of the ratio φ(n + 1)/φ(n) depends only on x, and the behaviour of φ(n) is in general dominated by the factor xn. The factor nk only asserts itself when x is numerically equal to 1.] 10. Prove that if x is positive then n √x → 1 as n → ∞. [Suppose, e.g., x > 1. Then x, √x, 3 √x, . . . is a decreasing sequence, and n √x > 1 for all values of n. Thus n √x → l, where l ■ 1. But if l > 1 we can find values of n, as large as we please, for which n √x > l or x > ln; and, since ln → +∞ as n → ∞, this is impossible.] 11. n √n → 1. [For n+1 √n + 1 < n √n if (n + 1)n < nn+1 or {1 + (1/n)}n < n, which is certainly satisfied if n ■ 3 (see § 73 for a proof). Thus n √n decreases as n increases from 3 onwards, and, as it is always greater than unity, it tends to a limit which is greater than or equal to unity. But if n √n → l, where l > 1, then n > ln, which is certainly untrue for sufficiently large values of n, since ln/n → +∞ with n (Exs. 7, 8).] 12. n √n! → +∞. [However large Δ may be, n! > Δn if n is large enough. For if un = Δn/n! then un+1/un = Δ/(n + 1), which tends to zero as n → ∞, so that un does the same (Ex. 6).] 13. Show that if –1 < x < 1 then un = m(m – 1) . . . (m – n + 1) n! xn = m n

xn tends to zero as n → ∞. [If m is a positive integer, un = 0 for n > m. Otherwise un+1 un = m – n n + 1 x → –x, unless x = 0.] [IV : 74] LIMITS OF FUNCTIONS OF A 164 73. The limit of

1 + 1 n n . A more difficult problem which can be solved by the help of § 69 arises when φ(n) = {1 + 1/n}n. It follows from the binomial theorem* that

1 + 1 n n = 1 + n · 1 n + n(n – 1) 1 · 2 1 n2 + · · · + n(n – 1) . . . (n – n + 1) 1 · 2 . . . n 1 nn = 1 + 1 + 1 1 · 2

1 – 1 n

+ 1 1 · 2 · 3

1 – 1 n

1 – 2 n

+ . . . + 1 1 · 2 . . . n

1 – 1 n

1 – 2 n

. . .

1 – n – 1 n

. The (p + 1)th term in this expression, viz. 1 1 · 2 . . . p

1 – 1 n

1 – 2 n

. . .

1 – p – 1 n

, is positive and an increasing function of n, and the number of terms also increases with n. Hence

1 + 1 n n increases with n, and so tends to a limit or to +∞, as n → ∞. But 1 + 1 n n < 1 + 1 + 1 1 · 2 + 1 1 · 2 · 3 + · · · + 1 1 · 2 · 3 . . . n < 1 + 1 + 1 2 + 1 22 + · · · + 1 2n–1 < 3. Thus

1 + 1 n n cannot tend to +∞, and so lim n→∞

1 + 1 n n = e, where e is a number such that 2 < e ■ 3. *The binomial theorem for a positive integral exponent, which is what is used here, is a theorem of elementary algebra. The other cases of the theorem belong to the theory of infinite series, and will be considered later. [IV : 74] POSITIVE INTEGRAL VARIABLE 165 74. Some algebraical lemmas. It will be convenient to prove at this stage a number of elementary inequalities which will be useful to us later on. (i) It is evident that if α > 1 and r is a positive integer then rαr > αr–1 + αr–2 + · · · + 1. Multiplying both sides of this inequality by α – 1, we obtain rαr(α – 1) > αr – 1; and adding r(αr – 1) to each side, and dividing by r(r + 1), we obtain αr+1 – 1 r + 1 > αr – 1 r (α > 1). (1) Similarly we can prove that 1 – βr+1 r + 1 < 1 – βr r (0 < β < 1). (2) It follows that if r and s are positive integers, and r > s, then αr – 1 r > as – 1 s , 1 – βr r < 1 – βs s . (3) Here 0 < β < 1 < α. In particular, when s = 1, we have αr – 1 > r(α – 1), 1 – βr < r(1 – β). (4) (ii) The inequalities (3) and (4) have been proved on the supposition that r and s are positive integers. But it is easy to see that they hold under the more general hypothesis that r and s are any positive rational numbers. Let us consider, for example, the first of the inequalities (3). Let r = a/b, s = c/d, where a, b, c, d are positive integers; so that ad > bc. If we put α = γbd, the inequality takes the form (γad – 1)/ad > (γbc – 1)/bc; and this we have proved already. The same argument applies to the remaining inequalities; and it can evidently be proved in a similar manner that αs – 1 < s(α – 1), 1 – βs > s(1 – β), (5) [IV : 74] LIMITS OF FUNCTIONS OF A 166 if s is a positive rational number less than 1. (iii) In what follows it is to be understood that all the letters denote positive numbers, that r and s are rational, and that α and r are greater than 1, β and s less than 1. Writing 1/β for α, and 1/α for β, in (4), we obtain αr – 1 < rαr–1(α – 1), 1 – βr > rβr–1(1 – β). (6) Similarly, from (5), we deduce αs – 1 > sαs–1(α – 1), 1 – βs < sβs–1(1 – β). (7) Combining (4) and (6), we see that rαr–1(α – 1) > αr – 1 > r(α – 1). (8) Writing x/y for α, we obtain rxr–1(x – y) > xr – yr > ryr–1(x – y) (9) if x > y > 0. And the same argument, applied to (5) and (7), leads to sxs–1(x – y) < xs – ys < sys–1(x – y). (10) Examples XXVIII. 1. Verify (9) for r = 2, 3, and (10) for s = 1 2 , 1 3 . 2. Show that (9) and (10) are also true if y > x > 0. 3. Show that (9) also holds for r < 0. [See Chrystal's Algebra, vol. ii, pp. 43–45.] 4. If φ(n) → l, where l > 0, as n → ∞, then φk → lk, k being any rational number. [We may suppose that k > 0, in virtue of Theorem III of § 66; and that 1 2 l < φ < 2l, as is certainly the case from a certain value of n onwards. If k > 1, kφk–1(φ – l) > φk – lk > klk–1(φ – l) or klk–1(l – φ) > lk – φk > kφk–1(l – φ), [IV : 75] POSITIVE INTEGRAL VARIABLE 167 according as φ > l or φ < l. It follows that the ratio of |φk – lk| and |φ – l| lies between k(1 2 l)k–1 and k(2l)k–1. The proof is similar when 0 < k < 1. The result is still true when l =

0, if k > 0.] 5. Extend the results of Exs. xxvii. 7, 8, 9 to the case in which r or k are any rational numbers. 75. The limit of n(n √x – 1). If in the first inequality (3) of § 74 we put r = 1/(n – 1), s = 1/n, we see that (n – 1)(n–1 √α – 1) > n(n √α – 1) when α > 1. Thus if φ(n) = n(n √α – 1) then φ(n) decreases steadily as n in- creases. Also φ(n) is always positive. Hence φ(n) tends to a limit l as n → ∞, and l ■ 0. Again if, in the first inequality (7) of § 74, we put s = 1/n, we obtain n(n √α – 1) > n √α

1 – 1 α

> 1 – 1 α . Thus l ■ 1 – (1/α) > 0. Hence, if α > 1, we have lim n→∞ n(n √α – 1) = f (α), where f (α) > 0. Next suppose β < 1, and let β = 1/α; then n(n √β – 1) = –n(√α – 1)/ n √α. Now n(n √α – 1) → f (α), and (Exs. xxvii. 10) n √α → 1. Hence, if β = 1/α < 1, we have n(n pβ – 1) → –f (α). Finally, if x = 1, then n(n √x – 1) = 0 for all values of n. Thus we arrive at the result: the limit lim n(n √x – 1) defines a function of x for all positive values of x. This function f (x) possesses the properties f (1/x) = –f (x), f (1) = 0, and is positive or negative according as x > 1 or x < 1. Later on we shall be able to identify this function with the Napierian logarithm of x. [IV : 76] LIMITS OF FUNCTIONS OF A 168 Example. Prove that f (xy) = f (x) + f (y). [Use the equations f (xy) = lim n(n √xy – 1) = lim{n(n √x – 1) n √y + n(n √y – 1)}.] 76. Infinite Series. Suppose that u(n) is any function of n defined for all values of n. If we add up the values of u(ν) for ν = 1, 2, . . . n, we obtain another function of n, viz. s(n) = u(1) + u(2) + · · · + u(n), also defined for all values of n. It is generally most convenient to alter our notation slightly and write this equation in the form sn = u1 + u2 + · · · + un, or, more shortly, sn = nX ν=1 uν . If now we suppose that sn tends to a limit s when n tends to ∞, we have lim n→∞ nX ν=1 uν = s. This equation is usually written in one of the forms ∞X ν=1 uν = s, u1 + u2 + u3 + · · · = s, the dots denoting the indefinite continuance of the series of u's. The meaning of the above equations, expressed roughly, is that by adding more and more of the u's together we get nearer and nearer to the limit s. More precisely, if any small positive number ■ is chosen, we can [IV : 77] POSITIVE INTEGRAL VARIABLE 169 choose n0(■) so that the sum of the first n0(■) terms, or any of greater number of terms, lies between s – ■ and s + ■; or in symbols s – ■ < sn < s + ■, if n ■ n0(■). In these circumstances we shall call the series u1 + u2 + . . . a convergent infinite series, and we shall call s the sum of the series, or the sum of all the terms of the series. Thus to say that the series u1 + u2 + . . . converges and has the sum s, or converges to the sum s or simply converges to s, is merely another way of stating that the sum sn = u1 + u2 + · · · + un of the first n terms tends to the limit s as n → ∞, and the consideration of such infinite series introduces no new ideas beyond those with which the early part of this chapter should already have made the reader familiar. In fact the sum sn is merely a function φ(n), such as we have been considering, expressed in a particular form. Any function φ(n) may be expressed in this form, by writing φ(n) = φ(1) + {φ(2) – φ(1)} + · · · + {φ(n) – φ(n – 1)}; and it is sometimes convenient to say that φ(n) converges (instead of 'tends') to the limit l, say, as n → ∞. If sn → +∞ or sn → –∞, we shall say that the series u1 + u2 + . . . is divergent or diverges to +∞, or –∞, as the case may be. These phrases too may be applied to any function φ(n): thus if φ(n) → +∞ we may say that φ(n) diverges to +∞. If sn does not tend to a limit or to +∞ or to –∞, then it oscillates finitely or infinitely: in this case we say that the series u1 + u2 + . . . oscillates finitely or infinitely.* *The reader should be warned that the words 'divergent' and 'oscillatory' are used differently by different writers. The use of the words here agrees with that of Bromwich's Infinite Series. In Hobson's Theory of Functions of a Real Variable a series is said to oscillate only if it oscillates finitely, series which oscillate infinitely being classed as 'divergent'. Many foreign writers use 'divergent' as meaning merely 'not convergent'. [IV : 77] LIMITS OF FUNCTIONS OF A 170 77. General theorems concerning infinite series. When we are dealing with infinite series we shall constantly have occasion to use the following general theorems. (1) If u1 +u2 +. . . is convergent, and has the sum s, then a+u1 +u2 +. . . is convergent and has the sum a+s. Similarly a+b+c+· · ·+k+u1 +u2 +. . . is convergent and has the sum a + b + c + · · · + k + s. (2) If u1 + u2 + . . . is convergent and has the sum s, then um+1 + um+2 + . . . is convergent and has the sum s – u1 – u2 – · · · – um. (3) If any series considered in (1) or (2) diverges or oscillates, then so do the others. (4) If u1 +u2 +. . . is convergent and has the sum s, then ku1 +ku2 +. . . is convergent and has the sum ks. (5) If the first series considered in (4) diverges or oscillates, then so does the second, unless k = 0. (6) If u1 + u2 + . . . and v1 + v2 + . . . are both convergent, then the series (u1 + v1) + (u2 + v2) + . . . is convergent and its sum is the sum of the first two series. All these theorems are almost obvious and may be proved at once from the definitions or by applying the results of §§ 63–66 to the sum sn = u1 + u2 + · · · + un. Those which follow are of a somewhat different character. (7) If u1 + u2 + . . . is convergent, then lim un = 0. For un = sn – sn–1, and sn and sn–1 have the same limit s. Hence lim un = s – s = 0. The reader may be tempted to think that the converse of the theorem is true and that if lim un = 0 then the series P un must be convergent. That this is not the case is easily seen from an example. Let the series be 1 + 1 2 + 1 3 + 1 4 + . . . so that un = 1/n. The sum of the first four terms is 1 + 1 2 + 1 3 + 1 4 > 1 + 1 2 + 2 4 = 1 + 1 2 + 1 2 . [IV : 77] POSITIVE INTEGRAL VARIABLE 171 The sum of the next four terms is 1 5 + 1 6 + 1 7 + 1 8 > 4 8 = 1 2 ; the sum of the next eight terms is greater than 8 16 = 1 2 , and so on. The sum of the first 4 + 4 + 8 + 16 + · · · + 2n = 2n+1 terms is greater than 2 + 1 2 + 1 2 + 1 2 + · · · + 1 2 = 1 2 (n + 3), and this increases beyond all limit with n: hence the series diverges to +∞. (8) If u1 + u2 + u3 + . . . is convergent, then so is any series formed by grouping the terms in brackets in any way to form new single terms, and the sums of

the two series are the same. The reader will be able to supply the proof of this theorem. Here again the converse is not true. Thus 1 – 1 + 1 – 1 + . . . oscillates, while (1 – 1) + (1 – 1) + . . . or 0 + 0 + 0 + . . . converges to 0. (9) If every term un is positive (or zero), then the series P un must either converge or diverge to +∞. If it converges, its sum must be positive (unless all the terms are zero, when of course its sum is zero). For sn is an increasing function of n, according to the definition of § 69, and we can apply the results of that section to sn. (10)If every term un is positive (or zero), then the necessary and suffi- cient condition that the series P un should be convergent is that it should be possible to find a number K such that the sum of any number of terms is less than K; and, if K can be so found, then the sum of the series is not greater than K. This also follows at once from § 69. It is perhaps hardly necessary to point out that the theorem is not true if the condition that every un is positive is not fulfilled. For example 1 – 1 + 1 – 1 + . . . obviously oscillates, sn being alternately equal to 1 and to 0. [IV : 78] LIMITS OF FUNCTIONS OF A 172 (11) If u1 + u2 + . . . , v1 + v2 + . . . are two series of positive (or zero) terms, and the second series is convergent, and if un ■ Kvn, where K is a constant, for all values of n, then the first series is also convergent, and its sum is less than or equal to K times that of the second. For if v1 + v2 + · · · = t then v1 + v2 + · · · + vn ■ t for all values of n, and so u1 + u2 + · · · + un ■ Kt; which proves the theorem. Conversely, if P un is divergent, and vn ■ Kun, then P vn is divergent. 78. The infinite geometrical series. We shall now consider the ‘geometrical’ series, whose general term is un = rn–1. In this case sn = 1 + r + r2 + · · · + rn–1 = (1 – rn)/(1 – r), except in the special case in which r = 1, when sn = 1 + 1 + · · · + 1 = n. In the last case sn → +∞. In the general case sn will tend to a limit if and only if rn does so. Referring to the results of § 72 we see that the series 1 + r + r2 + . . . is convergent and has the sum 1/(1 – r) if and only if –1 < r < 1. If r ■ 1, then sn ■ n, and so sn → +∞; i.e. the series diverges to +∞. If r = –1, then sn = 1 or sn = 0 according as n is odd or even: i.e. sn oscillates finitely. If r < –1, then sn oscillates infinitely. Thus, to sum up, the series 1 + r + r2 + . . . diverges to +∞ if r ■ 1, converges to 1/(1 – r) if –1 < r < 1, oscillates finitely if r = –1, and oscillates infinitely if r < –1. Examples XXIX. 1. Recurring decimals. The commonest exam- ple of an infinite geometric series is given by an ordinary recurring decimal. Consider, for example, the decimal .21713. This stands, according to the ordi- nary rules of arithmetic, for 2 10 + 1 102 + 7 103 + 1 104 + 3 105 + 1 106 + 3 107 +· · · = 217 1000 + 13 105

1 – 1 102

= 2687 12,375 . [IV : 78] POSITIVE INTEGRAL VARIABLE 173 The reader should consider where and how any of the general theorems of § 77 have been used in this reduction. 2. Show that in general .a1a2 . . . amα1α2 . . . αn = a1a2 . . . amα1 . . . αn – a1a2 . . . an 99 . . . 900 . . . 0 , the denominator containing n 9’s and m 0’s. 3. Show that a pure recurring decimal is always equal to a proper fraction whose denominator does not contain 2 or 5 as a factor. 4. A decimal with m non-recurring and n recurring decimal figures is equal to a proper fraction whose denominator is divisible by 2m or 5m but by no higher power of either. 5. The converses of Exs. 3, 4 are also true. Let r = p/q, and suppose first that q is prime to 10. If we divide all powers of 10 by q we can obtain at most q different remainders. It is therefore possible to find two numbers n1 and n2, where n1 > n2, such that 10n1 and 10n2 give the same remainder. Hence 10n1 – 10n2 = 10n2 (10n1–n2 – 1) is divisible by q, and so 10n – 1, where n = n1 –n2, is divisible by q. Hence r may be expressed in the form P/(10n –1), or in the form P 10n + P 102n + . . . , i.e. as a pure recurring decimal with n figures. If on the other hand q = 2α5β Q, where Q is prime to 10, and m is the greater of α and β, then 10mr has a denominator prime to 10, and is therefore expressible as the sum of an integer and a pure recurring decimal. But this is not true of 10μr, for any value of μ less than m; hence the decimal for r has exactly m non-recurring figures. 6. To the results of Exs. 2–5 we must add that of Ex. i. 3. Finally, if we observe that .9 = 9 10 + 9 102 + 9 103 + · · · = 1, we see that every terminating decimal can also be expressed as a mixed recurring decimal whose recurring part is composed entirely of 9’s. For example, .217 = .2169. Thus every proper fraction can be expressed as a recurring decimal, and conversely. 7. Decimals in general. The expression of irrational numbers as non-recurring decimals. Any decimal, whether recurring or not, corresponds [IV : 78] LIMITS OF FUNCTIONS OF A 174 to a definite number between 0 and 1. For the decimal .a1a2a3a4 . . . stands for the series a1 10 + a2 102 + a3 103 + ... Since all the digits ar are positive, the sum sn of the first n terms of this series increases with n, and it is certainly not greater than .9 or 1. Hence sn tends to a limit between 0 and 1. Moreover no two decimals can correspond to the same number (except in the special case noticed in Ex. 6). For suppose that .a1a2a3 . . . , .b1b2b3 . . . are two decimals which agree as far as the figures ar–1, br–1, while ar > br. Then ar ■ br + 1 > br.br+1br+2 . . . (unless br+1, br+2, . . . are all 9’s), and so .a1a2 . . . arar+1 · · · > .b1b2 . . . brbr+1 . . . . It follows that the expression of a rational fraction as a recurring decimal (Exs. 2–6) is unique. It also follows that every decimal which does not recur represents some irrational number between 0 and 1. Conversely, any such number can be expressed as such a decimal. For it must lie in one of the intervals 0, 1/10; 1/10, 2/10; . . . ; 9/10, 1. If it lies between r/10 and (r + 1)/10, then the first figure is r. By subdividing this interval into 10 parts we can determine the second figure; and so on. But (Exs. 3, 4) the decimal cannot recur. Thus, for example, the decimal 1.414 . . . , obtained by the ordinary process for the extraction of √2, cannot recur. 8. The decimals .101 001 000 100 001 0 . . . and .202 002 000 200 002 0 . . . , in which the number of zeros between two 1’s

or 2's increases by one at each stage, represent irrational numbers. 9. The decimal .111 010 100 010 10 . . . , in which the nth figure is 1 if n is prime, and zero otherwise, represents an irrational number. [Since the number of primes is infinite the decimal does not terminate. Nor can it recur: for if it did we could determine m and p so that m, m + p, m + 2p, m + 3p, . . . are all prime numbers; and this is absurd, since the series includes m + mp.]* *All the results of Exs. xxix may be extended, with suitable modifications, to decimals in any scale of notation. For a fuller discussion see Bromwich, Infinite Series, Appendix I. [IV : 78] POSITIVE INTEGRAL VARIABLE 175 Examples XXX. 1. The series rm + rm+1 + . . . is convergent if –1 < r < 1, and its sum is 1/(1 – r) – 1 – r – · · · – rm–1 (§ 77, (2)). 2. The series rm + rm+1 + . . . is convergent if –1 < r < 1, and its sum is rm/(1 – r) (§ 77, (4)). Verify that the results of Exs. 1 and 2 are in agreement. 3. Prove that the series 1 + 2r + 2r2 + . . . is convergent, and that its sum is (1 + r)/(1 – r), (α) by writing it in the form –1 + 2(1 + r + r2 + . . .), (β) by writing it in the form 1 + 2(r + r2 + . . .), (γ) by adding the two series 1 + r + r2 + . . . , r + r2 + ... In each case mention which of the theorems of § 77 are used in your proof. 4. Prove that the 'arithmetic' series a + (a + b) + (a + 2b) + . . . is always divergent, unless both a and b are zero. Show that, if b is not zero, the series diverges to +∞ or to –∞ according to the sign of b, while if b = 0 it diverges to +∞ or –∞ according to the sign of a. 5. What is the sum of the series (1 – r) + (r – r2) + (r2 – r3) + . . . when the series is convergent? [The series converges only if –1 < r ■ 1. Its sum is 1, except when r = 1, when its sum is 0.] 6. Sum the series r2 + r2 1 + r2 + r2 (1 + r2)2 + ... [The series is always convergent. Its sum is 1 + r2, except when r = 0, when its sum is 0.] 7. If we assume that 1 + r + r2 + . . . is convergent then we can prove that its sum is 1/(1 – r) by means of § 77, (1) and (4). For if 1 + r + r2 + · · · = s then s = 1 + r(1 + r2 + . . .) = 1 + rs. 8. Sum the series r + r 1 + r + r (1 + r)2 + . . . [IV : 78] LIMITS OF FUNCTIONS OF A 176 when it is convergent. [The series is convergent if –1 < 1/(1 + r) < 1, i.e. if r < –2 or if r > 0, and its sum is 1 + r. It is also convergent when r = 0, when its sum is 0.] 9. Answer the same question for the series r – r 1 + r + r (1 + r)2 – . . . , r + r 1 – r + r (1 – r)2 + . . . , 1 – r 1 + r + r 1 + r 2 – . . . , 1 + r 1 – r + r 1 – r 2 + ... 10. Consider the convergence of the series (1 + r) + (r2 + r3) + . . . , (1 + r + r2) + (r3 + r4 + r5) + . . . , 1 – 2r + r2 + r3 – 2r4 + r5 + . . . , (1 – 2r + r2) + (r3 – 2r4 + r5) + . . . , and find their sums when they are convergent. 11. If 0 ■ an ■ 1 then the series a0 + a1r + a2r2 + . . . is convergent for 0 ■ r < 1, and its sum is not greater than 1/(1 – r). 12. If in addition the series a0 + a1 + a2 + . . . is convergent, then the series a0 + a1r + a2r2 + . . . is convergent for 0 ■ r ■ 1, and its sum is not greater than the lesser of a0 + a1 + a2 + . . . and 1/(1 – r). 13. The series 1 + 1 1 + 1 1 · 2 + 1 1 · 2 · 3 + . . . is convergent. [For 1/(1 · 2 . . . n) ■ 1/2n–1.] 14. The series 1 + 1 1 · 2 + 1 1 · 2 · 3 · 4 + . . . , 1 1 + 1 1 · 2 · 3 + 1 1 · 2 · 3 · 4 · 5 + . . . are convergent. 15. The general harmonic series 1 a + 1 a + b + 1 a + 2b + . . . , where a and b are positive, diverges to +∞. [For un = 1/(a + nb) > 1/{n(a + b)}. Now compare with 1 + 1 2 + 1 3 + ...] [IV : 79] POSITIVE INTEGRAL VARIABLE 177 16. Show that the series (u0 – u1) + (u1 – u2) + (u2 – u3) + . . . is convergent if and only if un tends to a limit as n → ∞. 17. If u1 + u2 + u3 + . . . is divergent then so is any series formed by grouping the terms in brackets in any way to form new single terms. 18. Any series, formed by taking a selection of the terms of a convergent series of positive terms, is itself convergent. 79. The representation of functions of a continuous real vari- able by means of limits. In the preceding sections we have frequently been concerned with limits such as lim n→∞ φn(x), and series such as u1(x) + u2(x) + · · · = lim n→∞{u1(x) + u2(x) + · · · + un(x)}, in which the function of n whose limit we are seeking involves, besides n, another variable x. In such cases the limit is of course a function of x. Thus in § 75 we encountered the function f (x) = lim n→∞ n(n √x – 1) : and the sum of the geometrical series 1 + x + x2 + . . . is a function of x, viz. the function which is equal to 1/(1 – x) if –1 < x < 1 and is undefined for all other values of x. Many of the apparently 'arbitrary' or 'unnatural' functions considered in Ch. II are capable of a simple representation of this kind, as will appear from the following examples. [IV : 79] LIMITS OF FUNCTIONS OF A 178 Examples XXXI. 1. φn(x) = x. Here n does not appear at all in the expression of φn(x), and φ(x) = lim φn(x) = x for all values of x. 2. φn(x) = x/n. Here φ(x) = lim φn(x) = 0 for all values of x. 3. φn(x) = nx. If x > 0, φn(x) → +∞; if x < 0, φn(x) → –∞: only when x = 0 has φn(x) a limit (viz. 0) as n → ∞. Thus φ(x) = 0 when x = 0 and is not defined for any other value of x. 4. φn(x) = 1/nx, nx/(nx + 1). 5. φn(x) = xn. Here φ(x) = 0, (–1 < x < 1); φ(x) = 1, (x = 1); and φ(x) is not defined for any other value of x. 6. φn(x) = xn(1 – x). Here φ(x) differs from the φ(x) of Ex. 5 in that it has the value 0 when x = 1. 7. φn(x) = xn/n. Here φ(x) differs from the φ(x) of Ex. 6 in that it has the value 0 when x = –1 as well as when x = 1. 8. φn(x) = xn/(xn + 1). [φ(x) = 0, (–1 < x < 1); φ(x) = 1 2 , (x = 1); φ(x) = 1, (x < –1 or x > 1); and φ(x) is not defined when x = –1.] 9. φn(x) = xn/(xn – 1), 1/(xn + 1), 1/(xn – 1), 1/(xn + x–n), 1/(xn – x–n). 10. φn(x) = (xn – 1)/(xn + 1), (nxn – 1)/(nxn + 1), (xn – n)/(xn + n). [In the first case φ(x) = 1 when |x| > 1, φ(x) = –1 when |x| < 1, φ(x) = 0 when x = 1 and φ(x) is not defined when x = –1. The second and third functions differ from the first in that they are defined both when x = 1 and when x = –1: the second has the value 1 and the third the value –1 for both these values of x.] 11. Construct an example in which φ(x) = 1, (|x| > 1); φ(x) = –1, (|x| < 1); and φ(x) = 0, (x = 1 and x = –1). 12. φn(x) = x{(x2n – 1)/(x2n + 1)}2, n/(xn + x–n + n). 13. φn(x) = {xnf (x) + g(x)}/(xn + 1). [Here φ(x) = f (x), (|x| > 1); φ(x) = g(x), (|x| < 1); φ(x) = 1 2 {f (x) + g(x)}, (x = 1); and φ(x) is undefined when x = –1.] 14. φn(x) = (2/π) arc tan(nx). [φ(x) = 1, (x > 0); φ(x) = 0, (x = 0); φ(x) = –1, (x < 0). This function is important in the Theory of Numbers, and is usually denoted by sgn x.] 15. φn(x) = sin nxπ. [φ(x) = 0 when x is an integer; and φ(x) is otherwise undefined (Ex. xxiv. 7).] 16. If φn(x) = sin(n! xπ) then φ(x) = 0 for all rational values of x (Ex. xxiv. 14). [The consideration of irrational

values presents greater difficul- [IV : 80] POSITIVE INTEGRAL VARIABLE 179 ties.] 17. φn(x) = (cos2 xπ)n. [φ(x) = 0 except when x is integral, when φ(x) = 1.] 18. If N ■ 1752 then the number of days in the year N a.d. is lim{365 + (cos2 1 4 N π)n – (cos2 1 100 N π)n + (cos2 1 400 N π)n}. 80. The bounds of a bounded aggregate. Let S be any system or aggregate of real numbers s. If there is a number K such that s ■ K for every s of S, we say that S is bounded above. If there is a number k such that s ■ k for every s, we say that S is bounded below. If S is both bounded above and bounded below, we say simply that S is bounded. Suppose first that S is bounded above (but not necessarily below). There will be an infinity of numbers which possess the property possessed by K; any number greater than K, for example, possesses it. We shall prove that among these numbers there is a least,* which we shall call M . This number M is not exceeded by any member of S, but every number less than M is exceeded by at least one member of S. We divide the real numbers ξ into two classes L and R, putting ξ into L or R according as it is or is not exceeded by members of S. Then every ξ belongs to one and one only of the classes L and R. Each class exists; for any number less than any member of S belongs to L, while K belongs to R. Finally, any member of L is less than some member of S, and therefore less than any member of R. Thus the three conditions of Dedekind's Theorem (§ 17) are satisfied, and there is a number M dividing the classes. The number M is the number whose existence we had to prove. In the first place, M cannot be exceeded by any member of S. For if there were such a member s of S, we could write s = M + η, where η is positive. The number M + 1 2 η would then belong to L, because it is less than s, and to R, because it is greater than M ; and this is impossible. On the other hand, any number less *An infinite aggregate of numbers does not necessarily possess a least member. The set consisting of the numbers 1, 1 2 , 1 3 , . . . , 1 n , . . . , for example, has no least member. [IV : 82] LIMITS OF FUNCTIONS OF A 180 than M belongs to L, and is therefore exceeded by at least one member of S. Thus M has all the properties required. This number M we call the upper bound of S, and we may enunciate the fol- lowing theorem. Any aggregate S which is bounded above has an upper bound M . No member of S exceeds M ; but any number less than M is exceeded by at least one member of S. In exactly the same way we can prove the corresponding theorem for an aggregate bounded below (but not necessarily above). Any aggregate S which is bounded below has a lower bound m. No member of S is less than m; but there is at least one member of S which is less than any number greater than m. It will be observed that, when S is bounded above, M ■ K, and when S is bounded below, m ■ k. When S is bounded, k ■ m ■ M ■ K. 81. The bounds of a bounded function. Suppose that φ(n) is a function of the positive integral variable n. The aggregate of all the values φ(n) defines a set S, to which we may apply all the arguments of § 80. If S is bounded above, or bounded below, or bounded, we say that φ(n) is bounded above, or bounded below, or bounded. If φ(n) is bounded above, that is to say if there is a number K such that φ(n) ■ K for all values of n, then there is a number M such that (i) φ(n) ■ M for all values of n; (ii) if ■ is any positive number then φ(n) > M – ■ for at least one value of n. This number M we call the upper bound of φ(n). Similarly, if φ(n) is bounded below, that is to say if there is a number k such that φ(n) ■ k for all values of n, then there is a number m such that (i) φ(n) ■ m for all values of n; (ii) if ■ is any positive number then φ(n) < m + ■ for at least one value of n. This number m we call the lower bound of φ(n). If K exists, M ■ K; if k exists, m ■ k; and if both k and K exist then k ■ m ■ M ■ K. 82. The limits of indetermination of a bounded function. Sup- pose that φ(n) is a bounded function, and M and m its upper and lower bounds. Let us take any real number ξ, and consider now the relations of inequality which [IV : 82] POSITIVE INTEGRAL VARIABLE 181 may hold between ξ and the values assumed by φ(n) for large values of n. There are three mutually exclusive possibilities: (1) ξ ■ φ(n) for all sufficiently large values of n; (2) ξ ■ φ(n) for all sufficiently large values of n; (3) ξ < φ(n) for an infinity of values of n, and also ξ > φ(n) for an infinity of values of n. In case (1) we shall say that ξ is a superior number, in case (2) that it is an inferior number, and in case (3) that it is an intermediate number. It is plain that no superior number can be less than m, and no inferior number greater than M . Let us consider the aggregate of all superior numbers. It is bounded below, since none of its members are less than m, and has therefore a lower bound, which we shall denote by Λ. Similarly the aggregate of inferior numbers has an upper bound, which we denote by λ. We call Λ and λ respectively the upper and lower limits of indetermination of φ(n) as n tends to infinity; and write Λ = lim φ(n), λ = lim φ(n). These numbers have the following properties: (1) m ■ λ ■ Λ ■ M ; (2) Λ and λ are the upper and lower bounds of the aggregate of intermediate numbers, if any such exist; (3) if ■ is any positive number, then φ(n) < Λ + ■ for all sufficiently large values of n, and φ(n) > Λ – ■ for an infinity of values of n; (4) similarly φ(n) > λ – ■ for all sufficiently large values of n, and φ(n) < λ + ■ for an infinity of values of n; (5) the necessary and sufficient condition that φ(n) should tend to a limit is that Λ = λ, and in this case the limit is l, the common value of λ and Λ. Of these properties, (1) is an immediate consequence of the definitions; and we can prove (2) as follows. If Λ = λ = l, there can be at most one intermediate number, viz. l, and there is nothing to prove. Suppose then that Λ > λ. Any intermediate number ξ is less than any superior and greater than any inferior number, so that λ ■ ξ ■ Λ. But if λ < ξ < Λ then ξ must be intermediate, since it is plainly neither superior nor inferior. Hence there are intermediate numbers as near as we please to either λ or Λ. [IV : 82] LIMITS OF FUNCTIONS OF A 182 To prove (3) we observe that Λ + ■ is superior and Λ – ■ intermediate or inferior. The result is then an immediate consequence of the definitions; and the proof of (4) is substantially the same. Finally (5) may be proved as follows. If Λ = λ = l, then l – ■ < φ(n) < l + ■ for every positive

value of ■ and all sufficiently large values of n, so that φ(n) → l. Conversely, if φ(n) → l, then the inequalities above written hold for all sufficiently large values of n. Hence l – ■ is inferior and l + ■ superior, so that λ ■ l – ■, Λ ■ l + ■, and therefore Λ – λ ■ 2■. As Λ – λ ■ 0, this can only be true if Λ = λ. Examples XXXII. 1. Neither Λ nor λ is affected by any alteration in any finite number of values of φ(n). 2. If φ(n) = a for all values of n, then m = λ = Λ = M = a. 3. If φ(n) = 1/n, then m = λ = Λ = 0 and M = 1. 4. If φ(n) = (–1)n, then m = λ = –1 and Λ = M = 1. 5. If φ(n) = (–1)n/n, then m = –1, λ = Λ = 0, M = 1 2 . 6. If φ(n) = (–1)n{1 + (1/n)}, then m = –2, λ = –1, Λ = 1, M = 3 2 . 7. Let φ(n) = sin nθπ, where θ > 0. If θ is an integer then m = λ = Λ = M = 0. If θ is rational but not integral a variety of cases arise. Suppose, e.g., that θ = p/q, p and q being positive, odd, and prime to one another, and q > 1. Then φ(n) assumes the cyclical sequence of values sin(pπ/q), sin(2pπ/q), . . . , sin{(2q – 1)pπ/q}, sin(2qpπ/q), ... It is easily verified that the numerically greatest and least values of φ(n) are cos(π/2q) and – cos(π/2q), so that m = λ = – cos(π/2q), Λ = M = cos(π/2q). The reader may discuss similarly the cases which arise when p and q are not both odd. [IV : 84] POSITIVE INTEGRAL VARIABLE 183 The case in which θ is irrational is more difficult: it may be shown that in this case m = λ = –1 and Λ = M = 1. It may also be shown that the values of φ(n) are scattered all over the interval [–1, 1] in such a way that, if ξ is any number of the interval, then there is a sequence n1, n2, . . . such that φ(nk) → ξ as k → ∞.* The results are very similar when φ(n) is the fractional part of nθ. 83. The general principle of convergence for a bounded func- tion. The results of the preceding sections enable us to formulate a very important necessary and sufficient condition that a bounded function φ(n) should tend to a limit, a condition usually referred to as the general principle of con- vergence to a limit. Theorem 1. The necessary and sufficient condition that a bounded func- tion φ(n) should tend to a limit is that, when any positive number ■ is given, it should be possible to find a number n0(■) such that |φ(n2) – φ(n1)| < ■ for all values of n1 and n2 such that n2 > n1 ■ n0(■). In the first place, the condition is necessary. For if φ(n) → l then we can find n0 so that l – 1 2 ■ < φ(n) < l + 1 2 ■ when n ■ n0, and so |φ(n2) – φ(n1)| < ■ (1) when n1 ■ n0 and n2 ■ n0. In the second place, the condition is sufficient. In order to prove this we have only to show that it involves λ = Λ. But if λ < Λ then there are, however small ■ may be, infinitely many values of n such that φ(n) < λ + ■ and infinitely many such that φ(n) > Λ – ■; and therefore we can find values of n1 and n2, each greater than any assigned number n0, and such that φ(n2) – φ(n1) > Λ – λ – 2■, which is greater than 1 2 (Λ – λ) if ■ is small enough. This plainly contradicts the inequality (1). Hence λ = Λ, and so φ(n) tends to a limit. *A number of simple proofs of this result are given by Hardy and Littlewood, “Some Problems of Diophantine Approximation”, Acta Mathematica, vol. xxxvii. [IV : 85] LIMITS OF FUNCTIONS OF A 184 84. Unbounded functions. So far we have restricted ourselves to bounded functions; but the ‘general principle of convergence’ is the same for unbounded as for bounded functions, and the words ‘a bounded function’ may be omitted from the enunciation of Theorem 1. In the first place, if φ(n) tends to a limit l then it is certainly bounded; for all but a finite number of its values are less than l + ■ and greater than l – ■. In the second place, if the condition of Theorem 1 is satisfied, we have |φ(n2) – φ(n1)| < ■ whenever n1 ■ n0 and n2 ■ n0. Let us choose some particular value n1 greater than n0. Then φ(n1) – ■ < φ(n2) < φ(n1) + ■ when n2 ■ n0. Hence φ(n) is bounded; and so the second part of the proof of the last section applies also. The theoretical importance of the ‘general principle of convergence’ can hardly be overestimated. Like the theorems of § 69, it gives us a means of deciding whether a function φ(n) tends to a limit or not, without requiring us to be able to tell beforehand what the limit, if it exists, must be; and it has not the limitations inevitable in theorems of such a special character as those of § 69. But in elementary work it is generally possible to dispense with it, and to obtain all we want from these special theorems. And it will be found that, in spite of the importance of the principle, practically no applications are made of it in the chapters which follow.* We will only remark that, if we suppose that φ(n) = sn = u1 + u2 + · · · + un, we obtain at once a necessary and sufficient condition for the convergence of an infinite series, viz: Theorem 2. The necessary and sufficient condition for the convergence of the series u1 + u2 + . . . is that, given any positive number ■, it should be possible to find n0 so that |un1+1 + un1+2 + · · · + un2 | < ■ for all values of n1 and n2 such that n2 > n1 ■ n0. *A few proofs given in Ch. VIII can be simplified by the use of the principle. [IV : 86] POSITIVE INTEGRAL VARIABLE 185 85. Limits of complex functions and series of complex terms. In this chapter we have, up to the present, concerned ourselves only with real functions of n and series all of whose terms are real. There is however no difficulty in extending our ideas and definitions to the case in which the functions or the terms of the series are complex. Suppose that φ(n) is complex and equal to ρ(n) + iσ(n), where ρ(n), σ(n) are real functions of n. Then if ρ(n) and σ(n) converge respectively to limits r and s as n → ∞, we shall say that φ(n) converges to the limit l = r + is, and write lim φ(n) = l. Similarly, when un is complex and equal to vn + iwn, we shall say that the series u1 + u2 + u3 + . . . is convergent and has the sum l = r + is, if the series v1 + v2 + v3 + . . . , w1 + w2 + w3 + . . . are convergent and have the sums r, s respectively. To say that u1 + u2 + u3 + . . . is convergent and has the sum l is of course the same as to say that the sum sn = u1 + u2 + · · · + un = (v1 + v2 + · · · + vn) + i(w1 + w2 + · · · + wn) converges to the limit l as n → ∞. In the case of real functions and series we also gave definitions of di- vergence and oscillation, finite or infinite. But in the case of complex functions and series, where we have to consider the behaviour both of ρ(n) and of σ(n), there are so many possibilities that this is hardly worth while. When it is necessary to make further distinctions of this kind, we shall make them by stating the way in which the real or imaginary parts behave when

taken separately. [IV : 86] LIMITS OF FUNCTIONS OF A 186 86. The reader will find no difficulty in proving such theorems as the following, which are obvious extensions of theorems already proved for real functions and series. (1) If lim φ(n) = l then lim φ(n + p) = l for any fixed value of p. (2) If u1 + u2 + . . . is convergent and has the sum l, then a + b + c + · · · + k + u1 + u2 + . . . is convergent and has the sum a + b + c + · · · + k + l, and up+1 + up+2 + . . . is convergent and has the sum l – u1 – u2 – · · · – up. (3) If lim φ(n) = l and lim ψ(n) = m, then lim{φ(n) + ψ(n)} = l + m. (4) If lim φ(n) = l, then lim kφ(n) = kl. (5) If lim φ(n) = l and lim ψ(n) = m, then lim φ(n)ψ(n) = lm. (6) If u1 + u2 + . . . converges to the sum l, and v1 + v2 + . . . to the sum m, then (u1 + v1) + (u2 + v2) + . . . converges to the sum l + m. (7) If u1 +u2 +. . . converges to the sum l then ku1 +ku2 +. . . converges to the sum kl. (8) If u1 + u2 + u3 + . . . is convergent then lim un = 0. (9) If u1 + u2 + u3 + . . . is convergent, then so is any series formed by grouping the terms in brackets, and the sums of the two series are the same. As an example, let us prove theorem (5). Let φ(n) = ρ(n) + iσ(n), ψ(n) = ρ′(n) + iσ′(n), l = r + is, m = r′ + is′. Then ρ(n) → r, σ(n) → s, ρ′(n) → r′, σ′(n) → s′. But φ(n)ψ(n) = ρρ′ – σσ′ + i(ρσ′ + ρ′σ), and ρρ′ – σσ′ → rr′ – ss′, ρσ′ + ρ′σ → rs′ + r′s; so that φ(n)ψ(n) → rr′ – ss′ + i(rs′ + r′s), [IV : 86] POSITIVE INTEGRAL VARIABLE 187 i.e. φ(n)ψ(n) → (r + is)(r′ + is′) = lm. The following theorems are of a somewhat different character. (10)In order that φ(n) = ρ(n)+iσ(n) should converge to zero as n → ∞, it is necessary and sufficient that |φ(n)| = p{ρ(n)}2 + {σ(n)}2 should converge to zero. If ρ(n) and σ(n) both converge to zero then it is plain that pρ2 + σ2 does so. The converse follows from the fact that the numerical value of ρ or σ cannot be greater than pρ2 + σ2. (11) More generally, in order that φ(n) should converge to a limit l, it is necessary and sufficient that |φ(n) – l| should converge to zero. For φ(n) – l converges to zero, and we can apply (10). (12) Theorems 1 and 2 of §§ 83–84 are still true when φ(n) and un are complex. We have to show that the necessary and sufficient condition that φ(n) should tend to l is that |φ(n2) – φ(n1)| < ■ (1) when n2 > n1 ■ n0. If φ(n) → l then ρ(n) → r and σ(n) → s, and so we can find numbers n′ 0 and n′′ 0 depending on ■ and such that |ρ(n2) – ρ(n1)| < 1 2 ■, |σ(n2) – σ(n1)| < 1 2 ■, the first inequality holding when n2 > n1 ■ n′ 0, and the second when n2 > n1 ■ n′′ 0 . Hence |φ(n2) – φ(n1)| ■ |ρ(n2) – ρ(n1)| + |σ(n2) – σ(n1)| < ■ [IV : 88] LIMITS OF FUNCTIONS OF A 188 when n2 > n1 ■ n0, where n0 is the greater of n′ 0 and n′′ 0 . Thus the condition (1) is necessary. To prove that it is sufficient we have only to observe that |ρ(n2) – ρ(n1)| ■ |φ(n2) – φ(n1)| < ■ when n2 > n1 ■ n0. Thus ρ(n) tends to a limit r, and in the same way it may be shown that σ(n) tends to a limit s. 87. The limit of zn as n → ∞, z being any complex number. Let us consider the important case in which φ(n) = zn. This problem has already been discussed for real values of z in § 72. If zn → l then zn+1 → l, by (1) of § 86. But, by (4) of § 86, zn+1 = zzn → zl, and therefore l = zl, which is only possible if (a) l = 0 or (b) z = 1. If z = 1 then lim zn = 1. Apart from this special case the limit, if it exists, can only be zero. Now if z = r(cos θ + i sin θ), where r is positive, then zn = rn(cos nθ + i sin nθ), so that |zn| = rn. Thus |zn| tends to zero if and only if r < 1; and it follows from (10) of § 86 that lim zn = 0 if and only if r < 1. In no other case does zn converge to a limit, except when z = 1 and zn → 1. 88. The geometric series 1 + z + z2 + . . . when z is complex. Since sn = 1 + z + z2 + · · · + zn–1 = (1 – zn)/(1 – z), unless z = 1, when the value of sn is n, it follows that the series 1 + z + z2 + . . . is convergent if and only if r = |z| < 1. And its sum when convergent is 1/(1 – z). [IV : 88] POSITIVE INTEGRAL VARIABLE 189 Thus if z = r(cos θ + i sin θ) = r Cis θ, and r < 1, we have 1 + z + z2 + . . . = 1/(1 – r Cis θ), or 1 + r Cis θ + r2 Cis 2θ + . . . = 1/(1 – r Cis θ) = (1 – r cos θ + ir sin θ)/(1 – 2r cos θ + r2). Separating the real and imaginary parts, we obtain 1 + r cos θ + r2 cos 2θ + . . . = (1 – r cos θ)/(1 – 2r cos θ + r2), r sin θ + r2 sin 2θ + . . . = r sin θ/(1 – 2r cos θ + r2), provided r < 1. If we change θ into θ + π, we see that these results hold also for negative values of r numerically less than 1. Thus they hold when –1 < r < 1. Examples XXXIII. 1. Prove directly that φ(n) = rn cos nθ converges to 0 when r < 1 and to 1 when r = 1 and θ is a multiple of 2π. Prove further that if r = 1 and θ is not a multiple of 2π, then φ(n) oscillates finitely; if r > 1 and θ is a multiple of 2π, then φ(n) → +∞; and if r > 1 and θ is not a multiple of 2π, then φ(n) oscillates infinitely. 2. Establish a similar series of results for φ(n) = rn sin nθ. 3. Prove that zm + zm+1 + · · · = zm/(1 – z), zm + 2zm+1 + 2zm+2 + · · · = zm(1 + z)/(1 – z), if and only if |z| < 1. Which of the theorems of § 86 do you use? 4. Prove that if –1 < r < 1 then 1 + 2r cos θ + 2r2 cos 2θ + · · · = (1 – r2)/(1 – 2r cos θ + r2). 5. The series 1 + z 1 + z + z 1 + z 2 + . . . converges to the sum 1

1 – z 1 + z

= 1 + z if |z/(1 + z)| < 1. Show that this condition is equivalent to the condition that z has a real part greater than – 1 2 . [IV : 88] LIMITS OF FUNCTIONS OF A 190 MISCELLANEOUS EXAMPLES ON CHAPTER IV. 1. The function φ(n) takes the values 1, 0, 0, 0, 1, 0, 0, 0, 1, . . . when n = 0, 1, 2, ... Express φ(n) in terms of n by a formula which does not involve trigonometrical functions. [φ(n) = 1 4 {1 + (–1)n + in + (–i)n}.] 2. If φ(n) steadily increases, and ψ(n) steadily decreases, as n tends to ∞, and if ψ(n) > φ(n) for all values of n, then both φ(n) and ψ(n) tend to limits, and lim φ(n) ■ lim ψ(n). [This is an immediate corollary from § 69.] 3. Prove that, if φ(n) =

1 + 1 n n , ψ(n) =

1 – 1 n –n , then φ(n + 1) > φ(n) and ψ(n + 1) < ψ(n). [The first result has already been proved in § 73.] 4. Prove also that ψ(n) > φ(n) for all values of n: and deduce (by means of the preceding examples) that both φ(n) and ψ(n) tend to limits as n tends to ∞.* 5. The arithmetic mean of the products of all distinct pairs of positive integers whose sum is n is denoted by Sn. Show that lim(Sn/n2) = 1/6. (Math. Trip. 1903.) 6. Prove that if x1 = 1 2 {x + (A/x)}, x2 = 1 2 {x1 + (A/x1)}, and so on, x and A being positive, then lim xn = √A. [Prove first that xn – √A xn + √A = x – √A x + √A 2n .] 7. If φ(n) is a positive integer for all values of n, and tends to ∞ with n, then xφ(n) tends to 0 if 0 < x < 1 and to +∞ if x > 1. Discuss the behaviour of xφ(n), as n → ∞, for other values of x. 8. If an increases or decreases steadily as n increases, then the same is true of (a1 + a2 + · · · + an)/n. 9. If xn+1 = √k + xn, and k and x1 are positive, then the sequence x1, x2, x3, . . . is an increasing or decreasing sequence according as x1 is less than or *A proof that lim{ψ(n) – φ(n)} = 0, and that therefore each function tends to the limit e, will be found in Chrystal's Algebra, vol. ii, p. 78. We shall however prove this in Ch. IX by a different method. Exs. 8–12 are taken from Bromwich's Infinite Series. [IV : 88] POSITIVE INTEGRAL VARIABLE 191 greater than α, the positive root of the equation x2 = x + k; and in either case xn → α as n → ∞. 10. If xn+1 = k/(1 + xn), and k and x1 are positive, then the sequences x1, x3, x5, . . . and x2, x4, x6, . . . are one an increasing and the other a decreas- ing sequence, and each sequence tends to the limit α, the positive root of the equation x2 + x = k. 11. The function f (x) is increasing and continuous (see Ch. V) for all values of x, and a sequence x1, x2, x3, . . . is defined by the equation xn+1 = f (xn). Discuss on general graphical grounds the question as to whether xn tends to a root of the equation x = f (x). Consider in particular the case in which this equation has only one root, distinguishing the cases in which the curve y = f (x) crosses the line y = x from above to below and from below to above. 12. If x1, x2 are positive and xn+1 = 1 2 (xn +xn–1), then the sequences x1, x3, x5, . . . and x2, x4, x6, . . . are one a decreasing and the other an increasing sequence, and they have the common limit 1 3 (x1 + 2x2). 13. Draw a graph of the function y defined by the equation y = lim n→∞ x2n sin 1 2 πx + x2 x2n + 1 . (Math. Trip. 1901.) 14. The function y = lim n→∞ 1 1 + n sin2 πx is equal to 0 except when x is an integer, and then equal to 1. The function y = lim n→∞ ψ(x) + nφ(x) sin2 πx 1 + n sin2 πx is equal to φ(x) unless x is an integer, and then equal to ψ(x). 15. Show that the graph of the function y = lim n→∞ xnφ(x) + x–nψ(x) xn + x–n is composed of parts of the graphs of φ(x) and ψ(x), together with (as a rule) two isolated points. Is y defined when (a) x = 1, (b) x = –1, (c) x = 0? [IV : 88] LIMITS OF FUNCTIONS OF A 192 16. Prove that the function y which is equal to 0 when x is rational, and to 1 when x is irrational, may be represented in the form y = lim m→∞ sgn {sin2(m! πx)}, where sgn x = lim n→∞(2/π) arc tan(nx), as in Ex. xxxi. 14. [If x is rational then sin2(m! πx), and therefore sgn {sin2(m! πx)}, is equal to zero from a certain value of m onwards: if x is irrational then sin2(m! πx) is always positive, and so sgn {sin2(m! πx)} is always equal to 1.] Prove that y may also be represented in the form 1 – lim m→∞[lim n→∞{cos(m! πx)}2n]. 17. Sum the series ∞X 1 1 ν(ν + 1) , ∞X 1 1 ν(ν + 1) . . . (ν + k) . [Since 1 ν(ν + 1) . . . (ν + k) = 1 k 1 ν(ν + 1) . . . (ν + k – 1) – 1 (ν + 1)(ν + 2) . . . (ν + k)

, we have nX 1 1 ν(ν + 1) . . . (ν + k) = 1 k 1 1 · 2 . . . k – 1 (n + 1)(n + 2) . . . (n + k)

and so ∞X 1 1 ν(ν + 1) . . . (ν + k) = 1 k(k!) .] 18. If |z| < |α|, then L z – α = – L α

1 + z α + z2 α2 + . . .

; [IV : 88] POSITIVE INTEGRAL VARIABLE 193 and if |z| > |α|, then L z – α = L z

1 + α z + α2 z2 + . . .

. 19. Expansion of (Az + B)/(az2 + 2bz + c) in powers of z. Let α, β be the roots of az2 + 2bz + c = 0, so that az2 + 2bz + c = a(z – α)(z – β). We shall suppose that A, B, a, b, c are all real, and α and β unequal. It is then easy to verify that Az + B az2 + 2bz + c = 1 a(α – β) Aα + B z – α – Aβ + B z – β

. There are two cases, according as b2 > ac or b2 < ac. (1) If b2 > ac then the roots α, β are real and distinct. If |z| is less than either |α| or |β| we can expand 1/(z – α) and 1/(z – β) in ascending powers of z (Ex. 18). If |z| is greater than either |α| or |β| we must expand in descending powers of z; while if |z| lies between |α| and |β| one fraction must be expanded in ascending and one in descending powers of z. The reader should write down the actual results. If |z| is equal to |α| or |β| then no such expansion is possible. (2) If b2 < ac then the roots are conjugate complex numbers (Ch. III § 43), and we can write α = ρ Cis φ, β = ρ Cis(–φ), where ρ2 = αβ = c/a, ρ cos φ = 1 2 (α + β) = –b/a, so that cos φ = –pb2/ac, sin φ = p1 – (b2/ac). If |z| < ρ then each fraction may be expanded in ascending powers of z. The coefficient of zn will be found to be Aρ sin nφ + B sin{(n + 1)φ} aρn+1 sin φ . If |z| > ρ we obtain a similar expansion in descending powers, while if |z| = ρ no such expansion is possible. 20. Show that if |z| < 1 then 1 + 2z + 3z2 + · · · + (n + 1)zn + · · · = 1/(1 – z)2. [IV : 88] LIMITS OF FUNCTIONS OF A 194 [The sum to n terms is 1 – zn (1 – z)2 – nzn 1 – z .] 21. Expand L/(z – α)2 in powers of z, ascending or descending according as |z| < |α| or |z| > |α|. 22. Show that if b2 = ac and |az| < |b| then Az + B az2 + 2bz + c = ∞X 0 pnzn, where pn = {(–a)n/bn+2}{(n + 1)aB – nbA}; and find the corresponding ex-

pansion, in descending powers of z, which holds when |az| > |b|. 23. Verify the result of Ex. 19 in the case of the fraction 1/(1 + z2). [We have 1/(1 + z2) = P zn sin{ 1 2 (n + 1)π} = 1 – z2 + z4 – . . . .] 24. Prove that if |z| < 1 then 1 1 + z + z2 = 2 √3 ∞X 0 zn sin{ 2 3 (n + 1)π}. 25. Expand (1 + z)/(1 + z2), (1 + z2)/(1 + z3) and (1 + z + z2)/(1 + z4) in ascending powers of z. For what values of z do your results hold? 26. If a/(a + bz + cz2) = 1 + p1z + p2z2 + . . . then 1 + p2 1z + p2 2z2 + · · · = a + cz a – cz a2 a2 – (b2 – 2ac)z + c2z2 . (Math. Trip. 1900.) 27. If lim n→∞ sn = l then lim n→∞ s1 + s2 + · · · + sn n = l. [Let sn = l + tn. Then we have to prove that (t1 + t2 + · · · + tn)/n tends to zero if tn does so. We divide the numbers t1, t2, . . . , tn into two sets t1, t2, . . . , tp and tp+1, tp+2, . . . , tn. Here we suppose that p is a function of n which tends to ∞ as n → ∞, but more slowly than n, so that p → ∞ and p/n → 0: e.g. we might suppose p to be the integral part of √n. [IV : 88] POSITIVE INTEGRAL VARIABLE 195 Let ■ be any positive number. However small ■ may be, we can choose n0 so that tp+1, tp+2, . . . , tn are all numerically less than 1 2 ■ when n ■ n0, and so |(tp+1 + tp+2 + · · · + tn)/n| < 1 2 ■(n – p)/n < 1 2 ■. But, if A is the greatest of the moduli of all the numbers t1, t2, . . . , we have |(t1 + t2 + · · · + tp)/n| < pA/n, and this also will be less than 1 2 ■ when n ■ n0, if n0 is large enough, since p/n → 0 as n → ∞. Thus |(t1 + t2 + · · · + tn)/n| ■ |(t1 + t2 + · · · + tp)/n| + |(tp+1 + · · · + tn)/n| < ■ when n ■ n0; which proves the theorem. The reader, if he desires to become expert in dealing with questions about limits, should study the argument above with great care. It is very often neces- sary, in proving the limit of some given expression to be zero, to split it into two parts which have to be proved to have the limit zero in slightly different ways. When this is the case the proof is never very easy. The point of the proof is this: we have to prove that (t1 + t2 + · · · + tn)/n is small when n is large, the t's being small when their suffixes are large. We split up the terms in the bracket into two groups. The terms in the first group are not all small, but their number is small compared with n. The number in the second group is not small compared with n, but the terms are all small, and their number at any rate less than n, so that their sum is small compared with n. Hence each of the parts into which (t1 + t2 + · · · + tn)/n has been divided is small when n is large.] 28. If φ(n) – φ(n – 1) → l as n → ∞, then φ(n)/n → l. [If φ(n) = s1 + s2 + · · · + sn then φ(n) – φ(n – 1) = sn, and the theorem reduces to that proved in the last example.] 29. If sn = 1 2 {1 – (–1)n}, so that sn is equal to 1 or 0 according as n is odd or even, then (s1 + s2 + · · · + sn)/n → 1 2 as n → ∞. [This example proves that the converse of Ex. 27 is not true: for sn oscillates as n → ∞.] 30. If cn, sn denote the sums of the first n terms of the series 1 2 + cos θ + cos 2θ + . . . , sin θ + sin 2θ + . . . , [IV : 88] LIMITS OF FUNCTIONS OF A 196 then lim(c1 + c2 + · · · + cn)/n = 0, lim(s1 + s2 + · · · + sn)/n = 1 2 cot 1 2 θ. CHAPTER V LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE. CONTINUOUS AND DISCONTINUOUS FUNCTIONS 89. Limits as x tends to ∞. We shall now return to functions of a continuous real variable. We shall confine ourselves entirely to one-valued functions,* and we shall denote such a function by φ(x). We suppose x to assume successively all values corresponding to points on our fundamental straight line Λ, starting from some definite point on the line and progressing always to the right. In these circumstances we say that x tends to infinity, or to ∞, and write x → ∞. The only difference between the 'tending of n to ∞' discussed in the last chapter, and this 'tending of x to ∞', is that x assumes all values as it tends to ∞, i.e. that the point P which corresponds to x coincides in turn with every point of Λ to the right of its initial position, whereas n tended to ∞ by a series of jumps. We can express this distinction by saying that x tends continuously to ∞. As we explained at the beginning of the last chapter, there is a very close correspondence between functions of x and functions of n. Every function of n may be regarded as a selection from the values of a function of x. In the last chapter we discussed the peculiarities which may characterise the behaviour of a function φ(n) as n tends to ∞. Now we are concerned with the same problem for a function φ(x); and the definitions and theorems to which we are led are practically repetitions of those of the last chapter. Thus corresponding to Def. 1 of § 58 we have: Definition 1. The function φ(x) is said to tend to the limit l as x tends to ∞ if, when any positive number ■, however small, is assigned, a number x0(■) can be chosen such that, for all values of x equal to or greater than x0(■), φ(x) differs from l by less than ■, i.e. if |φ(x) – l| < ■ when x ■ x0(■). *Thus √x stands in this chapter for the one-valued function +√x and not (as in § 26) for the two-valued function whose values are +√x and –√x. 197 [V : 89] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 198 When this is the case we may write lim x→∞ φ(x) = l, or, when there is no risk of ambiguity, simply lim φ(x) = l, or φ(x) → l. Similarly we have: Definition 2. The function φ(x) is said to tend to ∞ with x if, when any number Δ, however large, is assigned, we can choose a number x0(Δ) such that φ(x) > Δ when x ■ x0(Δ). We then write φ(x) → ∞. Similarly we define φ(x) → –∞.* Finally we have: Definition 3. If the conditions of neither of the two preceding def- initions are satisfied, then φ(x) is said to oscillate as x tends to ∞. If |φ(x)| is less than some constant K when x ■ x0, then φ(x) is said to oscillate finitely, and otherwise infinitely. The reader will remember that in the last chapter we considered very carefully various less formal ways of expressing the facts represented by the formulae φ(n) → l, φ(n) → ∞. Similar modes of expression may of course be used in the present case. Thus we may say that φ(x) is small or nearly equal to l or large when x is large, using the words 'small', 'nearly', 'large' in a sense similar to that in which they were used in Ch. IV. *We shall sometimes find it convenient to write +∞, x → +∞, φ(x) → +∞ instead of ∞, x → ∞, φ(x) → ∞. In the corresponding definition of § 62, we postulated that |φ(n)| < K for all values of n, and not merely when n ■ n0. But then the two hypotheses would have been equivalent; for if |φ(n)| < K when n ■ n0, then |φ(n)| < K′ for all values of n, where K′ is the greatest of |φ(1)|, |φ(2)|, . . . , |φ(n0 – 1)| and K. Here the matter

is not quite so simple, as there are infinitely many values of x less than x0. [V : 90] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 199 Examples XXXIV. 1. Consider the behaviour of the following func- tions as $x \to \infty$: 1/x, 1 + (1/x), x2, xk, [x], x – [x], [x] + px – [x]. The first four functions correspond exactly to functions of n fully discussed in Ch. IV. The graphs of the last three were constructed in Ch. II (Exs. xvi. 1, 2, 4), and the reader will see at once that $[x] \to \infty$, x – [x] oscillates finitely, and [x] + px – [x] $\to \infty$. One simple remark may be inserted here. The function $\varphi(x) = x - [x]$ oscillates between 0 and 1, as is obvious from the form of its graph. It is equal to zero whenever x is an integer, so that the function $\varphi(n)$ derived from it is always zero and so tends to the limit zero. The same is true if $\varphi(x) = \sin x\pi$, $\varphi(n) = \sin n\pi = 0$. It is evident that $\varphi(x) \to l$ or $\varphi(x) \to \infty$ or $\varphi(x) \to -\infty$ involves the corre- sponding property for $\varphi(n)$, but that the converse is by no means always true. 2. Consider in the same way the functions: $(\sin x\pi)/x$, $x \sin x\pi$, $(x \sin x\pi)2$, $\tan x\pi$, $a \cos2\, x\pi + b \sin2\, x\pi$, illustrating your remarks by means of the graphs of the functions. 3. Give a geometrical explanation of Def. 1, analogous to the geometrical explanation of Ch. IV, § 59. 4. If $\varphi(x) \to l$, and l is not zero, then $\varphi(x) \cos x\pi$ and $\varphi(x) \sin x\pi$ oscillate finitely. If $\varphi(x) \to \infty$ or $\varphi(x) \to -\infty$, then they oscillate infinitely. The graph of either function is a wavy curve oscillating between the curves $y = \varphi(x)$ and $y = -\varphi(x)$. 5. Discuss the behaviour, as $x \to \infty$, of the function $y = f(x) \cos2\, x\pi + F(x) \sin2\, x\pi$, where f (x) and F (x) are some pair of simple functions (e.g. x and x2). [The graph of y is a curve oscillating between the curves y = f (x), y = F (x).] 90. Limits as x tends to $-\infty$. The reader will have no difficulty in framing for himself definitions of the meaning of the assertions 'x tends to $-\infty$', or 'x $\to -\infty$' and $\lim x \to -\infty\, \varphi(x) = l$, $\varphi(x) \to \infty$, $\varphi(x) \to -\infty$. [V : 93] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 200 In fact, if x = –y and $\varphi(x) = \varphi(-y) = \psi(y)$, then y tends to ∞ as x tends to $-\infty$, and the question of the behaviour of $\varphi(x)$ as x tends to $-\infty$ is the same as that of the behaviour of $\psi(y)$ as y tends to ∞. 91. Theorems corresponding to those of Ch. IV, §§ 63–67. The theorems concerning the sums, products, and quotients of functions proved in Ch. IV are all true (with obvious verbal alterations which the reader will have no difficulty in supplying) for functions of the continuous variable x. Not only the enunciations but the proofs remain substantially the same. 92. Steadily increasing or decreasing functions. The definition which corresponds to that of § 69 is as follows: the function $\varphi(x)$ will be said to increase steadily with x if $\varphi(x2) \blacksquare \varphi(x1)$ whenever x2 > x1. In many cases, of course, this condition is only satisfied from a definite value of x onwards, i.e. when x2 > x1 ■ x0. The theorem which follows in that section requires no alteration but that of n into x: and the proof is the same, except for obvious verbal changes. If $\varphi(x2) > \varphi(x1)$, the possibility of equality being excluded, whenever x2 > x1, then $\varphi(x)$ will be said to be steadily increasing in the stricter sense. We shall find that the distinction is often important (cf. §§ 108–109). The reader should consider whether or no the following functions increase steadily with x (or at any rate increase steadily from a certain value of x on- wards): x2 – x, x + sin x, x + 2 sin x, x2 + 2 sin x, [x], [x] + sin x, [x] + px – [x]. All these functions tend to ∞ as $x \to \infty$. 93. Limits as x tends to 0. Let $\varphi(x)$ be such a function of x that $\lim x \to \infty\, \varphi(x) = l$, and let y = 1/x. Then $\varphi(x) = \varphi(1/y) = \psi(y)$, say. As x tends to ∞, y tends to the limit 0, and $\psi(y)$ tends to the limit l. Let us now dismiss x and consider $\psi(y)$ simply as a function of y. We are for the moment concerned only with those values of y which correspond to large positive values of x, that is to say with small positive values of y. And $\psi(y)$ has the property that by making y sufficiently small we can [V : 93] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 201 make $\psi(y)$ differ by as little as we please from l. To put the matter more precisely, the statement expressed by $\lim \varphi(x) = l$ means that, when any positive number ■, however small, is assigned, we can choose x0 so that $|\varphi(x) - l| <$ ■ for all values of x greater than or equal to x0. But this is the same thing as saying that we can choose y0 = 1/x0 so that $|\psi(y) - l| <$ ■ for all positive values of y less than or equal to y0. We are thus led to the following definitions: A. If, when any positive number ■, however small, is assigned, we can choose y0(■) so that $|\varphi(y) - l| <$ ■ when 0 < y ■ y0(■), then we say that $\varphi(y)$ tends to the limit l as y tends to 0 by positive values, and we write $\lim y \to +0\, \varphi(y) = l$. B. If, when any number Δ, however large, is assigned, we can choose y0(Δ) so that $\varphi(y) > \Delta$ when 0 < y ■ y0(Δ), then we say that $\varphi(y)$ tends to ∞ as y tends to 0 by positive values, and we write $\varphi(y) \to \infty$. We define in a similar way the meaning of '$\varphi(y)$ tends to the limit l as y tends to 0 by negative values', or '$\lim \varphi(y) = l$ when $y \to -0$'. We have in fact only to alter 0 < y ■ y0(■) to –y0(■) ■ y < 0 in definition A. There is of course a corresponding analogue of definition B, and similar definitions in which $\varphi(y) \to -\infty$ as $y \to +0$ or $y \to -0$. If $\lim y \to +0\, \varphi(y) = l$ and $\lim y \to -0\, \varphi(y) = l$, we write simply $\lim y \to 0\, \varphi(y) = l$. [V : 94] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 202 This case is so important that it is worth while to give a formal definition. If, when any positive number ■, however small, is assigned, we can choose y0(■) so that, for all values of y different from zero but numerically less than or equal to y0(■), $\varphi(y)$ differs from l by less than ■, then we say that $\varphi(y)$ tends to the limit l as y tends to 0, and write $\lim y \to 0\, \varphi(y) = l$. So also, if $\varphi(y) \to \infty$ as $y \to +0$ and also as $y \to -0$, we say that $\varphi(y) \to \infty$ as $y \to 0$. We define in a similar manner the statement that $\varphi(y) \to -\infty$ as $y \to 0$. Finally, if $\varphi(y)$ does not tend to a limit, or to ∞, or to $-\infty$, as $y \to +0$, we say that $\varphi(y)$ oscillates as $y \to +0$, finitely or infinitely as the case may be; and we define oscillation as $y \to -0$ in a similar manner. The preceding definitions have been stated in terms of a variable de- noted by y: what letter is used is of course immaterial, and we may suppose x written instead of y throughout them. 94. Limits as x tends to a. Suppose that $\varphi(y) \to l$ as $y \to 0$, and write y = x – a, $\varphi(y) = \varphi(x - a) = \psi(x)$. If $y \to 0$ then $x \to a$ and $\psi(x) \to l$, and we are naturally led to write $\lim x \to a\, \psi(x) = l$, or simply $\lim \psi(x) = l$ or $\psi(x) \to l$, and to say that $\psi(x)$ tends to the limit l as x tends to a. The meaning

of this equation may be formally and directly defined as follows: if, given ■, we can always determine δ(■) so that |φ(x) – l| < ■ when 0 < |x – a| ■ δ(■), then lim x→a φ(x) = l. [V : 96] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 203 By restricting ourselves to values of x greater than a, i.e. by replacing 0 < |x – a| ■ δ(■) by a < x ■ a + δ(■), we define 'φ(x) tends to l when x approaches a from the right', which we may write as lim x→a+0 φ(x) = l. In the same way we can define the meaning of lim x→a–0 φ(x) = l. Thus lim x→a φ(x) = l is equivalent to the two assertions lim x→a+0 φ(x) = l, lim x→a–0 φ(x) = l. We can give similar definitions referring to the cases in which φ(x) → ∞ or φ(x) → –∞ as x → a through values greater or less than a; but it is probably unnecessary to dwell further on these definitions, since they are exactly similar to those stated above in the special case when a = 0, and we can always discuss the behaviour of φ(x) as x → a by putting x – a = y and supposing that y → 0. 95. Steadily increasing or decreasing functions. If there is a number δ such that φ(x′) ■ φ(x″) whenever a – δ < x′ < x″ < a + δ, then φ(x) will be said to increase steadily in the neighbourhood of x = a. Suppose first that x < a, and put y = 1/(a – x). Then y → ∞ as x → a – 0, and φ(x) = ψ(y) is a steadily increasing function of y, never greater than φ(a). It follows from § 92 that φ(x) tends to a limit not greater than φ(a). We shall write lim x→a+0 φ(x) = φ(a + 0). We can define φ(a – 0) in a similar manner; and it is clear that φ(a – 0) ■ φ(a) ■ φ(a + 0). It is obvious that similar considerations may be applied to decreasing functions. If φ(x′) < φ(x″), the possibility of equality being excluded, whenever a – δ < x′ < x″ < a + δ, then φ(x) will be said to be steadily increasing in the stricter sense. [V : 96] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 204 96. Limits of indetermination and the principle of conver- gence. All of the argument of §§ 80–84 may be applied to functions of a con- tinuous variable x which tends to a limit a. In particular, if φ(x) is bounded in an interval including a (i.e. if we can find δ, H, and K so that H < φ(x) < K when a – δ ■ x ■ a + δ).* then we can define λ and Λ, the lower and up- per limits of indetermination of φ(x) as x → a, and prove that the necessary and sufficient condition that φ(x) → l as x → a is that λ = Λ = l. We can also establish the analogue of the principle of convergence, i.e. prove that the necessary and sufficient condition that φ(x) should tend to a limit as x → a is that, when ■ is given, we can choose δ(■) so that |φ(x2) – φ(x1)| < ■ when 0 < |x2 – a| < |x1 – a| ■ δ(■). Examples XXXV. 1. If φ(x) → l, ψ(x) → l′, as x → a, then φ(x) + ψ(x) → l + l′, φ(x)ψ(x) → ll′, and φ(x)/ψ(x) → l/l′, unless in the last case l′ = 0. [We saw in § 91 that the theorems of Ch. IV, §§ 63 et seq. hold also for functions of x when x → ∞ or x → –∞. By putting x = 1/y we may extend them to functions of y, when y → 0, and by putting y = z – a to functions of z, when z → a. The reader should however try to prove them directly from the formal def- inition given above. Thus, in order to obtain a strict direct proof of the first result he need only take the proof of Theorem I of § 63 and write throughout x for n, a for ∞ and 0 < |x – a| ■ δ for n ■ n0.] 2. If m is a positive integer then xm → 0 as x → 0. 3. If m is a negative integer then xm → +∞ as x → +0, while xm → –∞ or xm → +∞ as x → –0, according as m is odd or even. If m = 0 then xm = 1 and xm → 1. 4. lim x→0(a + bx + cx2 + · · · + kxm) = a. 5. lim x→0 {(a + bx + · · · + kxm)/(α + βx + · · · + κxμ)} = a/α, unless α = 0. If α = 0 and a■ = 0, β■ = 0, then the function tends to +∞ or –∞, as x → +0, *For some further discussion of the notion of a function bounded in an interval see § 102. [V : 97] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 205 according as a and β have like or unlike signs; the case is reversed if x → –0. The case in which both a and α vanish is considered in Ex. xxxvi. 5. Discuss the cases which arise when a■ = 0 and more than one of the first coefficients in the denominator vanish. 6. lim x→a xm = am, if m is any positive or negative integer, except when a = 0 and m is negative. [If m > 0, put x = y + a and apply Ex. 4. When m < 0, the result follows from Ex. 1 above. It follows at once that lim P (x) = P (a), if P (x) is any polynomial.] 7. lim x→a R(x) = R(a), if R denotes any rational function and a is not one of the roots of its denominator. 8. Show that lim x→a xm = am for all rational values of m, except when a = 0 and m is negative. [This follows at once, when a is positive, from the inequalities (9) or (10) of § 74. For |xm – am| < H|x – a|, where H is the greater of the absolute values of mxm–1 and mam–1 (cf. Ex. xxviii. 4). If a is negative we write x = –y and a = –b. Then lim xm = lim(–1)mym = (–1)mbm = am.] 97. The reader will probably fail to see at first that any proof of such results as those of Exs. 4, 5, 6, 7, 8 above is necessary. He may ask 'why not simply put x = 0, or x = a? Of course we then get a, a/α, am, P (a), R(a)'. It is very important that he should see exactly where he is wrong. We shall therefore consider this point carefully before passing on to any further examples. The statement lim x→0 φ(x) = l is a statement about the values of φ(x) when x has any value distinct from but differing by little from zero.* It is not a statement about the value of φ(x) when x = 0. When we make the statement we assert that, when x is nearly equal to zero, φ(x) is nearly equal to l. We assert nothing whatever about what happens when x is actually equal to 0. So far as we *Thus in Def. A of § 93 we make a statement about values of y such that 0 < y ■ y0, the first of these inequalities being inserted expressly in order to exclude the value y = 0. [V : 97] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 206 know, φ(x) may not be defined at all for x = 0; or it may have some value other than l. For example, consider the function defined for all values of x by the equation φ(x) = 0. It is obvious that lim φ(x) = 0. (1) Now consider the function ψ(x) which differs from φ(x) only in that ψ(x) = 1 when x = 0. Then lim ψ(x) = 0, (2) for, when x is nearly equal to zero, ψ(x) is not only nearly but exactly equal to zero. But ψ(0) = 1. The graph of this function consists of the axis of x, with the point x = 0 left out, and one isolated point, viz. the point (0, 1). The equation (2) expresses the fact that if we move along the graph towards the axis of y, from either side, then the ordinate of the curve, being always equal to zero, tends to the limit zero. This fact is in no way affected by the position of the

isolated point (0, 1). The reader may object to this example on the score of artificiality: but it is easy to write down simple formulae representing functions which behave precisely like this near x = 0. One is ψ(x) = [1 – x2], where [1 – x2] denotes as usual the greatest integer not greater than 1 – x2. For if x = 0 then ψ(x) = [1] = 1; while if 0 < x < 1, or –1 < x < 0, then 0 < 1 – x2 < 1 and so ψ(x) = [1 – x2] = 0. Or again, let us consider the function y = x/x already discussed in Ch. II, § 24, (2). This function is equal to 1 for all values of x save x = 0. It is not equal to 1 when x = 0: it is in fact not defined at all for x = 0. For when we say that φ(x) is defined for x = 0 we mean (as we explained in Ch. II, l.c.) that we can calculate its value for x = 0 by putting x = 0 in the actual expression of φ(x). In [V : 97] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 207 this case we cannot. When we put x = 0 in φ(x) we obtain 0/0, which is a meaningless expression. The reader may object 'divide numerator and denominator by x'. But he must admit that when x = 0 this is impossible. Thus y = x/x is a function which differs from y = 1 solely in that it is not defined for x = 0. None the less lim(x/x) = 1, for x/x is equal to 1 so long as x differs from zero, however small the difference may be. Similarly φ(x) = {(x + 1)2 – 1}/x = x + 2 so long as x is not equal to zero, but is undefined when x = 0. None the less lim φ(x) = 2. On the other hand there is of course nothing to prevent the limit of φ(x) as x tends to zero from being equal to φ(0), the value of φ(x) for x = 0. Thus if φ(x) = x then φ(0) = 0 and lim φ(x) = 0. This is in fact, from a practical point of view, i.e. from the point of view of what most frequently occurs in applications, the ordinary case. Examples XXXVI. 1. lim x→a(x2 – a2)/(x – a) = 2a. 2. lim x→a(xm – am)/(x – a) = mam–1, if m is any integer (zero included). 3. Show that the result of Ex. 2 remains true for all rational values of m, provided a is positive. [This follows at once from the inequalities (9) and (10) of § 74.] 4. lim x→1(x7 – 2x5 + 1)/(x3 – 3x2 + 2) = 1. [Observe that x – 1 is a factor of both numerator and denominator.] 5. Discuss the behaviour of φ(x) = (a0xm + a1xm+1 + · · · + akxm+k)/(b0xn + b1xn+1 + · · · + blxn+l) as x tends to 0 by positive or negative values. [If m > n, lim φ(x) = 0. If m = n, lim φ(x) = a0/b0. If m < n and n – m is even, φ(x) → +∞ or φ(x) → –∞ according as a0/b0 > 0 or a0/b0 < 0. If m < n and n – m is odd, φ(x) → +∞ as x → +0 and φ(x) → –∞ as x → –0, or φ(x) → –∞ as x → +0 and φ(x) → +∞ as x → –0, according as a0/b0 > 0 or a0/b0 < 0.] [V : 97] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 208 6. Orders of smallness. When x is small x2 is very much smaller, x3 much smaller still, and so on: in other words lim x→0(x2/x) = 0, lim x→0(x3/x2) = 0, ... Another way of stating the matter is to say that, when x tends to 0, x2, x3, . . . all also tend to 0, but x2 tends to 0 more rapidly than x, x3 than x2, and so on. It is convenient to have some scale by which to measure the rapidity with which a function, whose limit, as x tends to 0, is 0, diminishes with x, and it is natural to take the simple functions x, x2, x3, . . . as the measures of our scale. We say, therefore, that φ(x) is of the first order of smallness if φ(x)/x tends to a limit other than 0 as x tends to 0. Thus 2x + 3x2 + x7 is of the first order of smallness, since lim(2x + 3x2 + x7)/x = 2. Similarly we define the second, third, fourth, . . . orders of smallness. It must not be imagined that this scale of orders of smallness is in any way complete. If it were complete, then every function φ(x) which tends to zero with x would be of either the first or second or some higher order of smallness. This is obviously not the case. For example φ(x) = x7/5 tends to zero more rapidly than x and less rapidly than x2. The reader may not unnaturally think that our scale might be made complete by including in it fractional orders of smallness. Thus we might say that x7/5 was of the 7 5 th order of smallness. We shall however see later on that such a scale of orders would still be altogether incomplete. And as a matter of fact the integral orders of smallness defined above are so much more important in applications than any others that it is hardly necessary to attempt to make our definitions more precise. Orders of greatness. Similar definitions are at once suggested to meet the case in which φ(x) is large (positively or negatively) when x is small. We shall say that φ(x) is of the kth order of greatness when x is small if φ(x)/x–k = xkφ(x) tends to a limit different from 0 as x tends to 0. These definitions have reference to the case in which x → 0. There are of course corresponding definitions relating to the cases in which x → ∞ or x → a. Thus if xkφ(x) tends to a limit other than zero, as x → ∞, then we say that φ(x) is of the kth order of smallness when x is large: while if (x – a)kφ(x) tends to a limit other than zero, as x → a, then we say that φ(x) is of the kth order of greatness when x is nearly equal to a. [V : 97] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 209 7.* lim √1 + x = lim √1 – x = 1. [Put 1 + x = y or 1 – x = y, and use Ex. xxxv. 8.] 8. lim{√1 + x – √1 – x}/x = 1. [Multiply numerator and denominator by√1 + x + √1 – x.] 9. Consider the behaviour of {√1 + xm – √1 – xm}/xn as x → 0, m and n being positive integers. 10. lim{√1 + x + x2 – 1}/x = 1 2 . 11. lim √1 + x – √1 + x2 √1 – x2 – √1 – x = 1. 12. Draw a graph of the function y = 1 x – 1 + 1 x – 1 2 + 1 x – 1 3 + 1 x – 1 4 1 x – 1 + 1 x – 1 2 + 1 x – 1 3 + 1 x – 1 4

. Has it a limit as x → 0? [Here y = 1 except for x = 1, 1 2 , 1 3 , 1 4 , when y is not defined, and y → 1 as x → 0.] 13. lim sin x x = 1. [It may be deduced from the definitions of the trigonometrical ratios that if x is positive and less than 1 2 π then sin x < x < tan x or cos x < sin x x < 1 or 0 < 1 – sin x x < 1 – cos x = 2 sin2 1 2 x. But 2 sin2 1 2 x < 2(1 2 x)2 = 1 2 x2. Hence lim x→+0

1 – sin x x

= 0, and lim x→+0 sin x x = 1. As sin x x is an even function, the result follows.] *In the examples which follow it is to be assumed that limits as x → 0 are required, unless (as in Exs. 19, 22) the contrary is explicitly stated. The proofs of the inequalities which are used here depend on certain properties of the area of a sector of a circle which are usually taken as geometrically intuitive; for

example, that the area of the sector is greater than that of the triangle inscribed in the sector. The justification of these assumptions must be postponed to Ch. VII. [V : 98] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 210 14. lim 1 – cos x x2 = 1 2 . 15. lim sin αx x = α. Is this true if α = 0? 16. lim arc sin x x = 1. [Put x = sin y.] 17. lim tan αx x = α, lim arc tan αx x = α. 18. lim cosec x – cot x x = 1 2 . 19. lim x→1 1 + cos πx tan2 πx = 1 2 . 20. How do the functions sin(1/x), (1/x) sin(1/x), x sin(1/x) behave as x → 0? [The first oscillates finitely, the second infinitely, the third tends to the limit 0. None is defined when x = 0. See Exs. xv. 6, 7, 8.] 21. Does the function y =

sin 1 x

sin 1 x

tend to a limit as x tends to 0? [No. The function is equal to 1 except when sin(1/x) = 0; i.e. when x = 1/π, 1/2π, . . . , –1/π, –1/2π, ... For these values the formula for y assumes the meaningless form 0/0, and y is therefore not defined for an infinity of values of x near x = 0.] 22. Prove that if m is any integer then [x] → m and x–[x] → 0 as x → m+0, and [x] → m – 1, x – [x] → 1 as x → m – 0. 98. Continuous functions of a real variable. The reader has no doubt some idea as to what is meant by a continuous curve. Thus he would call the curve C in Fig. 29 continuous, the curve C′ generally continuous but discontinuous for x = ξ′ and x = ξ″. Either of these curves may be regarded as the graph of a function φ(x). It is natural to call a function continuous if its graph is a continuous curve, and otherwise discontinuous. Let us take this as a provisional definition and try to distinguish more precisely some of the properties which are involved in it. In the first place it is evident that the property of the function y = φ(x) of which C is the graph may be analysed into some property possessed by [V : 98] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 211X Y ξ′ 0 ξ″ ξ1 ξ2 ξ C C′ C′ C′ P Fig. 29. the curve at each of its points. To be able to define continuity for all values of x we must first define continuity for any particular value of x. Let us therefore fix on some particular value of x, say the value x = ξ corresponding to the point P of the graph. What are the characteristic properties of φ(x) associated with this value of x? In the first place φ(x) is defined for x = ξ. This is obviously essential. If φ(ξ) were not defined there would be a point missing from the curve. Secondly φ(x) is defined for all values of x near x = ξ; i.e. we can find an interval, including x = ξ in its interior, for all points of which φ(x) is defined. Thirdly if x approaches the value ξ from either side then φ(x) ap- proaches the limit φ(ξ). The properties thus defined are far from exhausting those which are possessed by the curve as pictured by the eye of common sense. This pic- ture of a curve is a generalisation from particular curves such as straight lines and circles. But they are the simplest and most fundamental proper- ties: and the graph of any function which has these properties would, so far as drawing it is practically possible, satisfy our geometrical feeling of what a continuous curve should be. We therefore select these properties as embodying the mathematical notion of continuity. We are thus led to the following Definition. The function φ(x) is said to be continuous for x = ξ if it tends to a limit as x tends to ξ from either side, and each of these limits [V : 99] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 212 is equal to φ(ξ). We can now define continuity throughout an interval. The function φ(x) is said to be continuous throughout a certain interval of values of x if it is continuous for all values of x in that interval. It is said to be continuous everywhere if it is continuous for every value of x. Thus [x] is continuous in the interval [δ, 1 – δ], where δ is any positive number less than 1 2 ; and 1 and x are continuous everywhere. If we recur to the definitions of a limit we see that our definition is equivalent to ‘φ(x) is continuous for x = ξ if, given ■, we can choose δ(■) so that |φ(x) – φ(ξ)| < ■ if 0 ■ |x – ξ| ■ δ(■)’. We have often to consider functions defined only in an interval [a, b]. In this case it is convenient to make a slight and obvious change in our definition of continuity in so far as it concerns the particular points a and b. We shall then say that φ(x) is continuous for x = a if φ(a + 0) exists and is equal to φ(a), and for x = b if φ(b – 0) exists and is equal to φ(b). 99. The definition of continuity given in the last section may be illus- trated geometrically as follows. Draw the two horizontal lines y = φ(ξ) – ■ and y = φ(ξ) + ■. Then |φ(x) – φ(ξ)| < ■ expresses the fact that the point on the curve corresponding to x lies between these two lines. SimilarlyX Y 0 P ξ – δ ξ + δ y = φ(ξ) – ■ y = φ(ξ) + ■ Fig. 30. |x – ξ| ■ δ expresses the fact that x lies in the interval [ξ – δ, ξ + δ]. Thus [V : 99] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 213 our definition asserts that if we draw two such horizontal lines, no matter how close together, we can always cut off a vertical strip of the plane by two vertical lines in such a way that all that part of the curve which is con- tained in the strip lies between the two horizontal lines. This is evidently true of the curve C (Fig. 29), whatever value ξ may have. We shall now discuss the continuity of some special types of functions. Some of the results which follow were (as we pointed out at the time) tacitly assumed in Ch. II. Examples XXXVII. 1. The sum or product of two functions continu- ous at a point is continuous at that point. The quotient is also continuous unless the denominator vanishes at the point. [This follows at once from Ex. xxxv. 1.] 2. Any polynomial is continuous for all values of x. Any rational fraction is continuous except for values of x for which the denominator vanishes. [This follows from Exs. xxxv. 6, 7.] 3. √x is continuous for all positive values of x (Ex. xxxv. 8). It is not defined when x < 0, but is continuous for x = 0 in virtue of the remark made at the end of § 98. The same is true of xm/n, where m and n are any positive integers of which n is even. 4. The function xm/n, where n is odd, is continuous for all values of x. 5. 1/x is not continuous for x = 0. It has no value for x = 0, nor

does it tend to a limit as x → 0. In fact 1/x → +∞ or 1/x → –∞ according as x → 0 by positive or negative values. 6. Discuss the continuity of x–m/n, where m and n are positive integers, for x = 0. 7. The standard rational function R(x) = P (x)/Q(x) is discontinuous for x = a, where a is any root of Q(x) = 0. Thus (x2 + 1)/(x2 – 3x + 2) is dis- continuous for x = 1. It will be noticed that in the case of rational functions a discontinuity is always associated with (a) a failure of the definition for a partic- ular value of x and (b) a tending of the function to +∞ or –∞ as x approaches this value from either side. Such a particular kind of point of discontinuity is usually described as an infinity of the function. An 'infinity' is the kind of discontinuity of most common occurrence in ordinary work. 8. Discuss the continuity of p(x – a)(b – x), 3 p(x – a)(b – x), p(x – a)/(b – x), 3 p(x – a)/(b – x). [V : 99] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 214 9. sin x and cos x are continuous for all values of x. [We have sin(x + h) – sin x = 2 sin 1 2 h cos(x + 1 2 h), which is numerically less than the numerical value of h.] 10. For what values of x are tan x, cot x, sec x, and cosec x continuous or discontinuous? 11. If f (y) is continuous for y = η, and φ(x) is a continuous function of x which is equal to η when x = ξ, then f {φ(x)} is continuous for x = ξ. 12. If φ(x) is continuous for any particular value of x, then any polynomial in φ(x), such as a{φ(x)}m + . . . , is so too. 13. Discuss the continuity of 1/(a cos2 x + b sin2 x), √2 + cos x, √1 + sin x, 1/√1 + sin x. 14. sin(1/x), x sin(1/x), and x2 sin(1/x) are continuous except for x = 0. 15. The function which is equal to x sin(1/x) except when x = 0, and to zero when x = 0, is continuous for all values of x. 16. [x] and x – [x] are discontinuous for all integral values of x. 17. For what (if any) values of x are the following functions discontinuous: [x2], [√x], px – [x], [x] + px – [x], [2x], [x] + [–x]? 18. Classification of discontinuities. Some of the preceding examples suggest a classification of different types of discontinuity. (1) Suppose that φ(x) tends to a limit as x → a either by values less than or by values greater than a. Denote these limits, as in § 95, by φ(a – 0) and φ(a + 0) respectively. Then, for continuity, it is necessary and sufficient that φ(x) should be defined for x = a, and that φ(a – 0) = φ(a) = φ(a + 0). Discontinuity may arise in a variety of ways. (α) φ(a – 0) may be equal to φ(a + 0), but φ(a) may not be defined, or may differ from φ(a – 0) and φ(a + 0). Thus if φ(x) = x sin(1/x) and a = 0, φ(0 – 0) = φ(0 + 0) = 0, but φ(x) is not defined for x = 0. Or if φ(x) = [1 – x2] and a = 0, φ(0 – 0) = φ(0 + 0) = 0, but φ(0) = 1. (β) φ(a – 0) and φ(a + 0) may be unequal. In this case φ(a) may be equal to one or to neither, or be undefined. The first case is illustrated by φ(x) = [x], for which φ(0 – 0) = –1, φ(0 + 0) = φ(0) = 0; the second by φ(x) = [x] – [–x], for which φ(0 – 0) = –1, φ(0 + 0) = 1, φ(0) = 0; and the [V : 100] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 215 third by φ(x) = [x] + x sin(1/x), for which φ(0 – 0) = –1, φ(0 + 0) = 0, and φ(0) is undefined. In any of these cases we say that φ(x) has a simple discontinuity at x = a. And to these cases we may add those in which φ(x) is defined only on one side of x = a, and φ(a – 0) or φ(a + 0), as the case may be, exists, but φ(x) is either not defined when x = a or has when x = a a value different from φ(a–0) or φ(a+0). It is plain from § 95 that a function which increases or decreases steadily in the neighbourhood of x = a can have at most a simple discontinuity for x = a. (2) It may be the case that only one (or neither) of φ(a – 0) and φ(a + 0) exists, but that, supposing for example φ(a + 0) not to exist, φ(x) → +∞ or φ(x) → –∞ as x → a + 0, so that φ(x) tends to a limit or to +∞ or to –∞ as x approaches a from either side. Such is the case, for instance, if φ(x) = 1/x or φ(x) = 1/x2, and a = 0. In such cases we say (cf. Ex. 7) that x = a is an infinity of φ(x). And again we may add to these cases those in which φ(x) → +∞ or φ(x) → –∞ as x → a from one side, but φ(x) is not defined at all on the other side of x = a. (3) Any point of discontinuity which is not a point of simple discontinuity nor an infinity is called a point of oscillatory discontinuity. Such is the point x = 0 for the functions sin(1/x), (1/x) sin(1/x). 19. What is the nature of the discontinuities at x = 0 of the functions (sin x)/x, [x] + [–x], cosec x, p1/x, 3 p1/x, cosec(1/x), sin(1/x)/ sin(1/x)? 20. The function which is equal to 1 when x is rational and to 0 when x is irrational (Ch. II, Ex. xvi. 10) is discontinuous for all values of x. So too is any function which is defined only for rational or for irrational values of x. 21. The function which is equal to x when x is irrational and top(1 + p2)/(1 + q2) when x is a rational fraction p/q (Ch. II, Ex. xvi. 11) is discontinuous for all negative and for positive rational values of x, but continuous for positive irrational values. 22. For what points are the functions considered in Ch. IV, Exs. xxxi dis- continuous, and what is the nature of their discontinuities? [Consider, e.g., the function y = lim xn (Ex. 5). Here y is only defined when –1 < x ■ 1: it is equal to 0 when –1 < x < 1 and to 1 when x = 1. The points x = 1 and x = –1 are points of simple discontinuity.] [V : 100] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 216 100. The fundamental property of a continuous function. It may perhaps be thought that the analysis of the idea of a continuous curve given in § 98 is not the simplest or most natural possible. Another method of analysing our idea of continuity is the following. Let A and B be two points on the graph of φ(x) whose coordinates are x0, φ(x0) and x1, φ(x1) respectively. Draw any straight line λ which passes between A and B. Then common sense certainly declares that if the graph of φ(x) is continuous it must cut λ. If we consider this property as an intrinsic geometrical property of con- tinuous curves it is clear that there is no real loss of generality in supposing λ to be parallel to the axis of x. In this case the ordinates of A and B cannot be equal: let us suppose, for definiteness, that φ(x1) > φ(x0). And let λ be the line y = η, where φ(x0) < η < φ(x1). Then to say that the graph of φ(x) must cut λ is the same thing as to say that there is a value of x between x0 and x1 for which φ(x) = η. We conclude then that a continuous function φ(x) must possess the following property: if φ(x0) = y0, φ(x1) = y1, and y0 < η < y1, then there is a value of x between x0 and x1 for which φ(x) = η. In other words as x varies from x0 to x1, y must assume at least once every value between y0 and y1. We shall now prove that if φ(x)

is a continuous function of x in the sense defined in § 98 then it does in fact possess this property. There is a certain range of values of x, to the right of x0, for which φ(x) < η. For φ(x0) < η, and so φ(x) is certainly less than η if φ(x)–φ(x0) is numerically less than η – φ(x0). But since φ(x) is continuous for x = x0, this condition is certainly satisfied if x is near enough to x0. Similarly there is a certain range of values, to the left of x1, for which φ(x) > η. Let us divide the values of x between x0 and x1 into two classes L, R as follows: (1) in the class L we put all values ξ of x such that φ(x) < η when x = ξ and for all values of x between x0 and ξ; (2) in the class R we put all the other values of x, i.e. all numbers ξ [V : 100] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 217 such that either φ(ξ) ■ η or there is a value of x between x0 and ξ for which φ(x) ■ η. Then it is evident that these two classes satisfy all the conditions im- posed upon the classes L, R of § 17, and so constitute a section of the real numbers. Let ξ0 be the number corresponding to the section. First suppose φ(ξ0) > η, so that ξ0 belongs to the upper class: and let φ(ξ0) = η + k, say. Then φ(ξ′) < η and so φ(ξ0) – φ(ξ′) > k, for all values of ξ′ less than ξ0, which contradicts the condition of continuity for x = ξ0. Next suppose φ(ξ0) = η – k < η. Then, if ξ′ is any number greater than ξ0, either φ(ξ′) ■ η or we can find a number ξ″ between ξ0 and ξ′ such that φ(ξ″) ■ η. In either case we can find a number as near to ξ0 as we please and such that the corresponding values of φ(x) differ by more than k. And this again contradicts the hypothesis that φ(x) is continuous for x = ξ0. Hence φ(ξ0) = η, and the theorem is established. It should be observed that we have proved more than is asserted explicitly in the theorem; we have proved in fact that ξ0 is the least value of x for which φ(x) = η. It is not obvious, or indeed generally true, that there is a least among the values of x for which a function assumes a given value, though this is true for continuous functions. It is easy to see that the converse of the theorem just proved is not true. Thus such a function as the function φ(x) whose graph is represented by Fig. 31 obviously assumes at least once every value between φ(x0) and φ(x1): yet φ(x) is discontinuous. Indeed it is not even true that φ(x) must be continuous when it assumes each value once and once only. Thus let φ(x) be defined as follows from x = 0 to x = 1. If x = 0 let φ(x) = 0; if 0 < x < 1 let φ(x) = 1 – x; and if x = 1 let φ(x) = 1. The graph of the function is shown in Fig. 32; it includes the points O, C but not the points A, B. It is clear that, as x varies from 0 to 1, φ(x) assumes once and once only every value between φ(0) = 0 and φ(1) = 1; but φ(x) is discontinuous for x = 0 and x = 1. As a matter of fact, however, the curves which usually occur in elementary mathematics are composed of a finite number of pieces along which y always [V : 101] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 218x0 x1 Fig. 31.O B A C Fig. 32. varies in the same direction. It is easy to show that if y = φ(x) always varies in the same direction, i.e. steadily increases or decreases, as x varies from x0 to x1, then the two notions of continuity are really equivalent, i.e. that if φ(x) takes every value between φ(x0) and φ(x1) then it must be a continuous function in the sense of § 98. For let ξ be any value of x between x0 and x1. As x → ξ through values less than ξ, φ(x) tends to the limit φ(ξ – 0) (§ 95). Similarly as x → ξ through values greater than ξ, φ(x) tends to the limit φ(ξ + 0). The function will be continuous for x = ξ if and only if φ(ξ – 0) = φ(ξ) = φ(ξ + 0). But if either of these equations is untrue, say the first, then it is evident that φ(x) never assumes any value which lies between φ(ξ – 0) and φ(ξ), which is contrary to our assumption. Thus φ(x) must be continuous. The net result of this and the last section is consequently to show that our common-sense notion of what we mean by continuity is substantially accurate, and capable of precise statement in mathematical terms. 101. In this and the following paragraphs we shall state and prove some general theorems concerning continuous functions. [V : 102] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 219 Theorem 1. Suppose that φ(x) is continuous for x = ξ, and that φ(ξ) is positive. Then we can determine a positive number δ such that φ(ξ) is positive throughout the interval [ξ – δ, ξ + δ]. For, taking ■ = 1 2 φ(ξ) in the fundamental inequality of p. 212, we can choose δ so that |φ(x) – φ(ξ)| < 1 2 φ(ξ) throughout [ξ – δ, ξ + δ], and then φ(x) ■ φ(ξ) – |φ(x) – φ(ξ)| > 1 2 φ(ξ) > 0, so that φ(x) is positive. There is plainly a corresponding theorem referring to negative values of φ(x). Theorem 2. If φ(x) is continuous for x = ξ, and φ(x) vanishes for values of x as near to ξ as we please, or assumes, for values of x as near to ξ as we please, both positive and negative values, then φ(ξ) = 0. This is an obvious corollary of Theorem 1. If φ(ξ) is not zero, it must be positive or negative; and if it were, for example, positive, it would be positive for all values of x sufficiently near to ξ, which contradicts the hypotheses of the theorem. 102. The range of values of a continuous function. Let us consider a function φ(x) about which we shall only assume at present that it is defined for every value of x in an interval [a, b]. The values assumed by φ(x) for values of x in [a, b] form an aggregate S to which we can apply the arguments of § 80, as we applied them in § 81 to the aggregate of values of a function of n. If there is a number K such that φ(x) ■ K, for all values of x in question, we say that φ(x) is bounded above. In this case φ(x) possesses an upper bound M : no value of φ(x) exceeds M , but any number less than M is exceeded by at least one value of φ(x). Similarly we define ‘bounded below ’, ‘lower bound ’, ‘bounded’, as applied to functions of a continuous variable x. Theorem 1. If φ(x) is continuous throughout [a, b], then it is bounded in [a, b]. [V : 102] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 220 We can certainly determine an interval [a, ξ], extending to the right from a, in which φ(x) is bounded. For since φ(x) is continuous for x = a, we can, given any positive number ■ however small, determine an interval [a, ξ] throughout which φ(x) lies between φ(a) – ■ and φ(a) + ■; and obviously φ(x) is bounded in this interval. Now divide the points ξ of the interval [a, b] into two classes L, R, putting ξ in L if φ(ξ) is bounded in [a, ξ], and in R if this is not the case. It follows from what precedes that L certainly

exists: what we propose to prove is that R does not. Suppose that R does exist, and let β be the number corresponding to the section whose lower and upper classes are L and R. Since φ(x) is continuous for x = β, we can, however small ■ may be, determine an interval [β – η, β + η]* throughout which φ(β) – ■ < φ(x) < φ(β) + ■. Thus φ(x) is bounded in [β – η, β + η]. Now β – η belongs to L. Therefore φ(x) is bounded in [a, β – η]: and therefore it is bounded in the whole interval [a, β + η]. But β + η belongs to R and so φ(x) is not bounded in [a, β +η]. This contradiction shows that R does not exist. And so φ(x) is bounded in the whole interval [a, b]. Theorem 2. If φ(x) is continuous throughout [a, b], and M and m are its upper and lower bounds, then φ(x) assumes the values M and m at least once each in the interval. For, given any positive number ■, we can find a value of x for which M – φ(x) < ■ or 1/{M – φ(x)} > 1/■. Hence 1/{M – φ(x)} is not bounded, and therefore, by Theorem 1, is not continuous. But M – φ(x) is a continuous function, and so 1/{M – φ(x)} is continuous at any point at which its denominator does not vanish (Ex. xxxvii. 1). There must therefore be one point at which the denominator vanishes: at this point φ(x) = M . Similarly it may be shown that there is a point at which φ(x) = m. *If β = b we must replace this interval by [β – η, β], and β + η by β, throughout the argument which follows. [V : 103] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 221 The proof just given is somewhat subtle and indirect, and it may be well, in view of the great importance of the theorem, to indicate alterna- tive lines of proof. It will however be convenient to postpone these for a moment.* Examples XXXVIII. 1. If φ(x) = 1/x except when x = 0, and φ(x) = 0 when x = 0, then φ(x) has neither an upper nor a lower bound in any interval which includes x = 0 in its interior, as e.g. the interval [–1, +1]. 2. If φ(x) = 1/x2 except when x = 0, and φ(x) = 0 when x = 0, then φ(x) has the lower bound 0, but no upper bound, in the interval [–1, +1]. 3. Let φ(x) = sin(1/x) except when x = 0, and φ(x) = 0 when x = 0. Then φ(x) is discontinuous for x = 0. In any interval [–■, +■] the lower bound is –1 and the upper bound +1, and each of these values is assumed by φ(x) an infinity of times. 4. Let φ(x) = x – [x]. This function is discontinuous for all integral values of x. In the interval [0, 1] its lower bound is 0 and its upper bound 1. It is equal to 0 when x = 0 or x = 1, but it is never equal to 1. Thus φ(x) never assumes a value equal to its upper bound. 5. Let φ(x) = 0 when x is irrational, and φ(x) = q when x is a rational fraction p/q. Then φ(x) has the lower bound 0, but no upper bound, in any interval [a, b]. But if φ(x) = (–1)pq when x = p/q, then φ(x) has neither an upper nor a lower bound in any interval. 103. The oscillation of a function in an interval. Let φ(x) be any function bounded throughout [a, b], and M and m its upper and lower bounds. We shall now use the notation M (a, b), m(a, b) for M , m, in order to exhibit explicitly the dependence of M and m on a and b, and we shall write O(a, b) = M (a, b) – m(a, b). This number O(a, b), the difference between the upper and lower bounds of φ(x) in [a, b], we shall call the oscillation of φ(x) in [a, b]. The simplest of the properties of the functions M (a, b), m(a, b), O(a, b) are as follows. *See § 104. [V : 104] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 222 (1) If a ■ c ■ b then M (a, b) is equal to the greater of M (a, c) and M (c, b), and m(a, b) to the lesser of m(a, c) and m(c, b). (2) M (a, b) is an increasing, m(a, b) a decreasing, and O(a, b) an in- creasing function of b. (3) O(a, b) ■ O(a, c) + O(c, b). The first two theorems are almost immediate consequences of our def- initions. Let μ be the greater of M (a, c) and M (c, b), and let ■ be any positive number. Then φ(x) ■ μ throughout [a, c] and [c, b], and there- fore throughout [a, b]; and φ(x) > μ – ■ somewhere in [a, c] or in [c, b], and therefore somewhere in [a, b]. Hence M (a, b) = μ. The proposition concerning m may be proved similarly. Thus (1) is proved, and (2) is an obvious corollary. Suppose now that M1 is the greater and M2 the less of M (a, c) and M (c, b), and that m1 is the less and m2 the greater of m(a, c) and m(c, b). Then, since c belongs to both intervals, φ(c) is not greater than M2 nor less than m2. Hence M2 ■ m2, whether these numbers correspond to the same one of the intervals [a, c] and [c, b] or not, and O(a, b) = M1 – m1 ■ M1 + M2 – m1 – m2. But O(a, c) + O(c, b) = M1 + M2 – m1 – m2; and (3) follows. 104. Alternative proofs of Theorem 2 of § 102. The most straight- forward proof of Theorem 2 of § 102 is as follows. Let ξ be any number of the interval [a, b]. The function M (a, ξ) increases steadily with ξ and never ex- ceeds M . We can therefore construct a section of the numbers ξ by putting ξ in L or in R according as M (a, ξ) < M or M (a, ξ) = M . Let β be the number corresponding to the section. If a < β < b, we have M (a, β – η) < M, M (a, β + η) = M for all positive values of η, and so M (β – η, β + η) = M, [V : 105] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 223 by (1) of § 103. Hence φ(x) assumes, for values of x as near as we please to β, values as near as we please to M , and so, since φ(x) is continuous, φ(β) must be equal to M . If β = a then M (a, a + η) = M . And if β = b then M (a, b – η) < M , and so M (b – η, b) = M . In either case the argument may be completed as before. The theorem may also be proved by the method of repeated bisection used in § 71. If M is the upper bound of φ(x) in an interval P Q, and P Q is divided into two equal parts, then it is possible to find a half P1Q1 in which the upper bound of φ(x) is also M . Proceeding as in § 71, we construct a sequence of intervals P Q, P1Q1, P2Q2, . . . in each of which the upper bound of φ(x) is M . These intervals, as in § 71, converge to a point T , and it is easily proved that the value of φ(x) at this point is M . 105. Sets of intervals on a line. The Heine-Borel Theorem. We shall now proceed to prove some theorems concerning the oscillation of a function which are of a somewhat abstract character but of very great importance, particularly, as we shall see later, in the theory of integration. These theorems depend upon a general theorem concerning intervals on a line. Suppose that we are given a set of intervals in a straight line, that is to say an aggregate each of whose members is an interval [α, β]. We make no restriction as to the nature of these intervals; they may be finite or infinite in number; they may or may not overlap;*

and any number of them may be included in others. It is worth while in passing to give a few examples of sets of intervals to which we shall have occasion to return later. (i) If the interval [0, 1] is divided into n equal parts then the n intervals thus formed define a finite set of non-overlapping intervals which just cover up the line. (ii) We take every point ξ of the interval [0, 1], and associate with ξ the interval [ξ – δ, ξ + δ], where δ is a positive number less than 1, except that with 0 we associate [0, δ] and with 1 we associate [1 – δ, 1], and in general we reject any *The word overlap is used in its obvious sense: two intervals overlap if they have points in common which are not end points of either. Thus [0, 2 3] and [1 3 , 1] overlap. A pair of intervals such as [0, 1 2] and [1 2 , 1] may be said to abut. [V : 105] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 224 part of any interval which projects outside the interval [0, 1]. We thus define an infinite set of intervals, and it is obvious that many of them overlap with one another. (iii) We take the rational points p/q of the interval [0, 1], and associate with p/q the interval p q – δ q3 , p q + δ q3

, where δ is positive and less than 1. We regard 0 as 0/1 and 1 as 1/1: in these two cases we reject the part of the interval which lies outside [0, 1]. We obtain thus an infinite set of intervals, which plainly overlap with one another, since there are an infinity of rational points, other than p/q, in the interval associated with p/q. The Heine-Borel Theorem. Suppose that we are given an inter- val [a, b], and a set of intervals I each of whose members is included in [a, b]. Suppose further that I possesses the following properties: (i) every point of [a, b], other than a and b, lies inside* at least one interval of I; (ii) a is the left-hand end point, and b the right-hand end point, of at least one interval of I. Then it is possible to choose a finite number of intervals from the set I which form a set of intervals possessing the properties (i) and (ii). We know that a is the left-hand end point of at least one interval of I, say [a, a1]. We know also that a1 lies inside at least one interval of I, say [a′ 1, a2]. Similarly a2 lies inside an interval [a′ 2, a3] of I. It is plain that this argument may be repeated indefinitely, unless after a finite number of steps an coincides with b. If an does coincide with b after a finite number of steps then there is nothing further to prove, for we have obtained a finite set of intervals, selected from the intervals of I, and possessing the properties required. If an never coincides with b, then the points a1, a2, a3, . . . must (since each lies to the right of its predecessor) tend to a limiting position, but this limiting position may, so far as we can tell, lie anywhere in [a, b]. *That is to say ‘in and not at an end of’. [V : 105] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 225 Let us suppose now that the process just indicated, starting from a, is performed in all possible ways, so that we obtain all possible sequences of the type a1, a2, a3, ... Then we can prove that there must be at least one such sequence which arrives at b after a finite number of steps.a a′ 1 a1 a′ 2 a2 ξ a3 ξ′ ξ0 ξ″ b1 b Fig. 33. There are two possibilities with regard to any point ξ between a and b. Either (i) ξ lies to the left of some point an of some sequence or (ii) it does not. We divide the points ξ into two classes L and R according as to whether (i) or (ii) is true. The class L certainly exists, since all points of the interval [a, a1] belong to L. We shall now prove that R does not exist, so that every point ξ belongs to L. If R exists then L lies entirely to the left of R, and the classes L, R form a section of the real numbers between a and b, to which corresponds a number ξ0. The point ξ0 lies inside an interval of I, say [ξ′, ξ″], and ξ′ belongs to L, and so lies to the left of some term an of some sequence. But then we can take [ξ′, ξ″] as the interval [a′ n, an+1] associated with an in our construction of the sequence a1, a2, a3, . . . ; and all points to the left of ξ″ lie to the left of an+1. There are therefore points of L to the right of ξ0, and this contradicts the definition of R. It is therefore impossible that R should exist. Thus every point ξ belongs to L. Now b is the right-hand end point of an interval of I, say [b1, b], and b1 belongs to L. Hence there is a member an of a sequence a1, a2, a3, . . . such that an > b1. But then we may take the interval [a′ n, an+1] corresponding to an to be [b1, b], and so we obtain a sequence in which the term after the nth coincides with b, and therefore a finite set of intervals having the properties required. Thus the theorem is proved. It is instructive to consider the examples of p. 223 in the light of this theorem. [V : 106] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 226 (i) Here the conditions of the theorem are not satisfied: the points 1/n, 2/n, 3/n, . . . do not lie inside any interval of I. (ii) Here the conditions of the theorem are satisfied. The set of intervals [0, 2δ], [δ, 3δ], [2δ, 4δ], . . . , [1 – 2δ, 1], associated with the points δ, 2δ, 3δ, . . . , 1 – δ, possesses the properties required. (iii) In this case we can prove, by using the theorem, that there are, if δ is small enough, points of [0, 1] which do not lie in any interval of I. If every point of [0, 1] lay inside an interval of I (with the obvious reservation as to the end points), then we could find a finite number of intervals of I possess- ing the same property and having therefore a total length greater than 1. Now there are two intervals, of total length 2δ, for which q = 1, and q – 1 intervals, of total length 2δ(q – 1)/q3, associated with any other value of q. The sum of any finite number of intervals of I can therefore not be greater than 2δ times that of the series 1 + 1 23 + 2 33 + 3 43 + . . . , which will be shown to be convergent in Ch. VIII. Hence it follows that, if δ is small enough, the supposition that every point of [0, 1] lies inside an interval of I leads to a contradiction. The reader may be tempted to think that this proof is needlessly elaborate, and that the existence of points of the interval, not in any interval of I, follows at once from the fact that the sum of all these intervals is less than 1. But the theorem to which he would be appealing is (when the set of intervals is infinite) far from obvious, and can only be proved rigorously by some such use of the Heine-Borel Theorem as is made in the text. 106. We shall now apply the Heine-Borel Theorem to the proof of two important theorems concerning the oscillation of a continuous function. Theorem I. If φ(x) is continuous throughout the interval [a, b], then we can divide [a, b] into a finite number of sub-intervals [a, x1], [x1, x2], . . . , [xn, b], in each of

which the oscillation of φ(x) is less than an assigned positive number ■. Let ξ be any number between a and b. Since φ(x) is continuous for x = ξ, we can determine an interval [ξ – δ, ξ + δ] such that the oscillation [V : 106] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 227 of φ(x) in this interval is less than ■. It is indeed obvious that there are an infinity of such intervals corresponding to every ξ and every ■, for if the condition is satisfied for any particular value of δ, then it is satisfied a fortiori for any smaller value. What values of δ are admissible will naturally depend upon ξ; we have at present no reason for supposing that a value of δ admissible for one value of ξ will be admissible for another. We shall call the intervals thus associated with ξ the ■-intervals of ξ. If ξ = a then we can determine an interval [a, a + δ], and so an infinity of such intervals, having the same property. These we call the ■-intervals of a, and we can define in a similar manner the ■-intervals of b. Consider now the set I of intervals formed by taking all the ■-intervals of all points of [a, b]. It is plain that this set satisfies the conditions of the Heine-Borel Theorem; every point interior to the interval is interior to at least one interval of I, and a and b are end points of at least one such interval. We can therefore determine a set I′ which is formed by a finite number of intervals of I, and which possesses the same property as I itself. The intervals which compose the set I′ will in general overlap as in Fig. 34. But their end points obviously divide up [a, b] into a finite set ofa b Fig. 34. intervals I″ each of which is included in an interval of I′, and in each of which the oscillation of φ(x) is less than ■. Thus Theorem I is proved. Theorem II. Given any positive number ■, we can find a number η such that, if the interval [a, b] is divided in any manner into sub-intervals of length less than η, then the oscillation of φ(x) in each of them will be less than ■. Take ■1 < 1 2 ■, and construct, as in Theorem I, a finite set of sub- intervals j in each of which the oscillation of φ(x) is less than ■1. Let η be the length of the least of these sub-intervals j. If now we divide [a, b] into parts each of length less than η, then any such part must lie entirely within at most two successive sub-intervals j. Hence, in virtue of (3) of § 103, the [V : 107] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 228 oscillation of φ(x), in one of the parts of length less than η, cannot exceed twice the greatest oscillation of φ(x) in a sub-interval j, and is therefore less than 2■1, and therefore than ■. This theorem is of fundamental importance in the theory of definite integrals (Ch. VII). It is impossible, without the use of this or some sim- ilar theorem, to prove that a function continuous throughout an interval necessarily possesses an integral over that interval. 107. Continuous functions of several variables. The notions of continuity and discontinuity may be extended to functions of several inde- pendent variables (Ch. II, §§ 31 et seq.). Their application to such functions however, raises questions much more complicated and difficult than those which we have considered in this chapter. It would be impossible for us to discuss these questions in any detail here; but we shall, in the sequel, require to know what is meant by a continuous function of two variables, and we accordingly give the following definition. It is a straightforward generalisation of the last form of the definition of § 98. The function φ(x, y) of the two variables x and y is said to be contin- uous for x = ξ, y = η if, given any positive number ■, however small, we can choose δ(■) so that |φ(x, y) – φ(ξ, η)| < ■ when 0 ■ |x – ξ| ■ δ(■) and 0 ■ |y – η| ■ δ(■); that is to say if we can draw a square, whose sides are parallel to the axes of coordinates and of length 2δ(■), whose centre is the point (ξ, η), and which is such that the value of φ(x, y) at any point inside it or on its boundary differs from φ(ξ, η) by less than ■.* This definition of course presupposes that φ(x, y) is defined at all points of the square in question, and in particular at the point (ξ, η). Another method of stating the definition is this: φ(x, y) is continuous for x = ξ, y = η if φ(x, y) → φ(ξ, η) when x → ξ, y → η in any manner. This state- ment is apparently simpler; but it contains phrases the precise meaning of *The reader should draw a figure to illustrate the definition. [V : 108] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 229 which has not yet been explained and can only be explained by the help of inequalities like those which occur in our original statement. It is easy to prove that the sums, the products, and in general the quo- tients of continuous functions of two variables are themselves continuous. A polynomial in two variables is continuous for all values of the variables; and the ordinary functions of x and y which occur in every-day analysis are generally continuous, i.e. are continuous except for pairs of values of x and y connected by special relations. The reader should observe carefully that to assert the continuity of φ(x, y) with respect to the two variables x and y is to assert much more than its con- tinuity with respect to each variable considered separately. It is plain that if φ(x, y) is continuous with respect to x and y then it is certainly continuous with respect to x (or y) when any fixed value is assigned to y (or x). But the converse is by no means true. Suppose, for example, that φ(x, y) = 2xy x2 + y2 when neither x nor y is zero, and φ(x, y) = 0 when either x or y is zero. Then if y has any fixed value, zero or not, φ(x, y) is a continuous function of x, and in particular continuous for x = 0; for its value when x = 0 is zero, and it tends to the limit zero as x → 0. In the same way it may be shown that φ(x, y) is a continuous function of y. But φ(x, y) is not a continuous function of x and y for x = 0, y = 0. Its value when x = 0, y = 0 is zero; but if x and y tend to zero along the straight line y = ax, then φ(x, y) = 2a 1 + a2 , lim φ(x, y) = 2a 1 + a2 , which may have any value between –1 and 1. 108. Implicit functions. We have already, in Ch. II, met with the idea of an implicit function. Thus, if x and y are connected by the relation y5 – xy – y – x = 0, (1) then y is an ‘implicit function’ of x. But it is far from obvious that such an equation as this does really define a function y of x, or several such functions. In Ch. II we were content to take this [V : 108] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 230 for granted. We are now in a position to consider whether the assumption we made then was justified. We shall find the following terminology

useful. Suppose that it is possible to surround a point (a, b), as in § 107, with a square throughout which a certain condition is satisfied. We shall call such a square a neighbourhood of (a, b), and say that the condition in question is satisfied in the neighbourhood of (a, b), or near (a, b), meaning by this simply that it is possible to find some square throughout which the condition is satisfied. It is obvious that similar language may be used when we are dealing with a single variable, the square being replaced by an interval on a line. Theorem. If (i) f (x, y) is a continuous function of x and y in the neigh- bourhood of (a, b), (ii) f (a, b) = 0, (iii) f (x, y) is, for all values of x in the neighbourhood of a, a steadily increasing function of y, in the stricter sense of § 95, then (1) there is a unique function y = φ(x) which, when substituted in the equation f (x, y) = 0, satisfies it identically for all values of x in the neighbour- hood of a, (2) φ(x) is continuous for all values of x in the neighbourhood of a. In the figure the square represents a 'neighbourhood' of (a, b) throughout which the conditions (i) and (iii) are satisfied, and P the point (a, b). If we takeP P ′ Q Q′ R R′ (a, b) Fig. 35. Q and R as in the figure, it follows from (iii) that f (x, y) is positive at Q and [V : 108] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 231 negative at R. This being so, and f (x, y) being continuous at Q and at R, we can draw lines QQ′ and RR′ parallel to OX, so that R′Q′ is parallel to OY and f (x, y) is positive at all points of QQ′ and negative at all points of RR′. In particular f (x, y) is positive at Q′ and negative at R′, and therefore, in virtue of (iii) and § 100, vanishes once and only once at a point P ′ on R′Q′. The same construction gives us a unique point at which f (x, y) = 0 on each ordinate between RQ and R′Q′. It is obvious, moreover, that the same construction can be carried out to the left of RQ. The aggregate of points such as P ′ gives us the graph of the required function y = φ(x). It remains to prove that φ(x) is continuous. This is most simply effected by using the idea of the 'limits of indetermination' of φ(x) as x → a (§ 96). Suppose that x → a, and let λ and Λ be the limits of indetermination of φ(x) as x → a. It is evident that the points (a, λ) and (a, Λ) lie on QR. Moreover, we can find a sequence of values of x such that φ(x) → λ when x → a through the values of the sequence; and since f {x, φ(x)} = 0, and f (x, y) is a continuous function of x and y, we have f (a, λ) = 0. Hence λ = b; and similarly Λ = b. Thus φ(x) tends to the limit b as x → a, and so φ(x) is continuous for x = a. It is evident that we can show in exactly the same way that φ(x) is continuous for any value of x in the neighbourhood of a. It is clear that the truth of the theorem would not be affected if we were to change 'increasing' to 'decreasing' in condition (iii). As an example, let us consider the equation (1), taking a = 0, b = 0. It is evident that the conditions (i) and (ii) are satisfied. Moreover f (x, y) – f (x, y′) = (y – y′)(y4 + y3y′ + y2y′2 + yy′3 + y′4 – x – 1) has, when x, y, and y′ are sufficiently small, the sign opposite to that of y – y′. Hence condition (iii) (with 'decreasing' for 'increasing') is satisfied. It follows that there is one and only one continuous function y which satisfies the equa- tion (1) identically and vanishes with x. The same conclusion would follow if the equation were y2 – xy – y – x = 0. The function in question is in this case y = 1 2 {1 + x – p1 + 6x + x2}, [V : 109] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 232 where the square root is positive. The second root, in which the sign of the square root is changed, does not satisfy the condition of vanishing with x. There is one point in the proof which the reader should be careful to observe. We supposed that the hypotheses of the theorem were satisfied 'in the neigh- bourhood of (a, b)', that is to say throughout a certain square ξ – δ ■ x ■ ξ + δ, η – δ ■ y ■ η + δ. The conclusion holds 'in the neighbourhood of x = a', that is to say throughout a certain interval ξ – δ1 ■ x ■ ξ + δ1. There is nothing to show that the δ1 of the conclusion is the δ of the hypotheses, and indeed this is generally untrue. 109. Inverse Functions. Suppose in particular that f (x, y) is of the form F (y) – x. We then obtain the following theorem. If F (y) is a function of y, continuous and steadily increasing (or decreasing), in the stricter sense of § 95, in the neighbourhood of y = b, and F (b) = a, then there is a unique continuous function y = φ(x) which is equal to b when x = a and satisfies the equation F (y) = x identically in the neighbourhood of x = a. The function thus defined is called the inverse function of F (y). Suppose for example that y3 = x, a = 0, b = 0. Then all the conditions of the theorem are satisfied. The inverse function is x = 3 √y. If we had supposed that y2 = x then the conditions of the theorem would not have been satisfied, for y2 is not a steadily increasing function of y in any interval which includes y = 0: it decreases when y is negative and increases when y is positive. And in this case the conclusion of the theorem does not hold, for y2 = x defines two functions of x, viz. y = √x and y = –√x, both of which vanish when x = 0, and each of which is defined only for positive values of x, so that the equation has sometimes two solutions and sometimes none. The reader should consider the more general equations y2n = x, y2n+1 = x, in the same way. Another interesting example is given by the equation y5 – y – x = 0, already considered in Ex. xiv. 7. Similarly the equation sin y = x [V : 109] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 233 has just one solution which vanishes with x, viz. the value of arc sin x which vanishes with x. There are of course an infinity of solutions, given by the other values of arc sin x (cf. Ex. xv. 10), which do not satisfy this condition. So far we have considered only what happens in the neighbourhood of a particular value of x. Let us suppose now that F (y) is positive and steadily in- creasing (or decreasing) throughout an interval [a, b]. Given any point ξ of [a, b], we can determine an interval i including ξ, and a unique and continuous inverse function φi(x) defined throughout i. From the set I of intervals i we can, in virtue of the Heine-Borel Theorem, pick out a finite sub-set covering up the whole interval [a, b]; and it is plain that the finite set of functions φi(x), corresponding to the sub-set of intervals i thus selected, define together a unique inverse function φ(x) continuous through- out [a, b]. We thus obtain the theorem: if x = F (y), where F (y) is continuous and increases steadily and strictly from A to B as x

increases from a to b, then there is a unique inverse function y = φ(x) which is continuous and increases steadily and strictly from a to b as x increases from A to B. It is worth while to show how this theorem can be obtained directly without the help of the more difficult theorem of § 108. Suppose that A < ξ < B, and consider the class of values of y such that (i) a < y < b and (ii) F (y) ■ ξ. This class has an upper bound η, and plainly F (η) ■ ξ. If F (η) were less than ξ, we could find a value of y such that y > η and F (y) < ξ, and η would not be the upper bound of the class considered. Hence F (η) = ξ. The equation F (y) = ξ has therefore a unique solution y = η = φ(ξ), say; and plainly η increases steadily and continuously with ξ, which proves the theorem. MISCELLANEOUS EXAMPLES ON CHAPTER V. 1. Show that, if neither a nor b is zero, then axn + bxn–1 + · · · + k = axn(1 + ■x), where ■x is of the first order of smallness when x is large. 2. If P (x) = axn + bxn–1 + · · · + k, and a is not zero, then as x increases P (x) has ultimately the sign of a; and so has P (x + λ) – P (x), where λ is any constant. [V : 109] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 234 3. Show that in general (axn + bxn–1 + · · · + k)/(Axn + Bxn–1 + · · · + K) = α + (β/x)(1 + ■x), where α = a/A, β = (bA – aB)/A2, and ■x is of the first order of smallness when x is large. Indicate any exceptional cases. 4. Express (ax2 + bx + c)/(Ax2 + Bx + C) in the form α + (β/x) + (γ/x2)(1 + ■x), where ■x is of the first order of smallness when x is large. 5. Show that lim x→∞ √x{√x + a – √x} = 1 2 a. [Use the formula √x + a – √x = a/{√x + a + √x}.] 6. Show that √x + a = √x + 1 2 (a/√x)(1 + ■x), where ■x is of the first order of smallness when x is large. 7. Find values of α and β such that √ax2 + 2bx + c – αx – β has the limit zero as x → ∞; and prove that lim x{√ax2 + 2bx + c – αx – β} = (ac – b2)/2a. 8. Evaluate lim x→∞ x q x2 + px4 + 1 – x√2

. 9. Prove that (sec x – tan x) → 0 as x → 1 2 π. 10. Prove that φ(x) = 1 – cos(1 – cos x) is of the fourth order of smallness when x is small; and find the limit of φ(x)/x4 as x → 0. 11. Prove that φ(x) = x sin(sin x) – sin2 x is of the sixth order of smallness when x is small; and find the limit of φ(x)/x6 as x → 0. 12. From a point P on a radius OA of a circle, produced beyond the cir- cle, a tangent P T is drawn to the circle, touching it in T , and T N is drawn perpendicular to OA. Show that N A/AP → 1 as P moves up to A. 13. Tangents are drawn to a circular arc at its middle point and its ex- tremities; Δ is the area of the triangle formed by the chord of the arc and the two tangents at the extremities, and Δ′ the area of that formed by the three tangents. Show that Δ/Δ′ → 4 as the length of the arc tends to zero. [V : 109] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 235 14. For what values of a does {a + sin(1/x)}/x tend to (1) ∞, (2) –∞, as x → 0? [To ∞ if a > 1, to –∞ if a < –1: the function oscillates if –1 ■ a ■ 1.] 15. If φ(x) = 1/q when x = p/q, and φ(x) = 0 when x is irrational, then φ(x) is continuous for all irrational and discontinuous for all rational values of x. 16. Show that the function whose graph is drawn in Fig. 32 may be repre- sented by either of the formulae 1 – x + [x] – [1 – x], 1 – x – lim n→∞(cos2n+1 πx). 17. Show that the function φ(x) which is equal to 0 when x = 0, to 1 2 – x when 0 < x < 1 2 , to 1 2 when x = 1 2 , to 3 2 – x when 1 2 < x < 1, and to 1 when x = 1, assumes every value between 0 and 1 once and once only as x increases from 0 to 1, but is discontinuous for x = 0, x = 1 2 , and x = 1. Show also that the function may be represented by the formula 1 2 – x – 1 2 [2x] – 1 2 [1 – 2x]. 18. Let φ(x) = x when x is rational and φ(x) = 1 – x when x is irrational. Show that φ(x) assumes every value between 0 and 1 once and once only as x increases from 0 to 1, but is discontinuous for every value of x except x = 1 2 . 19. As x increases from – 1 2 π to 1 2 π, y = sin x is continuous and steadily increases, in the stricter sense, from –1 to 1. Deduce the existence of a function x = arc sin y which is a continuous and steadily increasing function of y from y = –1 to y = 1. 20. Show that the numerically least value of arc tan y is continuous for all values of y and increases steadily from – 1 2 π to 1 2 π as y varies through all real values. 21. Discuss, on the lines of §§ 108–109, the solution of the equations y2 – y – x = 0, y4 – y2 – x2 = 0, y4 – y2 + x2 = 0 in the neighbourhood of x = 0, y = 0. 22. If ax2 + 2bxy + cy2 + 2dx + 2ey = 0 and Δ = 2bde – ae2 – cd2, then one value of y is given by y = αx + βx2 + (γ + ■x)x3, where α = –d/e, β = Δ/2e3, γ = (cd – be)Δ/2e5, [V : 109] LIMITS OF FUNCTIONS OF A CONTINUOUS VARIABLE 236 and ■x is of the first order of smallness when x is small. [If y – αx = η then –2eη = ax2 + 2bx(η + αx) + c(η + αx)2 = Ax2 + 2Bxη + Cη2, say. It is evident that η is of the second order of smallness, xη of the third, and η2 of the fourth; and –2eη = Ax2 – (AB/e)x3, the error being of the fourth order.] 23. If x = ay + by2 + cy3 then one value of y is given by y = αx + βx2 + (γ + ■x)x3, where α = 1/a, β = –b/a3, γ = (2b2 – ac)/a5, and ■x is of the first order of smallness when x is small. 24. If x = ay + byn, where n is an integer greater than unity, then one value of y is given by y = αx + βxn + (γ + ■x)x2n–1, where α = 1/a, β = –b/an+1, γ = nb2/a2n+1, and ■x is of the (n – 1)th order of smallness when x is small. 25. Show that the least positive root of the equation xy = sin x is a con- tinuous function of y throughout the interval [0, 1], and decreases steadily from π to 0 as y increases from 0 to 1. [The function is the inverse of (sin x)/x: apply § 109.] 26. The least positive root of xy = tan x is a continuous function of y throughout the interval [1, ∞), and increases steadily from 0 to 1 2 π as y increases from 1 towards ∞. CHAPTER VI DERIVATIVES AND INTEGRALS 110. Derivatives or Differential Coefficients. Let us return to the consideration of the properties which we naturally associate with the notion of a curve. The first and most obvious property is, as we saw in the last chapter, that which gives a curve its appearance of connectedness, and which we embodied in our definition of a continuous function. The ordinary curves which occur in elementary geometry, such as straight lines, circles and conic sections, have of course many other prop- erties of a general character. The simplest and most noteworthy of these is perhaps that they have a definite direction at every point, or what is the same thing, that at every point of the curve we can draw a tangent to it. The reader will probably

remember that in elementary geometry the tangent to a curve at P is defined to be ‘the limiting position of the chord P Q, when Q moves up towards coincidence with P ’. Let us consider what is implied in the assumption of the existence of such a limiting position. In the figure (Fig. 36) P is a fixed point on the curve, and Q a variable point; P M , QN are parallel to OY and P R to OX. We denote the coor- dinates of P by x, y and those of Q by x + h, y + k: h will be positive or negative according as N lies to the right or left of M . We have assumed that there is a tangent to the curve at P , or that there is a definite ‘limiting position’ of the chord P Q. Suppose that P T , the tangent at P , makes an angle ψ with OX. Then to say that P T is the limiting position of P Q is equivalent to saying that the limit of the angle QP R is ψ, when Q approaches P along the curve from either side. We have now to distinguish two cases, a general case and an exceptional one. The general case is that in which ψ is not equal to 1 2 π, so that P T is not parallel to OY . In this case RP Q tends to the limit ψ, and RQ/P R = tan RP Q tends to the limit tan ψ. Now RQ/P R = (N Q – M P)/M N = {φ(x + h) – φ(x)}/h; 237 [VI : 110] DERIVATIVES AND INTEGRALS 238P Q Q R R T O X Y N NM ψ Fig. 36. and so lim h→0 φ(x + h) – φ(x) h = tan ψ. (1) The reader should be careful to note that in all these equations all lengths are regarded as affected with the proper sign, so that (e.g.) RQ is negative in the figure when Q lies to the left of P ; and that the convergence to the limit is unaffected by the sign of h. Thus the assumption that the curve which is the graph of φ(x) has a tangent at P , which is not perpendicular to the axis of x, implies that φ(x) has, for the particular value of x corresponding to P , the property that {φ(x + h) – φ(x)}/h tends to a limit when h tends to zero. This of course implies that both of {φ(x + h) – φ(x)}/h, {φ(x – h) – φ(x)}/(–h) tend to limits when h → 0 by positive values only, and that the two limits are equal. If these limits exist but are not equal, then the curve y = φ(x) has an angle at the particular point considered, as in Fig. 37. Now let us suppose that the curve has (like the circle or ellipse) a tangent at every point of its length, or at any rate every portion of its length which corresponds to a certain range of variation of x. Further let us suppose this tangent never perpendicular to the axis of x: in the case of a circle this would of course restrict us to considering an arc less than a semicircle. Then an equation such as (1) holds for all values of x which [VI : 111] DERIVATIVES AND INTEGRALS 239 fall inside this range. To each such value of x corresponds a value of tan ψ: tan ψ is a function of x, which is defined for all values of x in the range of values under consideration, and which may be calculated or derived from the original function φ(x). We shall call this function the derivative or derived function of φ(x), and we shall denote it by φ'(x). Another name for the derived function of φ(x) is the differential co- efficient of φ(x); and the operation of calculating φ'(x) from φ(x) is gen- erally known as differentiation. This terminology is firmly established for historical reasons: see § 115. Before we proceed to consider the special case mentioned above, in which ψ = 1 2 π, we shall illustrate our definition by some general remarks and particular illustrations. 111. Some general remarks. (1) The existence of a derived func- tion φ'(x) for all values of x in the interval a ■ x ■ b implies that φ(x) is continuous at every point of this interval. For it is evident that {φ(x + h) – φ(x)}/h cannot tend to a limit unless lim φ(x + h) = φ(x), and it is this which is the property denoted by continuity. (2) It is natural to ask whether the converse is true, i.e. whether every continuous curve has a definite tangent at every point, and every functionP O X Y α β Fig. 37. a differential coefficient for every value of x for which it is continuous.* The *We leave out of account the exceptional case (which we have still to examine) in [VI : 111] DERIVATIVES AND INTEGRALS 240 answer is obviously No: it is sufficient to consider the curve formed by two straight lines meeting to form an angle (Fig. 37). The reader will see at once that in this case {φ(x + h) – φ(x)}/h has the limit tan β when h → 0 by positive values and the limit tan α when h → 0 by negative values. This is of course a case in which a curve might reasonably be said to have two directions at a point. But the following example, although a little more difficult, shows conclusively that there are cases in which a continuous curve cannot be said to have either one direction or several directions at one of its points. Draw the graph (Fig. 14, p. 61) of the function x sin(1/x). The function is not defined for x = 0, and so is discontinuous for x = 0. On the other hand the function defined by the equations φ(x) = x sin(1/x) (x■ = 0), φ(x) = 0 (x = 0) is continuous for x = 0 (Exs. xxxvii. 14, 15), and the graph of this function is a continuous curve. But φ(x) has no derivative for x = 0. For φ'(0) would be, by definition, lim{φ(h) – φ(0)}/h or lim sin(1/h); and no such limit exists. It has even been shown that a function of x may be continuous and yet have no derivative for any value of x, but the proof of this is much more difficult. The reader who is interested in the question may be referred to Bromwich’s Infinite Series, pp. 490–1, or Hobson’s Theory of Functions of a Real Variable, pp. 620–5. (3) The notion of a derivative or differential coefficient was suggested to us by geometrical considerations. But there is nothing geometrical in the notion itself. The derivative φ'(x) of a function φ(x) may be defined, without any reference to any kind of geometrical representation of φ(x), by the equation φ'(x) = lim h→0 φ(x + h) – φ(x) h ; and φ(x) has or has not a derivative, for any particular value of x, according as this limit does or does not exist. The geometry of curves is merely one which the curve is supposed to have a tangent perpendicular to OX: apart from this possibility the two forms of the question stated above are equivalent. [VI : 111] DERIVATIVES AND INTEGRALS 241 of many departments of mathematics in which the idea of a derivative finds an application. Another important application is in dynamics. Suppose that a particle is moving in a straight line in such a way that at time t its distance from a fixed point on the line is s = φ(t). Then the ‘velocity of the particle at time t’ is by definition the limit of φ(t + h) – φ(t) h as h → 0. The notion of ‘velocity’ is in fact merely a special case of that of the derivative of a function. Examples XXXIX. 1. If φ(x) is a constant

then φ′(x) = 0. Interpret this result geometrically. 2. If φ(x) = ax + b then φ′(x) = a. Prove this (i) from the formal definition and (ii) by geometrical considerations. 3. If φ(x) = xm, where m is a positive integer, then φ′(x) = mxm–1. [For φ′(x) = lim (x + h)m – xm h = lim

mxm–1 + m(m – 1) 1 · 2 xm–2h + · · · + hm–1

. The reader should observe that this method cannot be applied to xp/q, where p/q is a rational fraction, as we have no means of expressing (x + h)p/q as a finite series of powers of h. We shall show later on (§ 118) that the result of this example holds for all rational values of m. Meanwhile the reader will find it instructive to determine φ′(x) when m has some special fractional value (e.g. 1 2), by means of some special device.] 4. If φ(x) = sin x, then φ′(x) = cos x; and if φ(x) = cos x, then φ′(x) = – sin x. [For example, if φ(x) = sin x, we have {φ(x + h) – φ(x)}/h = {2 sin 1 2 h cos(x + 1 2 h)}/h, the limit of which, when h → 0, is cos x, since lim cos(x + 1 2 h) = cos x (the cosine being a continuous function) and lim{(sin 1 2 h)/ 1 2 h} = 1 (Ex. xxxvi. 13).] [VI : 112] DERIVATIVES AND INTEGRALS 242 5. Equations of the tangent and normal to a curve y = φ(x). The tangent to the curve at the point (x0, y0) is the line through (x0, y0) which makes with OX an angle ψ, where tan ψ = φ′(x0). Its equation is therefore y – y0 = (x – x0)φ′(x0); and the equation of the normal (the perpendicular to the tangent at the point of contact) is (y – y0)φ′(x0) + x – x0 = 0. We have assumed that the tangent is not parallel to the axis of y. In this special case it is obvious that the tangent and normal are x = x0 and y = y0 respectively. 6. Write down the equations of the tangent and normal at any point of the parabola x2 = 4ay. Show that if x0 = 2a/m, y0 = a/m2, then the tangent at (x0, y0) is x = my + (a/m). 112. We have seen that if φ(x) is not continuous for a value of x then it cannot possibly have a derivative for that value of x. Thus such functions as 1/x or sin(1/x), which are not defined for x = 0, and so necessarily discontinuous for x = 0, cannot have derivatives for x = 0. Or again the function [x], which is discontinuous for every integral value of x, has no derivative for any such value of x. Example. Since [x] is constant between every two integral values of x, its derivative, whenever it exists, has the value zero. Thus the derivative of [x], which we may represent by [x]′, is a function equal to zero for all values of x save integral values and undefined for integral values. It is interesting to note that the function 1 – sin πx sin πx has exactly the same properties. We saw also in Ex. xxxvii. 7 that the types of discontinuity which occur most commonly, when we are dealing with the very simplest and most ob- vious kinds of functions, such as polynomials or rational or trigonometrical functions, are associated with a relation of the type φ(x) → +∞ [VI : 112] DERIVATIVES AND INTEGRALS 243O X Y P Q Q R R (a) P Q Q RR (b) P Q Q R R (c) P Q Q R R (d) Fig. 38. or φ(x) → –∞. In all these cases, as in such cases as those considered above, there is no derivative for certain special values of x. In fact, as was pointed out in § 111, (1), all discontinuities of φ(x) are also discontinuities of φ′(x). But the converse is not true, as we may easily see if we return to the geometrical point of view of § 110 and consider the special case, hitherto left aside, in which the graph of φ(x) has a tangent parallel to OY . This case may be subdivided into a number of cases, of which the most typical are shown in Fig. 38. In cases (c) and (d) the function is two valued on one side of P and not defined on the other. In such cases we may consider the two sets of values of φ(x), which occur on one side of P or the other, as defining distinct functions φ1(x) and φ2(x), the upper part of the curve corresponding to φ1(x). The reader will easily convince himself that in (a) {φ(x + h) – φ(x)}/h → +∞, as h → 0, and in (b) {φ(x + h) – φ(x)}/h → –∞; while in (c) {φ1(x + h) – φ1(x)}/h → +∞, {φ2(x + h) – φ2(x)}/h → –∞, [VI : 113] DERIVATIVES AND INTEGRALS 244 and in (d) {φ1(x + h) – φ1(x)}/h → –∞, {φ2(x + h) – φ2(x)}/h → +∞, though of course in (c) only positive and in (d) only negative values of h can be considered, a fact which by itself would preclude the existence of a derivative. We can obtain examples of these four cases by considering the functions defined by the equations (a) y3 = x, (b) y3 = –x, (c) y2 = x, (d) y2 = –x, the special value of x under consideration being x = 0. 113. Some general rules for differentiation. Throughout the theorems which follow we assume that the functions f (x) and F (x) have derivatives f ′(x) and F ′(x) for the values of x considered. (1) If φ(x) = f (x) + F (x), then φ(x) has a derivative φ′(x) = f ′(x) + F ′(x). (2) If φ(x) = kf (x), where k is a constant, then φ(x) has a derivative φ′(x) = kf ′(x). We leave it as an exercise to the reader to deduce these results from the general theorems stated in Ex. xxxv. 1. (3) If φ(x) = f (x)F (x), then φ(x) has a derivative φ′(x) = f (x)F ′(x) + f ′(x)F (x). For φ′(x) = lim f (x + h)F (x + h) – f (x)F (x) h = lim

f (x + h)F (x + h) – F (x) h + F (x)f (x + h) – f (x) h

= f (x)F ′(x) + F (x)f ′(x). [VI : 113] DERIVATIVES AND INTEGRALS 245 (4) If φ(x) = 1 f (x), then φ(x) has a derivative φ′(x) = – f ′(x) {f (x)}2 . In this theorem we of course suppose that f (x) is not equal to zero for the particular value of x under consideration. Then φ′(x) = lim 1 h f (x) – f (x + h) f (x + h)f (x)

= – f ′(x) {f (x)}2 . (5) If φ(x) = f (x) F (x), then φ(x) has a derivative φ′(x) = f ′(x)F (x) – f (x)F ′(x) {F (x)}2 . This follows at once from (3) and (4). (6) If φ(x) = F {f (x)}, then φ(x) has a derivative φ′(x) = F ′{f (x)}f ′(x). For let f (x) = y, f (x + h) = y + k. Then k → 0 as h → 0, and k/h → f ′(x). And φ′(x) = lim F {f (x + h)} – F {f (x)} h = lim F (y + k) – F (y) k

× lim k h

= F ′(y)f ′(x). This theorem includes (2) and (4) as special cases, as we see on taking F (x) = kx or F (x) = 1/x. Another interesting special case is that in which [VI : 115] DERIVATIVES AND INTEGRALS 246 f (x) = ax + b: the theorem then shows that the derivative of F (ax + b) is aF ′(ax + b). Our last theorem requires a few words of preliminary explanation. Sup- pose that x = ψ(y), where ψ(y) is continuous and steadily increasing (or decreasing), in the stricter sense of § 95, in a certain interval of values of y. Then we may write y = φ(x), where φ is the 'inverse' function (§ 109) of ψ. (7) If y = φ(x), where φ is the inverse function of ψ, so that x = ψ(y), and ψ(y) has a derivative ψ′(y) which is not equal to zero, then φ(x) has a derivative φ′(x) = 1 ψ′(y). For if φ(x + h) = y + k, then k → 0 as h → 0, and φ′(x) = lim h→0 φ(x + h) – φ(x) (x + h) – x = lim k→0 (y + k) – y ψ(y + k) – ψ(y) = 1 ψ′(y). The last function may now be expressed in terms of x by means of the relation y = φ(x), so that φ′(x) is the reciprocal of ψ′{φ(x)}. This theorem enables us to differentiate any function if we know the derivative of the inverse function. 114. Derivatives of complex functions. So far we have supposed that y = φ(x) is a purely real function of x. If y is a complex function φ(x) + iψ(x), then we define the derivative of y as being φ′(x) + iψ′(x). The reader will have no difficulty in seeing that Theorems (1)–(5) above retain their validity when φ(x) is complex. Theorems (6) and (7) have also analogues for complex functions, but these depend upon the general notion of a 'function of a complex variable', a notion which we have encountered at present only in a few particular cases. 115. The notation of the differential calculus. We have already explained that what we call a derivative is often called a differential coeffi- cient. Not only a different name but a different notation is often used; the [VI : 115] DERIVATIVES AND INTEGRALS 247 derivative of the function y = φ(x) is often denoted by one or other of the expressions Dxy, dy dx. Of these the last is the most usual and convenient: the reader must however be careful to remember that dy/dx does not mean 'a certain number dy divided by another number dx': it means 'the result of a certain opera- tion Dx or d/dx applied to y = φ(x)', the operation being that of forming the quotient {φ(x + h) – φ(x)}/h and making h → 0. Of course a notation at first sight so peculiar would not have been adopted without some reason, and the reason was as follows. The denominator h of the fraction {φ(x+h)–φ(x)}/h is the difference of the values x+h, x of the indepen- dent variable x; similarly the numerator is the difference of the corresponding values φ(x + h), φ(x) of the dependent variable y. These differences may be called the increments of x and y respectively, and denoted by δx and δy. Then the fraction is δy/δx, and it is for many purposes convenient to denote the limit of the fraction, which is the same thing as φ′(x), by dy/dx. But this notation must for the present be regarded as purely symbolical. The dy and dx which occur in it cannot be separated, and standing by themselves they would mean nothing: in particular dy and dx do not mean lim δy and lim δx, these limits being simply equal to zero. The reader will have to become familiar with this notation, but so long as it puzzles him he will be wise to avoid it by writing the differential coefficient in the form Dxy, or using the notation φ(x), φ′(x), as we have done in the preceding sections of this chapter. In Ch. VII, however, we shall show how it is possible to define the symbols dx and dy in such a way that they have an independent meaning and that the derivative dy/dx is actually their quotient. The theorems of § 113 may of course at once be translated into this notation. They may be stated as follows: (1) if y = y1 + y2, then dy dx = dy1 dx + dy2 dx ; (2) if y = ky1, then dy dx = k dy1 dx ; [VI : 116] DERIVATIVES AND INTEGRALS 248 (3) if y = y1y2, then dy dx = y1 dy2 dx + y2 dy1 dx ; (4) if y = 1 y1 , then dy dx = – 1 y2 1 dy1 dx ; (5) if y = y1 y2 , then dy dx =

y2 dy1 dx – y1 dy2 dx

y2 2 ; (6) if y is a function of x, and z a function of y, then dz dx = dz dy dy dx; (7) dy dx = 1 dx dy

. Examples XL. 1. If y = y1y2y3 then dy dx = y2y3 dy1 dx + y3y1 dy2 dx + y1y2 dy3 dx , and if y = y1y2 . . . yn then dy dx = nX r=1 y1y2 . . . yr–1yr+1 . . . yn dyr dx . In particular, if y = zn, then dy/dx = nzn–1(dz/dx); and if y = xn, then dy/dx = nxn–1, as was proved otherwise in Ex. xxxix. 3. 2. If y = y1y2 . . . yn then 1 y dy dx = 1 y1 dy1 dx + 1 y2 dy2 dx + · · · + 1 yn dyn dx . In particular, if y = zn, then 1 y dy dx = n z dz dx . [VI : 116] DERIVATIVES AND INTEGRALS 249 116. Standard forms. We shall now investigate more systematically the forms of the derivatives of a few of the the simplest types of functions. A. Polynomials. If φ(x) = a0xn + a1xn–1 + · · · + an, then φ′(x) = na0xn–1 + (n – 1)a1xn–2 + · · · + an–1. It is sometimes more convenient to use for the standard form of a polyno- mial of degree n in x what is known as the binomial form, viz. a0xn + n 1

a1xn–1 + n 2

a2xn–2 + · · · + an. In this case φ′(x) = n

a0xn–1 + n – 1 1

a1xn–2 + n – 1 2

a2xn–3 + · · · + an–1

. The binomial form of φ(x) is often written symbolically as (a0, a1, . . . , an)(x, 1)n; and then φ′(x) = n(a0, a1, . . . , an–1)(x, 1)n–1. We shall see later that φ(x) can always be expressed as the product of n factors in the form φ(x) = a0(x – α1)(x – α2) . . . (x – αn), where the α's are real or complex numbers. Then φ′(x) = a0 P(x – α2)(x – α3) . . . (x – αn), the notation implying that we form all possible products of n – 1 factors, and add them all together. This form of the result holds even if several of the numbers α are equal; but of course then some of the terms on the right-hand side are repeated. The reader will easily verify that if φ(x) = a0(x – α1)m1 (x – α2)m2 . . . (x – αν)mν , then φ′(x) = a0 Pm1(x – α1)m1–1(x – α2)m2 . . . (x – αν)mν . [VI : 116] DERIVATIVES AND INTEGRALS 250 Examples XLI. 1. Show that if φ(x) is a polynomial then φ′(x) is the coefficient of h in the expansion of φ(x + h) in powers of h. 2. If φ(x) is divisible by (x – α)2, then φ′(x) is divisible by x – α: and generally, if φ(x) is divisible by (x – α)m, then φ′(x) is divisible by (x – α)m–1. 3. Conversely, if φ(x) and φ′(x) are both divisible by x – α, then φ(x) is divisible by (x – α)2; and if φ(x) is divisible by x – α and φ′(x) by (x – α)m–1, then φ(x) is divisible by (x – α)m. 4. Show how to determine as completely as possible the multiple roots of P (x) = 0, where P (x) is a polynomial, with their degrees of multiplicity, by means of the elementary algebraical operations. [If H1 is the highest common factor of P and P ′, H2 the highest common factor of H1 and P ″, H3 that of H2 and P ‴, and so on, then the roots of H1H3/H2 2 = 0 are the double roots of P = 0, the roots of H2H4/H2 3 = 0 the treble roots, and so on. But it may not be possible to complete the solution of H1H3/H2 2 = 0, H2H4/H2 3 = 0, ... Thus if P (x) = (x – 1)3(x5 – x – 7)2 then H1H3/H2 2 = x5 – x – 7 and H2H4/H2 3 = x – 1; and we cannot solve the first equation.] 5. Find all the roots, with their degrees of multiplicity, of x4 + 3x3 – 3x2 – 11x – 6 = 0, x6 + 2x5 – 8x4 – 14x3 + 11x2 + 28x + 12 = 0. 6. If ax2 + 2bx + c has a double root, i.e. is of the form a(x – α)2, then 2(ax + b) must be divisible by x – α, so that α = –b/a. This value of x must satisfy ax2 + 2bx + c = 0. Verify that the condition thus arrived at is ac – b2 = 0. 7. The equation 1/(x – a) + 1/(x – b) + 1/(x – c) = 0 can have a pair of equal roots only if a = b = c. (Math. Trip. 1905.) 8. Show that ax3 + 3bx2 + 3cx + d = 0 has a double root if G2 + 4H3 = 0, where H = ac – b2, G = a2d – 3abc + 2b3. [Put ax + b = y, when the equation reduces to y3 + 3Hy + G = 0. This must have a root in common with y2 + H = 0.] 9. The reader may verify that if α, β, γ, δ are the roots of ax4 + 4bx3 + 6cx2 + 4dx + e = 0, then the equation whose roots are 1 12 a{(α – β)(γ – δ) – (γ – α)(β – δ)}, [VI : 117] DERIVATIVES AND INTEGRALS 251 and two similar expressions formed by permuting α, β, γ cyclically, is 4θ3 – g2θ – g3 = 0, where g2 = ae – 4bd + 3c2, g3 = ace + 2bcd – ad2 – eb2 – c3. It is clear that if two of α, β, γ, δ are equal then two of the roots of this cubic will be equal. Using the result of Ex. 8 we deduce that g3 2 – 27g2 3 = 0. 10. Rolle's Theorem for polynomials. If φ(x) is any polynomial, then between any pair of roots of φ(x) = 0 lies a root of φ′(x) = 0. A general proof of this theorem, applying not only to polynomials but to other classes of functions, will be given later. The following is an algebraical proof valid for polynomials only. We suppose that α, β are two successive roots, repeated respectively m and n times, so that φ(x) = (x – α)m(x – β)nθ(x), where θ(x) is a polynomial which has the same sign, say the positive sign, for α ■ x ■ β. Then φ′(x) = (x – α)m(x – β)nθ′(x) + {m(x – α)m–1(x – β)n + n(x – α)m(x – β)n–1}θ(x) = (x – α)m–1(x – β)n–1[(x – α)(x – β)θ′(x) + {m(x – β) + n(x – α)}θ(x)] = (x – α)m–1(x – β)n–1F (x), say. Now F (α) = m(α – β)θ(α) and F (β) = n(β – α)θ(β), which have opposite signs. Hence F (x), and so φ′(x), vanishes for some value of x between α and β. 117. B. Rational Functions. If R(x) = P (x) Q(x), where P and Q are polynomials, it follows at once from § 113, (5) that R′(x) = P ′(x)Q(x) – P (x)Q′(x) {Q(x)}2 , and this formula enables us to write down the derivative of any rational function. The form in which we obtain it, however, may or may not be the [VI : 117] DERIVATIVES AND INTEGRALS 252 simplest possible. It will be the simplest possible if Q(x) and Q′(x) have no common factor, i.e. if Q(x) has no repeated factor. But if Q(x) has a repeated factor then the expression which we obtain for R′(x) will be capable of further reduction. It is very often convenient, in differentiating a rational function, to employ the method of partial fractions. We shall suppose that Q(x), as in § 116, is expressed in the form a0(x – α1)m1 (x – α2)m2 . . . (x – αν)mν . Then it is proved in treatises on Algebra* that R(x) can be expressed in the form Π(x) + A1,1 x – α1 + A1,2 (x – α1)2 + · · · + A1,m1 (x – α1)m1 + A2,1 x – α2 + A2,2 (x – α2)2 + · · · + A2,m2 (x – α2)m2 + . . . , where Π(x) is a polynomial; i.e. as the sum of a polynomial and the sum of a number of terms of the type A (x – α)p , where α is a root of Q(x) = 0. We know already how to find the derivative of the polynomial: and it follows at once from Theorem (4) of § 113, or, if α is complex, from its extension indicated in § 114, that the derivative of the rational function last written is –pA(x – α)p–1 (x – α)2p = – pA (x – α)p+1 . We are now able to write down the derivative of the general rational function R(x), in the form Π′(x) – A1,1 (x – α1)2 – 2A1,2 (x – α1)3 – · · · · – A2,1 (x – α2)2 – 2A2,2 (x – α2)3 – . . . . *See, e.g., Chrystal's Algebra, vol. i, pp. 151 et seq. [VI : 118] DERIVATIVES AND INTEGRALS 253 Incidentally we have proved that the derivative of xm is mxm–1, for all integral values of m positive or negative. The method explained in this section is particularly useful when we have to differentiate a rational function several times (see Exs. xlv). Examples XLII. 1. Prove that d dx x 1 + x2

= 1 – x2 (1 + x2)2 , d dx 1 – x2 1 + x2

= – 4x (1 + x2)2 . 2. Prove that d dx ax2 + 2bx + c Ax2 + 2Bx + C

= (ax + b)(Bx + C) – (bx + c)(Ax + B) (Ax2 + 2Bx + C)2 . 3. If Q has a factor (x – α)m then the denominator of R′ (when R′ is reduced to its lowest terms) is divisible by (x – α)m+1 but by no higher power of x – α. 4. In no case can the denominator of R′ have a simple factor x – α. Hence no rational function (such as 1/x) whose denominator contains any simple factor can be the derivative of another rational function. 118. C. Algebraical Functions. The results of the preceding sec- tions, together with Theorem (6) of § 113, enable us to obtain the derivative of any explicit algebraical function whatsoever. The most important such function is xm, where m is a rational number. We have seen already (§ 117) that the derivative of this function is mxm–1 when m is an integer positive or negative; and we shall now prove that this result is true for all rational values of m. Suppose that y = xm = xp/q, where p and q are integers and q positive; and let z = x1/q, so that x = zq and y = zp. Then dy dx = dy dz dx dz

= p q zp–q = mxm–1. [VI : 118] DERIVATIVES AND INTEGRALS 254 This result may also be deduced as a corollary from Ex. xxxvi. 3. For, if φ(x) = xm, we have φ′(x) = lim h→0 (x + h)m – xm h = lim ξ→x ξm – xm ξ – x = mxm–1. It is clear that the more general formula d dx(ax + b)m = ma(ax + b)m–1 holds also for all rational values of m. The differentiation of implicit algebraical functions involves certain the- oretical difficulties to which we shall return in Ch. VII. But there is no practical difficulty in the actual calculation of the derivative of such a function: the method to be adopted will be illustrated sufficiently by an example. Suppose that y is given by the equation x3 + y3 – 3axy = 0. Differentiating with respect to x we find x2 + y2 dy dx – a

y + x dy dx

= 0 and so dy dx = –x2 – ay y2 – ax. Examples XLIII. 1. Find the derivatives of r 1 + x 1 – x , r ax + b cx + d , r ax2 + 2bx + c Ax2 + 2Bx + C , (ax + b)m(cx + d)n. 2. Prove that d dx x √a2 + x2

= a2 (a2 + x2)(3/2) , d dx x √a2 – x2

= a2 (a2 – x2)3/2 . [VI : 119] DERIVATIVES AND INTEGRALS 255 3. Find the differential coefficient of y when (i) ax2 + 2hxy + by2 + 2gx + 2f y + c = 0, (ii) x5 + y5 – 5ax2y2 = 0. 119. D. Transcendental Functions. We have already proved (Ex. xxxix. 4) that Dx sin x = cos x, Dx cos x = – sin x. By means of Theorems (4) and (5) of § 113, the reader will easily verify that Dx tan x = sec2 x, Dx cot x = – cosec2 x, Dx sec x = tan x sec x, Dx cosec x = – cot x cosec x. And by means of Theorem (7) we can determine the derivatives of the ordinary inverse trigonometrical functions. The reader should verify the following formulae: Dx arc sin x = ±1/√1 – x2, Dx arc cos x = ■1/√1 – x2, Dx arc tan x = 1/(1 + x2), Dx arc cot x = –1/(1 + x2), Dx arc sec x = ±1/{x√x2 – 1}, Dx arc cosec x = ■1/{x√x2 – 1}. In the case of the inverse sine and cosecant the ambiguous sign is the same as that of cos(arc sin x), in the case of the inverse cosine and secant the same as that of sin(arc cos x). The more general formulae Dx arc sin(x/a) = ±1/√a2 – x2, Dx arc tan(x/a) = a/(x2 + a2), which are also easily derived from Theorem (7) of § 113, are also of consid- erable importance. In the first of them the ambiguous sign is the same as that of a cos{arc sin(x/a)}, since ap1 – (x2/a2) = ±√a2 – x2 [VI : 119] DERIVATIVES AND INTEGRALS 256 according as a is positive or negative. Finally, by means of Theorem (6) of § 113, we are enabled to differenti- ate composite functions involving symbols both of algebraical and trigono- metrical functionality, and so to write down the derivative of any such function as occurs in the following examples. Examples XLIV.* 1. Find the derivatives of cosm x, sinm x, cos xm, sin xm, cos(sin x), sin(cos x), p a2 cos2 x + b2 sin2 x, cos x sin x pa2 cos2 x + b2 sin2 x , x arc sin x + p1 – x2, (1 + x) arc tan √x – √x. 2. Verify by differentiation that arc sin x+arc cos x is constant for all values of x between 0 and 1, and arc tan x + arc cot x for all positive values of x. 3. Find the derivatives of arc sin p1 – x2, arc sin{2xp1 – x2}, arc tan a + x 1 – ax

. How do you explain the simplicity of the results? 4. Differentiate 1 √ac – b2 arc tan ax + b √ac – b2 , – 1 √–a arc sin ax + b √b2 – ac . 5. Show that each of the functions 2 arc sin s x – β α – β , 2 arc tan r x – β α – x , arc sin 2p(α – x)(x – β) α – β has the derivative 1 p(α – x)(x – β) . *In these examples m is a rational number and a, b, . . . , α, β . . . have such values that the functions which involve them are real. [VI : 119] DERIVATIVES AND INTEGRALS 257 6. Prove that d dθ (arc cos r cos 3θ cos3 θ) = r 3 cos θ cos 3θ . (Math. Trip. 1904.) 7. Show that 1 pC(Ac – aC) d dx " arc cos s C(ax2 + c) c(Ax2 + C) # = 1 (Ax2 + C)√ax2 + c . 8. Each of the functions 1 √a2 – b2 arc cos a cos x + b a + b cos x

, 2 √a2 – b2 arc tan (r a – b a + b tan 1 2 x) has the derivative 1/(a + b cos x). 9. If X = a + b cos x + c sin x, and y = 1 √a2 – b2 – c2 arc cos aX – a2 + b2 + c2 X √b2 + c2 , then dy/dx = 1/X. 10. Prove that the derivative of F [f {φ(x)}] is F ′[f {φ(x)}] f ′{φ(x)}φ′(x), and extend the result to still more complicated cases. 11. If u and v are functions of x, then Dx arc tan(u/v) = (vDxu – uDxv)/(u2 + v2). 12. The derivative of y = (tan x + sec x)m is my sec x. 13. The derivative of y = cos x + i sin x is iy. 14. Differentiate x cos x, (sin x)/x. Show that the values of x for which the tangents to the curves y = x cos x, y = (sin x)/x are parallel to the axis of x are roots of cot x = x, tan x = x respectively. 15. It is easy to see (cf. Ex. xvii. 5) that the equation sin x = ax, where a is positive, has no real roots except x = 0 if a ■ 1, and if a < 1 a finite number of roots which increases as a diminishes. Prove that the values of a for which the

[VI : 120] DERIVATIVES AND INTEGRALS 258 number of roots changes are the values of cos ξ, where ξ is a positive root of the equation tan ξ = ξ. [The values required are the values of a for which y = ax touches y = sin x.] 16. If φ(x) = x2 sin(1/x) when x■ = 0, and φ(0) = 0, then φ′(x) = 2x sin(1/x) – cos(1/x) when x■ = 0, and φ′(0) = 0. And φ′(x) is discontinuous for x = 0 (cf. § 111, (2)). 17. Find the equations of the tangent and normal at the point (x0, y0) of the circle x2 + y2 = a2. [Here y = √a2 – x2, dy/dx = –x/√a2 – x2, and the tangent is y – y0 = (x – x0)

–x0/ q a2 – x2 0

, which may be reduced to the form xx0 + yy0 = a2. The normal is xy0 – yx0 = 0, which of course passes through the origin.] 18. Find the equations of the tangent and normal at any point of the ellipse (x/a)2 + (y/b)2 = 1 and the hyperbola (x/a)2 – (y/b)2 = 1. 19. The equations of the tangent and normal to the curve x = φ(t), y = ψ(t), at the point whose parameter is t, are x – φ(t) φ′(t) = y – ψ(t) ψ′(t) , {x – φ(t)}φ′(t) + {y – ψ(t)}ψ′(t) = 0. 120. Repeated differentiation. We may form a new function φ′′(x) from φ′(x) just as we formed φ′(x) from φ(x). This function is called the second derivative or second differential coefficient of φ(x). The second derivative of y = φ(x) may also be written in any of the forms D2 xy, d dx 2 y, d2y dx2 . In exactly the same way we may define the nth derivative or nth dif- ferential coefficient of y = φ(x), which may be written in any of the forms φ(n)(x), Dn x y, d dx n y, dny dxn . [VI : 120] DERIVATIVES AND INTEGRALS 259 But it is only in a few cases that it is easy to write down a general formula for the nth differential coefficient of a given function. Some of these cases will be found in the examples which follow. Examples XLV. 1. If φ(x) = xm then φ(n)(x) = m(m – 1) . . . (m – n + 1)xm–n. This result enables us to write down the nth derivative of any polynomial. 2. If φ(x) = (ax + b)m then φ(n)(x) = m(m – 1) . . . (m – n + 1)an(ax + b)m–n. In these two examples m may have any rational value. If m is a positive integer, and n > m, then φ(n)(x) = 0. 3. The formula d dx n A (x – α)p = (–1)n p(p + 1) . . . (p + n – 1)A (x – α)p+n enables us to write down the nth derivative of any rational function expressed in the standard form as a sum of partial fractions. 4. Prove that the nth derivative of 1/(1 – x2) is 1 2 (n!){(1 – x)–n–1 + (–1)n(1 + x)–n–1}. 5. Leibniz' Theorem. If y is a product uv, and we can form the first n derivatives of u and v, then we can form the nth derivative of y by means of Leibniz' Theorem, which gives the rule (uv)n = unv + n 1

un–1v1 + n 2

un–2v2 + · · · + n r

un–rvr + · · · + uvn, where suffixes indicate differentiations, so that un, for example, denotes the nth derivative of u. To prove the theorem we observe that (uv)1 = u1v + uv1, (uv)2 = u2v + 2u1v1 + uv2, [VI : 120] DERIVATIVES AND INTEGRALS 260 and so on. It is obvious that by repeating this process we arrive at a formula of the type (uv)n = unv + an,1un–1v1 + an,2un–2v2 + · · · + an,run–rvr + · · · + uvn. Let us assume that an,r = n r

for r = 1, 2, . . . , n – 1, and show that if this is so then an+1,r = n + 1 r

for r = 1, 2, . . . n. It will then follow by the principle of mathematical induction that an,r = n r

for all values of n and r in question. When we form (uv)n+1 by differentiating (uv)n it is clear that the coefficient of un+1–rvr is an,r + an,r–1 = n r

+ n r – 1

= n + 1 r

. This establishes the theorem. 6. The nth derivative of xmf (x) is m! (m – n)! xm–nf (x) + n m! (m – n + 1)! xm–n+1f ′(x) + n(n – 1) 1 · 2 m! (m – n + 2)! xm–n+2f ′′(x) + . . . , the series being continued for n + 1 terms or until it terminates. 7. Prove that Dn x cos x = cos(x + 1 2 nπ), Dn x sin x = sin(x + 1 2 nπ). 8. If y = A cos mx + B sin mx then D2 xy + m2y = 0. And if y = A cos mx + B sin mx + Pn(x), where Pn(x) is a polynomial of degree n, then Dn+3 x y + m2Dn+1 x y = 0. 9. If x2D2 xy + xDxy + y = 0 then x2Dn+2 x y + (2n + 1)xDn+1 x y + (n2 + 1)Dn x y = 0. [Differentiate n times by Leibniz' Theorem.] [VI : 120] DERIVATIVES AND INTEGRALS 261 10. If Un denotes the nth derivative of (Lx + M)/(x2 – 2Bx + C), then x2 – 2Bx + C (n + 1)(n + 2) Un+2 + 2(x – B) n + 1 Un+1 + Un = 0. (Math. Trip. 1900.) [First obtain the equation when n = 0; then differentiate n times by Leibniz' Theorem.] 11. The nth derivatives of a/(a2 + x2) and x/(a2 + x2). Since a a2 + x2 = 1 2i 1 x – ai – 1 x + ai

Some general theorems concerning derived functions. In all that follows we suppose that φ(x) is a function of x which has a derivative φ′(x) for all values of x in question. This assumption of course involves the continuity of φ(x). The meaning of the sign of φ′(x). Theorem A. If φ′(x0) > 0 then φ(x) < φ(x0) for all values of x less than x0 but sufficiently near to x0, and φ(x) > φ(x0) for all values of x greater than x0 but sufficiently near to x0. For {φ(x0 + h) – φ(x0)}/h converges to a positive limit φ′(x0) as h → 0. This can only be the case if φ(x0 + h) – φ(x0) and h have the same sign [VI : 121] DERIVATIVES AND INTEGRALS 263 for sufficiently small values of h, and this is precisely what the theorem states. Of course from a geometrical point of view the result is intuitive, the inequality φ′(x) > 0 expressing the fact that the tangent to the curve y = φ(x) makes a positive acute angle with the axis of x. The reader should formulate for himself the corresponding theorem for the case in which φ′(x) < 0. An immediate deduction from Theorem A is the following important theorem, generally known as Rolle's Theorem. In view of the great importance of this theorem it may be well to repeat that its truth depends on the assumption of the existence of the derivative φ′(x) for all values of x in question. Theorem B. If φ(a) = 0 and φ(b) = 0, then there must be at least one value of x which lies between a and b and for which φ′(x) = 0. There are two possibilities: the first is that φ(x) is equal to zero throughout the whole interval [a, b]. In this case φ′(x) is also equal to zero throughout the interval. If on the other hand φ(x) is not always equal to zero, then there must be values of x for which φ(x) is positive or nega- tive. Let us suppose, for example, that φ(x) is sometimes positive. Then, by Theorem 2 of § 102, there is a value ξ of x, not equal to a or b, and such that φ(ξ) is at least as great as the value of φ(x) at any other point in the interval. And φ′(ξ) must be equal to zero. For if it were positive then φ(x) would, by Theorem A, be greater than φ(ξ) for values of x greater than ξ but sufficiently near to ξ, so that there would certainly be values of φ(x) greater than φ(ξ). Similarly we can show that φ′(ξ) cannot be negative. Cor 1. If φ(a) = φ(b) = k, then there must be a value of x between a and b such that φ′(x) = 0. We have only to put φ(x) – k = ψ(x) and apply Theorem B to ψ(x). Cor 2. If φ′(x) > 0 for all values of x in a certain interval, then φ(x) is an increasing function of x, in the stricter sense of § 95, throughout that interval. Let x1 and x2 be two values of x in the interval in question, and x1 < x2. We have to show that φ(x1) < φ(x2). In the first place φ(x1) cannot be equal to φ(x2); for, if this were so, there would, by Theorem B, be a value of x between x1 and x2 for which φ′(x) = 0. Nor can φ(x1) be greater [VI : 122] DERIVATIVES AND INTEGRALS 264 than φ(x2). For, since φ′(x1) is positive, φ(x) is, by Theorem A, greater than φ(x1) when x is greater than x1 and sufficiently near to x1. It follows that there is a value x3 of x between x1 and x2 such that φ(x3) = φ(x1); and so, by Theorem B, that there is a value of x between x1 and x3 for which φ′(x) = 0. Cor 3. The conclusion of Cor. 2 still holds if the interval [a, b] consid- ered includes a finite number of exceptional values of x for which φ′(x) does not exist, or is not positive, provided φ(x) is continuous even for these ex- ceptional values of x. It is plainly sufficient to consider the case in which there is one excep- tional value of x only, and that corresponding to an end of the interval, say to a. If a < x1 < x2 < b, we can choose a + δ so that a + δ < x1, and φ′(x) > 0 throughout [a + δ, b], so that φ(x1) < φ(x2), by Cor. 2. All that remains is to prove that φ(a) < φ(x1). Now φ(x1) decreases steadily, and in the stricter sense, as x1 decreases towards a, and so φ(a) = φ(a + 0) = lim x1→a+0 φ(x1) < φ(x1). Cor 4. If φ′(x) > 0 throughout the interval [a, b], and φ(a) ■ 0, then φ(x) is positive throughout the interval [a, b]. The reader should compare the second of these corollaries very carefully with Theorem A. If, as in Theorem A, we assume only that φ′(x) is positive at a single point x = x0, then we can prove that φ(x1) < φ(x2) when x1 and x2 are sufficiently near to x0 and x1 < x0 < x2. For φ(x1) < φ(x0) and φ(x2) > φ(x0), by Theorem A. But this does not prove that there is any interval including x0 throughout which φ(x) is a steadily increasing function, for the assumption that x1 and x2 lie on opposite sides of x0 is essential to our conclusion. We shall return to this point, and illustrate it by an actual example, in a moment (§ 124). 122. Maxima and Minima. We shall say that the value φ(ξ) as- sumed by φ(x) when x = ξ is a maximum if φ(ξ) is greater than any other value assumed by φ(x) in the immediate neighbourhood of x = ξ, i.e. if we can find an interval [ξ – δ, ξ + δ] of values of x such that φ(ξ) > φ(x) [VI : 122] DERIVATIVES AND

INTEGRALS 265 when $\xi - \delta < x < \xi$ and when $\xi < x < \xi + \delta$; and we define a minimum in a similar manner. Thus in the figure the points A correspond to maxima, the points B to minima of the function whose graph is there shown. It isA1 A2 A3 B1 B2 B3 C Fig. 39. to be observed that the fact that A3 corresponds to a maximum and B1 to a minimum is in no way inconsistent with the fact that the value of the function is greater at B1 than at A3. Theorem C. A necessary condition for a maximum or minimum value of $\varphi(x)$ at $x = \xi$ is that $\varphi'(\xi) = 0$.* This follows at once from Theorem A. That the condition is not suffi- cient is evident from a glance at the point C in the figure. Thus if $y = x3$ then $\varphi'(x) = 3x2$, which vanishes when $x = 0$. But $x = 0$ does not give either a maximum or a minimum of x3, as is obvious from the form of the graph of x3 (Fig. 10, p. 51). But there will certainly be a maximum at $x = \xi$ if $\varphi'(\xi) = 0$, $\varphi'(x) > 0$ for all values of x less than but near to ξ, and $\varphi'(x) < 0$ for all values of x greater than but near to ξ: and if the signs of these two inequali- ties are reversed there will certainly be a minimum. For then we can (by Cor. 3 of § 121) determine an interval $[\xi - \delta, \xi]$ throughout which $\varphi(x)$ in- creases with x, and an interval $[\xi, \xi + \delta]$ throughout which it decreases as x increases: and obviously this ensures that $\varphi(\xi)$ shall be a maximum. *A function which is continuous but has no derivative may have maxima and minima. We are of course assuming the existence of the derivative. [VI : 124] DERIVATIVES AND INTEGRALS 266 This result may also be stated thus. If the sign of $\varphi'(x)$ changes at $x = \xi$ from positive to negative, then $x = \xi$ gives a maximum of $\varphi(x)$: and if the sign of $\varphi'(x)$ changes in the opposite sense, then $x = \xi$ gives a minimum. 123. There is another way of stating the conditions for a maximum or minimum which is often useful. Let us assume that $\varphi(x)$ has a second derivative $\varphi''(x)$: this of course does not follow from the existence of $\varphi'(x)$, any more than the existence of $\varphi'(x)$ follows from that of $\varphi(x)$. But in such cases as we are likely to meet with at present the condition is generally satisfied. Theorem D. If $\varphi'(\xi) = 0$ and $\varphi''(\xi) \neq 0$, then $\varphi(x)$ has a maximum or minimum at $x = \xi$, a maximum if $\varphi''(\xi) < 0$, a minimum if $\varphi''(\xi) > 0$. Suppose, e.g., that $\varphi''(\xi) < 0$. Then, by Theorem A, $\varphi'(x)$ is negative when x is less than ξ but sufficiently near to ξ, and positive when x is greater than ξ but sufficiently near to ξ. Thus $x = \xi$ gives a maximum. 124. In what has preceded (apart from the last paragraph) we have as- sumed simply that $\varphi(x)$ has a derivative for all values of x in the interval under consideration. If this condition is not fulfilled the theorems cease to be true. Thus Theorem B fails in the case of the function $y = 1 - \sqrt{x2}$, where the square root is to be taken positive. The graph of this function is shown in Fig. 40. Here $\varphi(-1) = \varphi(1) = 0$: but $\varphi'(x)$, as is evident from the figure, is equal to 1 if x is negative and to -1 if x is positive, and never vanishes. There is no derivative for $x = 0$, and no tangent to the graph at P . And in this case $x = 0$ obviously gives a maximum of $\varphi(x)$, but $\varphi'(0)$, as it does not exist, cannot be equal to zero, so that the test for a maximum fails. The bare existence of the derivative $\varphi'(x)$, however, is all that we have as- sumed. And there is one assumption in particular that we have not made, and that is that $\varphi'(x)$ itself is a continuous function. This raises a rather subtle but still a very interesting point. Can a function $\varphi(x)$ have a derivative for all values of x which is not itself continuous? In other words can a curve have a tangent at every point, and yet the direction of the tangent not vary continuously? The [VI : 124] DERIVATIVES AND INTEGRALS 267O X Y P –1 1 Fig. 40. reader, if he considers what the question means and tries to answer it in the light of common sense, will probably incline to the answer No. It is, however, not difficult to see that this answer is wrong. Consider the function $\varphi(x)$ defined, when $x \neq 0$, by the equation $\varphi(x) = x2 \sin(1/x)$; and suppose that $\varphi(0) = 0$. Then $\varphi(x)$ is continuous for all values of x. If $x \neq 0$ then $\varphi'(x) = 2x \sin(1/x) - \cos(1/x)$; while $\varphi'(0) = \lim h \to 0$ $h2 \sin(1/h) h = 0$. Thus $\varphi'(x)$ exists for all values of x. But $\varphi'(x)$ is discontinuous for $x = 0$; for $2x \sin(1/x)$ tends to 0 as $x \to 0$, and $\cos(1/x)$ oscillates between the limits of indetermination -1 and 1, so that $\varphi'(x)$ oscillates between the same limits. What is practically the same example enables us also to illustrate the point referred to at the end of § 121. Let $\varphi(x) = x2 \sin(1/x) + ax$, where $0 < a < 1$, when $x \neq 0$, and $\varphi(0) = 0$. Then $\varphi'(0) = a > 0$. Thus the conditions of Theorem A of § 121 are satisfied. But if $x \neq 0$ then $\varphi'(x) = 2x \sin(1/x) - \cos(1/x) + a$, [VI : 124] DERIVATIVES AND INTEGRALS 268 which oscillates between the limits of indetermination $a - 1$ and $a + 1$ as $x \to 0$. As $a - 1 < 0$, we can find values of x, as near to 0 as we like, for which $\varphi'(x) < 0$; and it is therefore impossible to find any interval, including $x = 0$, throughout which $\varphi(x)$ is a steadily increasing function of x. It is, however, impossible that $\varphi'(x)$ should have what was called in Ch. V (Ex. xxxvii. 18) a 'simple' discontinuity; e.g. that $\varphi'(x) \to a$ when $x \to +0$, $\varphi'(x) \to b$ when $x \to -0$, and $\varphi'(0) = c$, unless $a = b = c$, in which case $\varphi'(x)$ is continuous for $x = 0$. For a proof see § 125, Ex. xlvii. 3. Examples XLVI. 1. Verify Theorem B when $\varphi(x) = (x - a)m(x - b)n$ or $\varphi(x) = (x - a)m(x - b)n(x - c)p$, where m, n, p are positive integers and $a < b < c$. [The first function vanishes for $x = a$ and $x = b$. And $\varphi'(x) = (x - a)m-1(x - b)n-1\{(m + n)x - mb - na\}$ vanishes for $x = (mb + na)/(m + n)$, which lies between a and b. In the second case we have to verify that the quadratic equation $(m + n + p)x2 - \{m(b + c) + n(c + a) + p(a + b)\}x + mbc + nca + pab = 0$ has roots between a and b and between b and c.] 2. Show that the polynomials $2x3 + 3x2 - 12x + 7$, $3x4 + 8x3 - 6x2 - 24x + 19$ are positive when $x > 1$. 3. Show that $x - \sin x$ is an increasing function throughout any interval of values of x, and that $\tan x - x$ increases as x increases from $-1\ 2\ \pi$ to $1\ 2\ \pi$. For what values of a is $ax - \sin x$ a steadily increasing or decreasing function of x? 4. Show that $\tan x - x$ also increases from $x = 1\ 2\ \pi$ to $x = 3\ 2\ \pi$, from $x = 3\ 2\ \pi$ to $x = 5\ 2\ \pi$, and so on, and deduce that there is one and only one root of the equation $\tan x = x$ in each of these intervals (cf. Ex. xvii. 4). 5. Deduce from Ex. 3 that $\sin x - x < 0$ if $x > 0$, from this that $\cos x - 1 + 1\ 2\ x2 > 0$, and from this that $\sin x - x + 1\ 6\ x3 > 0$. And, generally, [VI : 124] DERIVATIVES AND INTEGRALS 269 prove that if $C2m = \cos x - 1 + x2\ 2! - \cdots - (-1)m$

x2m (2m)! , S2m+1 = sin x – x + x3 3! – · · · – (–1)m x2m+1 (2m + 1)! , and x > 0, then C2m and S2m+1 are positive or negative according as m is odd or even. 6. If f (x) and f ″(x) are continuous and have the same sign at every point of an interval [a, b], then this interval can include at most one root of either of the equations f (x) = 0, f ′(x) = 0. 7. The functions u, v and their derivatives u′, v′ are continuous throughout a certain interval of values of x, and uv′ – u′v never vanishes at any point of the interval. Show that between any two roots of u = 0 lies one of v = 0, and conversely. Verify the theorem when u = cos x, v = sin x. [If v does not vanish between two roots of u = 0, say α and β, then the function u/v is continuous throughout the interval [α, β] and vanishes at its extremities. Hence (u/v)′ = (u′v – uv′)/v2 must vanish between α and β, which contradicts our hypothesis.] 8. Determine the maxima and minima (if any) of (x – 1)2(x + 2), x3 – 3x, 2x3 – 3x2 – 36x + 10, 4x3 – 18x2 + 27x – 7, 3x4 – 4x3 + 1, x5 – 15x3 + 3. In each case sketch the form of the graph of the function. [Consider the last function, for example. Here φ′(x) = 5x2(x2 – 9), which vanishes for x = –3, x = 0, and x = 3. It is easy to see that x = –3 gives a maximum and x = 3 a minimum, while x = 0 gives neither, as φ′(x) is negative on both sides of x = 0.] 9. Discuss the maxima and minima of the function (x – a)m(x – b)n, where m and n are any positive integers, considering the different cases which occur according as m and n are odd or even. Sketch the graph of the function. 10. Discuss similarly the function (x – a)(x – b)2(x – c)3, distinguishing the different forms of the graph which correspond to different hypotheses as to the relative magnitudes of a, b, c. 11. Show that (ax + b)/(cx + d) has no maxima or minima, whatever values a, b, c, d may have. Draw a graph of the function. [VI : 124] DERIVATIVES AND INTEGRALS 270 12. Discuss the maxima and minima of the function y = (ax2 + 2bx + c)/(Ax2 + 2Bx + C), when the denominator has complex roots. [We may suppose a and A positive. The derivative vanishes if (ax + b)(Bx + C) – (Ax + B)(bx + c) = 0. (1) This equation must have real roots. For if not the derivative would always have the same sign, and this is impossible, since y is continuous for all values of x, and y → a/A as x → +∞ or x → –∞. It is easy to verify that the curve cuts the line y = a/A in one and only one point, and that it lies above this line for large positive values of x, and below it for large negative values, or vice versa, according as b/a > B/A or b/a < B/A. Thus the algebraically greater root of (1) gives a maximum if b/a > B/A, a minimum in the contrary case.] 13. The maximum and minimum values themselves are the values of λ for which ax2 +2bx+c–λ(Ax2 +2Bx+C) is a perfect square. [This is the condition that y = λ should touch the curve.] 14. In general the maxima and maxima of R(x) = P (x)/Q(x) are among the values of λ obtained by expressing the condition that P (x) – λQ(x) = 0 should have a pair of equal roots. 15. If Ax2 + 2Bx + C = 0 has real roots then it is convenient to proceed as follows. We have y – (a/A) = (λx + μ)/{A(Ax2 + 2Bx + C)}, where λ = bA – aB, μ = cA – aC. Writing further ξ for λx + μ and η for (A/λ2)(Ay – a), we obtain an equation of the form η = ξ/{(ξ – p)(ξ – q)}. This transformation from (x, y) to (ξ, η) amounts only to a shifting of the origin, keeping the axes parallel to themselves, a change of scale along each axis, and (if λ < 0) a reversal in direction of the axis of abscissae; and so a minimum of y, considered as a function of x, corresponds to a minimum of η considered as a function of ξ, and vice versa, and similarly for a maximum. [VI : 124] DERIVATIVES AND INTEGRALS 271 The derivative of η with respect to ξ vanishes if (ξ – p)(ξ – q) – ξ(ξ – p) – ξ(ξ – q) = 0, or if ξ2 = pq. Thus there are two roots of the derivative if p and q have the same sign, none if they have opposite signs. In the latter case the form of the graph of η is as shown in Fig. 41a.O ξ η p q Fig. 41a.O ξ η p q Fig. 41b.O ξ η p Fig. 41c. When p and q are positive the general form of the graph is as shown in Fig 41b, and it is easy to see that ξ = √pq gives a maximum and ξ = –√pq a minimum.* In the particular case in which p = q the function is η = ξ/(ξ – p)2, and its graph is of the form shown in Fig. 41c. The preceding discussion fails if λ = 0, i.e. if a/A = b/B. But in this case we have y – (a/A) = μ/{A(Ax2 + 2Bx + C)} = μ/{A2(x – x1)(x – x2)}, say, and dy/dx = 0 gives the single value x = 1 2 (x1 + x2). On drawing a graph it becomes clear that this value gives a maximum or minimum according as μ is positive or negative. The graph shown in Fig. 42 corresponds to the former case. *The maximum is –1/(√p–√q)2, the minimum –1/(√p+√q)2, of which the latter is the greater. [VI : 124] DERIVATIVES AND INTEGRALS 272O X Y x1 x2 Fig. 42. [A full discussion of the general function y = (ax2 +2bx+c)/(Ax2 +2Bx+C), by purely algebraical methods, will be found in Chrystal's Algebra, vol i, pp. 464–7.] 16. Show that (x – α)(x – β)/(x – γ) assumes all real values as x varies, if γ lies between α and β, and otherwise assumes all values except those included in an interval of length 4p|α – γ||β – γ|. 17. Show that y = x2 + 2x + c x2 + 4x + 3c can assume any real value if 0 < c < 1, and draw a graph of the function in this case. (Math. Trip. 1910.) 18. Determine the function of the form (ax2 + 2bx + c)/(Ax2 + 2Bx + C) which has turning values (i.e. maxima or minima) 2 and 3 when x = 1 and x = –1 respectively, and has the value 2.5 when x = 0. (Math. Trip. 1908.) 19. The maximum and minimum of (x + a)(x + b)/(x – a)(x – b), where a and b are positive, are – √a + √b √a – √b !2 , – √a – √b √a + √b !2 . 20. The maximum value of (x – 1)2/(x + 1)3 is 2 27 . 21. Discuss the maxima and minima of x(x – 1)/(x2 + 3x + 3), x4/(x – 1)(x – 3)3, (x – 1)2(3x2 – 2x – 37)/(x + 5)2(3x2 – 14x – 1). (Math. Trip. 1898.) [VI : 124] DERIVATIVES AND INTEGRALS 273 [If the last function be denoted by P (x)/Q(x), it will be found that P ′Q – P Q′ = 72(x – 7)(x – 3)(x – 1)(x + 1)(x + 2)(x + 5).] 22. Find the maxima and minima of a cos x + b sin x. Verify the result by expressing the function in the form A cos(x – a). 23. Find the maxima and minima of a2 cos2 x + b2 sin2 x, A cos2 x + 2H cos x sin x + B sin2 x. 24. Show that sin(x + a)/ sin(x + b) has no maxima or minima. Draw a graph of the function. 25. Show that the function sin2 x sin(x + a) sin(x + b) (0 < a < b < π) has an infinity of minima equal to 0 and of maxima equal to –4 sin a sin b/ sin2(a – b). (Math. Trip. 1909.) 26. The least value of a2 sec2 x + b2 cosec2 x is (a

+ b)2. 27. Show that tan 3x cot 2x cannot lie between 1 9 and 3 2 . 28. Show that, if the sum of the lengths of the hypothenuse and another side of a right-angled triangle is given, then the area of the triangle is a maximum when the angle between those sides is 60■. (Math. Trip. 1909.) 29. A line is drawn through a fixed point (a, b) to meet the axes OX, OY in P and Q. Show that the minimum values of P Q, OP + OQ, and OP · OQ are respectively (a2/3 + b2/3)3/2, (√a + √b)2, and 4ab. 30. A tangent to an ellipse meets the axes in P and Q. Show that the least value of P Q is equal to the sum of the semiaxes of the ellipse. 31. Find the lengths and directions of the axes of the conic ax2 + 2hxy + by2 = 1. [The length r of the semi-diameter which makes an angle θ with the axis of x is given by 1/r2 = a cos2 θ + 2h cos θ sin θ + b sin2 θ. [VI : 125] DERIVATIVES AND INTEGRALS 274 The condition for a maximum or minimum value of r is tan 2θ = 2h/(a – b). Eliminating θ between these two equations we find {a – (1/r2)}{b – (1/r2)} = h2.] 32. The greatest value of xmyn, where x and y are positive and x + y = k, is mmnnkm+n/(m + n)m+n. 33. The greatest value of ax + by, where x and y are positive and x2 + xy + y2 = 3κ2, is 2κpa2 – ab + b2. [If ax + by is a maximum then a + b(dy/dx) = 0. The relation between x and y gives (2x + y) + (x + 2y)(dy/dx) = 0. Equate the two values of dy/dx.] 34. If θ and φ are acute angles connected by the relation a sec θ + b sec φ = c, where a, b, c are positive, then a cos θ + b cos φ is a minimum when θ = φ. 125. The Mean Value Theorem. We can proceed now to the proof of another general theorem of extreme importance, a theorem commonly known as ‘The Mean Value Theorem’ or ‘The Theorem of the Mean’. Theorem. If φ(x) has a derivative for all values of x in the inter- val [a, b], then there is a value ξ of x between a and b, such that φ(b) – φ(a) = (b – a)φ′(ξ). Before we give a strict proof of this theorem, which is perhaps the most important theorem in the Differential Calculus, it will be well to point out its obvious geometrical meaning. This is simply (see Fig. 43) that if the curve AP B has a tangent at all points of its length then there must be a point, such as P , where the tangent is parallel to AB. For φ′(ξ) is the tangent of the angle which the tangent at P makes with OX, and {φ(b) – φ(a)}/(b – a) the tangent of the angle which AB makes with OX. It is easy to give a strict analytical proof. Consider the function φ(b) – φ(x) – b – x b – a {φ(b) – φ(a)}, [VI : 125] DERIVATIVES AND INTEGRALS 275O X Y a b A B ϕ(a) ϕ(b)P Fig. 43. which vanishes when x = a and x = b. It follows from Theorem B of § 121 that there is a value ξ for which its derivative vanishes. But this derivative is φ(b) – φ(a) b – a – φ′(x); which proves the theorem. It should be observed that it has not been assumed in this proof that φ′(x) is continuous. It is often convenient to express the Mean Value Theorem in the form φ(b) = φ(a) + (b – a)φ′{a + θ(b – a)}, where θ is a number lying between 0 and 1. Of course a + θ(b – a) is merely another way of writing ‘some number ξ between a and b’. If we put b = a + h we obtain φ(a + h) = φ(a) + hφ′(a + θh), which is the form in which the theorem is most often quoted. Examples XLVII. 1. Show that φ(b) – φ(x) – b – x b – a {φ(b) – φ(a)} is the difference between the ordinates of a point on the curve and the corre- sponding point on the chord. [VI : 127] DERIVATIVES AND INTEGRALS 276 2. Verify the theorem when φ(x) = x2 and when φ(x) = x3. [In the latter case we have to prove that (b3 – a3)/(b – a) = 3ξ2, where a < ξ < b; i.e. that if 1 3 (b2 + ab + a2) = ξ2 then ξ lies between a and b.] 3. Establish the theorem stated at the end of § 124 by means of the Mean Value Theorem. [Since φ′(0) = c, we can find a small positive value of x such that {φ(x) – φ(0)}/x is nearly equal to c; and therefore, by the theorem, a small positive value of ξ such that φ′(ξ) is nearly equal to c, which is inconsistent with lim x→+0 φ′(x) = a, unless a = c. Similarly b = c.] 4. Use the Mean Value Theorem to prove Theorem (6) of § 113, assuming that the derivatives which occur are continuous. [The derivative of F {f (x)} is by definition lim F {f (x + h)} – F {f (x)} h . But, by the Mean Value Theorem, f (x+h) = f (x)+hf ′(ξ), where ξ is a number lying between x and x + h. And F {f (x) + hf ′(ξ)} = F {f (x)} + hf ′(ξ) F ′(ξ1), where ξ1 is a number lying between f (x) and f (x)+hf ′(ξ). Hence the derivative of F {f (x)} is lim f ′(ξ) F ′(ξ1) = f ′(x) F ′{f (x)}, since ξ → x and ξ1 → f (x) as h → 0.] 126. The Mean Value Theorem furnishes us with a proof of a result which is of great importance in what follows: if φ′(x) = 0, throughout a certain interval of values of x, then φ(x) is constant throughout that interval. For, if a and b are any two values of x in the interval, then φ(b) – φ(a) = (b – a)φ′{a + θ(b – a)} = 0. An immediate corollary is that if φ′(x) = ψ′(x), throughout a certain interval, then the functions φ(x) and ψ(x) differ throughout that interval by a constant. [VI : 127] DERIVATIVES AND INTEGRALS 277 127. Integration. We have in this chapter seen how we can find the derivative of a given function φ(x) in a variety of cases, including all those of the commonest occurrence. It is natural to consider the converse question, that of determining a function whose derivative is a given function. Suppose that ψ(x) is the given function. Then we wish to determine a function such that φ′(x) = ψ(x). A little reflection shows us that this question may really be analysed into three parts. (1) In the first place we want to know whether such a function as φ(x) actually exists. This question must be carefully distinguished from the question as to whether (supposing that there is such a function) we can find any simple formula to express it. (2) We want to know whether it is possible that more than one such function should exist, i.e. we want to know whether our problem is one which admits of a unique solution or not; and if not, we want to know whether there is any simple relation between the different solutions which will enable us to express all of them in terms of any particular one. (3) If there is a solution, we want to know how to find an actual ex- pression for it. It will throw light on the nature of these three distinct questions if we compare them with the three corresponding questions which arise with regard to the differentiation of functions. (1) A function φ(x) may have a derivative for all values of x, like xm, where m is a positive integer, or sin x. It may generally, but not always have one, like 3 √x or tan x or sec x. Or again it may never have one: for example, the function

considered in Ex. xxxvii. 20, which is nowhere continuous, has obviously no derivative for any value of x. Of course during this chapter we have confined ourselves to functions which are continuous except for some special values of x. The example of the function 3 √x, however, shows that a continuous function may not have a derivative for some special value of x, in this case x = 0. Whether there are continuous functions which never have derivatives, or continuous curves which never have tangents, is a further question which is at present beyond us. Common-sense says No: but, as we have already stated in § 111, this is one of the cases in which higher mathematics has proved common-sense to be mistaken. [VI : 128] DERIVATIVES AND INTEGRALS 278 But at any rate it is clear enough that the question 'has φ(x) a deriva- tive φ′(x)?' is one which has to be answered differently in different cir- cumstances. And we may expect that the converse question 'is there a function φ(x) of which ψ(x) is the derivative?' will have different answers too. We have already seen that there are cases in which the answer is No: thus if ψ(x) is the function which is equal to a, b, or c according as x is less than, equal to, or greater than 0, then the answer is No (Ex. xlvii. 3), unless a = b = c. This is a case in which the given function is discontinuous. In what follows, however, we shall always suppose ψ(x) continuous. And then the answer is Yes: if ψ(x) is continuous then there is always a function φ(x) such that φ′(x) = ψ(x). The proof of this will be given in Ch. VII. (2) The second question presents no difficulties. In the case of differ- entiation we have a direct definition of the derivative which makes it clear from the beginning that there cannot possibly be more than one. In the case of the converse problem the answer is almost equally simple. It is that if φ(x) is one solution of the problem then φ(x) + C is another, for any value of the constant C, and that all possible solutions are comprised in the form φ(x) + C. This follows at once from § 126. (3) The practical problem of actually finding φ′(x) is a fairly simple one in the case of any function defined by some finite combination of the ordinary functional symbols. The converse problem is much more difficult. The nature of the difficulties will appear more clearly later on. Definitions. If ψ(x) is the derivative of φ(x), then we call φ(x) an integral or integral function of ψ(x). The operation of forming ψ(x) from φ(x) we call integration. We shall use the notation φ(x) = Z ψ(x) dx. It is hardly necessary to point out that R . . . dx like d/dx must, at present at any rate, be regarded purely as a symbol of operation: the R and the dx no more mean anything when taken by themselves than do the d and dx of the other operative symbol d/dx. [VI : 128] DERIVATIVES AND INTEGRALS 279 128. The practical problem of integration. The results of the earlier part of this chapter enable us to write down at once the integrals of some of the commonest functions. Thus Z xm dx = xm+1 m + 1, Z cos x dx = sin x, Z sin x dx = – cos x. (1) These formulae must be understood as meaning that the function on the right-hand side is one integral of that under the sign of integration. The most general integral is of course obtained by adding to the former a constant C, known as the arbitrary constant of integration. There is however one case of exception to the first formula, that in which m = –1. In this case the formula becomes meaningless, as is only to be expected, since we have seen already (Ex. xlii. 4) that 1/x cannot be the derivative of any polynomial or rational fraction. That there really is a function F (x) such that DxF (x) = 1/x will be proved in the next chapter. For the present we shall be content to assume its existence. This function F (x) is certainly not a polynomial or rational function; and it can be proved that it is not an algebraical function. It can indeed be proved that F (x) is an essentially new function, independent of any of the classes of functions which we have considered yet, that is to say incapable of expression by means of any finite combination of the functional symbols corresponding to them. The proof of this is unfortunately too detailed and tedious to be inserted in this book; but some further discussion of the subject will be found in Ch. IX, where the properties of F (x) are investigated systematically. Suppose first that x is positive. Then we shall write Z dx x = log x, (2) and we shall call the function on the right-hand side of this equation the logarithmic function: it is defined so far only for positive values of x. Next suppose x negative. Then –x is positive, and so log(–x) is defined by what precedes. Also d dx log(–x) = –1 –x = 1 x, [VI : 129] DERIVATIVES AND INTEGRALS 280 so that, when x is negative, Z dx x = log(–x). (3) The formulae (2) and (3) may be united in the formulae Z dx x = log(±x) = log |x|, (4) where the ambiguous sign is to be chosen so that ±x is positive: these formulae hold for all real values of x other than x = 0. The most fundamental of the properties of log x which will be proved in Ch. IX are expressed by the equations log 1 = 0, log(1/x) = – log x, log xy = log x + log y, of which the second is an obvious deduction from the first and third. It is not really necessary, for the purposes of this chapter, to assume the truth of any of these formulae; but they sometimes enable us to write our formulae in a more compact form than would otherwise be possible. It follows from the last of the formulae that log x2 is equal to 2 log x if x > 0 and to 2 log(–x) if x < 0, and in either case to 2 log |x|. Either of the formulae (4) is therefore equivalent to the formula Z dx x = 1 2 log x2. (5) The five formulae (1)–(3) are the five most fundamental standard forms of the Integral Calculus. To them should be added two more, viz. Z dx 1 + x2 = arc tan x, Z x √1 – x2 = ± arc sin x.* (6) *See § 119 for the rule for determining the ambiguous sign. [VI : 130] DERIVATIVES AND INTEGRALS 281 129. Polynomials. All the general theorems of § 113 may of course also be stated as theorems in integration. Thus we have, to begin with, the formulae Z {f (x) + F (x)} dx = Z f (x)dx + Z F (x) dx, (1) Z kf (x) dx = k Z f (x) dx. (2) Here it is assumed, of course, that the arbitrary constants are adjusted properly. Thus the formula (1) asserts that the sum of any integral of f (x) and any integral of F (x) is an integral of f (x) + F (x). These theorems enable us to write down at once the integral of any function of the form P Aν fν (x), the sum of a finite number of constant multiples of functions whose integrals are known. In particular we can write down the integral of any

polynomial : thus Z (a0xn + a1xn–1 + · · · + an) dx = a0xn+1 n + 1 + a1xn n + · · · + anx. 130. Rational Functions. After integrating polynomials it is natu- ral to turn our attention next to rational functions. Let us suppose R(x) to be any rational function expressed in the standard form of § 117, viz. as the sum of a polynomial Π(x) and a number of terms of the form A/(x – α)p. We can at once write down the integrals of the polynomial and of all the other terms except those for which p = 1, since Z A (x – α)p dx = – A p – 1 1 (x – α)p–1 , whether α be real or complex (§ 117). The terms for which p = 1 present rather more difficulty. It follows immediately from Theorem (6) of § 113 that Z F ′{f (x)} f ′(x) dx = F {f (x)}. (3) [VI : 130] DERIVATIVES AND INTEGRALS 282 In particular, if we take f (x) = ax + b, where a and b are real, and write φ(x) for F (x) and ψ(x) for F ′(x), so that φ(x) is an integral of ψ(x), we obtain Z ψ(ax + b) dx = 1 aφ(ax + b). (4) Thus, for example, Z dx ax + b = 1 a log |ax + b|, and in particular, if α is real, Z dx x – α = log |x – α|. We can therefore write down the integrals of all the terms in R(x) for which p = 1 and α is real. There remain the terms for which p = 1 and α is complex. In order to deal with these we shall introduce a restrictive hypothesis, viz. that all the coefficients in R(x) are real. Then if α = γ + δi is a root of Q(x) = 0, of multiplicity m, so is its conjugate ¯α = γ – δi; and if a partial fraction Ap/(x – α)p occurs in the expression of R(x), so does ¯Ap/(x – ¯α)p, where ¯Ap is conjugate to Ap. This follows from the nature of the algebraical processes by means of which the partial fractions can be found, and which are explained at length in treatises on Algebra.* Thus, if a term (λ + μi)/(x – γ – δi) occurs in the expression of R(x) in partial fractions, so will a term (λ – μi)/(x – γ + δi); and the sum of these two terms is 2{λ(x – γ) – μδ} (x – γ)2 + δ2 . This fraction is in reality the most general fraction of the form Ax + B ax2 + 2bx + c, *See, for example, Chrystal’s Algebra, vol. i, pp. 151–9. [VI : 130] DERIVATIVES AND INTEGRALS 283 where b2 < ac. The reader will easily verify the equivalence of the two forms, the formulae which express λ, μ, γ, δ in terms of A, B, a, b, c being λ = A/2a, μ = –D/(2a√Δ), γ = –b/a, δ = √Δ/a, where Δ = ac – b2, and D = aB – bA. If in (3) we suppose F {f (x)} to be log |f (x)|, we obtain Z f ′(x) f (x) dx = log |f (x)|; (5) and if we further suppose that f (x) = (x – λ)2 + μ2, we obtain Z 2(x – λ) (x – λ)2 + μ2 dx = log{(x – λ)2 + μ2}. And, in virtue of the equations (6) of § 128 and (4) above, we have Z –2δμ (x – λ)2 + μ2 dx = –2δ arc tan x – λ μ

. These two formulae enable us to integrate the sum of the two terms which we have been considering in the expression of R(x); and we are thus enabled to write down the integral of any real rational function, if all the factors of its denominator can be determined. The integral of any such function is composed of the sum of a polynomial, a number of rational functions of the type – A p – 1 1 (x – α)p–1 , a number of logarithmic functions, and a number of inverse tangents. It only remains to add that if α is complex then the rational function just written always occurs in conjunction with another in which A and α are replaced by the complex numbers conjugate to them, and that the sum of the two functions is a real rational function. [VI : 130] DERIVATIVES AND INTEGRALS 284 Examples XLVIII. 1. Prove that Z Ax + B ax2 + 2bx + c dx = A 2a log |X| + D 2a√–Δ log ax + b – √–Δ ax + b + √–Δ (where X = ax2 + bx + c) if Δ < 0, and Z Ax + B ax2 + 2bx + c dx = A 2a log |X| + D 2a√Δ arc tan ax + b √Δ

if Δ > 0, Δ and D having the same meanings as on p. 283. 2. In the particular case in which ac = b2 the integral is – D a(ax + b) + A a log |ax + b|. 3. Show that if the roots of Q(x) = 0 are all real and distinct, and P (x) is of lower degree than Q(x), then Z R(x) dx = P P (α) Q′(α) log |x – α|, the summation applying to all the roots α of Q(x) = 0. [The form of the fraction corresponding to α may be deduced from the facts that Q(x) x – α → Q′(α), (x – α)R(x) → P (α) Q′(α) , as x → α.] 4. If all the roots of Q(x) are real and α is a double root, the other roots being simple roots, and P (x) is of lower degree than Q(x), then the integral is A/(x – α) + A′ log |x – α| + P B log |x – β|, where A = – 2P (α) Q′′(α) , A′ = 2{3P ′(α)Q′′(α) – P (a)Q′′′(α)} 3{Q′′(α)}2 , B = P (β) Q′(β) , and the summation applies to all roots β of Q(x) = 0 other than α. 5. Calculate Z dx {(x – 1)(x2 + 1)}2 . [VI : 132] DERIVATIVES AND INTEGRALS 285 [The expression in partial fractions is 1 4(x – 1)2 – 1 2(x – 1) – i 8(x – i)2 + 2 – i 8(x – i) + i 8(x + i)2 + 2 + i 8(x + i) , and the integral is – 1 4(x – 1) – 1 4(x2 + 1) – 1 2 log |x – 1| + 1 4 log(x2 + 1) + 1 4 arc tan x.] 6. Integrate x (x – a)(x – b)(x – c) , x (x – a)2(x – b) , x (x – a)2(x – b)2 , x (x – a)3 , x (x2 + a2)(x2 + b2) , x2 (x2 + a2)(x2 + b)2 , x2 – a2 x2(x2 + a2) , x2 – a2 x(x2 + a2)2 . 7. Prove the formulae: Z dx 1 + x4 = 1 4√2

log 1 + x√2 + x2 1 – x√2 + x2

+ 2 arc tan x√2 1 – x2

, Z x2 dx 1 + x4 = 1 4√2

– log 1 + x√2 + x2 1 – x√2 + x2

+ 2 arc tan x√2 1 – x2

, Z dx 1 + x2 + x4 = 1 4√3 √3 log 1 + x + x2 1 – x + x2

+ 2 arc tan x√3 1 – x2

. 131. Note on the practical integration of rational functions. The analysis of § 130 gives us a general method by which we can find the integral of any real rational function R(x), provided we can solve the equation Q(x) = 0. In simple cases (as in Ex. 5 above) the application of the method is fairly simple. In more complicated cases the labour involved is sometimes prohibitive, and other devices have to be used. It is not part of the purpose of this book to go into practical problems of integration in detail. The reader who desires fuller information may be referred to Goursat's Cours d'Analyse, second ed., vol. i, pp. 246 et seq., Bertrand's Calcul Int´egral, and Dr Bromwich's tract Elementary Integrals (Bowes and Bowes, 1911). [VI : 133] DERIVATIVES AND INTEGRALS 286 If the equation Q(x) = 0 cannot be solved algebraically, then the method of partial fractions naturally fails and recourse must be had to other methods.* 132. Algebraical Functions. We naturally pass on next to the question of the integration of algebraical functions. We have to consider the problem of integrating y, where y is an algebraical function of x. It is however convenient to consider an apparently more general integral, viz. Z R(x, y) dx, where R(x, y) is any rational function of x and y. The greater generality of this form is only apparent, since (Ex. xiv. 6) the function R(x, y) is itself an algebraical function of x. The choice of this form is in fact dictated simply by motives of convenience: such a function as px + q + √ax2 + 2bx + c px + q – √ax2 + 2bx + c is far more conveniently regarded as a rational function of x and the simple algebraical function √ax2 + 2bx + c, than directly as itself an algebraical function of x. 133. Integration by substitution and rationalisation. It follows from equation (3) of § 130 that if Z ψ(x) dx = φ(x) then Z ψ{f (t)} f ′(t) dt = φ{f (t)}. (1) This equation supplies us with a method for determining the integral of ψ(x) in a large number of cases in which the form of the integral is not directly obvious. It may be stated as a rule as follows: put x = f (t), *See the author's tract "The integration of functions of a single variable" (Cambridge Tracts in Mathematics, No. 2, second edition, 1915). This does not often happen in practice. [VI : 134] DERIVATIVES AND INTEGRALS 287 where f (t) is any function of a new variable t which it may be convenient to choose; multiply by f ′(t), and determine (if possible) the integral of ψ{f (t)} f ′(t); express the result in terms of x. It will often be found that the function of t to which we are led by the application of this rule is one whose integral can easily be calculated. This is always so, for example, if it is a rational function, and it is very often possible to choose the relation between x and t so that this shall be the case. Thus the integral of R(√x), where R denotes a rational function, is reduced by the substitution x = t2 to the integral of 2tR(t2), i.e. to the integral of a rational function of t. This method of integration is called integration by rationalisation, and is of extremely wide application. Its application to the problem immediately under consideration is obvi- ous. If we can find a variable t such that x and y are both rational functions of t, say x = R1(t), y = R2(t), then Z R(x, y) dx = Z R{R1(t), R2(t)} R′ 1(t) dt, and the latter integral, being that of a rational function of t, can be calcu- lated by the methods of § 130. It would carry us beyond our present range to enter upon any general discussion as to when it is and when it is not possible to find an auxiliary variable t connected with x and y in the manner indicated above. We shall consider only a few simple and interesting special cases. 134. Integrals connected with conics. Let us suppose that x and y are connected by an equation of the form ax2 + 2hxy + by2 + 2gx + 2f y + c = 0; in other words that the graph of y, considered as a function of x is a conic. Suppose that (ξ, η) is any point on the conic, and let x – ξ = X, y – η = Y . If the relation between x and y is expressed in terms of X and Y , it assumes the form aX2 + 2hXY + bY 2 + 2GX + 2F Y = 0, [VI : 135] DERIVATIVES AND INTEGRALS 288 where F = hξ+bη+f , G = aξ+hη+g. In this equation put Y = tX. It will then be found that X and Y can both be expressed as rational functions of t, and therefore x and y can be so expressed, the actual formulae being x – ξ = – 2(G + F t) a + 2ht + bt2 , y – η = – 2t(G + F t) a + 2ht + bt2 . Hence the process of rationalisation described in the last section can be carried out. The reader should verify that hx + by + f = –1 2 (a + 2ht + bt2)dx dt , so that Z dx hx + by + f = –2 Z dt a + 2ht + bt2 . When h2 > ab it is in some ways advantageous to proceed as follows. The conic is a hyperbola whose asymptotes are parallel to the lines ax2 + 2hxy + by2 = 0, or b(y – μx)(y – μ′x) = 0, say. If we put y – μx = t, we obtain y – μx = t, y – μ′x = –2gx + 2f y + c bt , and it is clear that x and y can be calculated from these equations as rational functions of t. We shall illustrate this process by an application to an important special case. [VI : 136] DERIVATIVES AND INTEGRALS 289 135. The integral Z dx √ax2 + 2bx + c. Suppose in particular that y2 = ax2 + 2bx + c, where a > 0. It will be found that, if we put y + x√a = t, we obtain 2 dx dt = (t2 + c)√a + 2bt (t√a + b)2 , 2y = (t2 + c)√a + 2bt t√a + b , and so Z dx y = Z dt t√a + b = 1 √a log x√a + y + b √a . (1) If in particular a = 1, b = 0, c = a2, or a = 1, b = 0, c = –a2, we obtain Z dx √x2 + a2 = log{x + px2 + a2}, Z dx √x2 – a2 = log |x + px2 – a2|, (2) equations whose truth may be verified immediately by differentiation. With these formulae should be associated the third formula Z dx √a2 – x2 = arc sin(x/a), (3) which corresponds to a case of the general integral of this section in which a < 0. In (3) it is supposed that a > 0; if a < 0 then the integral is arc sin(x/|a|) (cf. § 119). In practice we should evaluate the general integral by reducing it (as in the next section) to one or other of these standard forms. The formula (3) appears very different from the formulae (2): the reader will hardly be in a position to appreciate the connection between them until he has read Ch. X. 136. The integral Z λx + μ √ax2 + 2bx + c dx. This integral can be inte- grated in all cases by means of the results of the preceding sections. It is most convenient to proceed as follows. Since λx + μ = (λ/a)(ax + b) + μ – (λb/a), Z ax + b √ax2 + 2bx + c dx = √ax2 + 2bx + c, [VI : 138] DERIVATIVES AND INTEGRALS 290 we have Z (λx + μ) dx √ax2 + 2bx + c = λ a √ax2 + 2bx + c +

μ – λb a Z dx √ax2 + 2bx + c. In the last integral a may be positive or negative. If a is positive we put x√a + (b/√a) = t, when we obtain 1 √a Z dt √t2 + κ, where κ = (ac – b2)/a. If a is negative we write A for –a and put x√A – (b/√A) = t, when we obtain 1 √–a Z dt √–κ – t2 . It thus appears that in any case the calculation of the integral may be made to depend on that of the integral considered in § 135, and that this integral may be reduced to one or other of the three forms Z dt √t2 + a2 , Z dt √t2 – a2 , Z dt √a2 – t2 . 137. The integral Z (λx + μ)√ax2 + 2bx + c dx. In exactly the same way we find Z (λx + μ)pax2 + 2bx + c dx = λ 3a

(ax2 + 2bx + c)3/2 +

μ – λb a Z pax2 + 2bx + c dx; and the last integral may be reduced to one or other of the three forms Z pt2 + a2 dt, Z pt2 – a2 dt, Z pa2 – t2 dt. In order to obtain these integrals it is convenient to introduce at this point another general theorem in integration. [VI : 138] DERIVATIVES AND INTEGRALS 291 138. Integration by parts. The theorem of integration by parts is merely another way of stating the rule for the differentiation of a product proved in § 113. It follows at once from Theorem (3) of § 113 that Z f ′(x)F (x) dx = f (x)F (x) – Z f (x)F ′(x) dx. It may happen that the function which we wish to integrate is expressible in the form f ′(x)F (x), and that f (x)F ′(x) can be integrated. Suppose, for example, that φ(x) = xψ(x), where ψ(x) is the second derivative of a known function χ(x). Then Z φ(x) dx = Z xχ′′(x) dx = xχ′(x) – Z χ′(x) dx = xχ′(x) – χ(x). We can illustrate the working of this method of integration by applying it to the integrals of the last section. Taking f (x) = ax + b, F (x) = pax2 + 2bx + c = y, we obtain a Z y dx = (ax + b)y – Z (ax + b)2 y dx = (ax + b)y – a Z y dx + (ac – b2) Z dx y , so that Z y dx = (ax + b)y 2a + ac – b2 2a Z dx y ; and we have seen already (§ 135) how to determine the last integral. Examples XLIX. 1. Prove that if a > 0 then Z px2 + a2 dx = 1 2 xpx2 + a2 + 1 2 a2 log{x + px2 + a2}, Z px2 – a2 dx = 1 2 xpx2 – a2 – 1 2 a2 log |x + px2 – a2|, Z pa2 – x2 dx = 1 2 xpa2 – x2 + 1 2 a2 arc sin(x/a). [VI : 138] DERIVATIVES AND INTEGRALS 292 2. Calculate the integrals Z dx √a2 – x2 , Z pa2 – x2 dx by means of the substitution x = a sin θ, and verify that the results agree with those obtained in § 135 and Ex. 1. 3. Calculate Z x(x + a)m dx, where m is any rational number, in three ways, viz. (i) by integration by parts, (ii) by the substitution (x + a)m = t, and (iii) by writing (x + a) – a for x; and verify that the results agree. 4. Prove, by means of the substitutions ax + b = 1/t and x = 1/u, that (in the notation of §§ 130 and 138) Z dx y3 = ax + b Δy , Z x dx y3 = – bx + c Δy . 5. Calculate Z dx p(x – a)(b – x) , where b > a, in three ways, viz. (i) by the methods of the preceding sections, (ii) by the substitution (b – x)/(x – a) = t2, and (iii) by the substitution x = a cos2 θ + b sin2 θ; and verify that the results agree. 6. Integrate p(x – a)(b – x) and p(b – x)/(x – a). 7. Show, by means of the substitution 2x + a + b = 1 2 (a – b){t2 + (1/t)2}, or by multiplying numerator and denominator by √x + a – √x + b, that if a > b then Z dx √x + a + √x + b = 1 2 √a – b

t + 1 3t3

. 8. Find a substitution which will reduce Z dx (x + a)3/2 + (x – a)3/2 to the integral of a rational function. (Math. Trip. 1899.) 9. Show that Z R{x, n √ax + b} dx is reduced, by the substitution ax + b = yn, to the integral of a rational function. 10. Prove that Z f ′′(x)F (x) dx = f ′(x)F (x) – f (x)F ′(x) + Z f (x)F ′′(x) dx [VI : 139] DERIVATIVES AND INTEGRALS 293 and generally Z f (n)(x)F (x) dx = f (n–1)(x)F (x) – f (n–2)(x)F ′(x) + · · · + (–1)n Z f (x)F (n)(x) dx. 11. The integral Z (1 + x)pxq dx, where p and q are rational, can be found in three cases, viz. (i) if p is an integer, (ii) if q is an integer, and (iii) if p + q is an integer. [In case (i) put x = us, where s is the denominator of q; in case (ii) put 1 + x = ts, where s is the denominator of p; and in case (iii) put 1 + x = xts, where s is the denominator of p.] 12. The integral Z xm(axn + b)q dx can be reduced to the preceding integral by the substitution axn = bt. [In practice it is often most convenient to calculate a particular integral of this kind by a ‘formula of reduction’ (cf. Misc. Ex. 39).] 13. The integral Z R{x, √ax + b, √cx + d} dx can be reduced to that of a rational function by the substitution 4x = –(b/a){t + (1/t)}2 – (d/c){t – (1/t)}2. 14. Reduce Z R(x, y) dx, where y2(x – y) = x2, to the integral of a rational function. [Putting y = tx we obtain x = 1/{t2(1 – t)}, y = 1/{t(1 – t)}.] 15. Reduce the integral in the same way when (a) y(x – y)2 = x, (b) (x2 + y2)2 = a2(x2 – y2). [In case (a) put x – y = t: in case (b) put x2 + y2 = t(x – y), when we obtain x = a2t(t2 + a2)/(t4 + a4), y = a2t(t2 – a2)/(t4 + a4).] 16. If y(x – y)2 = x then Z dx x – 3y = 1 2 log{(x – y)2 – 1}. 17. If (x2 + y2)2 = 2c2(x2 – y2) then Z dx y(x2 + y2 + c2) = – 1 c2 log x2 + y2 x – y

. [VI : 139] DERIVATIVES AND INTEGRALS 294 139. The general integral Z R(x, y) dx, where y2 = ax2 + 2bx + c. The most general integral, of the type considered in § 134, and associated with the special conic y2 = ax2 + 2bx + c, is Z R(x, √X) dx, (1) where X = y2 = ax2 + 2bx + c. We suppose that R is a real function. The subject of integration is of the form P/Q, where P and Q are polyno- mials in x and √X. It may therefore be reduced to the form A + B√X C + D√X = (A + B√X)(C – D√X) C2 – D2X = E + F √X, where A, B, . . . are rational functions of x. The only new problem which arises is that of the integration of a function of the form F √X, or, what is the same thing, G/√X, where G is a rational function of x. And the integral Z G √X dx (2) can always be evaluated by splitting up G into partial fractions. When we do this, integrals of three different types may arise. (i) In the first place there may be integrals of the type Z xm √X dx, (3) where m is a positive integer. The cases in which m = 0 or m = 1 have been disposed of in § 136. In order to calculate the integrals corresponding to larger values of m we observe that d dx (xm–1√X) = (m – 1)xm–2√X + (ax + b)xm–1 √X = αxm + βxm–1 + γxm–2 √X , where α, β, γ are constants whose values may be easily calculated. It is clear that, when

we integrate this equation, we obtain a relation between three suc- cessive integrals of the type (3). As we know the values of the integral for m = 0 and m = 1, we can calculate in turn its values for all other values of m. [VI : 139] DERIVATIVES AND INTEGRALS 295 (ii) In the second place there may be integrals of the type Z dx (x – p)m√X , (4) where p is real. If we make the substitution x – p = 1/t then this integral is reduced to an integral in t of the type (3). (iii) Finally, there may be integrals corresponding to complex roots of the denominator of G. We shall confine ourselves to the simplest case, that in which all such roots are simple roots. In this case (cf. § 130) a pair of conjugate complex roots of G gives rise to an integral of the type Z Lx + M (Ax2 + 2Bx + C)√ax2 + 2bx + c dx. (5) In order to evaluate this integral we put x = μt + ν t + 1 , where μ and ν are so chosen that aμν + b(μ + ν) + c = 0, Aμν + B(μ + ν) + C = 0; so that μ and ν are the roots of the equation (aB – bA)ξ2 – (cA – aC)ξ + (bC – cB) = 0. This equation has certainly real roots, for it is the same equation as equation (1) of Ex. xlvi. 12; and it is therefore certainly possible to find real values of μ and ν fulfilling our requirements. It will be found, on carrying out the substitution, that the integral (5) as- sumes the form H Z t dt (αt2 + β)pγt2 + δ + K Z dt (αt2 + β)pγt2 + δ . (6) The second of these integrals is rationalised by the substitution t pγt2 + δ = u, [VI : 139] DERIVATIVES AND INTEGRALS 296 which gives Z dt (αt2 + β)pγt2 + δ = Z du β + (αδ – βγ)u2 . Finally, if we put t = 1/u in the first of the integrals (6), it is transformed into an integral of the second type, and may therefore be calculated in the manner just explained, viz. by putting u/pγ + δu2 = u, i.e. 1/pγt2 + δ = v.* Examples L. 1. Evaluate Z dx x√x2 + 2x + 3 , Z dx (x – 1)√x2 + 1 , Z dx (x + 1)√1 + 2x – x2 . 2. Prove that Z dx (x – p)p(x – p)(x – q) = 2 q – p r x – q x – p . 3. If ag2 + ch2 = –ν < 0 then Z dx (hx + g)√ax2 + c = – 1 √ν arc tan " pν(ax2 + c) ch – agx # . 4. Show that Z dx (x – x0)y , where y2 = ax2 + 2bx + c, may be expressed in one or other of the forms – 1 y0 log axx0 + b(x + x0) + c + yy0 x – x0 , 1 z0 arc tan axx0 + b(x + x0) + c yz0

, according as ax2 0 + 2bx0 + c is positive and equal to y2 0 or negative and equal to –z2 0 . *The method of integration explained here fails if a/A = b/B; but then the integral may be reduced by the substitution ax + b = t. For further information concern- ing the integration of algebraical functions see Stolz, Grundz¨uge der Differential-und- integralrechnung, vol. i, pp. 331 et seq.; Bromwich, Elementary Integrals (Bowes and Bowes, 1911). An alternative method of reduction has been given by Sir G. Greenhill: see his A Chapter in the Integral Calculus, pp. 12 et seq., and the author's tract quoted on p. 286. [VI : 140] DERIVATIVES AND INTEGRALS 297 5. Show by means of the substitution y = √ax2 + 2bx + c/(x – p) that Z dx (x – p)√ax2 + 2bx + c = Z dy pλy2 – μ , where λ = ap2 + 2bp + c, μ = ac – b2. [This method of reduction is elegant but less straightforward than that explained in § 139.] 6. Show that the integral Z dx x√3x2 + 2x + 1 is rationalised by the substitution x = (1 + y2)/(3 – y2). (Math. Trip. 1911.) 7. Calculate Z (x + 1) dx (x2 + 4)√x2 + 9 . 8. Calculate Z dx (5x2 + 12x + 8)√5x2 + 2x – 7 . [Apply the method of § 139. The equation satisfied by μ and ν is ξ2 + 3ξ + 2 = 0, so that μ = –2, ν = –1, and the appropriate substitution is x = –(2t + 1)/(t + 1). This reduces the integral to – Z dt (4t2 + 1)√9t2 – 4 – Z t dt (4t2 + 1)√9t2 – 4 . The first of these integrals may be rationalised by putting t/√9t2 – 4 = u and the second by putting 1/√9t2 – 4 = v.] 9. Calculate Z (x + 1) dx (2x2 – 2x + 1)√3x2 – 2x + 1 , Z (x – 1) dx (2x2 – 6x + 5)√7x2 – 22x + 19 . (Math. Trip. 1911.) 10. Show that the integral Z R(x, y) dx, where y2 = ax2 + 2bx + c, is ra- tionalised by the substitution t = (x – p)/(y + q), where (p, q) is any point on the conic y2 = ax2 + 2bx + c. [The integral is of course also rationalised by the substitution t = (x – p)/(y – q): cf. § 134.] [VI : 141] DERIVATIVES AND INTEGRALS 298 140. Transcendental Functions. Owing to the immense variety of the different classes of transcendental functions, the theory of their in- tegration is a good deal less systematic than that of the integration of rational or algebraical functions. We shall consider in order a few classes of transcendental functions whose integrals can always be found. 141. Polynomials in cosines and sines of multiples of x. We can always integrate any function which is the sum of a finite number of terms such as A cosm ax sinm′ ax cosn bx sinn′ bx . . . , where m, m′, n, n′, . . . are positive integers and a, b, . . . any real numbers whatever. For such a term can be expressed as the sum of a finite number of terms of the types α cos{(pa + qb + . . .)x}, β sin{(pa + qb + . . .)x} and the integrals of these terms can be written down at once. Examples LI. 1. Integrate sin3 x cos2 2x. In this case we use the for- mulae sin3 x = 1 4 (3 sin x – sin 3x), cos2 2x = 1 2 (1 + cos 4x). Multiplying these two expressions and replacing sin x cos 4x, for example, by 1 2 (sin 5x – sin 3x), we obtain 1 16 Z (7 sin x – 5 sin 3x + 3 sin 5x – sin 7x) dx = – 7 16 cos x + 5 48 cos 3x – 3 80 cos 5x + 1 112 cos 7x. The integral may of course be obtained in different forms by different meth- ods. For example Z sin3 x cos2 2x dx = Z (4 cos4 x – 4 cos2 x + 1)(1 – cos2 x) sin x dx, which reduces, on making the substitution cos x = t, to Z (4t6 – 8t4 + 5t2 – 1) dt = 4 7 cos7 x – 8 5 cos5 x + 5 3 cos3 x – cos x. [VI : 143] DERIVATIVES AND INTEGRALS 299 It may be verified that this expression and that obtained above differ only by a constant. 2. Integrate by any method cos ax cos bx, sin ax sin bx, cos ax sin bx, cos2 x, sin3 x, cos4 x, cos x cos 2x cos 3x, cos3 2x sin2 3x, cos5 x sin7 x. [In cases of this kind it is sometimes convenient to use a formula of reduction (Misc. Ex. 39).] 142. The integrals Z xn cos x dx, Z xn sin x dx and associated integrals. The method of integration by parts enables us to generalise the preceding results. For Z xn cos x dx = xn sin x – n Z xn–1 sin x dx, Z xn sin x dx =–xn cos x + n Z xn–1 cos x dx, and clearly the integrals can be calculated completely by a repetition of this process whenever n is a positive integer. It follows that we can always calculate Z xn cos ax dx and Z xn sin ax dx if n is a positive integer; and so, by a process similar to that of the preceding paragraph, we can calculate Z P (x, cos ax, sin ax, cos bx, sin bx, . . .) dx, where P is any polynomial. Examples LII. 1. Integrate x sin x, x2 cos x, x2

cos2 x, x2 sin2 x sin2 2x, x sin2 x cos4 x, x3 sin3 1 3 x. 2. Find polynomials P and Q such that Z {(3x – 1) cos x + (1 – 2x) sin x} dx = P cos x + Q sin x. 3. Prove that Z xn cos x dx = Pn cos x + Qn sin x, where Pn = nxn–1 – n(n – 1)(n – 2)xn–3 + . . . , Qn = xn – n(n – 1)xn–2 + ... [VI : 143] DERIVATIVES AND INTEGRALS 300 143. Rational Functions of cos x and sin x. The integral of any rational function of cos x and sin x may be calculated by the substitution tan 1 2 x = t. For cos x = 1 – t2 1 + t2 , sin x = 2t 1 + t2 , dx dt = 2 1 + t2 , so that the substitution reduces the integral to that of a rational function of t. Examples LIII. 1. Prove that Z sec x dx = log | sec x + tan x|, Z cosec x dx = log | tan 1 2 x|. [Another form of the first integral is log | tan(1 4 π + 1 2 x)|; a third form is 1 2 log |(1 + sin x)/(1 – sin x)|.] 2. Z tan x dx = – log | cos x|, Z cot x dx = log | sin x|, Z sec2 x dx = tan x, Z cosec2 x dx = – cot x, Z tan x sec x dx = sec x, Z cot x cosec x dx = – cosec x. [These integrals are included in the general form, but there is no need to use a substitution, as the results follow at once from § 119 and equation (5) of § 130.] 3. Show that the integral of 1/(a + b cos x), where a + b is positive, may be expressed in one or other of the forms 2 √a2 – b2 arc tan (t r a – b a + b) , 1 √b2 – a2 log √b + a + t√b – a √b + a – t√b – a , where t = tan 1 2 x, according as a2 > b2 or a2 < b2. If a2 = b2 then the integral reduces to a constant multiple of that of sec2 1 2 x or cosec2 1 2 x, and its value may at once be written down. Deduce the forms of the integral when a+b is negative. 4. Show that if y is defined in terms of x by means of the equation (a + b cos x)(a – b cos y) = a2 – b2, where a is positive and a2 > b2, then as x varies from 0 to π one value of y also varies from 0 to π. Show also that sin x = √a2 – b2 sin y a – b cos y , sin x a + b cos x dx dy = sin y a – b cos y ; [VI : 144] DERIVATIVES AND INTEGRALS 301 and deduce that if 0 < x < π then Z dx a + b cos x = 1 √a2 – b2 arc cos a cos x + b a + b cos x

. Show that this result agrees with that of Ex. 3. 5. Show how to integrate 1/(a + b cos x + c sin x). [Express b cos x + c sin x in the form √b2 + c2 cos(x – α).] 6. Integrate (a + b cos x + c sin x)/(α + β cos x + γ sin x). [Determine λ, μ, ν so that a + b cos x + c sin x = λ + μ(α + β cos x + γ sin x) + ν(–β sin x + γ cos x). Then the integral is μx + ν log |α + β cos x + γ sin x| + λ Z dx α + β cos x + γ sin x .] 7. Integrate 1/(a cos2 x+2b cos x sin x+c sin2 x). [The subject of integration may be expressed in the form 1/(A + B cos 2x + C sin 2x), where A = 1 2 (a + c), B = 1 2 (a – c), C = b: but the integral may be calculated more simply by putting tan x = t, when we obtain Z sec2 x dx a + 2b tan x + c tan2 x = Z dt a + 2bt + ct2 .] 144. Integrals involving arc sin x, arc tan x, and log x. The inte- grals of the inverse sine and tangent and of the logarithm can easily be calculated by integration by parts. Thus Z arc sin x dx = x arc sin x – Z x dx √1 – x2 = x arc sin x + √1 – x2, Z arc tan x dx = x arc tan x – Z x dx 1 + x2 = x arc tan x – 1 2 log(1 + x2), Z log x dx = x log x – Z dx = x(log x – 1). [VI : 145] DERIVATIVES AND INTEGRALS 302 It is easy to see that if we can find the integral of y = f (x) then we can always find that of x = φ(y), where φ is the function inverse to f . For on making the substitution y = f (x) we obtain Z φ(y) dy = Z xf ′(x) dx = xf (x) – Z f (x) dx. The reader should evaluate the integrals of arc sin y and arc tan y in this way. Integrals of the form Z P (x, arc sin x) dx, Z P (x, log x) dx, where P is a polynomial, can always be calculated. Take the first form, for example. We have to calculate a number of integrals of the type Z xm(arc sin x)n dx. Making the substitution x = sin y, we obtain Z yn sinm y cos y dy, which can be found by the method of § 142. In the case of the second form we have to calculate a number of integrals of the type Z xm(log x)n dx. Integrating by parts we obtain Z xm(log x)n dx = xm+1(log x)n m + 1 – n m + 1 Z xm(log x)n–1 dx, and it is evident that by repeating this process often enough we shall always arrive finally at the complete value of the integral. 145. Areas of plane curves. One of the most important appli- cations of the processes of integration which have been explained in the preceding sections is to the calculation of areas of plane curves. Suppose that P0P P ′ (Fig. 44) is the graph of a continuous curve y = φ(x) which lies wholly above the axis of x, P being the point (x, y) and P ′ the point (x+h, y+k), and h being either positive or negative (positive in the figure). [VI : 145] DERIVATIVES AND INTEGRALS 303O N1 N N′ P0 P1 P P ′ R Fig. 44.P R P ′ Fig. 44a. The reader is of course familiar with the idea of an ‘area’, and in par- ticular with that of an area such as ON P P0. This idea we shall at present take for granted. It is indeed one which needs and has received the most careful mathematical analysis: later on we shall return to it and explain precisely what is meant by ascribing an ‘area’ to such a region of space as ON P P0. For the present we shall simply assume that any such region has associated with it a definite positive number (ON P P0) which we call its area, and that these areas possess the obvious properties indicated by common sense, e.g. that (P RP ′) + (N N ′RP) = (N N ′P ′P), (N1N P P1) < (ON P P0), and so on. Taking all this for granted it is obvious that the area ON P P0 is a function of x; we denote it by Φ(x). Also Φ(x) is a continuous function. For Φ(x + h) – Φ(x) = (N N ′P ′P) = (N N ′RP) + (P RP ′) = hφ(x) + (P RP ′). As the figure is drawn, the area P RP ′ is less than hk. This is not however necessarily true in general, because it is not necessarily the case [VI : 146] DERIVATIVES AND INTEGRALS 304 (see for example Fig. 44a) that the arc P P ′ should rise or fall steadily from P to P ′. But the area P RP ′ is always less than |h|λ(h), where λ(h) is the greatest distance of any point of the arc P P ′ from P R. Moreover, since φ(x) is a continuous function, λ(h) → 0 as h → 0. Thus we have Φ(x + h) – Φ(x) = h{φ(x) + μ(h)}, where |μ(h)| < λ(h) and λ(h) → 0 as h → 0. From this it follows at once that Φ(x) is continuous. Moreover Φ′(x) = lim h→0 Φ(x + h) – Φ(x) h = lim h→0{φ(x) + μ(h)} = φ(x). Thus the ordinate of the curve is the derivative of the area, and the area is the integral of the ordinate. We are thus able to formulate a rule for determining the area ON P P0. Calculate Φ(x), the integral of φ(x). This involves an arbitrary constant, which we suppose so chosen that Φ(0) = 0. Then the area required is Φ(x). If it were the area N1N P P1 which was wanted, we

should of course determine the constant so that Φ(x1) = 0, where x1 is the abscissa of P1. If the curve lay below the axis of x, Φ(x) would be negative, and the area would be the absolute value of Φ(x). 146. Lengths of plane curves. The notion of the length of a curve, other than a straight line, is in reality a more difficult one even than that of an area. In fact the assumption that P0P (Fig. 44) has a definite length, which we may denote by S(x), does not suffice for our purposes, as did the corresponding assumption about areas. We cannot even prove that S(x) is continuous, i.e. that lim{S(P ′) – S(P)} = 0. This looks obvious enough in the larger figure, but less so in such a case as is shown in the smaller figure. Indeed it is not possible to proceed further, with any degree of rigour, without a careful analysis of precisely what is meant by the length of a curve. It is however easy to see what the formula must be. Let us suppose that the curve has a tangent whose direction varies continuously, so that [VI : 146] DERIVATIVES AND INTEGRALS 305 φ′(x) is continuous. Then the assumption that the curve has a length leads to the equation {S(x + h) – S(x)}/h = {P P ′}/h = (P P ′/h) × ({P P ′}/P P ′), where {P P ′} is the arc whose chord is P P ′. Now P P ′ + √P R2 + RP ′2 = h r 1 + k2 h2 , and k = φ(x + h) – φ(x) = hφ′(ξ), where ξ lies between x and x + h. Hence lim(P P ′/h) = lim p1 + [φ′(ξ)]2 = p1 + [φ′(x)]2. If also we assume that lim{P P ′}/P P ′ = 1, we obtain the result S′(x) = lim{S(x + h) – S(x)}/h = p1 + [φ′(x)]2 and so S(x) = Z p1 + [φ′(x)]2 dx. Examples LIV. 1. Calculate the area of the segment cut off from the parabola y = x2/4a by the ordinate x = ξ, and the length of the arc which bounds it. 2. Answer the same questions for the curve ay2 = x3, showing that the length of the arc is 8a 27 (1 + 9ξ 4a 3/2 – 1) . 3. Calculate the areas and lengths of the circles x2 + y2 = a2, x2 + y2 = 2ax by means of the formulae of §§ 145–146. [VI : 146] DERIVATIVES AND INTEGRALS 306 4. Show that the area of the ellipse (x2/a2) + (y2/b2) = 1 is πab. 5. Find the area bounded by the curve y = sin x and the segment of the axis of x from x = 0 to x = 2π. [Here Φ(x) = – cos x, and the difference between the values of – cos x for x = 0 and x = 2π is zero. The explanation of this is of course that between x = π and x = 2π the curve lies below the axis of x, and so the corresponding part of the area is counted negative in applying the method. The area from x = 0 to x = π is – cos π + cos 0 = 2; and the whole area required, when every part is counted positive, is twice this, i.e. is 4.] 6. Suppose that the coordinates of any point on a curve are expressed as functions of a parameter t by equations of the type x = φ(t), y = ψ(t), φ and ψ being functions of t with continuous derivatives. Prove that if x steadily increases as t varies from t0 to t1, then the area of the region bounded by the corresponding portion of the curve, the axis of x, and the two ordinates corresponding to t0 and t1, is, apart from sign, A(t1) – A(t0), where A(t) = Z ψ(t)φ′(t) dt = Z y dx dt dt. 7. Suppose that C is a closed curve formed of a single loop and not met by any parallel to either axis in more than two points. And suppose that the coordinates of any point P on the curve can be expressed as in Ex. 6 in terms of t, and that, as t varies from t0 to t1, P moves in the same direction round the curve and returns after a single circuit to its original position. Show that the area of the loop is equal to the difference of the initial and final values of any one of the integrals – Z y dx dt dt, Z x dy dt dt, 1 2 Z x dy dt – y dx dt

dt, this difference being of course taken positively. 8. Apply the result of Ex. 7 to determine the areas of the curves given by (i) x a = 1 – t2 1 + t2 , y a = 2t 1 + t2 , (ii) x = a cos3 t, y = b sin3 t. 9. Find the area of the loop of the curve x3 + y3 = 3axy. [Putting y = tx we obtain x = 3at/(1 + t3), y = 3at2/(1 + t3). As t varies from 0 towards ∞ the [VI : 146] DERIVATIVES AND INTEGRALS 307 loop is described once. Also 1 2 Z y dx dt – x dy dt

dt = – 1 2 Z x2 d dt y x

dt = – 1 2 Z 9a2t2 (1 + t3)2 dt = 3a2 2(1 + t3) , which tends to 0 as t → ∞. Thus the area of the loop is 3 2 a2.] 10. Find the area of the loop of the curve x5 + y5 = 5ax2y2. 11. Prove that the area of a loop of the curve x = a sin 2t, y = a sin t is 4 3 a2. (Math. Trip. 1908.) 12. The arc of the ellipse given by x = a cos t, y = b sin t, between the points t = t1 and t = t2, is F (t2) – F (t1), where F (t) = a Z p 1 – e2 sin2 t dt, e being the eccentricity. [This integral cannot however be evaluated in terms of such functions as are at present at our disposal.] 13. Polar coordinates. Show that the area bounded by the curve r = f (θ), where f (θ) is a one-valued function of θ, and the radii θ = θ1, θ = θ2, is F (θ2) – F (θ1), where F (θ) = 1 2 Z r2 dθ. And the length of the corresponding arc of the curve is Φ(θ2) – Φ(θ1), where Φ(θ) = Z s r2 + dr dθ 2 dθ. Hence determine (i) the area and perimeter of the circle r = 2a sin θ; (ii) the area between the parabola r = 1 2 l sec2 1 2 θ and its latus rectum, and the length of the corresponding arc of the parabola; (iii) the area of the lima¸con r = a+b cos θ, distinguishing the cases in which a > b, a = b, and a < b; and (iv) the areas of the ellipses 1/r2 = a cos2 θ + 2h cos θ sin θ + b sin2 θ and l/r = 1 + e cos θ. [In the last case we are led to the integral Z dθ (1 + e cos θ)2 , which may be calculated (cf. Ex. liii. 4) by the help of the substitution (1 + e cos θ)(1 – e cos φ) = 1 – e2.] 14. Trace the curve 2θ = (a/r) + (r/a), and show that the area bounded by the radius vector θ = β, and the two branches which touch at the point r = a, θ = 1, is 2 3 a2(β2 – 1)3/2. (Math. Trip. 1900.) [VI : 146] DERIVATIVES AND INTEGRALS 308 15. A curve is given by an equation p = f (r), r being the radius vector and p the perpendicular from the origin on to the tangent. Show that the calculation of the area of the region bounded by an arc of the curve and two radii vectores depends upon that of the integral 1 2 Z pr dr pr2 – p2 . MISCELLANEOUS EXAMPLES ON CHAPTER VI. 1. A function f (x) is defined as being equal to 1 + x when x ■ 0, to x when 0 < x < 1, to 2 – x when 1 ■ x ■ 2, and to 3x – x2 when x > 2. Discuss the continuity of f (x) and the existence and continuity of f ′(x) for x = 0, x = 1, and x = 2.

(Math. Trip. 1908.) 2. Denoting a, ax + b, ax2 + 2bx + c, . . . by u0, u1, u2, . . . , show that u2 0u3 – 3u0u1u2 + 2u3 1 and u0u4 – 4u1u3 + 3u2 2 are independent of x. 3. If a0, a1, . . . , a2n are constants and Ur = (a0, a1, . . . , ar)(x, 1)r, then U0U2n – 2nU1U2n–1 + 2n(2n – 1) 1 · 2 U2U2n–2 – · · · + U2nU0 is independent of x. (Math. Trip. 1896.) [Differentiate and use the relation U ′ r = rUr–1.] 4. The first three derivatives of the function arc sin(μ sin x) – x, where μ > 1, are positive when 0 ■ x ■ 1 2 π. 5. The constituents of a determinant are functions of x. Show that its differential coefficient is the sum of the determinants formed by differentiating the constituents of one row only, leaving the rest unaltered. 6. If f1, f2, f3, f4 are polynomials of degree not greater than 4, then f1 f2 f3 f4 f ′ 1 f ′ 2 f ′ 3 f ′ 4 f ″ 1 f ″ 2 f ″ 3 f ″ 4 f ‴ 1 f ‴ 2 f ‴ 3 f ‴ 4 is also a polynomial of degree not greater than 4. [Differentiate five times, using the result of Ex. 5, and rejecting vanishing determinants.] 7. If y3 + 3yx + 2x3 = 0 then x2(1 + x3)y″ – 3 2 xy′ + y = 0. (Math. Trip. 1903.) [VI : 146] DERIVATIVES AND INTEGRALS 309 8. Verify that the differential equation y = φ{ψ(y1)} + φ{x – ψ(y1)}, where y1 is the derivative of y, and ψ is the function inverse to φ′, is satisfied by y = φ(c) + φ(x – c) or by y = 2φ(1 2 x). 9. Verify that the differential equation y = {x/ψ(y1)}φ{ψ(y1)}, where the notation is the same as that of Ex. 8, is satisfied by y = cφ(x/c) or by y = βx, where β = φ(α)/α and α is any root of the equation φ(α) – αφ′(α) = 0. 10. If ax + by + c = 0 then y2 = 0 (suffixes denoting differentiations with re- spect to x). We may express this by saying that the general differential equation of all straight lines is y2 = 0. Find the general differential equations of (i) all circles with their centres on the axis of x, (ii) all parabolas with their axes along the axis of x, (iii) all parabolas with their axes parallel to the axis of y, (iv) all circles, (v) all parabolas, (vi) all conics. [The equations are (i) 1 + y2 1 + yy2 = 0, (ii) y2 1 + yy2 = 0, (iii) y3 = 0, (iv) (1 + y2 1)y3 = 3y1y2 2 , (v) 5y2 3 = 3y2y4, (vi) 9y2 2 y5 – 45y2y3y4 + 40y3 3 = 0. In each case we have only to write down the general equation of the curves in question, and differentiate until we have enough equations to eliminate all the arbitrary constants.] 11. Show that the general differential equations of all parabolas and of all conics are respectively D2 x(y–2/3 2) = 0, D3 x(y–2/3 2) = 0. [The equation of a conic may be put in the form y = ax + b ± ppx2 + 2qx + r. From this we deduce y2 = ±(pr – q2)/(px2 + 2qx + r)3/2. If the conic is a parabola then p = 0.] 12. Denoting dy dx , 1 2! d2y dx2 , 1 3! d3y dx3 , 1 4! d4y dx4 , . . . by t, a, b, c, . . . and dx dy , 1 2! d2x dy2 , 1 3! d3x dy3 , 1 4! d4x dy4 , . . . by τ , α, β, γ, . . . , show that 4ac – 5b2 = (4αγ – 5β2)/τ 8, bt – a2 = –(βτ – α2)/τ 6. [VI : 146] DERIVATIVES AND INTEGRALS 310 Establish similar formulae for the functions a2d – 3abc – 2b3, (1 + t2)b – 2a2t, 2ct – 5ab. 13. Prove that, if yk is the kth derivative of y = sin(n arc sin x), then (1 – x2)yk+2 – (2k + 1)xyk+1 + (n2 – k2)yk = 0. [Prove first when k = 0, and differentiate k times by Leibniz' Theorem.] 14. Prove the formula vDn x u = Dn x (uv) – nDn–1 x (uDxv) + n(n – 1) 1 · 2 Dn–2 x (uD2 xv) – . . . where n is any positive integer. [Use the method of induction.] 15. A curve is given by x = a(2 cos t + cos 2t), y = a(2 sin t – sin 2t). Prove (i) that the equations of the tangent and normal, at the point P whose parameter is t, are x sin 1 2 t + y cos 1 2 t = a sin 3 2 t, x cos 1 2 t – y sin 1 2 t = 3a cos 3 2 t; (ii) that the tangent at P meets the curve in the points Q, R whose parameters are – 1 2 t and π – 1 2 t; (iii) that QR = 4a; (iv) that the tangents at Q and R are at right angles and intersect on the circle x2 + y2 = a2; (v) that the normals at P , Q, and R are concurrent and intersect on the circle x2 + y2 = 9a2; (vi) that the equation of the curve is (x2 + y2 + 12ax + 9a2)2 = 4a(2x + 3a)3. Sketch the form of the curve. 16. Show that the equations which define the curve of Ex. 15 may be replaced by ξ/a = 2u + (1/u2), η/a = (2/u) + u2, where ξ = x + yi, η = x – yi, u = Cis t. Show that the tangent and normal, at the point defined by u, are u2ξ – uη = a(u3 – 1), u2ξ + uη = 3a(u3 + 1), and deduce the properties (ii)–(v) of Ex. 15. 17. Show that the condition that x4 + 4px3 – 4qx – 1 = 0 should have equal roots may be expressed in the form (p + q)2/3 – (p – q)2/3 = 1. (Math. Trip. 1898.) [VI : 146] DERIVATIVES AND INTEGRALS 311 18. The roots of a cubic f (x) = 0 are α, β, γ in ascending order of magnitude. Show that if [α, β] and [β, γ] are each divided into six equal sub-intervals, then a root of f ′(x) = 0 will fall in the fourth interval from β on each side. What will be the nature of the cubic in the two cases when a root of f ′(x) = 0 falls at a point of division? (Math. Trip. 1907.) 19. Investigate the maxima and minima of f (x), and the real roots of f (x) = 0, f (x) being either of the functions x – sin x – tan α(1 – cos x), x – sin x – (α – sin α) – tan 1 2 α(cos α – cos x), and α an angle between 0 and π. Show that in the first case the condition for a double root is that tan α – α should be a multiple of π. 20. Show that by choice of the ratio λ : μ we can make the roots of λ(ax2 + bx + c) + μ(a′x2 + b′x + c′) = 0 real and having a difference of any magnitude, unless the roots of the two quadratics are all real and interlace; and that in the excepted case the roots are always real, but there is a lower limit for the magnitude of their difference. (Math. Trip. 1895.) [Consider the form of the graph of the function (ax2 +bx+c)/(a′x2 +b′x+c′): cf. Exs. xlvi. 12 et seq.] 21. Prove that π < sin πx x(1 – x) ■ 4 when 0 < x < 1, and draw the graph of the function. 22. Draw the graph of the function π cot πx – 1 x – 1 x – 1 . 23. Sketch the general form of the graph of y, given that dy dx = (6x2 + x – 1)(x – 1)2(x + 1)3 x2 . (Math. Trip. 1908.) 24. A sheet of paper is folded over so that one corner just reaches the opposite side. Show how the paper must be folded to make the length of the crease a maximum. 25. The greatest acute angle at which the ellipse (x2/a2) + (y2/b2) = 1 can be cut by a concentric circle is arc tan{(a2 – b2)/2ab}. (Math. Trip. 1900.) [VI : 146] DERIVATIVES AND INTEGRALS 312 26. In a triangle the area Δ and the semi-perimeter s are fixed. Show that any maximum or minimum of one of the sides is a root of the equation s(x – s)x2 + 4Δ2 = 0. Discuss the reality of the roots of this equation, and whether they correspond to maxima or minima. [The equations a + b + c = 2s, s(s – a)(s – b)(s – c) = Δ2 determine a and b as functions of c. Differentiate with respect to c, and

suppose that da/dc = 0. It will be found that b = c, s – b = s – c = 1 2 a, from which we deduce that s(a – s)a2 + 4∆2 = 0. This equation has three real roots if s4 > 27∆2, and one in the contrary case. In an equilateral triangle (the triangle of minimum perimeter for a given area) s4 = 27∆2; thus it is impossible that s4 < 27∆2. Hence the equation in a has three real roots, and, since their sum is positive and their product negative, two roots are positive and the third negative. Of the two positive roots one corresponds to a maximum and one to a minimum.] 27. The area of the greatest equilateral triangle which can be drawn with its sides passing through three given points A, B, C is 2∆ + a2 + b2 + c2 2√3 , a, b, c being the sides and ∆ the area of ABC. (Math. Trip. 1899.) 28. If ∆, ∆′ are the areas of the two maximum isosceles triangles which can be described with their vertices at the origin and their base angles on the cardioid r = a(1 + cos θ), then 256∆∆′ = 25a4√5. (Math. Trip. 1907.) 29. Find the limiting values which (x2 – 4y + 8)/(y2 – 6x + 3) approaches as the point (x, y) on the curve x2y – 4x2 – 4xy + y2 + 16x – 2y – 7 = 0 approaches the position (2, 3). (Math. Trip. 1903.) [If we take (2, 3) as a new origin, the equation of the curve becomes ξ2η – ξ2 + η2 = 0, and the function given becomes (ξ2 + 4ξ – 4η)/(η2 + 6η – 6ξ). If we put η = tξ, we obtain ξ = (1 – t2)/t, η = 1 – t2. The curve has a loop branching at the origin, which corresponds to the two values t = –1 and t = 1. Expressing the given function in terms of t, and making t tend to –1 or 1, we obtain the limiting values – 3 2 , – 2 3 .] 30. If f (x) = 1 sin x – sin a – 1 (x – a) cos a , then d da { lim x→a f (x)} – lim x→a f ′(x) = 3 4 sec3 a – 5 12 sec a. (Math. Trip. 1896.) [VI : 146] DERIVATIVES AND INTEGRALS 313 31. Show that if φ(x) = 1/(1 + x2) then φn(x) = Qn(x)/(1 + x2)n+1, where Qn(x) is a polynomial of degree n. Show also that (i) Qn+1 = (1 + x2)Q′ n – 2(n + 1)xQn, (ii) Qn+2 + 2(n + 2)xQn+1 + (n + 2)(n + 1)(1 + x2)Qn = 0, (iii) (1 + x2)Q′′ n – 2nxQ′ n + n(n + 1)Qn = 0, (iv) Qn = (–1)nn!

(n + 1)xn – (n + 1)n(n – 1) 3! xn–2 + . . .

, (v) all the roots of Qn = 0 are real and separated by those of Qn–1 = 0. 32. If f (x), φ(x), ψ(x) have derivatives when a ■ x ■ b, then there is a value of ξ lying between a and b and such that f (a) φ(a) ψ(a) f (b) φ(b) ψ(b) f ′(ξ) φ′(ξ) ψ′(ξ) = 0. [Consider the function formed by replacing the constituents of the third row by f (x), φ(x), ψ(x). This theorem reduces to the Mean Value Theorem (§ 125) when φ(x) = x and ψ(x) = 1.] 33. Deduce from Ex. 32 the formula f (b) – f (a) φ(b) – φ(a) = f ′(ξ) φ′(ξ) . 34. If φ′(x) → a as x → ∞, then φ(x)/x → a. If φ′(x) → ∞ then φ(x) → ∞. [Use the formula φ(x) – φ(x0) = (x – x0)φ′(ξ), where x0 < ξ < x.] 35. If φ(x) → a as x → ∞, then φ′(x) cannot tend to any limit other than zero. 36. If φ(x) + φ′(x) → a as x → ∞, then φ(x) → a and φ′(x) → 0. [Let φ(x) = a + ψ(x), so that ψ(x) + ψ′(x) → 0. If ψ′(x) is of constant sign, say positive, for all sufficiently large values of x, then ψ(x) steadily increases and must tend to a limit l or to ∞. If ψ(x) → ∞ then ψ′(x) → –∞, which contradicts our hypothesis. If ψ(x) → l then ψ′(x) → –l, and this is impossible (Ex. 35) unless l = 0. Similarly we may dispose of the case in which ψ′(x) is ultimately negative. If ψ(x) changes sign for values of x which surpass all limit, then these are the maxima and minima of ψ(x). If x has a large value corresponding to a maximum or minimum of ψ(x), then ψ(x) + ψ′(x) is small and [VI : 146] DERIVATIVES AND INTEGRALS 314 ψ′(x) = 0, so that ψ(x) is small. A fortiori are the other values of ψ(x) small when x is large. For generalisations of this theorem, and alternative lines of proof, see a paper by the author entitled “Generalisations of a limit theorem of Mr Mercer,” in volume 43 of the Quarterly Journal of Mathematics. The simple proof sketched above was suggested by Prof. E. W. Hobson.] 37. Show how to reduce Z R (x, r ax + b mx + n , r cx + d mx + n) dx to the integral of a rational function. [Put mx + n = 1/t and use Ex. xlix. 13.] 38. Calculate the integrals: Z dx (1 + x2)3 , Z r x – 1 x + 1 dx x , Z x dx √1 + x – 3 √1 + x , Z s a2 + r b2 + c x dx, Z cosec3 x dx, Z 5 cos x + 6 2 cos x + sin x + 3 dx, Z dx (2 – sin2 x)(2 + sin x – sin2 x) , Z cos x sin x dx cos4 x + sin4 x , Z cosec x√sec 2x dx, Z dx p(1 + sin x)(2 + sin x) , Z x + sin x 1 + cos x dx, Z arc sec x dx, Z (arc sin x)2 dx, Z x arc sin x dx, Z x arc sin x √1 – x2 dx, Z arc sin x x3 dx, Z arc sin x (1 + x)2 dx, Z arc tan x x2 dx, Z arc tan x (1 + x2)3/2 dx, Z log(α2 + β2x2) x2 dx, Z log(α + βx) (a + bx)2 dx. 39. Formulae of reduction. (i) Show that 2(n – 1)(q – 1 4 p2) Z dx (x2 + px + q)n = x + 1 2 p (x2 + px + q)n–1 + (2n – 3) Z dx (x2 + px + q)n–1 . [VI : 146] DERIVATIVES AND INTEGRALS 315 [Put x + 1 2 p = t, q – 1 4 p2 = λ: then we obtain Z dt (t2 + λ)n = 1 λ Z dt (t2 + λ)n–1 – 1 λ Z t2 dt (t2 + λ)n = 1 λ Z dt (t2 + λ)n–1 + 1 2λ(n – 1) Z t d dt 1 (t2 + λ)n–1

dt, and the result follows on integrating by parts. A formula such as this is called a formula of reduction. It is most useful when n is a positive integer. We can then express Z dx (x2 + px + q)n in terms of Z dx (x2 + px + q)n–1 , and so evaluate the integral for every value of n in turn.] (ii) Show that if Ip,q = Z xp(1 + x)q dx then (p + 1)Ip,q = xp+1(1 + x)q – qIp+1,q–1, and obtain a similar formula connecting Ip,q with Ip–1,q+1. Show also, by means of the substitution x = –y/(1 + y), that Ip,q = (–1)p+1 Z yp(1 + y)–p–q–2 dy. (iii) Show that if X = a + bx then Z xX–1/3 dx = –3(3a – 2bx)X2/3/10b2, Z x2X–1/3 dx = 3(9a2 – 6abx + 5b2x2)X2/3/40b3, Z xX–1/4 dx = –4(4a – 3bx)X3/4/21b2, Z x2X–1/4 dx = 4(32a2 – 24abx + 21b2x2)X3/4/231b3. (iv) If Im,n = Z xm dx (1 + x2)n then 2(n – 1)Im,n = –xm–1(1 + x2)–(n–1) + (m – 1)Im–2,n–1. [VI : 146] DERIVATIVES AND INTEGRALS 316 (v) If In = Z xn cos βx dx and Jn = Z xn sin βx dx then βIn = xn sin βx – nJn–1, βJn = –xn cos βx + nIn–1. (vi) If In = Z cosn x dx and Jn = Z sinn x dx then nIn = sin x cosn–1 x + (n – 1)In–2, nJn = – cos x sinn–1 x + (n – 1)Jn–2. (vii) If In = Z tann x dx then (n – 1)(In + In–2) = tann–1 x. (viii) If Im,n = Z cosm x sinn x dx then (m + n)Im,n = – cosm+1 x sinn–1 x + (n – 1)Im,n–2 = cosm–1 x sinn+1 x + (m – 1)Im–2,n. [We have (m + 1)Im,n = – Z sinn–1 x d dx (cosm+1 x) dx = – cosm+1 x sinn–1 x + (n – 1) Z cosm+2 x sinn–2 x dx = – cosm+1 x sinn–1 x + (n – 1)(Im,n–2 –

Im,n), which leads to the first reduction formula.] (ix) Connect Im,n = Z sinm x sin nx dx with Im–2,n. (Math. Trip. 1897.) (x) If Im,n = Z xm cosecn x dx then (n – 1)(n – 2)Im,n = (n – 2)2Im,n–2 + m(m – 1)Im–2,n–2 – xm–1 cosecn–1 x{m sin x + (n – 2)x cos x}. (Math. Trip. 1896.) [VI : 146] DERIVATIVES AND INTEGRALS 317 (xi) If In = Z (a + b cos x)–n dx then (n – 1)(a2 – b2)In = –b sin x(a + b cos x)–(n–1) + (2n – 3)aIn–1 – (n – 2)In–2. (xii) If In = Z (a cos2 x + 2h cos x sin x + b sin2 x)–n dx then 4n(n + 1)(ab – h2)In+2 – 2n(2n + 1)(a + b)In+1 + 4n2In = – d2In dx2 . (Math. Trip. 1898.) (xiii) If Im,n = Z xm(log x)n dx then (m + 1)Im,n = xm+1(log x)n – nIm,n–1. 40. If n is a positive integer then the value of Z xm(log x)n dx is xm+1 (log x)n m + 1 – n(log x)n–1 (m + 1)2 + n(n – 1)(log x)n–2 (m + 1)3 – · · · + (–1)nn! (m + 1)n+1

. 41. Show that the most general function φ(x), such that φ′′ + a2φ = 0 for all values of x, may be expressed in either of the forms A cos ax + B sin ax, ρ cos(ax+■), where A, B, ρ, ■ are constants. [Multiplying by 2φ′ and integrating we obtain φ′2 + a2φ2 = a2b2, where b is a constant, from which we deduce that ax = Z dφ pb2 – φ2 .] 42. Determine the most general functions y and z such that y′ + ωz = 0, and z′ – ωy = 0, where ω is a constant and dashes denote differentiation with respect to x. 43. The area of the curve given by x = cos φ + sin α sin φ 1 – cos2 α sin2 φ , y = sin φ – sin α cos φ 1 – cos2 α sin2 φ , where α is a positive acute angle, is 1 2 π(1 + sin α)2/ sin α. (Math. Trip. 1904.) [VI : 146] DERIVATIVES AND INTEGRALS 318 44. The projection of a chord of a circle of radius a on a diameter is of constant length 2a cos β; show that the locus of the middle point of the chord consists of two loops, and that the area of either is a2(β – cos β sin β). (Math. Trip. 1903.) 45. Show that the length of a quadrant of the curve (x/a)2/3 + (y/b)2/3 = 1 is (a2 + ab + b2)/(a + b). (Math. Trip. 1911.) 46. A point A is inside a circle of radius a, at a distance b from the centre. Show that the locus of the foot of the perpendicular drawn from A to a tangent to the circle encloses an area π(a2 + 1 2 b2). (Math. Trip. 1909.) 47. Prove that if (a, b, c, f, g, h)(x, y, 1)2 = 0 is the equation of a conic, then Z dx (lx + my + n)(hx + by + f) = α log P T P T ′ + β, where P T , P T ′ are the perpendiculars from a point P of the conic on the tangents at the ends of the chord lx + my + n = 0, and α, β are constants. (Math. Trip. 1902.) 48. Show that Z ax2 + 2bx + c (Ax2 + 2Bx + C)2 dx will be a rational function of x if and only if one or other of AC – B2 and aC + cA – 2bB is zero.* 49. Show that the necessary and sufficient condition that Z f (x) {F (x)}2 dx, where f and F are polynomials of which the latter has no repeated factor, should be a rational function of x, is that f ′F ′ – f F ′′ should be divisible by F . (Math. Trip. 1910.) 50. Show that Z α cos x + β sin x + γ (1 – e cos x)2 dx is a rational function of cos x and sin x if and only if αe + γ = 0; and determine the integral when this condition is satisfied. (Math. Trip. 1910.) *See the author's tract quoted on p. 286. CHAPTER VII ADDITIONAL THEOREMS IN THE DIFFERENTIAL AND INTEGRAL CALCULUS 147. Higher Mean Value Theorems. In the preceding chapter (§ 125) we proved that if f (x) has a derivative f ′(x) throughout the interval [a, b] then f (b) – f (a) = (b – a)f ′(ξ), where a < ξ < b; or that, if f (x) has a derivative throughout [a, a + h], then f (a + h) – f (a) = hf ′(a + θ1h), (1) where 0 < θ1 < 1. This we proved by considering the function f (b) – f (x) – b – x b – a {f (b) – f (a)} which vanishes when x = a and when x = b. Let us now suppose that f (x) has also a second derivative f ′′(x) throughout [a, b], an assumption which of course involves the continuity of the first derivative f ′(x), and consider the function f (b) – f (x) – (b – x)f ′(x) – b – x b – a 2 {f (b) – f (a) – (b – a)f ′(a)}. This function also vanishes when x = a and when x = b; and its derivative is 2(b – x) (b – a)2 {f (b) – f (a) – (b – a)f ′(a) – 1 2 (b – a)2f ′′(x)}, and this must vanish (§ 121) for some value of x between a and b (exclusive of a and b). Hence there is a value ξ of x, between a and b, and therefore capable of representation in the form a + θ2(b – a), where 0 < θ2 < 1, for which f (b) = f (a) + (b – a)f ′(a) + 1 2 (b – a)2f ′′(ξ). 319 [VII : 147] ADDITIONAL THEOREMS IN THE CALCULUS 320 If we put b = a + h we obtain the equation f (a + h) = f (a) + hf ′(a) + 1 2 h2f ′′(a + θ2h), (2) which is the standard form of what may be called the Mean Value Theorem of the second order. The analogy suggested by (1) and (2) at once leads us to formulate the following theorem: Taylor's or the General Mean Value Theorem. If f (x) is a function of x which has derivatives of the first n orders throughout the interval [a, b], then f (b) = f (a) + (b – a)f ′(a) + (b – a)2 2! f ′′(a) + . . . + (b – a)n–1 (n – 1)! f (n–1)(a) + (b – a)n n! f (n)(ξ), where a < ξ < b; and if b = a + h then f (a + h) = f (a) + hf ′(a) + 1 2 h2f ′′(a) + . . . + hn–1 (n – 1)!f (n–1)(a) + hn n! f (n)(a + θnh), where 0 < θn < 1. The proof proceeds on precisely the same lines as were adopted before in the special cases in which n = 1 and n = 2. We consider the function Fn(x) – b – x b – a n Fn(a), where Fn(x) = f (b) – f (x) – (b – x)f ′(x) – (b – x)2 2! f ′′(x) – . . . – (b – x)n–1 (n – 1)! f (n–1)(x). [VII : 147] ADDITIONAL THEOREMS IN THE CALCULUS 321 This function vanishes for x = a and x = b; its derivative is n(b – x)n–1 (b – a)n

Fn(a) – (b – a)n n! f (n)(x)

; and there must be some value of x between a and b for which the derivative vanishes. This leads at once to the desired result. In view of the great importance of this theorem we shall give at the end of this chapter another proof, not essentially distinct from that given above, but different in form and depending on the method of integration by parts. Examples LV. 1. Suppose that f (x) is a polynomial of degree r. Then f (n)(x) is identically zero when n > r, and the theorem leads to the algebraical identity f (a + h) = f (a) + hf ′(a) + h2 2! f ′′(a) + · · · + hr r! f (r)(a). 2. By applying the theorem to f (x) = 1/x, and supposing x and x + h positive, obtain the result 1 x + h = 1 x – h x2 + h2 x3 – · · · + (–1)n–1hn–1 xn + (–1)nhn (x + θnh)n+1 . [Since 1 x + h = 1 x – h x2 + h2 x3 – · · · +

(–1)n–1hn–1 xn + (–1)nhn xn(x + h) , we can verify the result by showing that xn(x + h) can be put in the form (x + θnh)n+1, or that xn+1 < xn(x + h) < (x + h)n+1, as is evidently the case.] 3. Obtain the formula sin(x + h) = sin x + h cos x – h2 2! sin x – h3 3! cos x + . . . + (–1)n–1 h2n–1 (2n – 1)! cos x + (–1)nh2n 2n! sin (x + θ2nh), [VII : 147] ADDITIONAL THEOREMS IN THE CALCULUS 322 the corresponding formula for cos(x + h), and similar formulae involving powers of h extending up to h2n+1. 4. Show that if m is a positive integer, and n a positive integer not greater than m, then (x+h)m = xm + m 1

xm–1h+· · ·+ m n – 1

xm–n+1hn–1 + m n

(x+θnh)m–nhn. Show also that, if the interval [x, x + h] does not include x = 0, the formula holds for all real values of m and all positive integral values of n; and that, even if x < 0 < x + h or x + h < 0 < x, the formula still holds if m – n is positive. 5. The formula f (x + h) = f (x) + hf ′(x + θ1h) is not true if f (x) = 1/x and x < 0 < x + h. [For f (x + h) – f (x) > 0 and hf ′(x + θ1h) = –h/(x + θ1h)2 < 0; it is evident that the conditions for the truth of the Mean Value Theorem are not satisfied.] 6. If x = –a, h = 2a, f (x) = x1/3, then the equation f (x + h) = f (x) + hf ′(x + θ1h) is satisfied by θ1 = 1 2 ± 1 18 √3. [This example shows that the result of the theorem may hold even if the conditions under which it was proved are not satisfied.] 7. Newton's method of approximation to the roots of equations. Let ξ be an approximation to a root of an algebraical equation f (x) = 0, the actual root being ξ + h. Then 0 = f (ξ + h) = f (ξ) + hf ′(ξ) + 1 2 h2f ′′(ξ + θ2h), so that h = – f (ξ) f ′(ξ) – 1 2 h2 f ′′(ξ + θ2h) f ′(ξ) . It follows that in general a better approximation than x = ξ is x = ξ – f (ξ) f ′(ξ) . If the root is a simple root, so that f ′(ξ +h)■ = 0, we can, when h is small enough, find a positive constant K such that |f ′(x)| > K for all the values of x which we are considering, and then, if h is regarded as of the first order of smallness, [VII : 147] ADDITIONAL THEOREMS IN THE CALCULUS 323 f (ξ) is of the first order of smallness, and the error in taking ξ – {f (ξ)/f ′(ξ)} as the root is of the second order. 8. Apply this process to the equation x2 = 2, taking ξ = 3/2 as the first approximation. [We find h = –1/12, ξ + h = 17/12 = 1.417 . . . , which is quite a good approximation, in spite of the roughness of the first. If now we repeat the process, taking ξ = 17/12, we obtain ξ + h = 577/408 = 1.414 215 . . . , which is correct to 5 places of decimals.] 9. By considering in this way the equation x2 – 1 – y = 0, where y is small, show that √1 + y = 1 + 1 2 y – { 1 4 y2/(2 + y)} approximately, the error being of the fourth order. 10. Show that the error in taking the root to be ξ – (f /f ′) – 1 2 (f 2f ′′/f ′3), where ξ is the argument of every function, is in general of the third order. 11. The equation sin x = αx, where α is small, has a root nearly equal to π. Show that (1 – α)π is a better approximation, and (1 – α + α2)π a better still. [The method of Exs. 7–10 does not depend on f (x) = 0 being an algebraical equation, so long as f ′ and f ′′ are continuous.] 12. Show that the limit when h → 0 of the number θn which occurs in the general Mean Value Theorem is 1/(n+1), provided that f (n+1)(x) is continuous. [For f (x + h) is equal to each of f (x)+· · ·+ hn n! f (n)(x+θnh), f (x)+· · ·+ hn n! f (n)(x)+ hn+1 (n + 1)! f (n+1)(x+θn+1h), where θn+1 as well as θn lies between 0 and 1. Hence f (n)(x + θnh) = f (n)(x) + hf (n+1)(x + θn+1h) n + 1 . But if we apply the original Mean Value Theorem to the function f (n)(x), taking θnh in place of h, we find f (n)(x + θnh) = f (n)(x) + θnhf (n+1)(x + θθnh), where θ also lies between 0 and 1. Hence θnf (n+1)(x + θθnh) = f (n+1)(x + θn+1h) n + 1 , from which the result follows, since f (n+1)(x + θθnh) and f (n+1)(x + θn+1h) tend to the same limit f (n+1)(x) as h → 0.] [VII : 148] ADDITIONAL THEOREMS IN THE CALCULUS 324 13. Prove that {f (x+2h)–2f (x+h)+f (x)}/h2 → f ′′(x) as h → 0, provided that f ′′(x) is continuous. [Use equation (2) of § 147.] 14. Show that, if the f (n)(x) is continuous for x = 0, then f (x) = a0 + a1x + a2x2 + · · · + (an + ■x)xn, where ar = f (r)(0)/r! and ■x → 0 as x → 0.* 15. Show that if a0 + a1x + a2x2 + · · · + (an + ■x)xn = b0 + b1x + b2x2 + · · · + (bn + ηx)xn, where ■x and ηx tend to zero as x → 0, then a0 = b0, a1 = b1, . . . , an = bn. [Making x → 0 we see that a0 = b0. Now divide by x and afterwards make x → 0. We thus obtain a1 = b1; and this process may be repeated as often as is necessary. It follows that if f (x) = a0 + a1x + a2x2 + · · · + (an + ■x)xn, and the first n derivatives of f (x) are continuous, then ar = f (r)(0)/r!.] 148. Taylor's Series. Suppose that f (x) is a function all of whose differential coefficients are continuous in an interval [a–η, a+η] surrounding the point x = a. Then, if h is numerically less than η, we have f (a + h) = f (a) + hf ′(a) + · · · + hn–1 (n – 1)!f (n–1)(a) + hn n! f (n)(a + θnh), where 0 < θn < 1, for all values of n. Or, if Sn = n–1X 0 hν ν! f (ν)(a), Rn = hn n! f (n)(a + θnh), we have f (a + h) – Sn = Rn. *It is in fact sufficient to suppose that f (n)(0) exists. See R. H. Fowler, "The elementary differential geometry of plane curves" (Cambridge Tracts in Mathematics, No. 20, p. 104). [VII : 148] ADDITIONAL THEOREMS IN THE CALCULUS 325 Now let us suppose, in addition, that we can prove that Rn → 0 as n → ∞. Then f (a + h) = lim n→∞ Sn = f (a) + hf ′(a) + h2 2! f ′′(a) + ... This expansion of f (a + h) is known as Taylor's Series. When a = 0 the formula reduces to f (h) = f (0) + hf ′(0) + h2 2! f ′′(0) + . . . , which is known as Maclaurin's Series. The function Rn is known as Lagrange's form of the remainder. The reader should be careful to guard himself against supposing that the continuity of all the derivatives of f (x) is a sufficient condition for the validity of Taylor's series. A direct discussion of the behaviour of Rn is always essential. Examples LVI. 1. Let f (x) = sin x. Then all the derivatives of f (x) are continuous for all values of x. Also |f n(x)| ■ 1 for all values of x and n. Hence in this case |Rn| ■ hn/n!, which tends to zero as n → ∞ (Ex. xxvii. 12) whatever value h may have. It follows that sin(x + h) = sin x + h cos x – h2 2! sin x – h3 3! cos x + h4 4! sin x + . . . , for all values of x and h. In particular sin h = h – h3 3! + h5 5! – .

. . , for all values of h. Similarly we can prove that cos(x+h) = cos x–h sin x– h2 2! cos x+ h3 3! sin x+. . . , cos h = 1– h2 2! + h4 4! –. . . . 2. The Binomial Series. Let f (x) = (1 + x)m, where m is any rational number, positive or negative. Then f (n)(x) = m(m–1) . . . (m–n+1)(1+x)m–n and Maclaurin's Series takes the form (1 + x)m = 1 + m 1

x + m 2

x2 + ... [VII : 149] ADDITIONAL THEOREMS IN THE CALCULUS 326 When m is a positive integer the series terminates, and we obtain the ordi- nary formula for the Binomial Theorem with a positive integral exponent. In the general case Rn = xn n! f (n)(θnx) = m n

xn(1 + θnx)m–n, and in order to show that Maclaurin's Series really represents (1 + x)m for any range of values of x when m is not a positive integer, we must show that Rn → 0 for every value of x in that range. This is so in fact if –1 < x < 1, and may be proved, when 0 ■ x < 1, by means of the expression given above for Rn, since (1 + θnx)m–n < 1 if n > m, and m n

xn → 0 as n → ∞ (Ex. xxvii. 13). But a difficulty arises if –1 < x < 0, since 1 + θnx < 1 and (1 + θnx)m–n > 1 if n > m; knowing only that 0 < θn < 1, we cannot be assured that 1 + θnx is not quite small and (1 + θnx)m–n quite large. In fact, in order to prove the Binomial Theorem by means of Taylor's The- orem, we need some different form for Rn, such as will be given later (§ 162). 149. Applications of Taylor's Theorem. A. Maxima and minima. Taylor's Theorem may be applied to give greater theoretical completeness to the tests of Ch. VI, §§ 122–123, though the results are not of much practical importance. It will be remembered that, assuming that φ(x) has derivatives of the first two orders, we stated the following as being sufficient conditions for a maximum or minimum of φ(x) at x = ξ: for a maximum, φ′(ξ) = 0, φ′′(ξ) < 0; for a minimum, φ′(ξ) = 0, φ′′(ξ) > 0. It is evident that these tests fail if φ′′(ξ) as well as φ′(ξ) is zero. Let us suppose that the first n derivatives φ′(x), φ′′(x), . . . , φ(n)(x) are continuous, and that all save the last vanish when x = ξ. Then, for sufficiently small values of h, φ(ξ + h) – φ(ξ) = hn n! φ(n)(ξ + θnh). [VII : 150] ADDITIONAL THEOREMS IN THE CALCULUS 327 In order that there should be a maximum or a minimum this expression must be of constant sign for all sufficiently small values of h, positive or negative. This evidently requires that n should be even. And if n is even there will be a maximum or a minimum according as φ(n)(ξ) is negative or positive. Thus we obtain the test: if there is to be a maximum or minimum the first derivative which does not vanish must be an even derivative, and there will be a maximum if it is negative, a minimum if it is positive. Examples LVII. 1. Verify the result when φ(x) = (x – a)m, m being a positive integer, and ξ = a. 2. Test the function (x – a)m(x – b)n, where m and n are positive integers, for maxima and minima at the points x = a, x = b. Draw graphs of the different possible forms of the curve y = (x – a)m(x – b)n. 3. Test the functions sin x – x, sin x – x + x3 6 , sin x – x + x3 6 – x5 120 , . . . , cos x – 1, cos x – 1 + x2 2 , cos x – 1 + x2 2 – x4 24 , . . . for maxima or minima at x = 0. 150. B. The calculation of certain limits. Suppose that f (x) and φ(x) are two functions of x whose derivatives f ′(x) and φ′(x) are continuous for x = ξ and that f (ξ) and φ(ξ) are both equal to zero. Then the function ψ(x) = f (x)/φ(x) is not defined when x = ξ. But of course it may well tend to a limit as x → ξ. Now f (x) = f (x) – f (ξ) = (x – ξ)f ′(x1), where x1 lies between ξ and x; and similarly φ(x) = (x – ξ)φ′(x2), where x2 also lies between ξ and x. Thus ψ(x) = f ′(x1)/φ′(x2). We must now distinguish four cases. [VII : 150] ADDITIONAL THEOREMS IN THE CALCULUS 328 (1) If neither f ′(ξ) nor φ′(ξ) is zero, then f (x)/φ(x) → f ′(ξ)/φ′(ξ). (2) If f ′(ξ) = 0, φ′(ξ)■ = 0, then f (x)/φ(x) → 0. (3) If f ′(ξ)■ = 0, φ′(ξ) = 0, then f (x)/φ(x) becomes numerically very large as x → ξ: but whether f (x)/φ(x) tends to ∞ or –∞, or is some- times large and positive and sometimes large and negative, we cannot say, without further information as to the way in which φ′(x) → 0 as x → ξ. (4) If f ′(ξ) = 0, φ′(ξ) = 0, then we can as yet say nothing about the behaviour of f (x)/φ(x) as x → 0. But in either of the last two cases it may happen that f (x) and φ(x) have continuous second derivatives. And then f (x) = f (x) – f (ξ) – (x – ξ)f ′(ξ) = 1 2 (x – ξ)2f ′′(x1), φ(x) = φ(x) – φ(ξ) – (x – ξ)φ′(ξ) = 1 2 (x – ξ)2φ′′(x2), where again x1 and x2 lie between ξ and x; so that ψ(x) = f ′′(x1)/φ′′(x2). We can now distinguish a variety of cases similar to those considered above. In particular, if neither second derivative vanishes for x = ξ, we have f (x)/φ(x) → f ′′(ξ)/φ′′(ξ). It is obvious that this argument can be repeated indefinitely, and we obtain the following theorem: suppose that f (x) and φ(x) and their deriva- tives, so far as may be wanted, are continuous for x = ξ. Suppose further that f (p)(x) and φ(q)(x) are the first derivatives of f (x) and φ(x) which do not vanish when x = ξ. Then (1) if p = q, f (x)/φ(x) → f (p)(ξ)/φ(p)(ξ); (2) if p > q, f (x)/φ(x) → 0; [VII : 151] ADDITIONAL THEOREMS IN THE CALCULUS 329 (3) if p < q, and q – p is even, either f (x)/φ(x) → +∞ or f (x)/φ(x) → –∞, the sign being the same as that of f (p)(ξ)/φ(q)(ξ); (4) if p < q and q – p is odd, either f (x)/φ(x) → +∞ or f (x)/φ(x) → –∞, as x → ξ + 0, the sign being the same as that of f (p)(ξ)/φ(q)(ξ), while if x → ξ – 0 the sign must be reversed. This theorem is in fact an immediate corollary from the equations f (x) = (x – ξ)p p! f (p)(x1), φ(x) = (x – ξ)q q! φ(q)(x2). Examples LVIII. 1. Find the limit of {x – (n + 1)xn+1 + nxn+2}/(1 – x)2, as x → 1. [Here the functions and their first derivatives vanish for x = 1, and f ′′(1) = n(n + 1), φ′′(1) = 2.] 2. Find the limits as x → 0 of (tan x – x)/(x – sin x), (tan nx – n tan x)/(n sin x – sin nx). 3. Find the limit of x{√x2 + a2 – x} as x → ∞. [Put x = 1/y.] 4. Prove that lim x→n(x – n) cosec xπ = (–1)n π , lim x→n 1 x – n

cosec xπ – (–1)n (x – n)π

= (–1)nπ 6 , n being any integer; and evaluate the corresponding limits involving cot xπ. 5. Find the limits as x → 0 of 1 x3

cosec x – 1 x – x 6

, 1 x3

cot x – 1 x + x 3

. 6. (sin x arc sin x – x2)/x6 → 1 18 , (tan x arc tan x – x2)/x6 → 2 9 , as x → 0. [VII : 151] ADDITIONAL THEOREMS IN THE CALCULUS 330 151. C. The contact of plane curves. Two curves are said to intersect (or cut) at a point if the point lies on each of them. They are said to touch at the point if they have the same tangent at the point. Let us suppose now that f (x), φ(x) are two functions which possess derivatives of all orders continuous for x = ξ, and let us consider the curves y = f (x), y = φ(x). In general f (ξ) and φ(ξ) will not be equal. In this case the abscissa x = ξ does not correspond to a point of intersection of the curves. If however f (ξ) = φ(ξ), the curves intersect in the point x = ξ, y = f (ξ) = φ(ξ). Let us suppose this to be the case. Then in order that the curves should not only cut but touch at this point it is obviously necessary and sufficient that the first derivatives f ′(x), φ′(x) should also have the same value when x = ξ. The contact of the curves in this case may be regarded from a different point of view. In the figure the two curves are drawn touching at P , andO X Y P Q R y = f (x) y = ϕ(x) ξ ξ + h Fig. 45. QR is equal to φ(ξ + h) – f (ξ + h), or, since φ(ξ) = f (ξ), φ′(ξ) = f ′(ξ), to 1 2 h2{φ″(ξ + θh) – f ″(ξ + θh)}, where θ lies between 0 and 1. Hence lim QR h2 = 1 2 {φ″(ξ) – f ″(ξ)}, [VII : 151] ADDITIONAL THEOREMS IN THE CALCULUS 331 when h → 0. In other words, when the curves touch at the point whose abscissa is ξ, the difference of their ordinates at the point whose abscissa is ξ + h is at least of the second order of smallness when h is small. The reader will easily verify that lim(QR/h) = φ′(ξ) – f ′(ξ) when the curves cut and do not touch, so that QR is then of the first order of smallness only. It is evident that the degree of smallness of QR may be taken as a kind of measure of the closeness of the contact of the curves. It is at once suggested that if the first n – 1 derivatives of f and φ have equal values when x = ξ, then QR will be of nth order of smallness; and the reader will have no difficulty in proving that this is so and that lim QR hn = 1 n!{φ(n)(ξ) – f (n)(ξ)}. We are therefore led to frame the following definition: Contact of the nth order. If f (ξ) = φ(ξ), f ′(ξ) = φ′(ξ), . . . , f (n)(ξ) = φ(n)(ξ), but f (n+1)(ξ)■ = φ(n+1)(ξ), then the curves y = f (x), y = φ(x) will be said to have contact of the nth order at the point whose abscissa is ξ. The preceding discussion makes the notion of contact of the nth order dependent on the choice of axes, and fails entirely when the tangent to the curves is parallel to the axis of y. We can deal with this case by taking y as the independent and x as the dependent variable. It is better, however, to consider x and y as functions of a parameter t. An excellent account of the theory will be found in Mr Fowler's tract referred to on p. 324, or in de la Vall´ee Poussin's Cours d'Analyse, vol. ii, pp. 396 et seq. Examples LIX. 1. Let φ(x) = ax + b, so that y = φ(x) is a straight line. The conditions for contact at the point for which x = ξ are f (ξ) = aξ + b, f ′(ξ) = a. If we determine a and b so as to satisfy these equations we find a = f ′(ξ), b = f (ξ) – ξf ′(ξ), and the equation of the tangent to y = f (x) at the point x = ξ is y = xf ′(ξ) + {f (ξ) – ξf ′(ξ)}, or y – f (ξ) = (x – ξ)f ′(ξ). Cf. Ex. xxxix. 5. [VII : 151] ADDITIONAL THEOREMS IN THE CALCULUS 332 2. The fact that the line is to have simple contact with the curve completely determines the line. In order that the tangent should have contact of the second order with the curve we must have f ″(ξ) = φ″(ξ), i.e. f ″(ξ) = 0. A point at which the tangent to a curve has contact of the second order is called a point of inflexion. 3. Find the points of inflexion on the graphs of the functions 3x4 – 6x3 + 1, 2x/(1 + x2), sin x, a cos2 x + b sin2 x, tan x, arc tan x. 4. Show that the conic ax2 + 2hxy + by2 + 2gx + 2f y + c = 0 cannot have a point of inflexion. [Here ax + hy + g + (hx + by + f)y1 = 0 and a + 2hy1 + by2 1 + (hx + by + f)y2 = 0, suffixes denoting differentiations. Thus at a point of inflexion a + 2hy1 + by2 1 = 0, or a(hx + by + f)2 – 2h(ax + hy + g)(hx + by + f) + b(ax + hy + g)2 = 0, or (ab – h2){ax2 + 2hxy + by2 + 2gx + 2f y} + af 2 – 2f gh + bg2 = 0. But this is inconsistent with the equation of the conic unless af 2 – 2f gh + bg2 = c(ab – h2) or abc + 2f gh – af 2 – bg2 – ch2 = 0; and this is the condition that the conic should degenerate into two straight lines.] 5. The curve y = (ax2 + 2bx + c)/(αx2 + 2βx + γ) has one or three points of inflexion according as the roots of αx2 + 2βx + γ = 0 are real or complex. [The equation of the curve can, by a change of origin (cf. Ex. xlvi. 15), be reduced to the form η = ξ/(Aξ2 + 2Bξ + C) = ξ/{A(ξ – p)(ξ – q)}, where p, q are real or conjugate. The condition for a point of inflexion will be found to be ξ3 – 3pqξ + pq(p + q) = 0, which has one or three real roots [VII : 151] ADDITIONAL THEOREMS IN THE CALCULUS 333 according as {pq(p – q)}2 is positive or negative, i.e. according as p and q are real or conjugate.] 6. Discuss in particular the curves y = (1–x)/(1+x2), y = (1–x2)/(1+x2), y = (1 + x2)/(1 – x2). 7. Show that when the curve of Ex. 5 has three points of inflexion, they lie on a straight line. [The equation ξ3 – 3pqξ + pq(p + q) = 0 can be put in the form (ξ – p)(ξ – q)(ξ + p + q) + (p – q)2ξ = 0, so that the points of inflexion lie on the line ξ + A(p – q)2η + p + q = 0 or Aξ – 4(AC – B2)η = 2B.] 8. Show that the curves y = x sin x, y = (sin x)/x have each infinitely many points of inflexion. 9. Contact of a circle with a curve. Curvature.* The general equation of a circle, viz. (x – a)2 + (y – b)2 = r2, (1) contains three arbitrary constants. Let us attempt to determine them so that the circle has contact of as high an order as possible with the curve y = f (x) at the point (ξ, η), where η = f (ξ). We write η1, η2 for f ′(ξ), f ″(ξ). Differentiating the equation of the circle twice we obtain (x – a) + (y – b)y1 = 0,

(2) 1 + y2 1 + (y – b)y2 = 0. (3) If the circle touches the curve then the equations (1) and (2) are satisfied when x = ξ, y = η, y1 = η1. This gives (ξ – a)/η1 = –(η – b) = r/p1 + η2 1 . If the contact is of the second order then the equation (3) must also be satisfied when y2 = η2. Thus b = η + {(1 + η2 1)/η2}; and hence we find a = ξ – η1(1 + η2 1) η2 , b = η + 1 + η2 1 η2 , r = (1 + η2 1)3/2 η2 . The circle which has contact of the second order with the curve at the point (ξ, η) is called the circle of curvature, and its radius the radius of curvature. The measure of curvature (or simply the curvature) is the reciprocal of the radius: thus the measure of curvature is f ″(ξ)/{1 + [f ′(ξ)]2}3/2, or d2η dξ2

1 + dη dξ 23/2 . *A much fuller discussion of the theory of curvature will be found in Mr Fowler's tract referred to on p. 324. [VII : 151] ADDITIONAL THEOREMS IN THE CALCULUS 334 10. Verify that the curvature of a circle is constant and equal to the reciprocal of the radius; and show that the circle is the only curve whose curvature is constant. 11. Find the centre and radius of curvature at any point of the conics y2 = 4ax, (x/a)2 + (y/b)2 = 1. 12. In an ellipse the radius of curvature at P is CD3/ab, where CD is the semi-diameter conjugate to CP . 13. Show that in general a conic can be drawn to have contact of the fourth order with the curve y = f (x) at a given point P . [Take the general equation of a conic, viz. ax2 + 2hxy + by2 + 2gx + 2f y + c = 0, and differentiate four times with respect to x. Using suffixes to denote differen- tiation we obtain ax + hy + g + (hx + by + f)y1 = 0, a + 2hy1 + by2 1 + (hx + by + f)y2 = 0, 3(h + by1)y2 + (hx + by + f)y3 = 0, 4(h + by1)y3 + 3by2 2 + (hx + by + f)y4 = 0. If the conic has contact of the fourth order, then these five equations must be satisfied by writing ξ, η, η1, η2, η3, η4, for x, y, y1, y2, y3, y4. We have thus just enough equations to determine the ratios a : b : c : f : g : h.] 14. An infinity of conics can be drawn having contact of the third order with the curve at P . Show that their centres all lie on a straight line. [Take the tangent and normal as axes. Then the equation of the conic is of the form 2y = ax2 + 2hxy + by2, and when x is small one value of y may be expressed (Ch. V, Misc. Ex. 22) in the form y = 1 2 ax2 + 1 2 ah + ■x x3, where ■x → 0 with x. But this expression must be the same as y = 1 2 f ″(0)x2 + { 1 6 f ‴(0) + ■′ x}x3, where ■′ x → 0 with x, and so a = f ″(0), h = f ‴(0)/3f ″(0), in virtue of the result of Ex. lv. 15. But the centre lies on the line ax + hy = 0.] [VII : 152] ADDITIONAL THEOREMS IN THE CALCULUS 335 15. Determine a parabola which has contact of the third order with the ellipse (x/a)2 + (y/b)2 = 1 at the extremity of the major axis. 16. The locus of the centres of conics which have contact of the third order with the ellipse (x/a)2 + (y/b)2 = 1 at the point (a cos α, b sin α) is the diameter x/(a cos α) = y/(b sin α). [For the ellipse itself is one such conic.] 152. Differentiation of functions of several variables. So far we have been concerned exclusively with functions of a single variable x, but there is nothing to prevent us applying the notion of differentiation to functions of several variables x, y, ... Suppose then that f (x, y) is a function of two* real variables x and y, and that the limits lim h→0 f (x + h, y) – f (x, y) h , lim k→0 f (x, y + k) – f (x, y) k exist for all values of x and y in question, that is to say that f (x, y) possesses a derivative df /dx or Dxf (x, y) with respect to x and a derivative df /dy or Dyf (x, y) with respect to y. It is usual to call these derivatives the partial differential coefficients of f , and to denote them by ∂f ∂x , ∂f ∂y or f ′ x(x, y), f ′ y(x, y) or simply f ′ x, f ′ y or fx, fy. The reader must not suppose, however, that these new notations imply any essential novelty of idea: 'partial differentiation' with respect to x is exactly the same process as ordinary differentiation, the only novelty lying in the presence in f of a second variable y independent of x. In what precedes we have supposed x and y to be two real variables entirely independent of one another. If x and y were connected by a relation *The new points which arise when we consider functions of several variables are illustrated sufficiently when there are two variables only. The generalisations of our theorems for three or more variables are in general of an obvious character. [VII : 152] ADDITIONAL THEOREMS IN THE CALCULUS 336 the state of affairs would be very different. In this case our definition of f ′ x would fail entirely, as we could not change x into x + h without at the same time changing y. But then f (x, y) would not really be a function of two variables at all. A function of two variables, as we defined it in Ch. II, is essentially a function of two independent variables. If y depends on x, y is a function of x, say y = φ(x); and then f (x, y) = f {x, φ(x)} is really a function of the single variable x. Of course we may also represent it as a function of the single variable y. Or, as is often most convenient, we may regard x and y as functions of a third variable t, and then f (x, y), which is of the form f {φ(t), ψ(t)}, is a function of the single variable t. Examples LX. 1. Prove that if x = r cos θ, y = r sin θ, so that r = px2 + y2, θ = arc tan(y/x), then ∂r ∂x = x px2 + y2 , ∂r ∂y = y px2 + y2 , ∂θ ∂x = – y x2 + y2 , ∂θ ∂y = x x2 + y2 , ∂x ∂r = cos θ, ∂y ∂r = sin θ, ∂x ∂θ = –r sin θ, ∂y ∂θ = r cos θ. 2. Account for the fact that ∂r ∂x■ = 1 ∂x ∂r

and ∂θ ∂x■ = 1 ∂x ∂θ

. [When we were considering a function y of one variable x it followed from the definitions that dy/dx and dx/dy were reciprocals. This is no longer the case when we are dealing with functions of two variables. Let P (Fig. 46) be the point (x, y) or (r, θ). To find ∂r/∂x we must increase x, say by an increment M M1 = δx, while keeping y constant. This brings P to P1. If along OP1 we take OP ′ = OP , the increment of r is P ′P1 = δr, say; and ∂r/∂x = lim(δr/δx). If on the other hand we want to calculate ∂x/∂r, x and y being now regarded as functions of r and θ, we must increase r by Δr, say, keeping θ constant. This brings P to P2, where P P2 = Δr: the corresponding increment of x is M M1 = Δx, say; and ∂x/∂r = lim(Δx/Δr). [VII : 152] ADDITIONAL THEOREMS IN THE CALCULUS

337O M M′ M1 P P ′ P1 P2 Fig. 46. Now Δx = δx:* but Δr■ = δr. Indeed it is easy to see from the figure that lim(δr/δx) = lim(P ′P1/P P1) = cos θ, but lim(Δr/Δx) = lim(P P2/P P1) = sec θ, so that lim(δr/Δr) = cos2 θ. The fact is of course that ∂x/∂r and ∂r/∂x are not formed upon the same hypothesis as to the variation of P .] 3. Prove that if z = f (ax + by) then b(∂z/∂x) = a(∂z/∂y). 4. Find ∂X/∂x, ∂X/∂y, . . . when X + Y = x, Y = xy. Express x, y as functions of X, Y and find ∂x/∂X, ∂x/∂Y , ... 5. Find ∂X/∂x, . . . when X + Y + Z = x, Y + Z = xy, Z = xyz; express x, y, z in terms of X, Y , Z and find ∂x/∂X, ... [There is of course no difficulty in extending the ideas of the last section to functions of any number of variables. But the reader must be careful to *Of course the fact that Δx = δx is due merely to the particular value of Δr that we have chosen (viz. P P2). Any other choice would give us values of Δx, Δr proportional to those used here. [VII : 153] ADDITIONAL THEOREMS IN THE CALCULUS 338 impress on his mind that the notion of the partial derivative of a function of several variables is only determinate when all the independent variables are specified. Thus if u = x + y + z, x, y, and z being the independent variables, then ∂u/∂x = 1. But if we regard u as a function of the variables x, x + y = η, and x + y + z = ζ, so that u = ζ, then ∂u/∂x = 0.] 153. Differentiation of a function of two functions. There is a theorem concerning the differentiation of a function of one variable, known generally as the Theorem of the Total Differential Coefficient, which is of very great importance and depends on the notions explained in the preceding section regarding functions of two variables. This theorem gives us a rule for differentiating f {φ(t), ψ(t)}, with respect to t. Let us suppose, in the first instance, that f (x, y) is a function of the two variables x and y, and that f ′ x, f ′ y are continuous functions of both variables (§ 107) for all of their values which come in question. And now let us suppose that the variation of x and y is restricted in that (x, y) lies on a curve x = φ(t), y = ψ(t), where φ and ψ are functions of t with continuous differential coefficients φ′(t), ψ′(t). Then f (x, y) reduces to a function of the single variable t, say F (t). The problem is to determine F ′(t). Suppose that, when t changes to t + τ , x and y change to x + ξ and y + η. Then by definition dF (t) dt = lim τ →0 1 τ [f {φ(t + τ), ψ(t + τ)} – f {φ(t), ψ(t)}] = lim 1 τ {f (x + ξ, y + η) – f (x, y)} = lim f (x + ξ, y + η) – f (x, y + η) ξ ξ τ + f (x, y + η) – f (x, y) η η τ

. [VII : 153] ADDITIONAL THEOREMS IN THE CALCULUS 339 But, by the Mean Value Theorem, {f (x + ξ, y + η) – f (x, y + η)}/ξ = f ′ x(x + θξ, y + η), {f (x, y + η) – f (x, y)}/η = f ′ y(x, y + θ′η), where θ and θ′ each lie between 0 and 1. As τ → 0, ξ → 0 and η → 0, and ξ/τ → φ′(t), η/τ → ψ′(t): also f ′ x(x + θξ, y + η) → f ′ x(x, y), f ′ y(x, y + θ′η) → f ′ y(x, y). Hence F ′(t) = Dtf {φ(t), ψ(t)} = f ′ x(x, y)φ′(t) + f ′ y(x, y)ψ′(t), where we are to put x = φ(t), y = ψ(t) after carrying out the differenti- ations with respect to x and y. This result may also be expressed in the form df dt = ∂f ∂x dx dt + ∂f ∂y dy dt . Examples LXI. 1. Suppose φ(t) = (1 – t2)/(1 + t2), ψ(t) = 2t/(1 + t2), so that the locus of (x, y) is the circle x2 + y2 = 1. Then φ′(t) = –4t/(1 + t2)2, ψ′(t) = 2(1 – t2)/(1 + t2)2, F ′(t) = {–4t/(1 + t2)2}f ′ x + {2(1 – t2)/(1 + t2)2}f ′ y, where x and y are to be put equal to (1 – t2)/(1 + t2) and 2t/(1 + t2) after carrying out the differentiations. We can easily verify this formula in particular cases. Suppose, e.g., that f (x, y) = x2 + y2. Then f ′ x = 2x, f ′ y = 2y, and it is easily verified that F ′(t) = 2xφ′(t) + 2yψ′(t) = 0, which is obviously correct, since F (t) = 1. 2. Verify the theorem in the same way when (a) x = tm, y = 1 – tm, f (x, y) = x + y; (b) x = a cos t, y = a sin t, f (x, y) = x2 + y2. 3. One of the most important cases is that in which t is x itself. We then obtain Dxf {x, ψ(x)} = Dxf (x, y) + Dyf (x, y)ψ′(x). [VII : 154] ADDITIONAL THEOREMS IN THE CALCULUS 340 where y is to be replaced by ψ(x) after differentiation. It was this case which led to the introduction of the notation ∂f /∂x, ∂f /∂y. For it would seem natural to use the notation df /dx for either of the functions Dxf {x, ψ(x)} and Dxf (x, y), in one of which y is put equal to ψ(x) before and in the other after differentiation. Suppose for example that y = 1 – x and f (x, y) = x + y. Then Dxf (x, 1 – x) = Dx1 = 0, but Dxf (x, y) = 1. The distinction between the two functions is adequately shown by denoting the first by df /dx and the second by ∂f /∂x, in which case the theorem takes the form df dx = ∂f ∂x + ∂f ∂y dy dx ; though this notation is also open to objection, in that it is a little misleading to denote the functions f {x, ψ(x)} and f (x, y), whose forms as functions of x are quite different from one another, by the same letter f in df /dx and ∂f /∂x. 4. If the result of eliminating t between x = φ(t), y = ψ(t) is f (x, y) = 0, then ∂f ∂x dx dt + ∂f ∂y dy dt = 0. 5. If x and y are functions of t, and r and θ are the polar coordinates of (x, y), then r′ = (xx′ + yy′)/r, θ′ = (xy′ – yx′)/r2, dashes denoting differentia- tions with respect to t. 154. The Mean Value Theorem for functions of two variables. Many of the results of the last chapter depended upon the Mean Value Theorem, expressed by the equation φ(x + h) – φ(x) = hf ′(x + θh), or as it may be written, if y = φ(x), δy = f ′(x + θ δx) δx. Now suppose that z = f (x, y) is a function of the two independent variables x and y, and that x and y receive increments h, k or δx, δy respectively: and let us attempt to express the corresponding increment of z, viz. δz = f (x + h, y + k) – f (x, y), [VII : 154] ADDITIONAL THEOREMS IN THE CALCULUS 341 in terms of h, k and the derivatives of z with respect to x and y. Let f (x + ht, y + kt) = F (t). Then f (x + h, y + k) – f (x, y) = F (1) – F (0) = F ′(θ), where 0 < θ < 1. But, by § 153, F ′(t) = Dtf (x + ht, y + kt) = hf ′ x(x + ht, y + kt) + kf ′ y(x + ht, y + kt). Hence finally δz = f (x + h, y + k) – f (x, y) = hf ′ x(x + θh, y + θk) + kf ′ y(x + θh, y + θk), which is the formula desired. Since f ′ x, f ′ y are supposed to be continuous functions of x and y, we have f ′ x(x + θh, y + θk) = f ′ x(x, y) + ■h,k, f ′ y(x + θh, y + θk) = f ′ y(x, y) + ηh,k, where ■h,k and ηh,k tend to zero as h and k tend to zero. Hence the theorem may be written in the form δz = (f ′ x + ■) δx + (f ′ y + η) δy, (1) where ■ and η are small when δx and δy are small. The result embodied in (1) may be expressed by saying that the equa- tion δz = f ′ x δx + f ′ y δy is approximately true; i.e. that the difference between the two sides of the equation is small in comparison with the

larger of δx and δy.* We must say ‘the larger of δx and δy’ because one of them might be small in comparison with the other; we might indeed have δx = 0 or δy = 0. *Or with |δx| + |δy| or pδx2 + δy2. [VII : 155] ADDITIONAL THEOREMS IN THE CALCULUS 342 It should be observed that if any equation of the form δz = λ δx + μ δy is ‘approximately true’ in this sense, we must have λ = f ′ x, μ = f ′ y. For we have δz – f ′ x δx – f ′ y δy = ■ δx + η δy, δz – λ δx – μ δy = ■′ δx + η′ δy where ■, η, ■′, η′ all tend to zero as δx and δy tend to zero; and so (λ – f ′ x) δx + (μ – f ′ y) δy = ρ δx + ρ′ δy where ρ and ρ′ tend to zero. Hence, if ζ is any assigned positive number, we can choose σ so that |(λ – f ′ x) δx + (μ – f ′ y) δy| < ζ(|δx| + |δy|) for all values of δx and δy numerically less than σ. Taking δy = 0 we obtain |(λ – f ′ x) δx| < ζ|δx|, or |λ – f ′ x| < ζ, and, as ζ may be as small as we please, this can only be the case if λ = f ′ x. Similarly μ = f ′ y. 155. Differentials. In the applications of the Calculus, especially in geometry, it is usually most convenient to work with equations expressed not, like equation (1) of § 154, in terms of the increments δx, δy, δz of the functions x, y, z, but in terms of what are called their differentials dx, dy, dz. Let us return for a moment to a function y = f (x) of a single variable x. If f ′(x) is continuous then δy = {f ′(x) + ■} δx, (1) where ■ → 0 as δx → 0: in other words the equation δy = f ′(x) δx (2) is ‘approximately’ true. We have up to the present attributed no meaning of any kind to the symbol dy standing by itself. We now agree to define dy by the equation dy = f ′(x) δx. (3) [VII : 155] ADDITIONAL THEOREMS IN THE CALCULUS 343 If we choose for y the particular function x, we obtain dx = δx, (4) so that dy = f ′(x) dx. (5) If we divide both sides of (5) by dx we obtain dy dx = f ′(x), (6) where dy/dx denotes not, as heretofore, the differential coefficient of y, but the quotient of the differentials dy, dx. The symbol dy/dx thus acquires a double meaning; but there is no inconvenience in this, since (6) is true whichever meaning we choose. The equation (5) has two apparent advantages over (2). It is exact and not merely approximate, and its truth does not depend on any assumption as to the continuity of f ′(x). On the other hand it is precisely the fact that we can, under certain conditions, pass from the exact equation (5) to the approximate equation (2), which gives the former its importance. The advantages of the ‘dif- ferential’ notation are in reality of a purely technical character. These technical advantages are however so great, especially when we come to deal with functions of several variables, that the use of the notation is almost inevitable. When f ′(x) is continuous, we have lim dy δy = 1 when δx → 0. This is sometimes expressed by saying that dy is the principal part of δy when δx is small, just as we might say that ax is the ‘principal part’ of ax + bx2 when x is small. We pass now to the corresponding definitions connected with a func- tion z of two independent variables x and y. We define the differential dz by the equation dz = f ′ x δx + f ′ y δy. (7) [VII : 155] ADDITIONAL THEOREMS IN THE CALCULUS 344 Putting z = x and z = y in turn, we obtain dx = δx, dy = δy, (8) so that dz = f ′ x dx + f ′ y dy, (9) which is the exact equation corresponding to the approximate equation (1) of § 154. Here again it is to be observed that the former is of importance only for reasons of practical convenience in working and because the latter can in certain circumstances be deduced from it. One property of the equation (9) deserves special remark. We saw in § 153 that if z = f (x, y), x and y being not independent but functions of a single variable t, so that z is also a function of t alone, then dz dt = ∂f ∂x dx dt + ∂f ∂y dy dt . Multiplying this equation by dt and observing that dx = dx dt dt, dy = dy dt dt, dz = dz dt dt, we obtain dz = f ′ x dx + f ′ y dy, which is the same in form as (9). Thus the formula which expresses dz in terms of dx and dy is the same whether the variables x and y are independent or not. This remark is of great importance in applications. It should also be observed that if z is a function of the two independent variables x and y, and dz = λ dx + μ dy, then λ = f ′ x, μ = f ′ y. This follows at once from the last paragraph of § 154. It is obvious that the theorems and definitions of the last three sections are capable of immediate extension to functions of any number of variables. [VII : 155] ADDITIONAL THEOREMS IN THE CALCULUS 345 Examples LXII. 1. The area of an ellipse is given by A = πab, where a, b are the semiaxes. Prove that dA A = da a + db b , and state the corresponding approximate equation connecting the increments of the axes and the area. 2. Express Δ, the area of a triangle ABC, as a function of (i) a, B, C, (ii) A, b, c, and (iii) a, b, c, and establish the formulae dΔ Δ = 2 da a + c dB a sin B + b dC a sin C , dΔ Δ = cot A dA + db b + dc c , dΔ = R(cos A da + cos B db + cos C dc), where R is the radius of the circumcircle. 3. The sides of a triangle vary in such a way that the area remains constant, so that a may be regarded as a function of b and c. Prove that ∂a ∂b = – cos B cos A , ∂a ∂c = – cos C cos A . [This follows from the equations da = ∂a ∂b db + ∂a ∂c dc, cos A da + cos B db + cos C dc = 0.] 4. If a, b, c vary so that R remains constant, then da cos A + db cos B + dc cos C = 0, and so ∂a ∂b = – cos A cos B , ∂a ∂c = – cos A cos C . [Use the formulae a = 2R sin A, . . . , and the facts that R and A + B + C are constant.] 5. If z is a function of u and v, which are functions of x and y, then ∂z ∂x = ∂z ∂u ∂u ∂x + ∂z ∂v ∂v ∂x , ∂z ∂y = ∂z ∂u ∂u ∂y + ∂z ∂v ∂v ∂y . [VII : 155] ADDITIONAL THEOREMS IN THE CALCULUS 346 [We have dz = ∂z ∂u du + ∂z ∂v dv, du = ∂u ∂x dx + ∂u ∂y dy, dv = ∂v ∂x dx + ∂v ∂y dy. Substitute for du and dv in the first equation and compare the result with the equation dz = ∂z ∂x dx + ∂z ∂y dy.] 6. Let z be a function of x and y, and let X, Y , Z be defined by the equations x = a1X + b1Y + c1Z, y = a2X + b2Y + c2Z, z = a3X + b3Y + c3Z. Then Z may be expressed as a function of X and Y . Express ∂Z/∂X, ∂Z/∂Y in terms of ∂z/∂x, ∂z/∂y. [Let these differential coefficients be denoted by P , Q and p, q. Then dz – p dx – q dy = 0, or (c1p + c2q – c3) dZ + (a1p + a2q – a3) dX + (b1p + b2q – b3) dY = 0. Comparing this equation with dZ – P dX – Q dY = 0 we see that P = – a1p + a2q – a3 c1p + c2q – c3 , Q = – b1p + b2q – b3 c1p + c2q – c3 .] 7. If (a1x + b1y + c1z)p + (a2x + b2y + c2z)q = a3x + b3y + c3z, then (a1X + b1Y + c1Z)P + (a2X + b2Y + c2Z)Q = a3X + b3Y + c3Z. (Math. Trip. 1899.) 8. Differentiation of

implicit functions. Suppose that f (x, y) and its derivative f ′ y(x, y) are continuous in the neighbourhood of the point (a, b), and that f (a, b) = 0, f ′ b(a, b)■ = 0. [VII : 156] ADDITIONAL THEOREMS IN THE CALCULUS 347 Then we can find a neighbourhood of (a, b) throughout which f ′ y(x, y) has always the same sign. Let us suppose, for example, that f ′ y(x, y) is positive near (a, b). Then f (x, y) is, for any value of x sufficiently near to a, and for values of y sufficiently near to b, an increasing function of y in the stricter sense of § 95. It follows, by the theorem of § 108, that there is a unique continuous function y which is equal to b when x = a and which satisfies the equation f (x, y) = 0 for all values of x sufficiently near to a. Let us now suppose that f (x, y) possesses a derivative f ′ x(x, y) which is also continuous near (a, b). If f (x, y) = 0, x = a + h, y = b + k, we have 0 = f (x, y) – f (a, b) = (f ′ a + ■)h + (f ′ b + η)k, where ■ and η tend to zero with h and k. Thus k h = – f ′ a + ■ f ′ b + η → – f ′ a f ′ b , or dy dx = – f ′ a f ′ b . 9. The equation of the tangent to the curve f (x, y) = 0, at the point x0, y0, is (x – x0)f ′ x0 (x0, y0) + (y – y0)f ′ y0 (x0, y0) = 0. 156. Definite Integrals and Areas. It will be remembered that, in Ch. VI, § 145, we assumed that, if f (x) is a continuous function of x, and P Q is the graph of y = f (x), then the region P pqQ shown in Fig. 47 has associated with it a definite number which we call its area. It is clear that, if we denote Op and Oq by a and x, and allow x to vary, this area is a function of x, which we denote by F (x). Making this assumption, we proved in § 145 that F ′(x) = f (x), and we showed how this result might be used in the calculation of the areas of particular curves. But we have still to justify the fundamental assumption that there is such a number as the area F (x). We know indeed what is meant by the area of a rectangle, and that it is measured by the product of its sides. Also the properties of triangles, [VII : 156] ADDITIONAL THEOREMS IN THE CALCULUS 348O X Y p q P Q Fig. 47. parallelograms, and polygons proved by Euclid enable us to attach a defi- nite meaning to the areas of such figures. But nothing which we know so far provides us with a direct definition of the area of a figure bounded by curved lines. We shall now show how to give a definition of F (x) which will enable us to prove its existence.* Let us suppose f (x) continuous throughout the interval [a, b], and let us divide up the interval into a number of sub-intervals by means of the points of division x0, x1, x2, . . . , xn, where a = x0 < x1 < · · · < xn–1 < xn = b. Further, let us denote by δν the interval [xν , xν+1], and by mν the lower bound (§ 102) of f (x) in δν , and let us write s = m0δ0 + m1δ1 + · · · + mnδn = Pmν δν , say. It is evident that, if M is the upper bound of f (x) in [a, b], then s ■ M (b – a). The aggregate of values of s is therefore, in the language of *The argument which follows is modelled on that given in Goursat's Cours d'Analyse (second edition), vol. i, pp. 171 et seq.; but Goursat's treatment is much more general. [VII : 156] ADDITIONAL THEOREMS IN THE CALCULUS 349 § 80, bounded above, and possesses an upper bound which we will denote by j. No value of s exceeds j, but there are values of s which exceed any number less than j. In the same way, if Mν is the upper bound of f (x) in δν , we can define the sum S = PMν δν . It is evident that, if m is the lower bound of f (x) in [a, b], then S ■ m(b – a). The aggregate of values of S is therefore bounded below, and possesses a lower bound which we will denote by J. No value of S is less than J, but there are values of S less than any number greater than J. It will help to make clear the significance of the sums s and S if we observe that, in the simple case in which f (x) increases steadily from x = a to x = b, mν is f (xν) and Mν is f (xν+1). In this case s is the total area of the rectangles shaded in Fig. 48, and S is the area bounded by a thick line. In general s and S Fig. 48. will still be areas, composed of rectangles, respectively included in and including the curvilinear region whose area we are trying to define. We shall now show that no sum such as s can exceed any sum such as S. Let s, S be the sums corresponding to one mode of subdivision, and [VII : 156] ADDITIONAL THEOREMS IN THE CALCULUS 350 s′, S′ those corresponding to another. We have to show that s ■ S′ and s′ ■ S. We can form a third mode of subdivision by taking as dividing points all points which are such for either s, S or s′, S′. Let s, S be the sums corresponding to this third mode of subdivision. Then it is easy to see that s ■ s, s ■ s′, S ■ S, S ■ S′. (1) For example, s differs from s in that at least one interval δν which occurs in s is divided into a number of smaller intervals δν,1, δν,2, . . . , δν,p, so that a term mν δν of s is replaced in s by a sum mν,1δν,1 + mν,2δν,2 + · · · + mν,pδν,p, where mν,1, mν,2, . . . are the lower bounds of f (x) in δν,1, δν,2, ... But evidently mν,1 ■ mν , mν,2 ■ mν , . . . , so that the sum just written is not less than mν δν . Hence s ■ s; and the other inequalities (1) can be established in the same way. But, since s ■ S, it follows that s ■ s ■ S ■ S′, which is what we wanted to prove. It also follows that j ■ J. For we can find an s as near to j as we please and an S as near to J as we please,* and so j > J would involve the existence of an s and an S for which s > S. So far we have made no use of the fact that f (x) is continuous. We shall now show that j = J, and that the sums s, S tend to the limit J when the points of division xν are multiplied indefinitely in such a way that all the intervals δν tend to zero. More precisely, we shall show that, given any positive number ■, it is possible to find δ so that 0 ■ J – s < ■, 0 ■ S – J < ■ *The s and the S do not in general correspond to the same mode of subdivision. [VII : 157] ADDITIONAL THEOREMS IN THE CALCULUS 351 whenever δν < δ for all values of ν. There is, by Theorem II of § 106, a number δ such that Mν – mν < ■/(b – a), whenever every δν is less than δ. Hence S – s = P(Mν – mν) δν < ■. But S – s = (S – J) + (J – j) + (j – s); and all the three terms on the right-hand side are positive, and therefore all less than ■. As J – j is a constant, it must be zero. Hence j = J and 0 ■ j – s < ■, 0 ■ S – J < ■, as was to be proved. We define the area of P pqQ as being the common limit of s and S, that is to say J. It is easy to give a more general form to this definition. Consider the sum σ = Pfν δν where fν denotes the value of f (x) at any point in δν . Then σ plainly lies between s and S, and so tends to the limit J when the

intervals δν tend to zero. We may therefore define the area as the limit of σ. 157. The definite integral. Let us now suppose that f (x) is a continuous function, so that the region bounded by the curve y = f (x), the ordinates x = a and x = b, and the axis of x, has a definite area. We proved in Ch. VI, § 145, that if F (x) is an 'integral function' of f (x), i.e. if F ′(x) = f (x), F (x) = Z f (x) dx, then the area in question is F (b) – F (a). As it is not always practicable actually to determine the form of F (x), it is convenient to have a formula which represents the area P pqQ and contains no explicit reference to F (x). We shall write (P pqQ) = Z b a f (x) dx. [VII : 157] ADDITIONAL THEOREMS IN THE CALCULUS 352 The expression on the right-hand side of this equation may then be regarded as being defined in either of two ways. We may regard it as simply an abbreviation for F (b) – F (a), where F (x) is some integral function of f (x), whether an actual formula expressing it is known or not; or we may regard it as the value of the area P pqQ, as directly defined in § 156. The number Z b a f (x) dx is called a definite integral; a and b are called its lower and upper limits; f (x) is called the subject of integration or integrand; and the interval [a, b] the range of integration. The definite integral depends on a and b and the form of the function f (x) only, and is not a function of x. On the other hand the integral function F (x) = Z f (x) dx is sometimes called the indefinite integral of f (x). The distinction between the definite and the indefinite integral is merely one of point of view. The definite integral Z b a f (x) dx = F (b) – F (a) is a function of b, and may be regarded as a particular integral function of f (b). On the other hand the indefinite integral F (x) can always be expressed by means of a definite integral, since F (x) = F (a) + Z x a f (t) dt. But when we are considering 'indefinite integrals' or 'integral functions' we are usually thinking of a relation between two functions, in virtue of which one is the derivative of the other. And when we are considering a 'definite integral' we are not as a rule concerned with any possible variation of the limits. Usually the limits are constants such as 0 and 1; and Z 1 0 f (x) dx = F (1) – F (0) is not a function at all, but a mere number. [VII : 158] ADDITIONAL THEOREMS IN THE CALCULUS 353 It should be observed that the integral Z x a f (t) dt, having a differential co- efficient f (x), is a fortiori a continuous function of x. Since 1/x is continuous for all positive values of x, the investigations of the preceding paragraphs supply us with a proof of the actual existence of the function log x, which we agreed to assume provisionally in § 128. 158. Area of a sector of a circle. The circular functions. The theory of the trigonometrical functions cos x, sin x, etc., as usually pre- sented in text-books of elementary trigonometry, rests on an unproved assumption. An angle is the configuration formed by two straight lines OA, OP ; there is no particular difficulty in translating this 'geometrical' definition into purely analytical terms. The assumption comes at the next stage, when it is assumed that angles are capable of numerical measure- ment, that is to say that there is a real number x associated with the con-O N A P Fig. 49. figuration, just as there is a real number associated with the region P pqQ of Fig. 47. This point once admitted, cos x and sin x may be defined in the ordinary way, and there is no further difficulty of principle in the elabora- tion of the theory. The whole difficulty lies in the question, what is the x which occurs in cos x and sin x? To answer this question, we must define the measure of an angle, and we are now in a position to do so. The most natural definition would be this: suppose that AP is an arc of a circle whose centre is O and whose radius is unity, so that OA = OP = 1. Then x, the [VII : 158] ADDITIONAL THEOREMS IN THE CALCULUS 354 measure of the angle, is the length of the arc AP . This is, in substance, the definition adopted in the text-books, in the accounts which they give of the theory of 'circular measure'. It has however, for our present purpose, a fatal defect; for we have not proved that the arc of a curve, even of a circle, possesses a length. The notion of the length of a curve is capable of precise mathematical analysis just as much as that of an area; but the analysis, although of the same general character as that of the preceding sections, is decidedly more difficult, and it is impossible that we should give any general treatment of the subject here. We must therefore found our definition on the notion not of length but of area. We define the measure of the angle AOP as twice the area of the sector AOP of the unit circle. Suppose, in particular, that OA is y = 0 and that OP is y = mx, where m > 0. The area is a function of m, which we may denote by φ(m). If we write μ for (1 + m2)– 1 2 , P is the point (μ, mμ), and we have φ(m) = 1 2 mμ2 + Z 1 μ √1 – x2 dx. Differentiating with respect to m, we find φ′(m) = 1 2(1 + m2), φ(m) = 1 2 Z m 0 dt 1 + t2 . Thus the analytical equivalent of our definition would be to define arc tan m by the equation arc tan m = Z m 0 dt 1 + t2 ; and the whole theory of the circular functions could be worked out from this starting point, just as the theory of the logarithm is worked out from a similar definition in Ch. IX. See Appendix III. Examples LXIII. Calculation of the definite from the indefinite integral. 1. Show that Z b a xn dx = bn+1 – an+1 n + 1 , [VII : 158] ADDITIONAL THEOREMS IN THE CALCULUS 355 and in particular that Z 1 0 xn dx = 1 n + 1 . 2. Z b a cos mx dx = sin mb – sin ma m , Z b a sin mx dx = cos ma – cos mb m . 3. Z b a dx 1 + x2 = arc tan b – arc tan a, Z 1 0 dx 1 + x2 = 1 4 π. [There is an apparent difficulty here owing to the fact that arc tan x is a many valued function. The difficulty may be avoided by observing that, in the equation Z x 0 dt 1 + t2 = arc tan x, arc tan x must denote an angle lying between – 1 2 π and 1 2 π. For the integral vanishes when x = 0 and increases steadily and continuously as x increases. Thus the same is true of arc tan x, which therefore tends to 1 2 π as x → ∞. In the same way we can show that arc tan x → – 1 2 π as x → –∞. Similarly, in the equation Z x 0 dt √1 – t2 = arc sin x, where –1 < x < 1, arc sin x denotes an angle lying between – 1 2 π and 1 2 π. Thus, if a and b are both numerically less than unity, we have Z b a dx √1 – x2 = arc sin b – arc sin a.] 4. Z 1 0 dx 1 – x + x2 = 2π 3√3 , Z 1 0 dx 1 + x + x2 = π 3√3 . 5. Z 1 0 dx 1 + 2x cos α + x2 = α 2 sin α if –π < α < π, except when α = 0, when the value of the integral is 1 2 , which is the limit of 1 2 α cosec

α as α → 0. 6. Z 1 0 p1 – x2 dx = 1 4 π, Z a 0 pa2 – x2 dx = 1 4 πa2 (a > 0). 7. Z π 0 dx a + b cos x = π √a2 – b2 , if a > |b|. [For the form of the indefinite integral see Exs. liii. 3, 4. If |a| < |b| then the subject of integration has an [VII : 159] ADDITIONAL THEOREMS IN THE CALCULUS 356 infinity between 0 and π. What is the value of the integral when a is negative and –a > |b|?] 8. Z 1 2 π 0 dx a2 cos2 x + b2 sin2 x = π 2ab , if a and b are positive. What is the value of the integral when a and b have opposite signs, or when both are negative? 9. Fourier's integrals. Prove that if m and n are positive integers then Z 2π 0 cos mx sin nx dx is always equal to zero, and Z 2π 0 cos mx cos nx dx, Z 2π 0 sin mx sin nx dx are equal to zero unless m = n, when each is equal to π. 10. Prove that Z π 0 cos mx cos nx dx and Z π 0 sin mx sin nx dx are each equal to zero except when m = n, when each is equal to 1 2 π; and that Z π 0 cos mx sin nx dx = 2n n2 – m2 , Z π 0 cos mx sin nx dx = 0, according as n – m is odd or even. 159. Calculation of the definite integral from its definition as the limit of a sum. In a few cases we can evaluate a definite integral by direct calculation, starting from the definitions of §§ 156 and 157. As a rule it is much simpler to use the indefinite integral, but the reader will find it instructive to work through a few examples. Examples LXIV. 1. Evaluate Z b a x dx by dividing [a, b] into n equal parts by the points of division a = x0, x1, x2, . . . , xn = b, and calculating the limit as n → ∞ of (x1 – x0)f (x0) + (x2 – x1)f (x1) + · · · + (xn – xn–1)f (xn–1). [VII : 160] ADDITIONAL THEOREMS IN THE CALCULUS 357 [This sum is b – a n

na + b – a n {1 + 2 + · · · + (n – 1)}

= (b – a)

a + (b – a) n(n – 1) 2n2

, which tends to the limit 1 2 (b2 – a2) as n → ∞. Verify the result by graphical reasoning.] 2. Calculate Z b a x2 dx in the same way. 3. Calculate Z b a x dx, where 0 < a < b, by dividing [a, b] into n parts by the points of division a, ar, ar2, . . . , arn–1, arn, where rn = b/a. Apply the same method to the more general integral Z b a xm dx. 4. Calculate Z b a cos mx dx and Z b a sin mx dx by the method of Ex. 1. 5. Prove that n n–1P r=0 1 n2 + r2 → 1 4 π as n → ∞. [This follows from the fact that n n2 + n n2 + 12 + · · · + n n2 + (n – 1)2 = n–1X r=0 (1/n) 1 + (r/n)2 , which tends to the limit Z 1 0 dx 1 + x2 as n → ∞, in virtue of the direct definition of the integral.] 6. Prove that 1 n2 n–1P r=0 √n2 – r2 → 1 4 π. [The limit is Z 1 0 p1 – x2 dx.] 160. General properties of the definite integral. The definite integral possesses the important properties expressed by the following equa- [VII : 160] ADDITIONAL THEOREMS IN THE CALCULUS 358 tions.* (1) Z b a f (x) dx = – Z a b f (x) dx. This follows at once from the definition of the integral by means of the integral function F (x), since F (b) – F (a) = –{F (a) – F (b)}. It should be observed that in the direct definition it was presupposed that the upper limit is greater than the lower; thus this method of definition does not apply to the integral Z a b f (x) dx when a < b. If we adopt this definition as fundamental we must extend it to such cases by regarding the equation (1) as a definition of its right-hand side. (2) Z a a f (x) dx = 0. (3) Z b a f (x) dx + Z c b f (x) dx = Z c a f (x) dx. (4) Z b a kf (x) dx = k Z b a f (x) dx. (5) Z b a {f (x) + φ(x)} dx = Z b a f (x) dx + Z b a φ(x) dx. The reader will find it an instructive exercise to write out formal proofs of these properties, in each case giving a proof starting from (α) the definition by means of the integral function and (β) the direct definition. The following theorems are also important. (6) If f (x) ■ 0 when a ■ x ■ b, then Z b a f (x) dx ■ 0. We have only to observe that the sum s of § 156 cannot be negative. It will be shown later (Misc. Ex. 41) that the value of the integral cannot be zero unless *All functions mentioned in these equations are of course continuous, as the definite integral has been defined for continuous functions only. [VII : 160] ADDITIONAL THEOREMS IN THE CALCULUS 359 f (x) is always equal to zero: this may also be deduced from the second corollary of § 121. (7) If H ■ f (x) ■ K when a ■ x ■ b, then H(b – a) ■ Z b a f (x) dx ■ K(b – a). This follows at once if we apply (6) to f (x) – H and K – f (x). (8) Z b a f (x) dx = (b – a)f (ξ), where ξ lies between a and b. This follows from (7). For we can take H to be the least and K the greatest value of f (x) in [a, b]. Then the integral is equal to η(b–a), where η lies between H and K. But, since f (x) is continuous, there must be a value of ξ for which f (ξ) = η (§ 100). If F (x) is

the integral function, we can write the result of (8) in the form F (b) – F (a) = (b – a)F ′(ξ), so that (8) appears now to be only another way of stating the Mean Value Theorem of § 125. We may call (8) the First Mean Value Theorem for Integrals. (9) The Generalised Mean Value Theorem for integrals. If φ(x) is positive, and H and K are defined as in (7), then H Z b a φ(x) dx ■ Z b a f (x)φ(x) dx ■ K Z b a φ(x) dx; and Z b a f (x)φ(x) dx = f (ξ) Z b a φ(x) dx, where ξ is defined as in (8). [VII : 160] ADDITIONAL THEOREMS IN THE CALCULUS 360 This follows at once by applying Theorem (6) to the integrals Z b a {f (x) – H}φ(x) dx, Z b a {K – f (x)}φ(x) dx. The reader should formulate for himself the corresponding result which holds when φ(x) is always negative. (10) The Fundamental Theorem of the Integral Calculus. The function F (x) = Z x a f (t) dt has a derivative equal to f (x). This has been proved already in § 145, but it is convenient to restate the result here as a formal theorem. It follows as a corollary, as was pointed out in § 157, that F (x) is a continuous function of x. Examples LXV. 1. Show, by means of the direct definition of the definite integral, and equations (1)–(5) above, that (i) Z a –a φ(x2) dx = 2 Z a 0 φ(x2) dx, Z a –a xφ(x2) dx = 0; (ii) Z 1 2 π 0 φ(cos x) dx = Z 1 2 π 0 φ(sin x) dx = 1 2 Z π 0 φ(sin x) dx; (iii) Z mπ 0 φ(cos2 x) dx = m Z π 0 φ(cos2 x) dx, m being an integer. [The truth of these equations will appear geometrically intuitive, if the graphs of the functions under the sign of integration are sketched.] 2. Prove that Z π 0 sin nx sin x dx is equal to π or to 0 according as n is odd or or even. [Use the formula (sin nx)/(sin x) = 2 cos{(n – 1)x} + 2 cos{(n – 3)x} + . . . , the last term being 1 or 2 cos x.] 3. Prove that Z π 0 sin nx cot x dx is equal to 0 or to π according as n is odd or even. [VII : 160] ADDITIONAL THEOREMS IN THE CALCULUS 361 4. If φ(x) = a0 + a1 cos x + b1 sin x + a2 cos 2x + · · · + an cos nx + bn sin nx, and k is a positive integer not greater than n, then Z 2π 0 φ(x) dx = 2πa0, Z 2π 0 cos kxφ(x) dx = πak, Z 2π 0 sin kxφ(x) dx = πbk. If k > n then the value of each of the last two integrals is zero. [Use Ex. lxiii. 9.] 5. If φ(x) = a0 + a1 cos x + a2 cos 2x + · · · + an cos nx, and k is a positive integer not greater than n, then Z π 0 φ(x) dx = πa0, Z π 0 cos kxφ(x) dx = 1 2 πak. If k > n then the value of the last integral is zero. [Use Ex. lxiii. 10.] 6. Prove that if a and b are positive then Z 2π 0 dx a2 cos2 x + b2 sin2 x = 2π ab . [Use Ex. lxiii. 8 and Ex. 1 above.] 7. If f (x) ■ φ(x) when a ■ x ■ b, then Z b a f dx ■ Z b a φ dx. 8. Prove that 0 < Z 1 2 π 0 sinn+1 x dx < Z 1 2 π 0 sinn x dx, 0 < Z 1 4 π 0 tann+1 x dx < Z 1 4 π 0 tann x dx. 9.* If n > 1 then .5 < Z 1 2 0 dx √1 – x2n < .524. [The first inequality follows from the fact that √1 – x2n < 1, the second from the fact that √1 – x2n > √1 – x2.] *Exs. 9–13 are taken from Prof. Gibson's Elementary Treatise on the Calculus. [VII : 161] ADDITIONAL THEOREMS IN THE CALCULUS 362 10. Prove that 1 2 < Z 1 0 dx √4 – x2 + x3 < 1 6 π. 11. Prove that (3x + 8)/16 < 1/√4 – 3x + x3 < 1/√4 – 3x if 0 < x < 1, and hence that 19 32 < Z 1 0 dx √4 – 3x + x3 < 2 3 . 12. Prove that .573 < Z 2 1 dx √4 – 3x + x3 < .595. [Put x = 1 + u: then replace 2 + 3u2 + u3 by 2 + 4u2 and by 2 + 3u2.] 13. If α and φ are positive acute angles then φ < Z φ 0 dx p1 – sin2 α sin2 x < φ p1 – sin2 α sin2 φ . If α = φ = 1 6 π, then the integral lies between .523 and .541. 14. Prove that Z b a f (x) dx ■ Z b a |f (x)| dx. [If σ is the sum considered at the end of § 156, and σ′ the corresponding sum formed from the function |f (x)|, then |σ| ■ σ′.] 15. If |f (x)| ■ M , then Z b a f (x)φ(x) dx ■ M Z b a |φ(x)| dx. 161. Integration by parts and by substitution. It follows from § 138 that Z b a f (x)φ′(x) dx = f (b)φ(b) – f (a)φ(a) – Z b a f ′(x)φ(x) dx. This formula is known as the formula for integration of a definite in- tegral by parts. [VII : 161] ADDITIONAL THEOREMS IN THE CALCULUS 363 Again, we know (§ 133) that if F (t) is the integral function of f (t), then Z f {φ(x)}φ′(x) dx = F {φ(x)}. Hence, if φ(a) = c, φ(b) = d, we have Z d c f (t) dt = F (d) – F (c) = F {φ(b)} – F {φ(a)} = Z b a f {φ(x)}φ′(x) dx; which is the formula for the transformation of a definite integral by sub- stitution. The formulae for integration by parts and for transformation often en- able us to evaluate a definite integral without the labour of actually find- ing the integral function of the subject of integration, and sometimes even when the integral function cannot be found. Some instances of this will be found in the following examples. That the value of a definite integral may sometimes be found without a knowledge of the integral function is only to be expected, for the fact that we cannot determine the general form of a function F (x) in no way precludes the possibility that we may be able to determine the difference F (b) – F (a) between two of its particular values. But as a rule this can only be effected by the use of more advanced methods than are at present at our disposal. Examples LXVI. 1. Prove that Z b a xf ′′(x) dx = {bf ′(b) – f (b)} – {af ′(a) – f (a)}. 2. More generally, Z b a xmf (m+1)(x) dx = F (b) – F (a), where F (x) = xmf (m)(x) – mxm–1f (m–1)(x) + m(m – 1)xm–2f (m–2)(x) – · · · + (–1)mm! f (x). [VII : 161] ADDITIONAL THEOREMS IN THE CALCULUS 364 3. Prove that Z 1 0 arc sin x dx = 1 2 π – 1, Z 1 0 x arc tan x dx = 1 4 π – 1 2 . 4. Prove that if a and b are positive then Z 1 2 π 0 x cos x sin x dx (a2 cos2 x + b2 sin2 x)2 = π 4ab2(a + b) . [Integrate by parts and use Ex. lxiii. 8.] 5. If f1(x) = Z x 0 f (t) dt, f2(x) = Z x 0 f1(t) dt, . . . , fk(x) = Z x 0 fk–1(t) dt, then fk(x) = 1 (k – 1)! Z x 0 f (t)(x – t)k–1 dt. [Integrate repeatedly by parts.] 6. Prove by integration by parts that if um,n = Z 1 0 xm(1 – x)n dx, where m and n are positive integers, then (m + n + 1)um,n = num,n–1, and deduce that um,n = m! n! (m + n + 1)! . 7. Prove that if un = Z 1 4 π 0 tann x dx then un + un–2 = 1/(n – 1). Hence evaluate the integral for all positive integral values of n. [Put tann x = tann–2 x(sec2 x – 1) and integrate by parts.] 8. Deduce from the last example that un lies between 1/{2(n – 1)} and 1/{2(n + 1)}. [VII : 161] ADDITIONAL THEOREMS IN THE CALCULUS 365 9. Prove that if un = Z 1 2 π 0 sinn x dx then un = {(n – 1)/n}un–2. [Write sinn–1 x sin x for sinn x and integrate by parts.] 10. Deduce that un is equal to 2 · 4 · 6 . . . (n – 1) 3 · 5 · 7 . . . n , 1 2 π 1 · 3 · 5 . . . (n – 1) 2 · 4 · 6 . . . n , according as n is odd or even. 11. The Second Mean Value Theorem. If f (x) is a function of x which has a differential coefficient of constant sign for all values of x from x = a to x = b, then there is a number ξ between a and b

such that Z b a f (x)φ(x) dx = f (a) Z ξ a φ(x) dx + f (b) Z b ξ φ(x) dx. [Let Z x a φ(t) dt = Φ(x). Then Z b a f (x)φ(x) dx = Z b a f (x)Φ′(x) dx = f (b)Φ(b) – Z b a f ′(x)Φ(x) dx = f (b)Φ(b) – Φ(ξ) Z b a f ′(x) dx, by the generalised Mean Value Theorem of § 160: i.e. Z b a f (x)φ(x) dx = f (b)Φ(b) + {f (a) – f (b)}Φ(ξ), which is equivalent to the result given.] 12. Bonnet's form of the Second Mean Value Theorem. If f ′(x) is of constant sign, and f (b) and f (a) – f (b) have the same sign, then Z b a f (x)φ(x) dx = f (a) Z X a φ(x) dx, [VII : 161] ADDITIONAL THEOREMS IN THE CALCULUS 366 where X lies between a and b. [For f (b)Φ(b)+{f (a)–f (b)}Φ(ξ) = μf (a), where μ lies between Φ(ξ) and Φ(b), and so is the value of Φ(x) for a value of x such as X. The important case is that in which 0 ■ f (b) ■ f (x) ■ f (a).] Prove similarly that if f (a) and f (b) – f (a) have the same sign, then Z b a f (x)φ(x) dx = f (b) Z b X φ(x) dx, where X lies between a and b. [Use the function Ψ(ξ) = Z b ξ φ(x) dx. It will be found that the integral can be expressed in the form f (a)Ψ(a) + {f (b) – f (a)}Ψ(ξ). The important case is that in which 0 ■ f (a) ■ f (x) ■ f (b).] 13. Prove that Z X′ X sin x x dx < 2 X if X′ > X > 0. [Apply the first formula of Ex. 12, and note that the integral of sin x over any interval whatever is numerically less than 2.] 14. Establish the results of Ex. lxv. 1 by means of the rule for substitution. [In (i) divide the range of integration into the two parts [–a, 0], [0, a], and put x = –y in the first. In (ii) use the substitution x = 1 2 π – y to obtain the first equation: to obtain the second divide the range [0, π] into two equal parts and use the substitution x = 1 2 π + y. In (iii) divide the range into m equal parts and use the substitutions x = π + y, x = 2π + y, ...] 15. Prove that Z b a F (x) dx = Z b a F (a + b – x) dx. 16. Prove that Z 1 2 π 0 cosm x sinm x dx = 2–m Z 1 2 π 0 cosm x dx. 17. Prove that Z π 0 xφ(sin x) dx = 1 2 π Z π 0 φ(sin x) dx. [VII : 162] ADDITIONAL THEOREMS IN THE CALCULUS 367 [Put x = π – y.] 18. Prove that Z π 0 x sin x 1 + cos2 x dx = 1 4 π2. 19. Show by means of the transformation x = a cos2 θ + b sin2 θ that Z b a p(x – a)(b – x) dx = 1 8 π(b – a)2. 20. Show by means of the substitution (a + b cos x)(a – b cos y) = a2 – b2 that Z π 0 (a + b cos x)–n dx = (a2 – b2)–(n– 1 2) Z π 0 (a – b cos y)n–1 dy, when n is a positive integer and a > |b|, and evaluate the integral when n = 1, 2, 3. 21. If m and n are positive integers then Z b a (x – a)m(b – x)n dx = (b – a)m+n+1 m! n! (m + n + 1)! . [Put x = a + (b – a)y, and use Ex. 6.] 162. Proof of Taylor's Theorem by Integration by Parts. We shall now give the alternative form of the proof of Taylor's Theorem to which we alluded in § 147. Let f (x) be a function whose first n derivatives are continuous, and let Fn(x) = f (b) – f (x) – (b – x)f ′(x) – · · · · – (b – x)n–1 (n – 1)! f (n–1)(x). Then F ′ n(x) = –(b – x)n–1 (n – 1)! f (n)(x), and so Fn(a) = Fn(b) – Z b a F ′ n(x) dx = 1 (n – 1)! Z b a (b – x)n–1f (n)(x) dx. [VII : 163] ADDITIONAL THEOREMS IN THE CALCULUS 368 If now we write a+h for b, and transform the integral by putting x = a+th, we obtain f (a + h) = f (a) + hf ′(a) + · · · + hn–1 (n – 1)!f (n–1)(a) + Rn, (1) where Rn = hn (n – 1)! Z 1 0 (1 – t)n–1f (n)(a + th) dt. (2) Now, if p is any positive integer not greater than n, we have, by Theo- rem (9) of § 160, Z 1 0 (1 – t)n–1f (n)(a + th) dt = Z 1 0 (1 – t)n–p(1 – t)p–1f (n)(a + th) dt = (1 – θ)n–pf (n)(a + θh) Z 1 0 (1 – t)p–1 dt, where 0 < θ < 1. Hence Rn = (1 – θ)n–pf (n)(a + θh)hn p(n – 1)! . (3) If we take p = n we obtain Lagrange's form of Rn (§ 148). If on the other hand we take p = 1 we obtain Cauchy's form, viz. Rn = (1 – θ)n–1f (n)(a + θh)hn (n – 1)! .* (4) 163. Application of Cauchy's form to the Binomial Series. If f (x) = (1 + x)m, where m is not a positive integer, then Cauchy's form of the remainder is Rn = m(m – 1) . . . (m – n + 1) 1 · 2 . . . (n – 1) (1 – θ)n–1xn (1 + θx)n–m . *The method used in § 147 can also be modified so as to obtain these alternative forms of the remainder. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 369 Now (1 – θ)/(1 + θx) is less than unity, so long as –1 < x < 1, whether x is positive or negative; and (1 + θx)m–1 is less than a constant K for all values of n, being in fact less than (1 + |x|)m–1 if m > 1 and than (1 – |x|)m–1 if m < 1. Hence |Rn| < K|m| m – 1 n – 1

|xn| = ρn, say. But ρn → 0 as n → ∞, by Ex. xxvii. 13, and so Rn → 0. The truth of the Binomial Theorem is thus established for all rational values of m and all values of x between –1 and 1. It will be remembered that the difficulty in using Lagrange's form, in Ex. lvi. 2, arose in connection with negative values of x. 164. Integrals of complex functions of a real variable. So far we have always supposed that the subject of integration in a definite integral is real. We define the integral of a complex function f (x) = φ(x) + iψ(x) of the real variable x, between the limits a and b, by the equations Z b a f (x) dx = Z b a {φ(x) + iψ(x)} dx = Z b a φ(x) dx + i Z b a ψ(x) dx; and it is evident that the properties of such integrals may be deduced from those of the real integrals already considered. There is one of these properties that we shall make use of later on. It is expressed by the inequality Z b a f (x) dx ■ Z b a |f (x)| dx.* (1) This inequality may be deduced without difficulty from the definitions of §§ 156 and 157. If δν has the same meaning as in § 156, φν and ψν are the values of φ and ψ at a point of δν , and fν = φν + iψν , then we have Z b a f dx = Z b a φ dx + i Z b a ψ dx = lim Pφν δν + i lim Pψν δν = lim P(φν + iψν) δν = lim Pfν δν , *The corresponding inequality for a real integral was proved in Ex. lxv. 14. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 370 and so Z b a f dx = | lim Pfν δν | = lim |Pfν δν |; while Z b a |f | dx = lim P|fν | δν . The result now follows at once from the inequality |Pfν δν | ■ P|fν | δν . It is evident that the formulae (1) and (2) of § 162 remain true when f is a complex function φ + iψ. MISCELLANEOUS EXAMPLES ON CHAPTER VII. 1. Verify the terms given of the following Taylor's Series: (1) tan x = x + 1 3 x3 + 2 15 x5 + . . . , (2) sec x = 1 + 1 2 x2 + 5 24 x4 + . . . , (3) x cosec x = 1 + 1 6 x2 + 7 360 x4 + . . . , (4) x cot x = 1 – 1 3 x2 – 1 45 x4 – . . . . 2. Show that if f (x) and its first n + 2 derivatives are continuous, and f (n+1)(0)■ = 0, and θn is the value of θ which occurs in Lagrange's form of the remainder after n terms of Taylor's Series, then θn = 1 n + 1 + n 2(n + 1)2(n + 2) (f (n+2)(0) f (n+1)(0) + ■x) x, where ■x → 0 as x → 0. [Follow the method of Ex. lv. 12.] 3. Verify the

last result when f (x) = 1/(1+x). [Here (1+θnx)n+1 = 1+x.] 4. Show that if f (x) has derivatives of the first three orders then f (b) = f (a) + 1 2 (b – a){f ′(a) + f ′(b)} – 1 12 (b – a)3f ′′′(α), [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 371 where a < α < b. [Apply to the function f (x) – f (a) – 1 2 (x – a){f ′(a) + f ′(x)} – x – a b – a 3 [f (b) – f (a) – 1 2 (b – a){f ′(a) + f ′(b)}] arguments similar to those of § 147.] 5. Show that under the same conditions f (b) = f (a) + (b – a)f ′{ 1 2 (a + b)} + 1 24 (b – a)3f ′′′(α). 6. Show that if f (x) has derivatives of the first five orders then f (b) = f (a) + 1 6 (b – a)[f ′(a) + f ′(b) + 4f ′{ 1 2 (a + b)}] – 1 2880 (b – a)5f (5)(α). 7. Show that under the same conditions f (b) = f (a)+ 1 2 (b–a){f ′(a)+f ′(b)}– 1 12 (b–a)2{f ′′(b)–f ′′(a)}+ 1 720 (b–a)5f (5)(α). 8. Establish the formulae (i) f (a) f (b) g(a) g(b) = (b – a) f (a) f ′(β) g(a) g′(β) , where β lies between a and b, and (ii) f (a) f (b) f (c) g(a) g(b) g(c) h(a) h(b) h(c) = 1 2 (b – c)(c – a)(a – b) f (a) f ′(β) f ′′(γ) g(a) g′(β) g′′(γ) h(a) h′(β) h′′(γ) , where β and γ lie between the least and greatest of a, b, c. [To prove (ii) consider the function φ(x) = f (a) f (b) f (x) g(a) g(b) g(x) h(a) h(b) h(x) – (x – a)(x – b) (c – a)(c – b) f (a) f (b) f (c) g(a) g(b) g(c) h(a) h(b) h(c) , which vanishes when x = a, x = b, and x = c. Its first derivative, by Theorem B of § 121, must vanish for two distinct values of x lying between the least and [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 372 greatest of a, b, c; and its second derivative must therefore vanish for a value γ of x satisfying the same condition. We thus obtain the formula f (a) f (b) f (c) g(a) g(b) g(c) h(a) h(b) h(c) = 1 2 (c – a)(c – b) f (a) f (b) f ′′(γ) g(a) g(b) g′′(γ) h(a) h(b) h′′(γ) . The reader will now complete the proof without difficulty.] 9. If F (x) is a function which has continuous derivatives of the first n orders, of which the first n–1 vanish when x = 0, and A ■ F (n)(x) ■ B when 0 ■ x ■ h, then A(xn/n!) ■ F (x) ■ B(xn/n!) when 0 ■ x ■ h. Apply this result to f (x) – f (0) – xf ′(0) – · · · – xn–1 (n – 1)! f (n–1)(0), and deduce Taylor's Theorem. 10. If Δhφ(x) = φ(x) – φ(x + h), Δ2 hφ(x) = Δh{Δhφ(x)}, and so on, and φ(x) has derivatives of the first n orders, then Δn hφ(x) = nX r=0 (–1)r n r

φ(x + rh) = (–h)nφ(n)(ξ), where ξ lies between x and x + nh. Deduce that if φ(n)(x) is continuous then {Δn hφ(x)}/hn → (–1)nφ(n)(x) as h → 0. [This result has been stated already when n = 2, in Ex. lv. 13.] 11. Deduce from Ex. 10 that xn–m Δn hxm → m(m – 1) . . . (m – n + 1)hn as x → ∞, m being any rational number and n any positive integer. In particular prove that x√x{√x – 2√x + 1 + √x + 2} → – 1 4 . 12. Suppose that y = φ(x) is a function of x with continuous derivatives of at least the first four orders, and that φ(0) = 0, φ′(0) = 1, so that y = φ(x) = x + a2x2 + a3x3 + (a4 + ■x)x4, where ■x → 0 as x → 0. Establish the formula x = ψ(y) = y – a2y2 + (2a2 2 – a3)y3 – (5a3 2 – 5a2a3 + a4 + ■y)y4, [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 373 where ■y → 0 as y → 0, for that value of x which vanishes with y; and prove that φ(x)ψ(x) – x2 x4 → a2 2 as x → 0. 13. The coordinates (ξ, η) of the centre of curvature of the curve x = f (t), y = F (t), at the point (x, y), are given by –(ξ – x)/y′ = (η – y)/x′ = (x′2 + y′2)/(x′y′′ – x′′y′); and the radius of curvature of the curve is (x′2 + y′2)3/2/(x′y′′ – x′′y′), dashes denoting differentiations with respect to t. 14. The coordinates (ξ, η) of the centre of curvature of the curve 27ay2 = 4x3, at the point (x, y), are given by 3a(ξ + x) + 2x2 = 0, η = 4y + (9ay)/x. (Math. Trip. 1899.) 15. Prove that the circle of curvature at a point (x, y) will have contact of the third order with the curve if (1 + y2 1)y3 = 3y1y2 2 at that point. Prove also that the circle is the only curve which possesses this property at every point; and that the only points on a conic which possess the property are the extremities of the axes. [Cf. Ch. VI, Misc. Ex. 10 (iv).] 16. The conic of closest contact with the curve y = ax2 +bx3 +cx4 +· · ·+kxn, at the origin, is a3y = a4x2 +a2bxy +(ac–b2)y2. Deduce that the conic of closest contact at the point (ξ, η) of the curve y = f (x) is 18η3 2 T = 9η4 2 (x – ξ)2 + 6η2 2 η3(x – ξ)T + (3η2η4 – 4η2 3)T 2, where T = (y – η) – η1(x – ξ). (Math. Trip. 1907.) 17. Homogeneous functions.* If u = xnf (y/x, z/x, . . .) then u is unal- tered, save for a factor λn, when x, y, z, . . . are all increased in the ratio λ : 1. *In this and the following examples the reader is to assume the continuity of all the derivatives which occur. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 374 In these circumstances u is called a homogeneous function of degree n in the variables x, y, z, ... Prove that if u is homogeneous and of degree n then x ∂u ∂x + y ∂u ∂y + z ∂u ∂z + · · · = nu. This result is known as Euler's Theorem on homogeneous functions. 18. If u is homogeneous and of degree n then ∂u/∂x, ∂u/∂y, . . . are homo- geneous and of degree n – 1. 19. Let f (x, y) = 0 be an equation in x and y (e.g. xn + yn – x = 0), and let F (x, y, z) = 0 be the form it assumes when made homogeneous by the introduction of a third variable z in place of unity (e.g. xn + yn – xzn–1 = 0). Show that the equation of the tangent at the point (ξ, η) of the curve f (x, y) = 0 is xFξ + yFη + zFζ = 0, where Fξ, Fη, Fζ denote the values of Fx, Fy, Fz when x = ξ, y = η, z = ζ = 1. 20. Dependent and independent functions. Jacobians or functional determinants. Suppose that u and v are functions of x and y connected by an identical relation φ(u, v) = 0. (1) Differentiating (1) with respect to x and y, we obtain ∂φ ∂u ∂u ∂x + ∂φ ∂v ∂v ∂x = 0, ∂φ ∂u ∂u ∂y + ∂φ ∂v ∂v ∂y = 0, (2) and, eliminating the derivatives of φ, J = ux uy vx vy = uxvy – uyvx = 0, (3) where ux, uy, vx, vy are the derivatives of u and v with respect to x and y. This condition is therefore necessary for the existence of a relation such as (1). It can be proved that the condition is also sufficient; for this we must refer to Goursat's Cours d' Analyse, vol. i, pp. 125 et seq. Two functions u and v are said to be dependent or independent according as they are or are not connected by such a relation as (1). It is usual to call J [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 375 the Jacobian or functional determinant of u and v with respect to x and y, and to write J = ∂(u, v) ∂(x, y) . Similar results hold for functions of any number of variables. Thus three functions u, v, w of three variables x, y, z are or are not connected by a relation φ(u, v, w) = 0 according as J = ux uy uz vx vy vz wx wy wz = ∂(u, v, w) ∂(x, y, z) does or does not vanish for all values of x, y, z. 21. Show that ax2 + 2hxy + by2 and Ax2 + 2Hxy + By2 are independent

unless a/A = h/H = b/B. 22. Show that ax2 + by2 + cz2 + 2f yz + 2gzx + 2hxy can be expressed as a product of two linear functions of x, y, and z if and only if abc + 2f gh – af 2 – bg2 – ch2 = 0. [Write down the condition that px + qy + rz and p′x + q′y + r′z should be connected with the given function by a functional relation.] 23. If u and v are functions of ξ and η, which are themselves functions of x and y, then ∂(u, v) ∂(x, y) = ∂(u, v) ∂(ξ, η) ∂(ξ, η) ∂(x, y) . Extend the result to any number of variables. 24. Let f (x) be a function of x whose derivative is 1/x and which vanishes when x = 1. Show that if u = f (x) + f (y), v = xy, then uxvy – uyvx = 0, and hence that u and v are connected by a functional relation. By putting y = 1, show that this relation must be f (x) + f (y) = f (xy). Prove in a similar manner that if the derivative of f (x) is 1/(1 + x2), and f (0) = 0, then f (x) must satisfy the equation f (x) + f (y) = f x + y 1 – xy

. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 376 25. Prove that if f (x) = Z x 0 dt √1 – t4 then f (x) + f (y) = f (xp1 – y4 + y√1 – x4 1 + x2y2) . 26. Show that if a functional relation exists between u = f (x)+f (y)+f (z), v = f (y)f (z)+f (z)f (x)+f (x)f (y), w = f (x)f (y)f (z), then f must be a constant. [The condition for a functional relation will be found to be f ′(x)f ′(y)f ′(z){f (y) – f (z)}{f (z) – f (x)}{f (x) – f (y)} = 0.] 27. If f (y, z), f (z, x), and f (x, y) are connected by a functional relation then f (x, x) is independent of x. (Math. Trip. 1909.) 28. If u = 0, v = 0, w = 0 are the equations of three circles, rendered homogeneous as in Ex. 19, then the equation ∂(u, v, w) ∂(x, y, z) = 0 represents the circle which cuts them all orthogonally. (Math. Trip. 1900.) 29. If A, B, C are three functions of x such that A A′ A′′ B B′ B′′ C C′ C′′ vanishes identically, then we can find constants λ, μ, ν such that λA + μB + νC vanishes identically; and conversely. [The converse is almost obvious. To prove the direct theorem let α = BC′ – B′C, ... Then α′ = BC′′ – B′′C, . . . , and it follows from the vanishing of the determinant that βγ′ – β′γ = 0, . . . ; and so that the ratios α : β : γ are constant. But αA + βB + γC = 0.] 30. Suppose that three variables x, y, z are connected by a relation in virtue of which (i) z is a function of x and y, with derivatives zx, zy, and (ii) x is a function of y and z, with derivatives xy, xz . Prove that xy = –zy/zx, xz = 1/zx. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 377 [We have dz = zx dx + zy dy, dx = xy dy + xz dz. The result of substituting for dx in the first equation is dz = (zxxy + zy) dy + zxxz dz, which can be true only if zxxy + zy = 0, zxxz = 1.] 31. Four variables x, y, z, u are connected by two relations in virtue of which any two can be expressed as functions of the others. Show that yu z zu x xu y = –yx z zy xxz y = 1, xu z zy x + yu z zx y = 1, where yu z denotes the derivative of y, when expressed as a function of z and u, with respect to z. (Math. Trip. 1897.) 32. Find A, B, C, λ so that the first four derivatives of Z a+x a f (t) dt – x[Af (a) + Bf (a + λx) + Cf (a + x)] vanish when x = 0; and A, B, C, D, λ, μ so that the first six derivatives of Z a+x a f (t) dt – x[Af (a) + Bf (a + λx) + Cf (a + μx) + Df (a + x)] vanish when x = 0. 33. If a > 0, ac – b2 > 0, and x1 > x0, then Z x1 x0 dx ax2 + 2bx + c = 1 √ac – b2 arc tan ((x1 – x0)√ac – b2 ax1x0 + b(x1 + x0) + c) , the inverse tangent lying between 0 and π.* 34. Evaluate the integral Z 1 –1 sin α dx 1 – 2x cos α + x2 . For what values of α is the integral a discontinuous function of α? (Math. Trip. 1904.) *In connection with Exs. 33–35, 38, and 40 see a paper by Dr Bromwich in vol. xxxv of the Messenger of Mathematics. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 378 [The value of the integral is 1 2 π if 2nπ < α < (2n + 1)π, and – 1 2 π if (2n – 1)π < α < 2nπ, n being any integer; and 0 if α is a multiple of π.] 35. If ax2 + 2bx + c > 0 when x0 ■ x ■ x1, f (x) = √ax2 + 2bx + c, and y = f (x), y0 = f (x0), y1 = f (x1), X = (x1 – x0)/(y1 + y0), then Z x1 x0 dx y = 1 √a log 1 + X√a 1 – X√a , –2 √–a arc tan{X √–a}, according as a is positive or negative. In the latter case the inverse tangent lies between 0 and 1 2 π. [It will be found that the substitution t = x – x0 y + y0 reduces the integral to the form 2 Z X 0 dt 1 – at2 .] 36. Prove that Z a 0 dx x + √a2 – x2 = 1 4 π. (Math. Trip. 1913.) 37. If a > 1 then Z 1 –1 √1 – x2 a – x dx = π{a – pa2 – 1}. 38. If p > 1, 0 < q < 1, then Z 1 0 dx p{1 + (p2 – 1)x}{1 – (1 – q2)x} = 2ω (p + q) sin ω , where ω is the positive acute angle whose cosine is (1 + pq)/(p + q). 39. If a > b > 0, then Z 2π 0 sin2 θ dθ a – b cos θ = 2π b2 {a – pa2 – b2}. (Math. Trip. 1904.) [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 379 40. Prove that if a > √b2 + c2 then Z π 0 dθ a + b cos θ + c sin θ = 2 √a2 – b2 – c2 arc tan (√a2 – b2 – c2 c) , the inverse tangent lying between 0 and π. 41. If f (x) is continuous and never negative, and Z b a f (x) dx = 0, then f (x) = 0 for all values of x between a and b. [If f (x) were equal to a positive number k when x = ξ, say, then we could, in virtue of the continuity of f (x), find an interval [ξ – δ, ξ + δ] throughout which f (x) > 1 2 k; and then the value of the integral would be greater than δk.] 42. Schwarz's inequality for integrals. Prove that Z b a φψ dx 2 ■ Z b a φ2 dx Z b a ψ2 dx. [Use the definitions of §§ 156 and 157, and the inequality (Pφν ψν δν)2 ■ Pφ2 ν δν Pψ2 ν δν (Ch. I, Misc. Ex. 10).] 43. If Pn(x) = 1 (β – α)nn! d dx n {(x – α)(β – x)}n, then Pn(x) is a polynomial of degree n, which possesses the property that Z β α Pn(x)θ(x) dx = 0 if θ(x) is any polynomial of degree less than n. [Integrate by parts m + 1 times, where m is the degree of θ(x), and observe that θ(m+1)(x) = 0.] 44. Prove that Z β α Pm(x)Pn(x) dx = 0 if m■ = n, but that if m = n then the value of the integral is (β – α)/(2n + 1). [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 380 45. If Qn(x) is a polynomial of degree n, which possesses the property that Z β α Qn(x)θ(x) dx = 0 if θ(x) is any polynomial of degree less than n, then Qn(x) is a constant multiple of Pn(x). [We can choose κ so that Qn – κPn is of degree n – 1: then Z β α Qn(Qn – κPn) dx = 0, Z β α Pn(Qn – κPn) dx = 0, and so Z β α (Qn – κPn)2 dx = 0. Now apply Ex. 41.] 46. Approximate Values of definite integrals. Show that the error in taking 1 2 (b – a){φ(a) + φ(b)} as the value of the integral Z b a φ(x) dx is less than 1 12 M (b – a)3, where M is the maximum of |φ′′(x)| in the interval [a, b]; and that the error in taking (b – a)φ{ 1 2 (a + b)} is less than 1 24 M (b – a)3. [Write f ′(x) = φ(x) in Exs. 4 and 5.] Show

that the error in taking 1 6 (b – a)[φ(a) + φ(b) + 4φ{ 1 2 (a + b)}] as the value is less than 1 2880 M (b – a)5, where M is the maximum of φ(4)(x). [Use Ex. 6. This rule, which gives a very good approximation, is known as Simpson's Rule. It amounts to taking one-third of the first approximation given above and two-thirds of the second.] Show that the approximation assigned by Simpson's Rule is the area bounded by the lines x = a, x = b, y = 0, and a parabola with its axis parallel to OY and passing through the three points on the curve y = φ(x) whose abscissae are a, 1 2 (a + b), b. It should be observed that if φ(x) is any cubic polynomial then φ(4)(x) = 0, and Simpson's Rule is exact. That is to say, given three points whose abscissae are a, 1 2 (a + b), b, we can draw through them an infinity of curves of the type y = α + βx + γx2 + δx3; and all such curves give the same area. For one curve δ = 0, and this curve is a parabola. [VII : 164] ADDITIONAL THEOREMS IN THE CALCULUS 381 47. If φ(x) is a polynomial of the fifth degree, then Z 1 0 φ(x) dx = 1 18 {5φ(α) + 8φ(1 2) + 5φ(β)}, α and β being the roots of the equation x2 – x + 1 10 = 0. (Math. Trip. 1909.) 48. Apply Simpson's Rule to the calculation of π from the formula 1 4 π = Z 1 0 dx 1 + x2 . [The result is .7833 . . . . If we divide the integral into two, from 0 to 1 2 and 1 2 to 1, and apply Simpson's Rule to the two integrals separately, we obtain .785 391 6 . . . . The correct value is .785 398 1 . . . .] 49. Show that 8.9 < Z 5 3 p4 + x2 dx < 9. (Math. Trip. 1903.) 50. Calculate the integrals Z 1 0 dx 1 + x , Z 1 0 dx √1 + x4 , Z π 0 √sin x dx, Z π 0 sin x x dx, to two places of decimals. [In the last integral the subject of integration is not defined when x = 0: but if we assign to it, when x = 0, the value 1, it becomes continuous throughout the range of integration.] CHAPTER VIII THE CONVERGENCE OF INFINITE SERIES AND INFINITE INTEGRALS 165. In Ch. IV we explained what was meant by saying that an infi- nite series is convergent, divergent, or oscillatory, and illustrated our def- initions by a few simple examples, mainly derived from the geometrical series 1 + x + x2 + . . . and other series closely connected with it. In this chapter we shall pursue the subject in a more systematic manner, and prove a number of theorems which enable us to determine when the simplest series which commonly occur in analysis are convergent. We shall often use the notation um + um+1 + · · · + un = nX m φ(ν), and write ∞P 0 un, or simply P un, for the infinite series u0 + u1 + u2 + ...* 166. Series of Positive Terms. The theory of the convergence of series is comparatively simple when all the terms of the series considered are positive. We shall consider such series first, not only because they are the easiest to deal with, but also because the discussion of the convergence *It is of course a matter of indifference whether we denote our series by u1 + u2 + . . . (as in Ch. IV) or by u0 + u1 + . . . (as here). Later in this chapter we shall be concerned with series of the type a0 + a1x + a2x2 + . . . : for these the latter notation is clearly more convenient. We shall therefore adopt this as our standard notation. But we shall not adhere to it systematically, and we shall suppose that u1 is the first term whenever this course is more convenient. It is more convenient, for example, when dealing with the series 1 + 1 2 + 1 3 + . . . , to suppose that un = 1/n and that the series begins with u1, than to suppose that un = 1/(n + 1) and that the series begins with u0. This remark applies, e.g., to Ex. lxviii. 4. Here and in what follows 'positive' is to be regarded as including zero. 382 [VIII : 168] THE CONVERGENCE OF INFINITE SERIES, ETC. 383 of a series containing negative or complex terms can often be made to depend upon a similar discussion of a series of positive terms only. When we are discussing the convergence or divergence of a series we may disregard any finite number of terms. Thus, when a series contains a finite number only of negative or complex terms, we may omit them and apply the theorems which follow to the remainder. 167. It will be well to recall the following fundamental theorems es- tablished in § 77. A. A series of positive terms must be convergent or diverge to ∞, and cannot oscillate. B. The necessary and sufficient condition that P un should be conver- gent is that there should be a number K such that u0 + u1 + · · · + un < K for all values of n. C. The comparison theorem. If P un is convergent, and vn ■ un for all values of n, then P vn is convergent, and P vn ■ P un. More generally, if vn ■ Kun, where K is a constant, then P vn is convergent and P vn ■ K P un. And if P un is divergent, and vn ■ Kun, thenP vn is divergent.* Moreover, in inferring the convergence or divergence of P vn by means of one of these tests, it is sufficient to know that the test is satisfied for sufficiently large values of n, i.e. for all values of n greater than a definite value n0. But of course the conclusion that P vn ■ K P un does not necessarily hold in this case. A particularly useful case of this theorem is D. If P un is convergent (divergent) and un/vn tends to a limit other than zero as n → ∞, then P vn is convergent (divergent). *The last part of this theorem was not actually stated in § 77, but the reader will have no difficulty in supplying the proof. [VIII : 168] THE CONVERGENCE OF INFINITE SERIES, ETC. 384 168. First applications of these tests. The one important fact which we know at present, as regards the convergence of any special class of series, is that P rn is convergent if r < 1 and divergent if r ■ 1.* It is therefore natural to try to apply Theorem C, taking un = rn. We at once find 1. The series P vn is convergent if vn ■ Krn, where r < 1, for all sufficiently large values of n. When K = 1, this condition may be written in the form v1/n n ■ r. Hence we obtain what is known as Cauchy's test for the convergence of a series of positive terms; viz. 2. The series P vn is convergent if v1/n n ■ r, where r < 1, for all sufficiently large values of n. There is a corresponding test for divergence, viz. 2a. The series P vn is divergent if v1/n n ■ 1 for an infinity of values of n. This hardly requires proof, for v1/n n ■ 1 involves vn ■ 1. The two theorems 2 and 2a are of very wide application, but for some purposes it is more convenient to use a different test of convergence, viz. 3. The series P vn is convergent if vn+1/vn ■ r, r < 1, for all suffi- ciently large values of n. To prove this we observe that if vn+1/vn ■ r when n ■ n0 then vn = vn vn–1 vn–1 vn–2 . . . vn0+1 vn0 vn0 ■ vn0 rn0 rn; and the result follows by

comparison with the convergent series P rn. This test is known as d'Alembert's test. We shall see later that it is less gen- eral, theoretically, than Cauchy's, in that Cauchy's test can be applied whenever d'Alembert's can, and sometimes when the latter cannot. More- over the test for divergence which corresponds to d'Alembert's test for convergence is much less general than the test given by Theorem 2a. It is true, as the reader will easily prove for himself, that if vn+1/vn ■ r ■ 1 for all values of n, or all sufficiently large values, then P vn is divergent. *We shall use r in this chapter to denote a number which is always positive or zero. [VIII : 168] THE CONVERGENCE OF INFINITE SERIES, ETC. 385 But it is not true (see Ex. lxvii. 9) that this is so if only vn+1/vn ■ r ■ 1 for an infinity of values of n, whereas in Theorem 2a our test had only to be satisfied for such an infinity of values. None the less d'Alembert's test is very useful in practice, because when vn is a complicated function vn+1/vn is often much less complicated and so easier to work with. In the simplest cases which occur in analysis it often happens that vn+1/vn or v1/n n tends to a limit as n → ∞.* When this limit is less than 1, it is evident that the conditions of Theorems 2 or 3 above are satisfied. Thus 4. If v1/n n or vn+1/vn tends to a limit less than unity as n → ∞, then the series P vn is convergent. It is almost obvious that if either function tend to a limit greater than unity, then P vn is divergent. We leave the formal proof of this as an exercise to the reader. But when v1/n n or vn+1/vn tends to 1 these tests generally fail completely, and they fail also when v1/n n or vn+1/vn oscillates in such a way that, while always less than 1, it assumes for an infinity of values of n values approaching indefinitely near to 1. And the tests which involve vn+1/vn fail even when that ratio oscillates so as to be sometimes less than and sometimes greater than 1. When v1/n n behaves in this way Theorem 2a is sufficient to prove the divergence of the series. But it is clear that there is a wide margin of cases in which some more subtle tests will be needed. Examples LXVII. 1. Apply Cauchy's and d'Alembert's tests (as spe- cialised in 4 above) to the series P nkrn, where k is a positive rational number. [Here vn+1/vn = {(n + 1)/n}kr → r, so that d'Alembert's test shows at once that the series is convergent if r < 1 and divergent if r > 1. The test fails if r = 1: but the series is then obviously divergent. Since lim n1/n = 1 (Ex. xxvii. 11), Cauchy's test leads at once to the same conclusions.] 2. Consider the series P(Ank + Bnk–1 + · · · + K)rn. [We may suppose A positive. If the coefficient of rn is denoted by P (n), then P (n)/nk → A and, by *It will be proved in Ch. IX (Ex. lxxxvii. 36) that if vn+1/vn → l then v1/n n → l. That the converse is not true may be seen by supposing that vn = 1 when n is odd and vn = 2 when n is even. [VIII : 168] THE CONVERGENCE OF INFINITE SERIES, ETC. 386 D of § 167, the series behaves like P nkrn.] 3. Consider X Ank + Bnk–1 + · · · + K αnl + βnl–1 + · · · + κ rn (A > 0, α > 0). [The series behaves like P nk–lrn. The case in which r = 1, k < l requires further consideration.] 4. We have seen (Ch. IV, Misc. Ex. 17) that the series X 1 n(n + 1) , X 1 n(n + 1) . . . (n + p) are convergent. Show that Cauchy's and d'Alembert's tests both fail when applied to them. [For lim u1/n n = lim(un+1/un) = 1.] 5. Show that the series P n–p, where p is an integer not less than 2, is convergent. [Since lim{n(n + 1) . . . (n + p – 1)}/np = 1, this follows from the convergence of the series considered in Ex. 4. It has already been shown in § 77, (7) that the series is divergent if p = 1, and it is obviously divergent if p ■ 0.] 6. Show that the series X Ank + Bnk–1 + · · · + K αnl + βnl–1 + · · · + κ is convergent if l > k + 1 and divergent if l ■ k + 1. 7. If mn is a positive integer, and mn+1 > mn, then the series P rmn is convergent if r < 1 and divergent if r ■ 1. For example the series 1 + r + r4 + r9 + . . . is convergent if r < 1 and divergent if r ■ 1. 8. Sum the series 1 + 2r + 2r4 + . . . to 24 places of decimals when r = .1 and to 2 places when r = .9. [If r = .1, then the first 5 terms give the sum 1.200 200 002 000 000 2, and the error is 2r25 + 2r36 + · · · < 2r25 + 2r36 + 2r47 + · · · = 2r25/(1 – r11) < 3/1025. If r = .9, then the first 8 terms give the sum 5.458 . . . , and the error is less than 2r64/(1 – r17) < .003.] [VIII : 169] THE CONVERGENCE OF INFINITE SERIES, ETC. 387 9. If 0 < a < b < 1, then the series a + b + a2 + b2 + a3 + . . . is convergent. Show that Cauchy's test may be applied to this series, but that d'Alembert's test fails. [For v2n+1/v2n = (b/a)n+1 → ∞, v2n+2/v2n+1 = b(a/b)n+2 → 0.] 10. The series 1 + r + r2 2! + r3 3! + . . . and 1 + r + r2 22 + r3 33 + . . . are convergent for all positive values of r. 11. If P un is convergent then so are P u2 n and P un/(1 + un). 12. If P u2 n is convergent then so is P un/n. [For 2un/n ■ u2 n + (1/n2) andP(1/n2) is convergent.] 13. Show that 1 + 1 32 + 1 52 + · · · = 3 4

1 + 1 22 + 1 32 + . . .

and 1 + 1 22 + 1 32 + 1 52 + 1 62 + 1 72 + 1 92 + · · · = 15 16

1 + 1 22 + 1 32 + . . .

. [To prove the first result we note that 1 + 1 22 + 1 32 + . . . =

1 + 1 22

+ 1 32 + 1 42

+ . . . = 1 + 1 32 + 1 52 + · · · + 1 22

1 + 1 22 + 1 32 + . . .

, by theorems (8) and (6) of § 77.] 14. Prove by a reductio ad absurdum that P(1/n) is divergent. [If the series were convergent we should have, by the argument used in Ex. 13, 1 + 1 2 + 1 3 + · · · = (1 + 1 3 + 1 5 + . . .) + 1 2 (1 + 1 2 + 1 3 + . . .), or 1 2 + 1 4 + 1 6 + · · · = 1 + 1 3 + 1 5 + . . . which is obviously absurd, since every term of the first series is less than the corresponding term of the second.] [VIII : 170] THE CONVERGENCE OF INFINITE SERIES, ETC. 388 169. Before proceeding further in the investigation of tests of con- vergence and divergence, we shall prove an important general theorem concerning series of positive terms. Dirichlet's Theorem.* The sum of a series of positive terms is the same in whatever order the terms are taken. This theorem asserts that if we have a convergent series of positive terms, u0 + u1 + u2 + . . . say, and form any other series v0 + v1 + v2 + . . . out of the same terms, by taking them in any new order, then the second series is convergent and has the same sum as the first. Of course no terms must be omitted: every u must come somewhere among the v′s, and vice versa. The proof is extremely simple. Let s be the sum of the series of u′s. Then the sum of any number of terms, selected from the u′s, is not greater than s. But every v is a u, and therefore the sum of any number of terms selected from the v′s is not greater than s. Hence P vn is convergent, and its sum t is not greater than s. But we can show in exactly the same way that s ■ t. Thus s = t. 170. Multiplication of Series of Positive Terms. An immediate corollary from Dirichlet's Theorem is the following theorem: if u0 + u1 + u2 + . . . and v0 + v1 + v2 + . . . are two convergent series of positive terms, and s and t are their respective sums, then the series u0v0 + (u1v0 + u0v1) + (u2v0 + u1v1 + u0v2) + . . . is convergent and has the sum st. *This theorem seems to have first been stated explicitly by Dirichlet in 1837. It was no doubt known to earlier writers, and in particular to Cauchy. [VIII : 170] THE CONVERGENCE OF INFINITE SERIES, ETC. 389 Arrange all the possible products of pairs umvn in the form of a doubly infinite array u0v0 u1v0 u2v0 u3v0 . . . u0v1 u1v1 u2v1 u3v1 . . . u0v2 u1v2 u2v2 u3v2 . . . u0v3 u1v3 u2v3 u3v3 . . . . . We can rearrange these terms in the form of a simply infinite series in a variety of ways. Among these are the following. (1) We begin with the single term u0v0 for which m + n = 0; then we take the two terms u1v0, u0v1 for which m + n = 1; then the three terms u2v0, u1v1, u0v2 for which m + n = 2; and so on. We thus obtain the series u0v0 + (u1v0 + u0v1) + (u2v0 + u1v1 + u0v2) + . . . of the theorem. (2) We begin with the single term u0v0 for which both suffixes are zero; then we take the terms u1v0, u1v1, u0v1 which involve a suffix 1 but no higher suffix; then the terms u2v0, u2v1, u2v2, u1v2, u0v2 which involve a suffix 2 but no higher suffix; and so on. The sums of these groups of terms are respectively equal to u0v0, (u0 + u1)(v0 + v1) – u0v0, (u0 + u1 + u2)(v0 + v1 + v2) – (u0 + u1)(v0 + v1), . . . and the sum of the first n + 1 groups is (u0 + u1 + · · · + un)(v0 + v1 + · · · + vn), and tends to st as n → ∞. When the sum of the series is formed in this manner the sum of the first one, two, three, . . . groups comprises all the terms in the first, second, third, . . . rectangles indicated in the diagram above. The sum of the series formed in the second manner is st. But the first series is (when the brackets are removed) a rearrangement of the second; and therefore, by Dirichlet's Theorem, it converges to the sum st. Thus the theorem is proved. [VIII : 171] THE CONVERGENCE OF INFINITE SERIES, ETC. 390 Examples LXVIII. 1. Verify that if r < 1 then 1 + r2 + r + r4 + r6 + r3 + · · · = 1 + r + r3 + r2 + r5 + r7 + · · · = 1/(1 – r). 2.* If either of the series u0 + u1 + . . . , v0 + v1 + . . . is divergent, then so is the series u0v0 + (u1v0 + u0v1) + (u2v0 + u1v1 + u0v2) + . . . , except in the trivial case in which every term of one series is zero. 3. If the series u0 + u1 + . . . , v0 + v1 + . . . , w0 + w1 + . . . converge to sums r, s, t, then the series P λk, where λk = P umvnwp, the summation being extended to all sets of values of m, n, p such that m + n + p = k, converges to the sum rst. 4. If P un and P vn converge to sums s and t, then the series P wn, where wn = P ulvm, the summation extending to all pairs l, m for which lm = n, converges to the sum st. 171. Further tests for convergence and divergence. The exam- ples on pp. 385–387 suffice to show that there are simple and interesting types of series of positive terms which cannot be dealt with by the general tests of § 168. In fact, if we consider the simplest type of series, in which un+1/un tends to a limit as n → ∞, the tests of § 168 generally fail when this limit is 1. Thus in Ex. lxvii. 5 these tests failed, and we had to fall back upon a special device, which was in essence that of using the series of Ex. lxvii. 4 as our comparison series, instead of the geometric series. The fact is that the geometric series, by comparison with which the tests of § 168 were obtained, is not only convergent but very rapidly convergent, far more rapidly than is necessary in order to ensure convergence. The tests derived from comparison with it are therefore naturally very crude, and much more delicate tests are often wanted. We proved in Ex. xxvii. 7 that nkrn → 0 as n → ∞, provided r < 1, whatever value k may have; and in Ex. lxvii. 1 we proved more than this, viz. that the series P nkrn is convergent. It follows that the sequence r, r2, r3, . . . , rn, . . . , where r < 1, diminishes more rapidly than the sequence 1–k, 2–k, 3–k, . . . , n–k, ... This seems at first paradoxical if r is not much less than unity, and k is large. Thus of the two sequences 2 3 , 4 9 , 8 27 , . . . ; 1, 1 4096 , 1 531,441 , . . . [VIII : 172] THE CONVERGENCE OF INFINITE SERIES, ETC. 391 whose general terms are (2 3)n and n–12, the second seems at first sight to decrease far more rapidly. But this is far from being the case; if only we go far enough into the sequences we shall find the terms of the first sequence very much the smaller. For example, (2/3)4 = 16/81 < 1/5, (2/3)12 < (1/5)3 < (1/10)2, (2/3)1000 < (1/10)166, while 1000–12 = 10–36; so that the 1000th term of the first sequence is less than the 10130th part of the corresponding term of the second sequence. Thus the series P(2/3)n is far more rapidly convergent than the series P n–12, and even this series is very much more rapidly convergent than P n–2.* 172. We shall proceed to establish two further tests for the con- vergence or divergence of

series of positive terms, Maclaurin's (or Cauchy's) Integral Test and Cauchy's Condensation Test, which, though very far from being completely general, are sufficiently general for our needs in this chapter. In applying either of these tests we make a further assumption as to the nature of the function un, about which we have so far assumed only that it is positive. We assume that un decreases steadily with n: i.e. that un+1 ■ un for all values of n, or at any rate all sufficiently large values. This condition is satisfied in all the most important cases. From one point of view it may be regarded as no restriction at all, so long as we are dealing with series of positive terms: for in virtue of Dirichlet's theorem above we may rearrange the terms without affecting the question of convergence or divergence; and there is nothing to prevent us rearranging the terms in descending order of magnitude, and applying our tests to the series of decreasing terms thus obtained. *Five terms suffice to give the sum of P n–12 correctly to 7 places of decimals, whereas some 10,000,000 are needed to give an equally good approximation to P n–2. A large number of numerical results of this character will be found in Appendix III (compiled by Mr J. Jackson) to the author's tract 'Orders of Infinity' (Cambridge Math. Tracts, No. 12). [VIII : 173] THE CONVERGENCE OF INFINITE SERIES, ETC. 392 But before we proceed to the statement of these two tests, we shall state and prove a simple and important theorem, which we shall call Abel's Theorem.* This is a one-sided theorem in that it gives a sufficient test for divergence only and not for convergence, but it is essentially of a more elementary character than the two theorems mentioned above. 173. Abel's (or Pringsheim's) Theorem. If P un is a convergent series of positive and decreasing terms, then lim nun = 0. Suppose that nun does not tend to zero. Then it is possible to find a positive number δ such that nun ■ δ for an infinity of values of n. Let n1 be the first such value of n; n2 the next such value of n which is more than twice as large as n1; n3 the next such value of n which is more than twice as large as n2; and so on. Then we have a sequence of numbers n1, n2, n3, . . . such that n2 > 2n1, n3 > 2n2, . . . and so n2 – n1 > 1 2 n2, n3 – n2 > 1 2 n3, . . . ; and also n1un1 ■ δ, n2un2 ■ δ, ... But, since un decreases as n increases, we have u0 + u1 + · · · + un1–1 ■ n1un1 ■ δ, un1 + · · · + un2–1 ■ (n2 – n1)un2 > 1 2 n2un2 ■ 1 2 δ, un2 + · · · + un3–1 ■ (n3 – n2)un3 > 1 2 n3un3 ■ 1 2 δ, and so on. Thus we can bracket the terms of the series P un so as to obtain a new series whose terms are severally greater than those of the divergent series δ + 1 2 δ + 1 2 δ + . . . ; and therefore P un is divergent. Examples LXIX. 1. Use Abel's theorem to show that P(1/n) andP{1/(an + b)} are divergent. [Here nun → 1 or nun → 1/a.] 2. Show that Abel's theorem is not true if we omit the condition that un decreases as n increases. [The series 1 + 1 22 + 1 32 + 1 4 + 1 52 + 1 62 + 1 72 + 1 82 + 1 9 + 1 102 + . . . , *This theorem was discovered by Abel but forgotten, and rediscovered by Pring- sheim. [VIII : 174] THE CONVERGENCE OF INFINITE SERIES, ETC. 393 in which un = 1/n or 1/n2, according as n is or is not a perfect square, is convergent, since it may be rearranged in the form 1 22 + 1 32 + 1 52 + 1 62 + 1 72 + 1 82 + 1 102 + · · · +

1 + 1 4 + 1 9 + . . .

, and each of these series is convergent. But, since nun = 1 whenever n is a perfect square, it is clearly not true that nun → 0.] 3. The converse of Abel's theorem is not true, i.e. it is not true that, if un decreases with n and lim nun = 0, then P un is convergent. [Take the series P(1/n) and multiply the first term by 1, the second by 1 2 , the next two by 1 3 , the next four by 1 4 , the next eight by 1 5 , and so on. On grouping in brackets the terms of the new series thus formed we obtain 1 + 1 2 · 1 2 + 1 3 1 3 + 1 4 + 1 4 1 5 + 1 6 + 1 7 + 1 8 + . . . ; and this series is divergent, since its terms are greater than those of 1 + 1 2 · 1 2 + 1 3 · 1 2 + 1 4 · 1 2 + . . . , which is divergent. But it is easy to see that the terms of the series 1 + 1 2 · 1 2 + 1 3 · 1 3 + 1 3 · 1 4 + 1 4 · 1 5 + 1 4 · 1 6 + . . . satisfy the condition that nun → 0. In fact nun = 1/ν if 2ν–2 < n ■ 2ν–1, and ν → ∞ as n → ∞.] 174. Maclaurin's (or Cauchy's) Integral Test.* If un decreases steadily as n increases, we can write un = φ(n) and suppose that φ(n) is the value assumed, when x = n, by a continuous and steadily decreasing function φ(x) of the continuous variable x. Then, If ν is any positive integer, we have φ(ν – 1) ■ φ(x) ■ φ(ν) when ν – 1 ■ x ■ ν. Let vν = φ(ν – 1) – Z ν ν–1 φ(x) dx = Z ν ν–1 {φ(ν – 1) – φ(x)} dx, *The test was discovered by Maclaurin and rediscovered by Cauchy, to whom it is usually attributed. [VIII : 174] THE CONVERGENCE OF INFINITE SERIES, ETC. 394 so that 0 ■ vν ■ φ(ν – 1) – φ(ν). Then P vν is a series of positive terms, and v2 + v3 + · · · + vn ■ φ(1) – φ(n) ■ φ(1). Hence P vν is convergent, and so v2 + v3 + · · · + vn or n–1X 1 φ(ν) – Z n 1 φ(x) dx tends to a positive limit as n → ∞. Let us write Φ(ξ) = Z ξ 1 φ(x) dx, so that Φ(ξ) is a continuous and steadily increasing function of ξ. Then u1 + u2 + · · · + un–1 – Φ(n) tends to a positive limit, not greater than φ(1), as n → ∞. Hence P uν is convergent or divergent according as Φ(n) tends to a limit or to infin- ity as n → ∞, and therefore, since Φ(n) increases steadily, according as Φ(ξ) tends to a limit or to infinity as ξ → ∞. Hence if φ(x) is a function of x which is positive and continuous for all values of x greater than unity, and decreases steadily as x increases, then the series φ(1) + φ(2) + . . . does or does not converge according as Φ(ξ) = Z ξ 1 φ(x) dx does or does not tend to a limit l as ξ → ∞; and, in the first case, the sum of the series is not greater than φ(1) + l. The sum must in fact be less than φ(1) + l. For it follows from (6) of § 160, and Ch. VII, Misc. Ex. 41, that vν < φ(ν – 1) – φ(ν), unless φ(x) = φ(ν) throughout the interval [ν – 1, ν]; and this cannot be true for all values of ν. [VIII : 175] THE CONVERGENCE OF INFINITE SERIES, ETC. 395 Examples LXX. 1. Prove that ∞X 1 1 n2 + 1 < 1 2 + 1 4 π. 2. Prove that – 1 2 π < ∞X 1 a a2 + n2 < 1 2 π. (Math. Trip. 1909.) 3. Prove that if m > 0 then 1 m2 + 1

(m + 1)2 + 1 (m + 2)2 + · · · < m + 1 m . 175. The series P n–s. By far the most important application of the Integral Test is to the series 1–s + 2–s + 3–s + · · · + n–s + . . . , where s is any rational number. We have seen already (§ 77 and Exs. lxvii. 14, lxix. 1) that the series is divergent when s = 1. If s ■ 0 then it is obvious that the series is divergent. If s > 0 then un decreases as n increases, and we can apply the test. Here Φ(ξ) = Z ξ 1 dx xs = ξ1–s – 1 1 – s , unless s = 1. If s > 1 then ξ1–s → 0 as ξ → ∞, and Φ(ξ) → 1 (s – 1) = l, say. And if s < 1 then ξ1–s → ∞ as ξ → ∞, and so Φ(ξ) → ∞. Thus the series P n–s is convergent if s > 1, divergent if s ■ 1, and in the first case its sum is less than s/(s – 1). [VIII : 175] THE CONVERGENCE OF INFINITE SERIES, ETC. 396 So far as divergence for s < 1 is concerned, this result might have been derived at once from comparison with P(1/n), which we already know to be divergent. It is however interesting to see how the Integral Test may be applied to the series P(1/n), when the preceding analysis fails. In this case Φ(ξ) = Z ξ 1 dx x , and it is easy to see that Φ(ξ) → ∞ as ξ → ∞. For if ξ > 2n then Φ(ξ) > Z 2n 1 dx x = Z 2 1 dx x + Z 4 2 dx x + · · · + Z 2n 2n–1 dx x . But by putting x = 2ru we obtain Z 2r+1 2r dx x = Z 2 1 du u , and so Φ(ξ) > n Z 2 1 du u , which shows that Φ(ξ) → ∞ as ξ → ∞. Examples LXXI. 1. Prove by an argument similar to that used above, and without integration, that Φ(ξ) = Z ξ 1 dx xs , where s < 1, tends to infinity with ξ. 2. The series P n–2, P n–3/2, P n–11/10 are convergent, and their sums are not greater than 2, 3, 11 respectively. The series P n–1/2, P n–10/11 are divergent. 3. The series P ns/(nt + a), where a > 0, is convergent or divergent ac- cording as t > 1 + s or t ■ 1 + s. [Compare with P ns–t.] 4. Discuss the convergence or divergence of the series P(a1ns1 + a2ns2 + · · · + aknsk)/(b1nt1 + b2nt2 + · · · + blntl), where all the letters denote positive numbers and the s's and t's are rational and arranged in descending order of magnitude. [VIII : 176] THE CONVERGENCE OF INFINITE SERIES, ETC. 397 5. Prove that 2√n – 2 < 1 √1 + 1 √2 + · · · + 1 √n < 2√n – 1, 1 2 π < 1 2√1 + 1 3√2 + 1 4√3 + · · · < 1 2 (π + 1). (Math. Trip. 1911.) 6. If φ(n) → l > 1 then the series P n–φ(n) is convergent. If φ(n) → l < 1 then it is divergent. 176. Cauchy's Condensation Test. The second of the two tests mentioned in § 172 is as follows: if un = φ(n) is a decreasing function of n, then the series P φ(n) is convergent or divergent according as P 2nφ(2n) is convergent or divergent. We can prove this by an argument which we have used already (§ 77) in the special case of the series P(1/n). In the first place φ(3) + φ(4) ■ 2φ(4), φ(5) + φ(6) + · · · + φ(8) ■ 4φ(8), ... φ(2n + 1) + φ(2n + 2) + · · · + φ(2n+1) ■ 2nφ(2n+1). If P 2nφ(2n) diverges then so do P 2n+1φ(2n+1) and P 2nφ(2n+1), and then the inequalities just obtained show that P φ(n) diverges. On the other hand φ(2) + φ(3) ■ 2φ(2), φ(4) + φ(5) + · · · + φ(7) ■ 4φ(4), and so on. And from this set of inequalities it follows that if P 2nφ(2n) converges then so does P φ(n). Thus the theorem is established. For our present purposes the field of application of this test is practically the same as that of the Integral Test. It enables us to discuss the seriesP n–s with equal ease. For P n–s will converge or diverge according asP 2n2–ns converges or diverges, i.e. according as s > 1 or s ■ 1. [VIII : 177] THE CONVERGENCE OF INFINITE SERIES, ETC. 398 Examples LXXII. 1. Show that if a is any positive integer greater than 1 then P φ(n) is convergent or divergent according as P anφ(an) is con- vergent or divergent. [Use the same arguments as above, taking groups of a, a2, a3, . . . terms.] 2. If P 2nφ(2n) converges then it is obvious that lim 2nφ(2n) = 0. Hence deduce Abel's Theorem of § 173. 177. Infinite Integrals. The Integral Test of § 174 shows that, if φ(x) is a positive and decreasing function of x, then the series P φ(n) is convergent or divergent according as the integral function Φ(x) does or does not tend to a limit as x → ∞. Let us suppose that it does tend to a limit, and that lim x→∞ Z x 1 φ(t) dt = l. Then we shall say that the integral Z ∞ 1 φ(t) dt is convergent, and has the value l; and we shall call the integral an infi- nite integral. So far we have supposed φ(t) positive and decreasing. But it is natural to extend our definition to other cases. Nor is there any special point in supposing the lower limit to be unity. We are accordingly led to formulate the following definition: If φ(t) is a function of t continuous when t ■ a, and lim x→∞ Z x a φ(t) dt = l, then we shall say that the infinite integral Z ∞ a φ(t) dt (1) is convergent and has the value l. [VIII : 177] THE CONVERGENCE OF INFINITE SERIES, ETC. 399 The ordinary integral between limits a and A, as defined in Ch. VII, we shall sometimes call in contrast a finite integral. On the other hand, when Z x a φ(t) dt → ∞, we shall say that the integral diverges to ∞, and we can give a similar definition of divergence to –∞. Finally, when none of these alternatives occur, we shall say that the integral oscillates, finitely or infinitely, as x → ∞. These definitions suggest the following remarks. (i) If we write Z x a φ(t) dt = Φ(x), then the integral converges, diverges, or oscillates according as Φ(x) tends to a limit, tends to ∞ (or to –∞), or oscillates, as x → ∞. If Φ(x) tends to a limit, which we may denote by Φ(∞), then the value of the integral is Φ(∞). More generally, if Φ(x) is any integral function of φ(x), then the value of the integral is Φ(∞) – Φ(a). (ii) In the special case in which φ(t) is always positive it is clear that Φ(x) is an increasing function of x. Hence the only alternatives are convergence and divergence to ∞. (iii) The integral (1) of course depends on a, but is quite independent of t, and is in no way altered by the substitution of any other letter for t (cf. § 157). (iv) Of course the reader will not be puzzled by the use of the term infinite integral to denote something which has a definite value such as 2 or 1 2 π. The distinction between an infinite integral and a finite integral is similar to that between an infinite series and a finite series: no one supposes that an infinite series is necessarily divergent. (v) The integral Z x a φ(t) dt was defined in §§ 156 and 157 as a simple limit, i.e. the limit of a certain finite sum. The infinite integral is therefore the limit of a limit, or what is known as a repeated limit. The notion of the infinite integral is in fact essentially more complex than that of the finite integral, of which it is a development. [VIII : 178] THE

CONVERGENCE OF INFINITE SERIES, ETC. 400 (vi) The Integral Test of § 174 may now be stated in the form: if φ(x) is positive and steadily decreases as x increases, then the infinite series P φ(n) and the infinite integral Z ∞ 1 φ(x) dx converge or diverge together. (vii) The reader will find no difficulty in formulating and proving theorems for infinite integrals analogous to those stated in (1)–(6) of § 77. Thus the result analogous to (2) is that if Z ∞ a φ(x) dx is convergent, and b > a, then Z ∞ b φ(x) dx is convergent and Z ∞ a φ(x) dx = Z b a φ(x) dx + Z ∞ b φ(x) dx. 178. The case in which φ(x) is positive. It is natural to consider what are the general theorems, concerning the convergence or divergence of the infinite integral (1) of § 177, analogous to theorems A–D of § 167. That A is true of integrals as well as of series we have already seen in § 177, (ii). Corresponding to B we have the theorem that the necessary and sufficient condition for the convergence of the integral (1) is that it should be possible to find a constant K such that Z x a φ(t) dt < K for all values of x greater than a. Similarly, corresponding to C, we have the theorem: if Z ∞ a φ(x) dx is convergent, and ψ(x) ■ Kφ(x) for all values of x greater than a, thenZ ∞ a ψ(x) dx is convergent and Z ∞ a ψ(x) dx ■ K Z ∞ a φ(x) dx. We leave it to the reader to formulate the corresponding test for divergence. We may observe that d'Alembert's test (§ 168), depending as it does on the notion of successive terms, has no analogue for integrals; and that the [VIII : 178] THE CONVERGENCE OF INFINITE SERIES, ETC. 401 analogue of Cauchy's test is not of much importance, and in any case could only be formulated when we have investigated in greater detail the theory of the function φ(x) = rx, as we shall do in Ch. IX. The most important special tests are obtained by comparison with the integral Z ∞ a dx xs (a > 0), whose convergence or divergence we have investigated in § 175, and are as follows: if φ(x) < Kx–s, where s > 1, when x ■ a, then Z ∞ a φ(x) dx is convergent; and if φ(x) > Kx–s, where s ■ 1, when x ■ a, then the integral is divergent; and in particular, if lim xsφ(x) = l, where l > 0, then the integral is convergent or divergent according as s > 1 or s ■ 1. There is one fundamental property of a convergent infinite series in regard to which the analogy between infinite series and infinite integrals breaks down. If P φ(n) is convergent then φ(n) → 0; but it is not always true, even when φ(x) is always positive, that if Z ∞ a φ(x) dx is convergent then φ(x) → 0. Consider for example the function φ(x) whose graph is indicated by the thick line in the figure. Here the height of the peaks corresponding to the points x = 1, 2, 3, . . . is in each case unity, and the breadth of the peak corresponding to x = n is 2/(n + 1)2. The area of the peak is 1/(n + 1)2, and it is evident that,0 X Y 1 2 3 Fig. 50. for any value of ξ, Z ξ 0 φ(x) dx < ∞X 0 1 (n + 1)2 , [VIII : 178] THE CONVERGENCE OF INFINITE SERIES, ETC. 402 so that Z ∞ 0 φ(x) dx is convergent; but it is not true that φ(x) → 0. Examples LXXIII. 1. The integral Z ∞ a αxr + βxr–1 + · · · + λ Axs + Bxs–1 + · · · + L dx, where α and A are positive and a is greater than the greatest root of the de- nominator, is convergent if s > r + 1 and otherwise divergent. 2. Which of the integrals Z ∞ a dx √x , Z ∞ a dx x4/3 , Z ∞ a dx c2 + x2 , Z ∞ a x dx c2 + x2 , Z ∞ a x2 dx c2 + x2 , Z ∞ a x2 dx α + 2βx2 + γx4 are convergent? In the first two integrals it is supposed that a > 0, and in the last that a is greater than the greatest root (if any) of the denominator. 3. The integrals Z ξ a cos x dx, Z ξ a sin x dx, Z ξ a cos(αx + β) dx oscillate finitely as ξ → ∞. 4. The integrals Z ξ a x cos x dx, Z ξ a x2 sin x dx Z ξ a xn cos(αx + β) dx, where n is any positive integer, oscillate infinitely as ξ → ∞. 5. Integrals to –∞. If Z a ξ φ(x) dx tends to a limit l as ξ → –∞, then we say that Z a –∞ φ(x) dx is convergent and equal to l. Such integrals possess properties in every respect analogous to those of the integrals discussed in the preceding sections: the reader will find no difficulty in formulating them. 6. Integrals from –∞ to +∞. If the integrals Z a –∞ φ(x) dx, Z ∞ a φ(x) dx [VIII : 179] THE CONVERGENCE OF INFINITE SERIES, ETC. 403 are both convergent, and have the values k, l respectively, then we say that Z ∞ –∞ φ(x) dx is convergent and has the value k + l. 7. Prove that Z 0 –∞ dx 1 + x2 = Z ∞ 0 dx 1 + x2 = 1 2 Z ∞ –∞ dx 1 + x2 = 1 2 π. 8. Prove generally that Z ∞ –∞ φ(x2) dx = 2 Z ∞ 0 φ(x2) dx, provided that the integral Z ∞ 0 φ(x2) dx is convergent. 9. Prove that if Z ∞ 0 xφ(x2) dx is convergent then Z ∞ –∞ xφ(x2) dx = 0. 10. Analogue of Abel's Theorem of § 173. If φ(x) is positive and steadily decreases, and Z ∞ a φ(x) dx is convergent, then xφ(x) → 0. Prove this (a) by means of Abel's Theorem and the Integral Test and (b) directly, by arguments analogous to those of § 173. 11. If a = x0 < x1 < x2 < . . . and xn → ∞, and un = Z xn+1 xn φ(x) dx, then the convergence of Z ∞ a φ(x) dx involves that of P un. If φ(x) is always positive the converse statement is also true. [That the converse is not true in general is shown by the example in which φ(x) = cos x, xn = nπ.] 179. Application to infinite integrals of the rules for substitu- tion and integration by parts. The rules for the transformation of a definite integral which were discussed in § 161 may be extended so as to apply to infinite integrals. (1) Transformation by substitution. Suppose that Z ∞ a φ(x) dx (1) [VIII : 179] THE CONVERGENCE OF INFINITE SERIES, ETC. 404 is convergent. Further suppose that, for any value of ξ greater than a, we have, as in § 161, Z ξ a φ(x) dx = Z τ b φ{f (t)}f ′(t) dt, (2) where a = f (b), ξ = f (τ). Finally suppose that the functional relation x = f (t) is such that x → ∞ as t → ∞. Then, making τ and so ξ tend to ∞ in (2), we see that the integral Z ∞ b φ{f (t)}f ′(t) dt (3) is convergent and equal to the integral (1). On the other hand it may happen that ξ → ∞ as τ → –∞ or as τ → c. In the first case we obtain Z ∞ a φ(x) dx = lim τ →–∞ Z τ b φ{f (t)}f ′(t) dt = – lim τ →–∞ Z b τ φ{f (t)}f ′(t) dt = – Z b –∞ φ{f (t)}f ′(t) dt. In the second case we obtain Z ∞ a φ(x) dx = lim τ →c Z τ b φ{f (t)}f ′(t) dt. (4) We shall return to this equation in § 181. There are of course corresponding results for the integrals Z a –∞ φ(x) dx, Z ∞ –∞ φ(x) dx, which it is not worth while to set out in detail: the reader will be able to formulate them for himself. [VIII : 179] THE CONVERGENCE OF INFINITE SERIES, ETC. 405 Examples LXXIV. 1. Show, by means of the substitution x = tα, that if s > 1 and α > 0 then Z ∞ 1 x–s dx = α Z ∞

1 tα(1–s)–1 dt; and verify the result by calculating the value of each integral directly. 2. If Z ∞ a φ(x) dx is convergent then it is equal to one or other of α Z ∞ (a–β)/α φ(αt + β) dt, – α Z (a–β)/α –∞ φ(αt + β) dt, according as α is positive or negative. 3. If φ(x) is a positive and steadily decreasing function of x, and α and β are any positive numbers, then the convergence of the series P φ(n) implies and is implied by that of the series P φ(αn + β). [It follows at once, on making the substitution x = αt + β, that the integrals Z ∞ a φ(x) dx, Z ∞ (a–β)/α φ(αt + β) dt converge or diverge together. Now use the Integral Test.] 4. Show that Z ∞ 1 dx (1 + x)√x = 1 2 π. [Put x = t2.] 5. Show that Z ∞ 0 √x (1 + x)2 dx = 1 2 π. [Put x = t2 and integrate by parts.] 6. If φ(x) → h as x → ∞, and φ(x) → k as x → –∞, then Z ∞ –∞ {φ(x – a) – φ(x – b)} dx = –(a – b)(h – k). [VIII : 179] THE CONVERGENCE OF INFINITE SERIES, ETC. 406 [For Z ξ –ξ′ {φ(x – a) – φ(x – b)} dx = Z ξ –ξ′ φ(x – a) dx – Z ξ –ξ′ φ(x – b) dx = Z ξ–a –ξ′–a φ(t) dt – Z ξ–b –ξ′–b φ(t) dt = Z –ξ′–b –ξ′–a φ(t) dt – Z ξ–b ξ–a φ(t) dt. The first of these two integrals may be expressed in the form (a – b)k + Z –ξ′–b –ξ′–a ρ dt, where ρ → 0 as ξ′ → ∞, and the modulus of the last integral is less than or equal to |a – b|κ, where κ is the greatest value of ρ throughout the interval [–ξ′ – a, –ξ′ – b]. Hence Z –ξ′–b –ξ′–a φ(t) dt → (a – b)k. The second integral may be discussed similarly.] (2) Integration by parts. The formula for integration by parts (§ 161) is Z ξ a f (x)φ′(x) dx = f (ξ)φ(ξ) – f (a)φ(a) – Z ξ a f ′(x)φ(x) dx. Suppose now that ξ → ∞. Then if any two of the three terms in the above equation which involve ξ tend to limits, so does the third, and we obtain the result Z ∞ a f (x)φ′(x) dx = lim ξ→∞ f (ξ)φ(ξ) – f (a)φ(a) – Z ∞ a f ′(x)φ(x) dx. There are of course similar results for integrals to –∞, or from –∞ to ∞. [VIII : 180] THE CONVERGENCE OF INFINITE SERIES, ETC. 407 Examples LXXV. 1. Show that Z ∞ 0 x (1 + x)3 dx = 1 2 Z ∞ 0 dx (1 + x)2 = 1 2 . 2. Z ∞ 0 x2 (1 + x)4 dx = 2 3 Z ∞ 0 x (1 + x)3 dx = 1 3 . 3. If m and n are positive integers, and Im,n = Z ∞ 0 xm dx (1 + x)m+n , then Im,n = {m/(m + n – 1)}Im–1,n. Hence prove that Im,n = m! (n – 2)!/(m + n – 1)!. 4. Show similarly that if Im,n = Z ∞ 0 x2m+1 dx (1 + x2)m+n then Im,n = {m/(m + n – 1)}Im–1,n, 2Im,n = m! (n – 2)!/(m + n – 1)!. Verify the result by applying the substitution x = t2 to the result of Ex. 3. 180. Other types of infinite integrals. It was assumed, in the definition of the ordinary or finite integral given in Ch. VII, that (1) the range of integration is finite and (2) the subject of integration is continuous. It is possible, however, to extend the notion of the ‘definite integral’ so as to apply to many cases in which these conditions are not satisfied. The ‘infinite’ integrals which we have discussed in the preceding sections, for example, differ from those of Ch. VII in that the range of integration is infinite. We shall now suppose that it is the second of the conditions (1), (2) that is not satisfied. It is natural to try to frame definitions applicable to some such cases at any rate. There is only one such case which we shall consider here. We shall suppose that φ(x) is continuous throughout the [VIII : 180] THE CONVERGENCE OF INFINITE SERIES, ETC. 408 range of integration [a, A] except for a finite number of values of x, say x = ξ1, ξ2, . . . , and that φ(x) → ∞ or φ(x) → –∞ as x tends to any of these exceptional values from either side. It is evident that we need only consider the case in which [a, A] contains one such point ξ. When there is more than one such point we can divide up [a, A] into a finite number of sub-intervals each of which contains only one; and, if the value of the integral over each of these sub-intervals has been defined, we can then define the integral over the whole interval as being the sum of the integrals over each sub-interval. Further, we can suppose that the one point ξ in [a, A] comes at one or other of the limits a, A. For, if it comes between a and A, we can then define Z A a φ(x) dx as Z ξ a φ(x) dx + Z A ξ φ(x) dx, assuming each of these integrals to have been satisfactorily defined. We shall suppose, then, that ξ = a; it is evident that the definitions to which we are led will apply, with trifling changes, to the case in which ξ = A. Let us then suppose φ(x) to be continuous throughout [a, A] except for x = a, while φ(x) → ∞ as x → a through values greater than a. A typical example of such a function is given by φ(x) = (x – a)–s, where s > 0; or, in particular, if a = 0, by φ(x) = x–s. Let us therefore consider how we can define Z A 0 dx xs , (1) when s > 0. The integral Z ∞ 1/A ys–2 dy is convergent if s < 1 (§ 175) and means lim η→∞ Z η 1/A ys–2 dy. But if we make the substitution y = 1/x, we obtain Z η 1/A ys–2 dy = Z A 1/η x–s dx. [VIII : 181] THE CONVERGENCE OF INFINITE SERIES, ETC. 409 Thus lim η→∞ Z A 1/η x–s dx, or, what is the same thing, lim ■→+0 Z A ■ x–s dx, exists provided that s < 1; and it is natural to define the value of the integral (1) as being equal to this limit. Similar considerations lead us to define Z A a (x – a)–s dx by the equation Z A a (x – a)–s dx = lim ■→+0 Z A a+■ (x – a)–s dx. We are thus led to the following general definition: if the integral Z A a+■ φ(x) dx tends to a limit l as ■ → +0, we shall say that the integral Z A a φ(x) dx is convergent and has the value l. Similarly, when φ(x) → ∞ as x tends to the upper limit A, we define Z A a φ(x) dx as being lim ■→+0 Z A–■ a φ(x) dx : and then, as we explained above, we can extend our definitions to cover the case in which the interval [a, A] contains any finite number of infinities of φ(x). An integral in which the subject of integration tends to ∞ or to –∞ as x tends to some value or values included in the range of integration will be called an infinite integral of the second kind : the first kind of infinite integrals being the class discussed in §§ 177 et seq. Nearly all the remarks (i)–(vii) made at the end of § 177 apply to infinite integrals of the second kind as well as to those of the first. [VIII : 181] THE CONVERGENCE OF INFINITE SERIES, ETC. 410 181. We may now write the equation (4) of § 179 in the form Z ∞ a φ(x) dx = Z c b φ{f (t)}f ′(t) dt. (1) The integral on the right-hand side is defined as the limit, as τ → c, of the corresponding integral over the range [b, τ], i.e. as an infinite integral of the second kind. And when φ{f (t)}f ′(t) has an infinity at t = c the integral is essentially an infinite integral. Suppose for example, that φ(x) = (1 + x)–m, where 1 < m < 2, and a = 0, and that f (t) = t/(1 – t). Then b = 0, c = 1, and (1) becomes Z ∞ 0 dx (1 + x)m = Z 1 0 (1 – t)m–2 dt; (2) and the integral on the

right-hand side is an infinite integral of the second kind. On the other hand it may happen that φ{f (t)}f ′(t) is continuous for t = c. In this case Z c b φ{f (t)}f ′(t) dt is a finite integral, and lim τ →c Z τ b φ{f (t)}f ′(t) dt = Z c b φ{f (t)}f ′(t) dt, in virtue of the corollary to Theorem (10) of § 160. In this case the substitution x = f (t) transforms an infinite into a finite integral. This case arises if m ■ 2 in the example considered a moment ago. Examples LXXVI. 1. If φ(x) is continuous except for x = a, while φ(x) → ∞ as x → a, then the necessary and sufficient condition that Z A a φ(x) dx should be convergent is that we can find a constant K such that Z A a+■ φ(x) dx < K for all values of ■, however small (cf. § 178). [VIII : 181] THE CONVERGENCE OF INFINITE SERIES, ETC. 411 It is clear that we can choose a number A′ between a and A, such that φ(x) is positive throughout [a, A′]. If φ(x) is positive throughout the whole interval [a, A] then we can of course identify A′ and A. Now Z A a–■ φ(x) dx = Z A′ a–■ φ(x) dx + Z A A′ φ(x) dx. The first integral on the right-hand side of the above equation increases as ■ decreases, and therefore tends to a limit or to ∞; and the truth of the result stated becomes evident. If the condition is not satisfied then Z A a–■ φ(x) dx → ∞. We shall then say that the integral Z A a φ(x) dx diverges to ∞. It is clear that, if φ(x) → ∞ as x → a + 0, then convergence and divergence to ∞ are the only alternatives for the integral. We may discuss similarly the case in which φ(x) → –∞. 2. Prove that Z A a (x – a)–s dx = (A – a)1–s 1 – s if s < 1, while the integral is divergent if s ■ 1. 3. If φ(x) → ∞ as x → a + 0 and φ(x) < K(x – a)–s, where s < 1, then Z A a φ(x) dx is convergent; and if φ(x) > K(x – a)–s, where s ■ 1, then the integral is divergent. [This is merely a particular case of a general comparison theorem analogous to that stated in § 178.] 4. Are the integrals Z A a dx p(x – a)(A – x) , Z A a dx (A – x) 3 √x – a , Z A a dx (A – x) 3 √A – x , Z A a dx √x2 – a2 , Z A a dx 3 √A3 – x3 , Z A a dx x2 – a2 , Z A a dx A3 – x3 convergent or divergent? 5. The integrals Z 1 –1 dx 3 √x , Z a+1 a–1 dx 3 √x – a are convergent, and the value of each is zero. [VIII : 181] THE CONVERGENCE OF INFINITE SERIES, ETC. 412 6. The integral Z π 0 dx √sin x is convergent. [The subject of integration tends to ∞ as x tends to either limit.] 7. The integral Z π 0 dx (sin x)s is convergent if and only if s < 1. 8. The integral Z 1 2 π 0 xs (sin x)t dx is convergent if t < s + 1. 9. Show that Z h 0 sin x xp dx, where h > 0, is convergent if p < 2. Show also that, if 0 < p < 2, the integrals Z π 0 sin x xp dx, Z 2π π sin x xp dx, Z 3π 2π sin x xp dx, . . . alternate in sign and steadily decrease in absolute value. [Transform the integral whose limits are kπ and (k + 1)π by the substitution x = kπ + y.] 10. Show that Z h 0 sin x xp dx, where 0 < p < 2, attains its greatest value when h = π. (Math. Trip. 1911.) 11. The integral Z 1 2 π 0 (cos x)l(sin x)m dx is convergent if and only if l > –1, m > –1. 12. Such an integral as Z ∞ 0 xs–1 dx 1 + x , [VIII : 181] THE CONVERGENCE OF INFINITE SERIES, ETC. 413 where s < 1, does not fall directly under any of our previous definitions. For the range of integration is infinite and the subject of integration tends to ∞ as x → +0. It is natural to define this integral as being equal to the sum Z 1 0 xs–1 dx 1 + x + Z ∞ 1 xs–1 dx 1 + x , provided that these two integrals are both convergent. The first integral is a convergent infinite integral of the second kind if 0 < s < 1. The second is a convergent infinite integral of the first kind if s < 1. It should be noted that when s > 1 the first integral is an ordinary finite integral; but then the second is divergent. Thus the integral from 0 to ∞ is convergent if and only if 0 < s < 1. 13. Prove that Z ∞ 0 xs–1 1 + xt dx is convergent if and only if 0 < s < t. 14. The integral Z ∞ 0 xs–1 – xt–1 1 – x dx is convergent if and only if 0 < s < 1, 0 < t < 1. [It should be noticed that the subject of integration is undefined when x = 1; but (xs–1 – xt–1)/(1 – x) → t – s as x → 1 from either side; so that the subject of integration becomes a continuous function of x if we assign to it the value t – s when x = 1. It often happens that the subject of integration has a discontinuity which is due simply to a failure in its definition at a particular point in the range of integration, and can be removed by attaching a particular value to it at that point. In this case it is usual to suppose the definition of the subject of integration completed in this way. Thus the integrals Z 1 2 π 0 sin mx x dx, Z 1 2 π 0 sin mx sin x dx are ordinary finite integrals, if the subjects of integration are regarded as having the value m when x = 0.] 15. Substitution and integration by parts. The formulae for transfor- mation by substitution and integration by parts may of course be extended to [VIII : 181] THE CONVERGENCE OF INFINITE SERIES, ETC. 414 infinite integrals of the second as well as of the first kind. The reader should formulate the general theorems for himself, on the lines of § 179. 16. Prove by integration by parts that if s > 0, t > 1, then Z 1 0 xs–1(1 – x)t–1 dx = t – 1 s Z 1 0 xs(1 – x)t–2 dx. 17. If s > 0 then Z 1 0 xs–1 dx 1 + x = Z ∞ 1 t–s dt 1 + t . [Put x = 1/t.] 18. If 0 < s < 1 then Z 1 0 xs–1 + x–s 1 + x dx = Z ∞ 0 t–s dt 1 + t = Z ∞ 0 ts–1 dt 1 + t . 19. If a + b > 0 then Z ∞ b dx (x + a)√x – b = π √a + b . (Math. Trip. 1909.) 20. Show, by means of the substitution x = t/(1 – t), that if l and m are both positive then Z ∞ 0 xl–1 (1 + x)l+m dx = Z 1 0 tl–1(1 – t)m–1 dt. 21. Show, by means of the substitution x = pt/(p + 1 – t), that if l, m, and p are all positive then Z 1 0 xl–1(1 – x)m–1 dx (x + p)l+m = 1 (1 + p)lpm Z 1 0 tl–1(1 – t)m–1 dt. 22. Prove that Z b a dx p(x – a)(b – x) = π and Z b a x dx p(x – a)(b – x) = 1 2 π(a + b), [VIII : 182] THE CONVERGENCE OF INFINITE SERIES, ETC. 415 (i) by means of the substitution x = a+(b–a)t2, (ii) by means of the substitution (b – x)/(x – a) = t, and (iii) by means of the substitution x = a cos2 t + b sin2 t. 23. If s > –1 then Z 1 2 π 0 (sin θ)s dθ = Z 1 0 xs dx √1 – x2 = 1 2 Z 1 0 x 1 2 (s–1) dx √1 – x = 1 2 Z 1 0 (1 – x) 1 2 (s–1) dx √x . 24. Establish the formulae Z 1 0 f (x) dx √1 – x2 = Z 1 2 π 0 f (sin θ) dθ, Z b a f (x) dx p(x – a)(b – x) = 2 Z 1 2 π 0 f (a cos2 θ + b sin2 θ) dθ, Z a –a f r a – x a + x

dx = 4a Z 1 2 π 0 f (tan θ) cos θ sin θ dθ. 25. Prove that Z 1 0 dx (1 + x)(2 + x)px(1 – x) = π 1 √2 – 1 √6

. [Put x = sin2 θ and use Ex. lxiii. 8.] (Math. Trip. 1912.) 182. Some care has occasionally to be exercised in applying the rule for transformation by substitution. The following example affords a good illustra- tion of this. Let J = Z 7 1 (x2 – 6x + 13) dx. We find by direct integration that J = 48. Now let us apply the substitution y = x2 – 6x + 13, which gives x = 3 ± √y – 4. Since y = 8 when x = 1 and y = 20 when x = 7, we appear to be led to the result J = Z 20 8 y dx dy dy = ± 1 2 Z 20 8 y dy √y – 4 . [VIII : 183] THE CONVERGENCE OF INFINITE SERIES, ETC. 416 The indefinite integral is 1 3 (y – 4)3/2 + 4(y – 4)1/2, and so we obtain the value ± 80 3 , which is certainly wrong whichever sign we choose. The explanation is to be found in a closer consideration of the relation be- tween x and y. The function x2 – 6x + 13 has a minimum for x = 3, when y = 4. As x increases from 1 to 3, y decreases from 8 to 4, and dx/dy is negative, so that dx dy = – 1 2√y – 4 . As x increases from 3 to 7, y increases from 4 to 20, and the other sign must be chosen. Thus J = Z 7 1 y dx = Z 4 8

– y 2√y – 4

dy + Z 20 4 y 2√y – 4 dy, a formula which will be found to lead to the correct result. Similarly, if we transform the integral Z π 0 dx = π by the substitution x = arc sin y, we must observe that dx/dy = 1/p1 – y2 or dx/dy = –1/p1 – y2 according as 0 ■ x < 1 2 π or 1 2 π < x ■ π. Example. Verify the results of transforming the integrals Z 1 0 (4x2 – x + 1 16) dx, Z π 0 cos2 x dx by the substitutions 4x2 – x + 1 16 = y, x = arc sin y respectively. 183. Series of positive and negative terms. Our definitions of the sum of an infinite series, and the value of an infinite integral, whether of the first or the second kind, apply to series of terms or integrals of functions whose values may be either positive or negative. But the special tests for convergence or divergence which we have established in this chapter, and the examples by which we have illustrated them, have had reference almost entirely to the case in which all these values are positive. Of course the [VIII : 184] THE CONVERGENCE OF INFINITE SERIES, ETC. 417 case in which they are all negative is not essentially different, as it can be reduced to the former by changing un into –un or φ(x) into –φ(x). In the case of a series it has always been explicitly or tacitly assumed that any conditions imposed upon un may be violated for a finite number of terms: all that is necessary is that such a condition (e.g. that all the terms are positive) should be satisfied from some definite term onwards. Similarly in the case of an infinite integral the conditions have been supposed to be satisfied for all values of x greater than some definite value, or for all values of x within some definite interval [a, a + δ] which includes the value a near which the subject of integration tends to infinity. Thus our tests apply to such a series as X n2 – 10 n4 , since n2 – 10 > 0 when n ■ 4, and to such integrals as Z ∞ 1 3x – 7 (x + 1)3 dx, Z 1 0 1 – 2x √x dx, since 3x – 7 > 0 when x > 7 3 , and 1 – 2x > 0 when 0 < x < 1 2 . But when the changes of sign of un persist throughout the series, i.e. when the number of both positive and negative terms is infinite, as in the series 1 – 1 2 + 1 3 – 1 4 + . . . ; or when φ(x) continually changes sign as x → ∞, as in the integral Z ∞ 1 sin x xs dx, or as x → a, where a is a point of discontinuity of φ(x), as in the integral Z A a sin 1 x – a dx x – a; then the problem of discussing convergence or divergence becomes more difficult. For now we have to consider the possibility of oscillation as well as of convergence or divergence. We shall not, in this volume, have to consider the more general problem for integrals. But we shall, in the ensuing chapters, have to consider certain simple examples of series containing an infinite number of both positive and negative terms. [VIII : 184] THE CONVERGENCE OF INFINITE SERIES, ETC. 418 184. Absolutely Convergent Series. Let us then consider a seriesP un in which any term may be either positive or negative. Let |un| = αn, so that αn = un if un is positive and αn = –un if un is negative. Further, let vn = un or vn = 0, according as un is positive or negative, and wn = –un or wn = 0, according as un is negative or positive; or, what is the same thing, let vn or wn be equal to αn according as un is positive or negative, the other being in either case equal to zero. Then it is evident that vn and wn are always positive, and that un = vn – wn, αn = vn + wn. If, for example, our series is 1 – (1/2)2 + (1/3)2 – . . . , then un = (–1)n–1/n2 and αn = 1/n2, while vn = 1/n2 or vn = 0 according as n is odd or even and wn = 1/n2 or wn = 0 according as n is even or odd. We can now distinguish two cases. A. Suppose that the series P αn is convergent. This is the case, for instance, in the example above, where P αn is 1 + (1/2)2 + (1/3)2 + ... Then both P vn and P wn are convergent: for (Ex. xxx. 18) any series se- lected from the terms of a convergent series of positive terms is convergent. And hence, by theorem (6) of § 77, P un or P(vn – wn) is convergent and equal to P vn – P wn. We are thus led to formulate the following definition. Definition. When P αn or P |un| is convergent, the series P un is said to be absolutely convergent. And what we have proved above amounts to this: if P un is absolutely convergent then it is convergent; so are the series formed by its positive and negative terms taken separately; and the sum of the series is equal to the sum of the positive terms plus the sum of the negative terms. [VIII : 185] THE CONVERGENCE OF INFINITE SERIES, ETC. 419 The reader should carefully guard himself against supposing that the state- ment ‘an absolutely convergent series is convergent’ is a mere tautology. When we say that P un is ‘absolutely convergent’ we do not assert directly that P un is convergent: we assert the convergence of another series P |un|, and it is by no means evident a priori that this precludes oscillation on the part of P un. Examples LXXVII. 1. Employ the ‘general principle of convergence’ (§ 84) to prove the theorem that an absolutely convergent series is convergent. [Since P |un| is convergent, we can, when any positive number ■ is assigned, choose n0 so that |un1+1| + |un1+2| + · · · + |un2 | < ■ when n2 > n1

■ n0. A fortiori |un1+1 + un1+2 + · · · + un2 | < ■, and therefore P un is convergent.] 2. If P an is a convergent series of positive terms, and |bn| ■ Kan, thenP bn is absolutely convergent. 3. If P an is a convergent series of positive terms, then the series P anxn is absolutely convergent when –1 ■ x ■ 1. 4. If P an is a convergent series of positive terms, then the seriesP an cos nθ, P an sin nθ are absolutely convergent for all values of θ. [Ex- amples are afforded by the series P rn cos nθ, P rn sin nθ of § 88.] 5. Any series selected from the terms of an absolutely convergent series is absolutely convergent. [For the series of the moduli of its terms is a selection from the series of the moduli of the terms of the original series.] 6. Prove that if P |un| is convergent then |Pun| ■ P|un|, and that the only case to which the sign of equality can apply is that in which every term has the same sign. [VIII : 186] THE CONVERGENCE OF INFINITE SERIES, ETC. 420 185. Extension of Dirichlet's Theorem to absolutely conver- gent series. Dirichlet's Theorem (§ 169) shows that the terms of a se- ries of positive terms may be rearranged in any way without affecting its sum. It is now easy to see that any absolutely convergent series has the same property. For let P un be so rearranged as to become P u′ n, and let α′ n, v′ n, w′ n be formed from u′ n as αn, vn, wn were formed from un. ThenP α′ n is convergent, as it is a rearrangement of P αn, and so are P v′ n,P w′ n, which are rearrangements of P vn, P wn. Also, by Dirichlet's The- orem, P v′ n = P vn and P w′ n = P wn and so Pu′ n = Pv′ n – Pw′ n = Pvn – Pwn = Pun. 186. Conditionally convergent series. B. We have now to con- sider the second case indicated above, viz. that in which the series of moduliP αn diverges to ∞. Definition. If P un is convergent, but P |un| divergent, the original series is said to be conditionally convergent. In the first place we note that, if P un is conditionally convergent, then the series P vn, P wn of § 184 must both diverge to ∞. For they obviously cannot both converge, as this would involve the convergence of P(vn + wn) or P αn. And if one of them, say P wn, is convergent, and P vn divergent, then NX 0 un = NX 0 vn – NX 0 wn, (1) and therefore tends to ∞ with N , which is contrary to the hypothesis thatP un is convergent. Hence P vn, P wn are both divergent. It is clear from equation (1) above that the sum of a conditionally convergent series is the limit of the difference of two functions each of which tends to ∞ with n. It is obvious too that P un no longer possesses the property of convergent se- ries of positive terms (Ex. xxx. 18), and all absolutely convergent series (Ex. lxxvii. 5), that any selection from the terms itself forms a conver- gent series. And it seems more than likely that the property prescribed by Dirichlet's Theorem will not be possessed by conditionally convergent [VIII : 187] THE CONVERGENCE OF INFINITE SERIES, ETC. 421 series; at any rate the proof of § 185 fails completely, as it depended essen- tially on the convergence of P vn and P wn separately. We shall see in a moment that this conjecture is well founded, and that the theorem is not true for series such as we are now considering. 187. Tests of convergence for conditionally convergent series. It is not to be expected that we should be able to find tests for conditional convergence as simple and general as those of §§ 167 et seq. It is naturally a much more difficult matter to formulate tests of convergence for series whose convergence, as is shown by equation (1) above, depends essentially on the cancelling of the positive by the negative terms. In the first instance there are no comparison tests for convergence of conditionally convergent series. For suppose we wish to infer the convergence of P vn from that of P un. We have to compare v0 + v1 + · · · + vn, u0 + u1 + · · · + un. If every u and every v were positive, and every v less than the correspond- ing u, we could at once infer that v0 + v1 + · · · + vn < u0 + · · · + un, and so that P vn is convergent. If the u's only were positive and every v numerically less than the corresponding u, we could infer that |v0| + |v1| + · · · + |vn| < u0 + · · · + un, and so that P vn is absolutely convergent. But in the general case, when the u's and v's are both unrestricted as to sign, all that we can infer is that |v0| + |v1| + · · · + |vn| < |u0| + · · · + |un|. This would enable us to infer the absolute convergence of P vn from the absolute convergence of P un; but if P un is only conditionally convergent we can draw no inference at all. [VIII : 188] THE CONVERGENCE OF INFINITE SERIES, ETC. 422 Example. We shall see shortly that the series 1– 1 2 + 1 3 – 1 4 +. . . is convergent. But the series 1 2 + 1 3 + 1 4 + 1 5 + . . . is divergent, although each of its terms is numerically less than the corresponding term of the former series. It is therefore only natural that such tests as we can obtain should be of a much more special character than those given in the early part of this chapter. 188. Alternating Series. The simplest and most common condi- tionally convergent series are what is known as alternating series, series whose terms are alternately positive and negative. The convergence of the most important series of this type is established by the following theorem. If φ(n) is a positive function of n which tends steadily to zero as n → ∞, then the series φ(0) – φ(1) + φ(2) – . . . is convergent, and its sum lies between φ(0) and φ(0) – φ(1). Let us write φ0, φ1, . . . for φ(0), φ(1), . . . ; and let sn = φ0 – φ1 + φ2 – · · · + (–1)nφn. Then s2n+1 – s2n–1 = φ2n – φ2n+1 ■ 0, s2n – s2n–2 = –(φ2n–1 – φ2n) ■ 0. Hence s0, s2, s4, . . . , s2n, . . . is a decreasing sequence, and therefore tends to a limit or to –∞, and s1, s3, s5, . . . , s2n+1, . . . is an increasing sequence, and therefore tends to a limit or to ∞. But lim(s2n+1 – s2n) = lim(–1)2n+1φ2n+1 = 0, from which it follows that both sequences must tend to limits, and that the two limits must be the same. That is to say, the sequence s0, s1, . . . , sn, . . . tends to a limit. Since s0 = φ0, s1 = φ0 – φ1, it is clear that this limit lies between φ0 and φ0 – φ1. [VIII : 188] THE CONVERGENCE OF INFINITE SERIES, ETC. 423 Examples LXXVIII. 1. The series 1 – 1 2 + 1 3 – 1 4 + . . . , 1 – 1 √2 + 1 √3 – 1 √4 + . . . , X (–1)n (n + a) , X (–1)n √n + a , X (–1)n (√n + √a) , X (–1)n (√n + √a)2 , where a > 0, are conditionally convergent. 2. The series P(–1)n(n + a)–s, where a > 0, is absolutely convergent if s > 1, conditionally convergent if 0 < s ■ 1, and oscillatory if s ■ 0. 3. The sum of the series of § 188 lies between sn and sn+1 for all

values of n; and the error committed by taking the sum of the first n terms instead of the sum of the whole series is numerically not greater than the modulus of the (n + 1)th term. 4. Consider the series X (–1)n √n + (–1)n , which we suppose to begin with the term for which n = 2, to avoid any difficulty as to the definitions of the first few terms. This series may be written in the form X (–1)n √n + (–1)n – (–1)n √n

+ (–1)n √n

or X (–1)n √n – 1 n + (–1)n√n

= X(ψn – χn), say. The series P ψn is convergent; but P χn is divergent, as all its terms are positive, and lim nχn = 1. Hence the original series is divergent, although it is of the form φ2 – φ3 + φ4 – . . . , where φn → 0. This example shows that the condition that φn should tend steadily to zero is essential to the truth of the theorem. The reader will easily verify that √2n + 1 – 1 < √2n + 1, so that this condition is not satisfied. 5. If the conditions of § 188 are satisfied except that φn tends steadily to a positive limit l, then the series P(–1)nφn oscillates finitely. 6. Alteration of the sum of a conditionally convergent series by rearrangement of the terms. Let s be the sum of the series 1– 1 2 + 1 3 – 1 4 +. . . , and s2n the sum of its first 2n terms, so that lim s2n = s. [VIII : 189] THE CONVERGENCE OF INFINITE SERIES, ETC. 424 Now consider the series 1 + 1 3 – 1 2 + 1 5 + 1 7 – 1 4 + . . . (1) in which two positive terms are followed by one negative term, and let t3n denote the sum of the first 3n terms. Then t3n = 1 + 1 3 + · · · + 1 4n – 1 – 1 2 – 1 4 – · · · – 1 2n = s2n + 1 2n + 1 + 1 2n + 3 + · · · + 1 4n – 1 . Now lim 1 2n + 1 – 1 2n + 2 + 1 2n + 3 – · · · + 1 4n – 1 – 1 4n

= 0, since the sum of the terms inside the bracket is clearly less than n/(2n + 1)(2n + 2); and lim 1 2n + 2 + 1 2n + 4 + · · · + 1 4n

= 1 2 lim 1 n nX r=1 1 1 + (r/n) = 1 2 Z 2 1 dx x , by §§ 156 and 158. Hence lim t3n = s + 1 2 Z 2 1 dx x , and it follows that the sum of the series (1) is not s, but the right-hand side of the last equation. Later on we shall give the actual values of the sums of the two series: see § 213 and Ch. IX, Misc. Ex. 19. It can indeed be proved that a conditionally convergent series can always be so rearranged as to converge to any sum whatever, or to diverge to ∞ or to –∞. For a proof we may refer to Bromwich's Infinite Series, p. 68. 7. The series 1 + 1 √3 – 1 √2 + 1 √5 + 1 √7 – 1 √4 + . . . diverges to ∞. [Here t3n = s2n + 1 √2n + 1 + 1 √2n + 3 + · · · + 1 √4n – 1 > s2n + n √4n – 1 , where s2n = 1 – 1 √2 + · · · – 1 √2n , which tends to a limit as n → ∞.] [VIII : 189] THE CONVERGENCE OF INFINITE SERIES, ETC. 425 189. Abel's and Dirichlet's Tests of Convergence. A more gen- eral test, which includes the test of § 188 as a particular test case, is the following. Dirichlet's Test. If φn satisfies the same conditions as in § 188, andP an is any series which converges or oscillates finitely, then the series a0φ0 + a1φ1 + a2φ2 + . . . is convergent. The reader will easily verify the identity a0φ0 +a1φ1 +· · ·+anφn = s0(φ0 –φ1)+s1(φ1 –φ2)+· · ·+sn–1(φn–1 –φn)+snφn, where sn = a0 + a1 + · · · + an. Now the series (φ0 – φ1) + (φ1 – φ2) + . . . is convergent, since the sum to n terms is φ0 – φn and lim φn = 0; and all its terms are positive. Also since P an, if not actually convergent, at any rate oscillates finitely, we can determine a constant K so that |sν | < K for all values of ν. Hence the series Psν (φν – φν+1) is absolutely convergent, and so s0(φ0 – φ1) + s1(φ1 – φ2) + · · · + sn–1(φn–1 – φn) tends to a limit as n → ∞. Also φn, and therefore snφn, tends to zero. And therefore a0φ0 + a1φ1 + · · · + anφn tends to a limit, i.e. the series P aν φν is convergent. Abel's Test. There is another test, due to Abel, which, though of less frequent application than Dirichlet's, is sometimes useful. Suppose that φn, as in Dirichlet's Test, is a positive and decreasing function of n, but that its limit as n → ∞ is not necessarily zero. Thus we postulate less about φn, but to make up for this we postulate more about P an, viz. that it is convergent. Then we have the theorem: if φn is a positive and decreasing function of n, and P an is convergent, then P anφn is convergent. For φn has a limit as n → ∞, say l: and lim(φn – l) = 0. Hence, by Dirichlet's Test, P an(φn – l) is convergent; and as P an is convergent it follows that P anφn is convergent. This theorem may be stated as follows: a convergent series remains conver- gent if we multiply its terms by any sequence of positive and decreasing factors. [VIII : 189] THE CONVERGENCE OF INFINITE SERIES, ETC. 426 Examples LXXIX. 1. Dirichlet's and Abel's Tests may also be estab- lished by means of the general principle of convergence (§ 84). Let us suppose, for example, that the conditions of Abel's Test are satisfied. We have identically amφm + am+1φm+1 + · · · + anφn = sm,m(φm – φm+1) + sm,m+1(φm+1 – φm+2) + · · · + sm,n–1(φn–1 – φn) + sm,nφn . . . , (1) where sm,ν = am + am+1 + · · · + aν . The left-hand side of (1) therefore lies between hφm and Hφm, where h and H are the algebraically least and greatest of sm,m, sm,m+1, . . . , sm,n. But, given any positive number ■, we can choose m0 so that |sm,ν | < ■ when m ■ m0, and so |amφm + am+1φm+1 + · · · + anφn| < ■φm ■ ■φ1 when n > m ■ m0. Thus the series P anφn is convergent. 2. The series P cos nθ and P sin nθ oscillate finitely when θ is not a mul- tiple of π. For, if we denote the sums of the first n terms of the two series by sn and tn, and write z = Cis θ, so that |z| = 1 and z■ = 1, we have |sn + itn| = 1 – zn 1 – z ■ 1 + |zn| |1 – z| ■ 2 |1 – z| ; and so |sn| and |tn| are also not greater than 2/|1 – z|. That the series are not actually convergent follows from the fact that their nth terms do not tend to zero (Exs. xxiv. 7, 8). The sine series converges to zero if θ is a multiple of π. The cosine series oscillates finitely if θ is an odd multiple of π and diverges if θ is an even multiple of π. It follows that if θn is a positive function of n which tends steadily to

zero as n → ∞, then the series Pφn cos nθ, Pφn sin nθ are convergent, except perhaps the first series when θ is a multiple of 2π. In this case the first series reduces to P φn, which may or may not be convergent: the second series vanishes identically. If P φn is convergent then both series are absolutely convergent (Ex. lxxvii. 4) for all values of θ, and the whole [VIII : 190] THE CONVERGENCE OF INFINITE SERIES, ETC. 427 interest of the result lies in its application to the case in which P φn is divergent. And in this case the series above written are conditionally and not absolutely convergent, as will be proved in Ex. lxxix. 6. If we put θ = π in the cosine series we are led back to the result of § 188, since cos nπ = (–1)n. 3. The series P n–s cos nθ, P n–s sin nθ are convergent if s > 0, unless (in the case of the first series) θ is a multiple of 2π and 0 < s ■ 1. 4. The series of Ex. 3 are in general absolutely convergent if s > 1, condi- tionally convergent if 0 < s ■ 1, and oscillatory if s ■ 0 (finitely if s = 0 and infinitely if s < 0). Mention any exceptional cases. 5. If P ann–s is convergent or oscillates finitely, then P ann–t is convergent when t > s. 6. If φn is a positive function of n which tends steadily to 0 as n → ∞, andP φn is divergent, then the series P φn cos nθ, P φn sin nθ are not absolutely convergent, except the sine-series when θ is a multiple of π. [For suppose, e.g., that P φn| cos nθ| is convergent. Since cos2 nθ ■ | cos nθ|, it follows thatP φn cos2 nθ or 1 2 Pφn(1 + cos 2nθ) is convergent. But this is impossible, since P φn is divergent and P φn cos 2nθ, by Dirichlet's Test, convergent, unless θ is a multiple of π. And in this case it is obvious that P φn| cos nθ| is divergent. The reader should write out the corresponding argument for the sine-series, noting where it fails when θ is a multiple of π.] 190. Series of complex terms. So far we have confined ourselves to series all of whose terms are real. We shall now consider the series Pun = P(vn + iwn), where vn and wn are real. The consideration of such series does not, of course, introduce anything really novel. The series is convergent if, and only if, the series Pvn, Pwn are separately convergent. There is however one class of such series so im- portant as to require special treatment. Accordingly we give the following definition, which is an obvious extension of that of § 184. [VIII : 191] THE CONVERGENCE OF INFINITE SERIES, ETC. 428 Definition. The series P un, where un = vn +iwn, is said to be abso- lutely convergent if the series P vn and P wn are absolutely convergent. Theorem. The necessary and sufficient condition for the absolute con- vergence of P un is the convergence of P |un| or P pv2 n + w2 n. For if P un is absolutely convergent, then both of the series P |vn|,P |wn| are convergent, and so P{|vn| + |wn|} is convergent: but |un| = pv2 n + w2 n ■ |vn| + |wn|, and therefore P |un| is convergent. On the other hand |vn| ■ pv2 n + w2 n, |wn| ■ pv2 n + w2 n, so that P |vn| and P |wn| are convergent whenever P |un| is convergent. It is obvious that an absolutely convergent series is convergent, since its real and imaginary parts converge separately. And Dirichlet's Theorem (§§ 169, 185) may be extended at once to absolutely convergent complex series by applying it to the separate series P vn and P wn. The convergence of an absolutely convergent series may also be deduced directly from the general principle of convergence (cf. Ex. lxxvii. 1). We leave this as an exercise to the reader. 191. Power Series. One of the most important parts of the theory of the ordinary functions which occur in elementary analysis (such as the sine and cosine, and the logarithm and exponential, which will be discussed in the next chapter) is that which is concerned with their expansion in series of the form P anxn. Such a series is called a power series in x. We have already come across some cases of expansion in series of this kind in connection with Taylor's and Maclaurin's series (§ 148). There, however, we were concerned only with a real variable x. We shall now consider a few general properties of power series in z, where z is a complex variable. A. A power series P anzn may be convergent for all values of z, for a certain region of values, or for no values except z = 0. It is sufficient to give an example of each possibility. [VIII : 193] THE CONVERGENCE OF INFINITE SERIES, ETC. 429 1. The series P zn n! is convergent for all values of z. For if un = zn n! then |un+1|/|un| = |z|/(n + 1) → 0 as n → ∞, whatever value z may have. Hence, by d'Alembert's Test, P |un| is convergent for all values of z, and the original series is absolutely convergent for all values of z. We shall see later on that a power series, when convergent, is generally absolutely convergent. 2. The series P n! zn is not convergent for any value of z except z = 0. For if un = n! zn then |un+1|/|un| = (n + 1)|z|, which tends to ∞ with n, unless z = 0. Hence (cf. Exs. xxvii. 1, 2, 5) the modulus of the nth term tends to ∞ with n; and so the series cannot converge, except when z = 0. It is obvious that any power series converges when z = 0. 3. The series P zn is always convergent when |z| < 1, and never convergent when |z| ■ 1. This was proved in § 88. Thus we have an actual example of each of the three possibilities. 192. B. If a power series P anzn is convergent for a particular value of z, say z1 = r1(cos θ1 + i sin θ1), then it is absolutely convergent for all values of z such that |z| < r1. For lim anzn 1 = 0, since P anzn 1 is convergent, and therefore we can certainly find a constant K such that |anzn 1 | < K for all values of n. But, if |z| = r < r1, we have |anzn| = |anzn 1 | r r1 n < K r r1 n , and the result follows at once by comparison with the convergent geomet- rical series P(r/r1)n. In other words, if the series converges at P then it converges absolutely at all points nearer to the origin than P . Example. Show that the result is true even if the series oscillates finitely when z = z1. [If sn = a0 + a1z1 + · · · + anzn 1 then we can find K so that |sn| < K for all values of n. But |anzn 1 | = |sn – sn–1| ■ |sn–1| + |sn| < 2K, and the argument can be completed as before.] [VIII : 193] THE CONVERGENCE OF INFINITE SERIES, ETC. 430 193. The region of convergence of a power series. The circle of convergence. Let z = r be any point on the positive real axis. If the power series converges when z = r then it converges absolutely at all points inside the circle |z| = r. In particular it converges for all real values of z less than r. Now let us divide the points r of the positive real axis into two classes, the

class at which the series converges and the class at which it does not. The first class must contain at least the one point z = 0. The second class, on the other hand, need not exist, as the series may converge for all values of z. Suppose however that it does exist, and that the first class of points does include points besides z = 0. Then it is clear that every point of the first class lies to the left of every point of the second class. Hence there is a point, say the point z = R, which divides the two classes, and may itself belong to either one or the other. Then the series is absolutely convergent at all points inside the circle |z| = R. For let P be any such point. We can draw a circle, whose centre is O and whose radius is less than R, so as to include P inside it. Let thisO XQ A Q′ P P ′ Fig. 51. circle cut OA in Q. Then the series is convergent at Q, and therefore, by Theorem B, absolutely convergent at P . On the other hand the series cannot converge at any point P ′ outside the circle. For if it converged at P ′ it would converge absolutely at all points nearer to O than P ; and this is absurd, as it does not converge at any point between A and Q′ (Fig. 51). So far we have excepted the cases in which the power series (1) does not [VIII : 193] THE CONVERGENCE OF INFINITE SERIES, ETC. 431 converge at any point on the positive real axis except z = 0 or (2) converges at all points on the positive real axis. It is clear that in case (1) the power series converges nowhere except when z = 0, and that in case (2) it is absolutely convergent everywhere. Thus we obtain the following result: a power series either (1) converges for z = 0 and for no other value of z; or (2) converges absolutely for all values of z; or (3) converges absolutely for all values of z within a certain circle of radius R, and does not converge for any value of z outside this circle. In case (3) the circle is called the circle of convergence and its radius the radius of convergence of the power series. It should be observed that this general result gives absolutely no infor- mation about the behaviour of the series on the circle of convergence. The examples which follow show that as a matter of fact there are very diverse possibilities as to this. Examples LXXX. 1. The series 1 + az + a2z2 + . . . , where a > 0, has a radius of convergence equal to 1/a. It does not converge anywhere on its circle of convergence, diverging when z = 1/a and oscillating finitely at all other points on the circle. 2. The series z 12 + z2 22 + z3 32 + . . . has its radius of convergence equal to 1; it converges absolutely at all points on its circle of convergence. 3. More generally, if |an+1|/|an| → λ, or |an|1/n → λ, as n → ∞, then the series a0 + a1z + a2z2 + . . . has 1/λ as its radius of convergence. In the first case lim |an+1zn+1|/|anzn| = λ|z|, which is less or greater than unity according as |z| is less or greater than 1/λ, so that we can use d'Alembert's Test (§ 168, 3). In the second case we can use Cauchy's Test (§ 168, 2) similarly. 4. The logarithmic series. The series z – 1 2 z2 + 1 3 z3 – . . . [VIII : 194] THE CONVERGENCE OF INFINITE SERIES, ETC. 432 is called (for reasons which will appear later) the 'logarithmic' series. It follows from Ex. 3 that its radius of convergence is unity. When z is on the circle of convergence we may write z = cos θ + i sin θ, and the series assumes the form cos θ – 1 2 cos 2θ + 1 3 cos 3θ – · · · + i(sin θ – 1 2 sin 2θ + 1 3 sin 3θ – . . .). The real and imaginary parts are both convergent, though not absolutely convergent, unless θ is an odd multiple of π (Exs. lxxix. 3, 4). If θ is an odd multiple of π then z = –1, and the series assumes the form –1 – 1 2 – 1 3 – . . . , and so diverges to –∞. Thus the logarithmic series converges at all points of its circle of convergence except the point z = –1. 5. The binomial series. Consider the series 1 + mz + m(m – 1) 2! z2 + m(m – 1)(m – 2) 3! z3 + ... If m is a positive integer then the series terminates. In general |an+1| |an| = |m – n| n + 1 → 1, so that the radius of convergence is unity. We shall not discuss here the question of its convergence on the circle, which is a little more difficult.* 194. Uniqueness of a power series. If P anzn is a power series which is convergent for some values of z at any rate besides z = 0, and f (z) is its sum, then it is easy to see that f (z) can be expressed in the form a0 + a1z + a2z2 + · · · + (an + ■z)zn, where ■z → 0 as |z| → 0. For if μ is any number less than the radius of convergence of the series, and |z| < μ, then |an|μn < K, where K is a constant (cf. § 192), and so f (z) – nX 0 aν zν ■ |an+1||zn+1| + |an+2||zn+2| + . . . < K |z| μ n+1 1 + |z| μ + |z|2 μ2 + . . .

= K|z|n+1 μn(μ – |z|) , *See Bromwich, Infinite Series, pp. 225 et seq.; Hobson, Plane Trigonometry (3rd edition), pp. 268 et seq. [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 433 where K is a number independent of z. It follows from Ex. lv. 15 that if P anzn = P bnzn for all values of z whose modulus is less than some number μ, then an = bn for all values of n. This result is capable of considerable general- isations into which we cannot enter now. It shows that the same function f (z) cannot be represented by two different power series. 195. Multiplication of Series. We saw in § 170 that if P un andP vn are two convergent series of positive terms, then P un × P vn =P wn, where wn = u0vn + u1vn–1 + · · · + unv0. We can now extend this result to all cases in which P un and P vn are absolutely convergent; for our proof was merely a simple application of Dirichlet's Theorem, which we have already extended to all absolutely convergent series. Examples LXXXI. 1. If |z| is less than the radius of convergence of either of the series P anzn, P bnzn, then the product of the two series is P cnzn, where cn = a0bn + a1bn–1 + · · · + anb0. 2. If the radius of convergence of P anzn is R, and f (z) is the sum of the series when |z| < R, and |z| is less than either R or unity, then f (z)/(1 – z) = P snzn, where sn = a0 + a1 + · · · + an. 3. Prove, by squaring the series for 1/(1 – z), that 1/(1 – z)2 = 1 + 2z + 3z2 + . . . if |z| < 1. 4. Prove similarly that 1/(1 – z)3 = 1 + 3z + 6z2 + . . . , the general term being 1 2 (n + 1)(n + 2)zn. 5. The Binomial Theorem for a negative integral exponent. If |z| < 1, and m is a positive integer, then 1 (1 – z)m = 1 + mz + m(m + 1) 1 · 2 z2 + · · · + m(m + 1) . . . (m + n – 1) 1 · 2 . . . n zn + ... [Assume the truth of the theorem for all indices up to m. Then, by Ex. 2, [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 434 1/(1 – z)m+1 = P snzn, where sn = 1 + m + m(m + 1) 1 · 2 + · · ·

+ m(m + 1) . . . (m + n – 1) 1 · 2 . . . n = (m + 1)(m + 2) . . . (m + n) 1 · 2 . . . n , as is easily proved by induction.] 6. Prove by multiplication of series that if f (m, z) = 1 + m 1

z + m 2

z2 + . . . , and |z| < 1, then f (m, z)f (m′, z) = f (m + m′, z). [This equation forms the basis of Euler's proof of the Binomial Theorem. The coefficient of zn in the product series is m′ n

+ m 1 m′ n – 1

+ m 2 m′ n – 2

+ · · · + m n – 1 m′ 1

+ m n

. This is a polynomial in m and m′: but when m and m′ are positive integers this polynomial must reduce to m + m′ k

in virtue of the Binomial Theorem for a positive integral exponent, and if two such polynomials are equal for all positive integral values of m and m′ then they must be equal identically.] 7. If f (z) = 1 + z + z2 2! + . . . then f (z)f (z′) = f (z + z′). [For the series for f (z) is absolutely convergent for all values of z: and it is easy to see that if un = zn n! , vn = z′n n! , then wn = (z + z′)n n! .] 8. If C(z) = 1 – z2 2! + z4 4! – . . . , S(z) = z – z3 3! + z5 5! – . . . , then C(z + z′) = C(z)C(z′) – S(z)S(z′), S(z + z′) = S(z)C(z′) + C(z)S(z′), and {C(z)}2 + {S(z)}2 = 1. [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 435 9. Failure of the Multiplication Theorem. That the theorem is not always true when P un and P vn are not absolutely convergent may be seen by considering the case in which un = vn = (–1)n √n + 1 . Then wn = (–1)n nX r=0 1 p(r + 1)(n + 1 – r) . But p(r + 1)(n + 1 – r) ■ 1 2 (n+2), and so |wn| > (2n+2)/(n+2), which tends to 2; so that P wn is certainly not convergent. MISCELLANEOUS EXAMPLES ON CHAPTER VIII. 1. Discuss the convergence of the series P nk{√n + 1 – 2√n + √n – 1}, where k is real. (Math. Trip. 1890.) 2. Show that Pnr∆k(ns), where ∆un = un – un+1, ∆2un = ∆(∆un), and so on, is convergent if and only if k > r + s + 1, except when s is a positive integer less than k, when every term of the series is zero. [The result of Ch. VII, Misc. Ex. 11, shows that ∆k(ns) is in general of order ns–k.] 3. Show that ∞X 1 n2 + 9n + 5 (n + 1)(2n + 3)(2n + 5)(n + 4) = 5 36 . (Math. Trip. 1912.) [Resolve the general term into partial fractions.] 4. Show that, if R(n) is any rational function of n, we can determine a polynomial P (n) and a constant A such that P{R(n) – P (n) – (A/n)} is convergent. Consider in particular the cases in which R(n) is one of the functions 1/(an + b), (an2 + 2bn + c)/(αn2 + 2βn + γ). [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 436 5. Show that the series 1 – 1 1 + z + 1 2 – 1 2 + z + 1 3 – 1 3 + z + . . . is convergent provided only that z is not a negative integer. 6. Investigate the convergence or divergence of the series X sin a n , X 1 n sin a n , X(–1)n sin a n , X 1 – cos a n

, X(–1)nn

1 – cos a n

, where a is real. 7. Discuss the convergence of the series ∞X 1

1 + 1 2 + 1 3 + · · · + 1 n sin(nθ + α) n , where θ and α are real. (Math. Trip. 1989.) 8. Prove that the series 1 – 1 2 – 1 3 + 1 4 + 1 5 + 1 6 – 1 7 – 1 8 – 1 9 – 1 10 + . . . , in which successive terms of the same sign form groups of 1, 2, 3, 4, . . . terms, is convergent; but that the corresponding series in which the groups contain 1, 2, 4, 8, . . . terms oscillates finitely. (Math. Trip. 1908.) 9. If u1, u2, u3, . . . is a decreasing sequence of positive numbers whose limit is zero, then the series u1 – 1 2 (u1 + u2) + 1 3 (u1 + u2 + u3) – . . . , u1 – 1 3 (u1 + u3) + 1 5 (u1 + u3 + u5) – . . . are convergent. [For if (u1 + u2 + · · · + un)/n = vn then v1, v2, v3, . . . is also a decreasing sequence whose limit is zero (Ch. IV, Misc. Exs. 8, 27). This shows that the first series is convergent; the second we leave to the reader. In particular the series 1 – 1 2 1 + 1 2 + 1 3 1 + 1 2 + 1 3 – . . . , 1 – 1 3 1 + 1 3 + 1 5 1 + 1 3 + 1 5 – . . . are convergent.] [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 437 10. If u0 +u1 +u2 +. . . is a divergent series of positive and decreasing terms, then (u0 + u2 + · · · + u2n)/(u1 + u3 + · · · + u2n+1) → 1. 11. Prove that if α > 0 then lim p→∞ ∞P n=0 (p + n)–1–α = 0. 12. Prove that lim α→0+ α ∞P 1 n–1–α = 1. [It follows from § 174 that 0 < 1–1–α + 2–1–α + · · · + (n – 1)–1–α – Z n 1 x–1–α dx ■ 1, and it is easy to deduce that P n–1–α lies between 1/α and (1/α) + 1.] 13. Find the sum of the series ∞P 1 un, where un = xn – x–n–1 (xn + x–n)(xn+1 + x–n–1) = 1 x – 1 1 xn + x–n – 1 xn+1 + x–n–1

, for all real values of x for which the series is convergent. (Math. Trip. 1901.) [If |x| is not equal to unity then the series has the sum x/{(x – 1)(x2 + 1)}. If x = 1 then un = 0 and the sum is 0. If x = –1 then un = 1 2 (–1)n+1 and the series oscillates finitely.] 14. Find

the sums of the series z 1 + z + 2z2 1 + z2 + 4z4 1 + z4 + . . . , z 1 – z2 + z2 1 – z4 + z4 1 – z8 + . . . (in which all the indices are powers of 2), whenever they are convergent. [The first series converges only if |z| < 1, its sum then being z/(1 – z); the second series converges to z/(1 – z) if |z| < 1 and to 1/(1 – z) if |z| > 1.] 15. If |an| ■ 1 for all values of n then the equation 0 = 1 + a1z + a2z2 + . . . cannot have a root whose modulus is less than 1 2 , and the only case in which it can have a root whose modulus is equal to 1 2 is that in which an = – Cis(nθ), when z = 1 2 Cis(–θ) is a root. [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 438 16. Recurring Series. A power series P anzn is said to be a recurring series if its coefficients satisfy a relation of the type an + p1an–1 + p2an–2 + · · · + pkan–k = 0, (1) where n ■ k and p1, p2, . . . , pk are independent of n. Any recurring series is the expansion of a rational function of z. To prove this we observe in the first place that the series is certainly convergent for values of z whose modulus is sufficiently small. For let G be the greater of the two numbers 1, |p1| + |p2| + · · · + |pk|. Then it follows from the equation (1) that |an| ■ Gαn, where αn is the modulus of the numerically greatest of the preceding coefficients; and from this that |an| < KGn, where K is independent of n. Thus the recurring series is certainly convergent for values of z whose modulus is less than 1/G. But if we multiply the series f (z) = P anzn by p1z, p2z2, . . . , pkzk, and add the results, we obtain a new series in which all the coefficients after the (k – 1)th vanish in virtue of the relation (1), so that (1 + p1z + p2z2 + · · · + pkzk)f (z) = P0 + P1z + · · · + Pk–1zk–1, where P0, P1, . . . , Pk–1 are constants. The polynomial 1+p1z +p2z2 +· · ·+pkzk is called the scale of relation of the series. Conversely, it follows from the known results as to the expression of any rational function as the sum of a polynomial and certain partial fractions of the type A/(z – a)p, and from the Binomial Theorem for a negative integral exponent, that any rational function whose denominator is not divisible by z can be expanded in a power series convergent for values of z whose modulus is sufficiently small, in fact if |z| < ρ, where ρ is the least of the moduli of the roots of the denominator (cf. Ch. IV, Misc. Exs. 18 et seq.). And it is easy to see, by reversing the argument above, that the series is a recurring series. Thus the necessary and sufficient condition that a power series should be a recurring series is that it should be the expansion of such a rational function of z. 17. Solution of Difference-Equations. A relation of the type of (1) in Ex. 16 is called a linear difference-equation in an with constant coefficients. Such equations may be solved by a method which will be sufficiently explained by an example. Suppose that the equation is an – an–1 – 8an–2 + 12an–3 = 0. [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 439 Consider the recurring power series P anzn. We find, as in Ex. 16, that its sum is a0 + (a1 – a0)z + (a2 – a1 – 8a0)z2 1 – z – 8z2 + 12z3 = A1 1 – 2z + A2 (1 – 2z)2 + B 1 + 3z , where A1, A2, and B are numbers easily expressible in terms of a0, a1, and a2. Expanding each fraction separately we see that the coefficient of zn is an = 2n{A1 + (n + 1)A2} + (–3)nB. The values of A1, A2, B depend upon the first three coefficients a0, a1, a2, which may of course be chosen arbitrarily. 18. The solution of the difference-equation un – 2 cos θun–1 + un–2 = 0 is un = A cos nθ + B sin nθ, where A and B are arbitrary constants. 19. If un is a polynomial in n of degree k, then P unzn is a recurring series whose scale of relation is (1 – z)k+1. (Math. Trip. 1904.) 20. Expand 9/{(z – 1)(z + 2)2} in ascending powers of z. (Math. Trip. 1913.) 21. Prove that if f (n) is the coefficient of zn in the expansion of z/(1+z +z2) in powers of z, then (1) f (n) + f (n – 1) + f (n – 2) = 0, (2) f (n) = (ωn 3 – ω2n 3)/(ω3 – ω2 3), where ω3 is a complex cube root of unity. Deduce that f (n) is equal to 0 or 1 or –1 according as n is of the form 3k or 3k + 1 or 3k + 2, and verify this by means of the identity z/(1 + z + z2) = z(1 – z)/(1 – z3). 22. A player tossing a coin is to score one point for every head he turns up and two for every tail, and is to play on until his score reaches or passes a total n. Show that his chance of making exactly the total n is 1 3 {2 + (– 1 2)n}. (Math. Trip. 1898.) [If pn is the probability then pn = 1 2 (pn–1 + pn–2). Also p0 = 1, p1 = 1 2 .] 23. Prove that 1 a + 1 + 1 a + 2 + · · · + 1 a + n = n 1 1 a + 1 – n 2 1! (a + 1)(a + 2) + . . . if n is a positive integer and a is not one of the numbers –1, –2, . . . , –n. [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 440 [This follows from splitting up each term on the right-hand side into partial fractions. When a > –1, the result may be deduced very simply from the equation Z 1 0 xa 1 – xn 1 – x dx = Z 1 0 (1 – x)a{1 – (1 – x)n} dx x by expanding (1 – xn)/(1 – x) and 1 – (1 – x)n in powers of x and integrating each term separately. The result, being merely an algebraical identity, must be true for all values of a save –1, –2, . . . , –n.] 24. Prove by multiplication of series that ∞X 0 zn n! ∞X 1 (–1)n–1zn n · n! = ∞X 1

1 + 1 2 + 1 3 + · · · + 1 n zn n! . [The coefficient of zn will be found to be 1 n! n 1

– 1 2 n 2

+ 1 3 n 3

– . . .

. Now use Ex. 23, taking a = 0.] 25. If An → A and Bn → B as n → ∞, then (A1Bn + A2Bn–1 + · · · + AnB1)/n → AB. [Let An = A + ■n. Then the expression given is equal to A B1 + B2 + · · · + Bn n + ■1Bn + ■2Bn–1 + · · · + ■nB1 n . The first term tends to AB (Ch. IV, Misc. Ex. 27). The modulus of the second is less than β{|■1| + |■2| + · · · + |■n|}/n, where β is any number greater than the greatest value of |Bν |: and this expression tends to zero.] 26. Prove that if cn = a1bn + a2bn–1 + · · · + anb1 and An = a1 + a2 + · · ·

+ an, Bn = b1 + b2 + · · · + bn, Cn = c1 + c2 + · · · + cn, then Cn = a1Bn + a2Bn–1 + · · · + anB1 = b1An + b2An–1 + · · · + bnA1 [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 441 and C1 + C2 + · · · + Cn = A1Bn + A2Bn–1 + · · · + AnB1. Hence prove that if the series P an, P bn are convergent and have the sums A, B, so that An → A, Bn → B, then (C1 + C2 + · · · + Cn)/n → AB. Deduce that if P cn is convergent then its sum is AB. This result is known as Abel's Theorem on the multiplication of Series. We have already seen that we can multiply the series P an, P bn in this way if both series are absolutely convergent: Abel's Theorem shows that we can do so even if one or both are not absolutely convergent, provided only that the product series is convergent. 27. Prove that 1 2 1 – 1 2 + 1 3 – . . . 2 = 1 2 – 1 3 1 + 1 2 + 1 4 1 + 1 2 + 1 3 – . . . , 1 2 1 – 1 3 + 1 5 – . . . 2 = 1 2 – 1 4 1 + 1 3 + 1 6 1 + 1 3 + 1 5 – . . . . [Use Ex. 9 to establish the convergence of the series.] 28. For what values of m and n is the integral Z π 0 sinm x(1 – cos x)n dx convergent? [If m + 1 and m + 2n + 1 are positive.] 29. Prove that if a > 1 then Z 1 –1 dx (a – x)√1 – x2 = π √a2 – 1 . 30. Establish the formulae Z ∞ 0 F {px2 + 1 + x} dx = 1 2 Z ∞ 1

1 + 1 y2

F (y) dy, Z ∞ 0 F {px2 + 1 – x} dx = 1 2 Z 1 0

1 + 1 y2

F (y) dy. In particular, prove that if n > 1 then Z ∞ 0 dx {√x2 + 1 + x}n = Z ∞ 0 {px2 + 1 – x}n dx = n n2 – 1 . [VIII : 195] THE CONVERGENCE OF INFINITE SERIES, ETC. 442 [In this and the succeeding examples it is of course supposed that the arbitrary functions which occur are such that the integrals considered have a meaning in accordance with the definitions of §§ 177 et seq.] 31. Show that if 2y = ax–(b/x), where a and b are positive, then y increases steadily from –∞ to ∞ as x increases from 0 to ∞. Hence show that Z ∞ 0 f

1 2

ax + b x

dx = 1 a Z ∞ –∞ f {py2 + ab} (1 + y py2 + ab) dy = 2 a Z ∞ 0 f {py2 + ab} dy. 32. Show that if 2y = ax+(b/x), where a and b are positive, then two values of x correspond to any value of y greater than √ab. Denoting the greater of these by x1 and the less by x2, show that, as y increases from √ab towards ∞, x1 increases from pb/a towards ∞, and x2 decreases from pb/a to 0. Hence show that Z ∞ √b/a f (y) dx1 = 1 a Z ∞ √ab f (y) (y py2 – ab + 1) dy, Z √b/a 0 f (y) dx2 = 1 a Z ∞ √ab f (y) (y py2 – ab – 1) dy, and that Z ∞ 0 f

1 2

= 1 4 π. Establish similar results in which the limits of integration are 0 and 1. (Math. Trip. 1913.) CHAPTER IX THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS OF A REAL VARIABLE 196. The number of essentially different types of functions with which we have been concerned in the foregoing chapters is not very large. Among those which have occurred the most important for ordinary purposes are polynomials, rational functions, algebraical functions, explicit or implicit, and trigonometrical functions, direct or inverse. We are however far from having exhausted the list of functions which are important in mathematics. The gradual expansion of the range of mathematical knowledge has been accompanied by the introduction into analysis of one new class of

function after another. These new functions have generally been introduced because it appeared that some problem which was occupying the attention of mathematicians was incapable of solution by means of the functions already known. The process may fairly be compared with that by which the irrational and complex numbers were first introduced, when it was found that certain algebraical equations could not be solved by means of the numbers already recognised. One of the most fruitful sources of new functions has been the problem of integration. Attempts have been made to integrate some function f (x) in terms of functions already known. These attempts have failed; and after a certain number of failures it has begun to appear probable that the problem is insoluble. Sometimes it has been proved that this is so; but as a rule such a strict proof has not been forthcoming until later on. Generally it has happened that mathematicians have taken the impossibility for granted as soon as they have become reasonably convinced of it, and have introduced a new function F (x) defined by its possessing the required property, viz. that F ′(x) = f (x). Starting from this definition, they have investigated the properties of F (x); and it has then appeared that F (x) has properties which no finite combination of the functions previously known could possibly have; and thus the correctness of the assumption that the original problem could not possibly be solved has been established. One such case occurred in the preceding pages, when in Ch. VI we defined the function log x by 444 [IX : 197] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 445 means of the equation log x = Z dx x . Let us consider what grounds we have for supposing log x to be a really new function. We have seen already (Ex. xlii. 4) that it cannot be a rational function, since the derivative of a rational function is a rational function whose denominator contains only repeated factors. The question whether it can be an algebraical or trigonometrical function is more difficult. But it is very easy to become convinced by a few experiments that differentiation will never get rid of algebraical irrationalities. For example, the result of differentiating √1 + x any number of times is always the product of √1 + x by a rational function, and so generally. The reader should test the correctness of the statement by experimenting with a number of examples. Similarly, if we differentiate a func- tion which involves sin x or cos x, one or other of these functions persists in the result. We have, therefore, not indeed a strict proof that log x is a new function— that we do not profess to give*—but a reasonable presumption that it is. We shall therefore treat it as such, and we shall find on examination that its prop- erties are quite unlike those of any function which we have as yet encountered. 197. Definition of log x. We define log x, the logarithm of x, by the equation log x = Z x 1 dt t . We must suppose that x is positive, since (Ex. lxxvi. 2) the integral has no meaning if the range of integration includes the point x = 0. We might have chosen a lower limit other than 1; but 1 proves to be the most convenient. With this definition log 1 = 0. We shall now consider how log x behaves as x varies from 0 towards ∞. It follows at once from the definition that log x is a continuous function of x which increases steadily with x and has a derivative Dx log x = 1/x; *For such a proof see the author's tract quoted on p. 286. [IX : 197] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 446 and it follows from § 175 that log x tends to ∞ as x → ∞. If x is positive but less than 1, then log x is negative. For log x = Z x 1 dt t = – Z 1 x dt t < 0. Moreover, if we make the substitution t = 1/u in the integral, we obtain log x = Z x 1 dt t = – Z 1/x 1 du u = – log(1/x). Thus log x tends steadily to –∞ as x decreases from 1 to 0. The general form of the graph of the logarithmic function is shown in Fig. 52. Since the derivative of log x is 1/x, the slope of the curve is very0 X Y 1 Fig. 52. gentle when x is very large, and very steep when x is very small. Examples LXXXII. 1. Prove from the definition that if u > 0 then u/(1 + u) < log(1 + u) < u. [For log(1 + u) = Z u 0 dt 1 + t , and the subject of integration lies between 1 and 1/(1 + u).] [IX : 198] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 447 2. Prove that log(1 + u) lies between u – u2 2 and u – u2 2(1 + u) when u is positive. [Use the fact that log(1 + u) = u – Z u 0 t dt 1 + t .] 3. If 0 < u < 1 then u < – log(1 – u) < u/(1 – u). 4. Prove that lim x→1 log x x – 1 = lim t→0 log(1 + t) t = 1. [Use Ex. 1.] 198. The functional equation satisfied by log x. The function log x satisfies the functional equation f (xy) = f (x) + f (y). (1) For, making the substitution t = yu, we see that log xy = Z xy 1 dt t = Z x 1/y du u = Z x 1 du u – Z 1/y 1 du u = log x – log(1/y) = log x + log y, which proves the theorem. Examples LXXXIII. 1. It can be shown that there is no solution of the equation (1) which possesses a differential coefficient and is fundamentally distinct from log x. For when we differentiate the functional equation, first with respect to x and then with respect to y, we obtain the two equations yf ′(xy) = f ′(x), xf ′(xy) = f ′(y); and so, eliminating f ′(xy), xf ′(x) = yf ′(y). But if this is true for every pair of values of x and y, then we must have xf ′(x) = C, or f ′(x) = C/x, where C is a constant. Hence f (x) = Z C x dx + C′ = C log x + C′, and it is easy to see that C′ = 0. Thus there is no solution fundamentally distinct from log x, except the trivial solution f (x) = 0, obtained by taking C = 0. [IX : 199] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 448 2. Show in the same way that there is no solution of the equation f (x) + f (y) = f x + y 1 – xy

which possesses a differential coefficient and is fundamentally distinct from arc tan x. 199. The manner in which log x tends to infinity with x. It will be remembered that in Ex. xxxvi. 6 we defined certain different ways in which a function of x may tend to infinity with x, distinguishing between functions which, when x is large, are of the first, second, third, . . . orders of greatness. A function f (x) was said to be of the kth order of greatness when f (x)/xk tends to a limit different from zero as x tends to infinity. It is easy to define a whole series of functions which tend to infinity with x, but whose order of greatness is smaller than the first. Thus √x, 3 √x, 4 √x, . . . are such functions. We may say generally that xα, where α is any positive rational number, is of the αth order of greatness

when x is large. We may suppose α as small as we please, e.g. less than .000 000 1. And it might be thought that by giving α all possible values we should exhaust the possible ‘orders of infinity’ of f (x). At any rate it might be supposed that if f (x) tends to infinity with x, however slowly, we could always find a value of α so small that xα would tend to infinity more slowly still; and, conversely, that if f (x) tends to infinity with x, however rapidly, we could always find a value of α so great that xα would tend to infinity more rapidly still. Perhaps the most interesting feature of the function log x is its be- haviour as x tends to infinity. It shows that the presupposition stated above, which seems so natural, is unfounded. The logarithm of x tends to infinity with x, but more slowly than any positive power of x, integral or fractional. In other words log x → ∞ but log x xα → 0 for all positive values of α. This fact is sometimes expressed loosely by say- ing that the ‘order of infinity of log x is infinitely small’; but the reader will [IX : 202] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 449 hardly require at this stage to be warned against such modes of expression. 200. Proof that (log x)/xα → 0 as x → ∞. Let β be any positive number. Then 1/t < 1/t1–β when t > 1, and so log x = Z x 1 dt t < Z x 1 dt t1–β , or log x < (xβ – 1)/β < xβ /β, when x > 1. Now if α is any positive number we can choose a smaller positive value of β. And then 0 < (log x)/xα < xβ–α/β (x > 1). But, since α > β, xβ–α/β → 0 as x → ∞, and therefore (log x)/xα → 0. 201. The behaviour of log x as x → +0. Since (log x)/xα = –yα log y if x = 1/y, it follows from the theorem proved above that lim y→+0 yα log y = – lim x→+∞(log x)/xα = 0. Thus log x tends to –∞ and log(1/x) = – log x to ∞ as x tends to zero by positive values, but log(1/x) tends to ∞ more slowly than any positive power of 1/x, integral or fractional. [IX : 202] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 450 202. Scales of infinity. The logarithmic scale. Let us consider once more the series of functions x, √x, 3 √x, . . . , n √x, . . . , which possesses the property that, if f (x) and φ(x) are any two of the functions contained in it, then f (x) and φ(x) both tend to ∞ as x → ∞, while f (x)/φ(x) tends to 0 or to ∞ according as f (x) occurs to the right or the left of φ(x) in the series. We can now continue this series by the insertion of new terms to the right of all those already written down. We can begin with log x, which tends to infinity more slowly than any of the old terms. Then √log x tends to ∞ more slowly than log x, 3 √log x than √log x, and so on. Thus we obtain a series x, √x, 3 √x, . . . , n √x, . . . log x, plog x, 3 plog x, . . . n plog x, . . . formed of two simply infinite series arranged one after the other. But this is not all. Consider the function log log x, the logarithm of log x. Since (log x)/xα → 0, for all positive values of α, it follows on putting x = log y that (log log y)/(log y)α = (log x)/xα → 0. Thus log log y tends to ∞ with y, but more slowly than any power of log y. Hence we may continue our series in the form x, √x, 3 √x, . . . log x, plog x, 3 plog x, . . . log log x, plog log x, . . . n plog log x, . . . ; and it will by now be obvious that by introducing the functions log log log x, log log log log x, . . . we can prolong the series to any extent we like. By putting x = 1/y we obtain a similar scale of infinity for functions of y which tend to ∞ as y tends to 0 by positive values.* Examples LXXXIV. 1. Between any two terms f (x), F (x) of the series we can insert a new term φ(x) such that φ(x) tends to ∞ more slowly than f (x) and more rapidly than F (x). [Thus between √x and 3 √x we could *For fuller information as to ‘scales of infinity’ see the author’s tract ‘Orders of Infinity’, Camb. Math. Tracts, No. 12. [IX : 202] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 451 insert x5/12: between √log x and 3 √log x we could insert (log x)5/12. And, gen- erally, φ(x) = pf (x)F (x) satisfies the conditions stated.] 2. Find a function which tends to ∞ more slowly than √x, but more rapidly than xα, where α is any rational number less than 1/2. [√x/(log x) is such a function; or √x/(log x)β , where β is any positive rational number.] 3. Find a function which tends to ∞ more slowly than √x, but more rapidly than √x/(log x)α, where α is any rational number. [The function √x/(log log x) is such a function. It will be gathered from these examples that incompleteness is an inherent characteristic of the logarithmic scale of infinity.] 4. How does the function f (x) = {xα(log x)α′ (log log x)α′′ }/{xβ (log x)β′ (log log x)β′′ } behave as x tends to ∞? [If α■ = β then the behaviour of f (x) = xα–β (log x)α′–β′ (log log x)α′′–β′′ is dominated by that of xα–β . If α = β then the power of x disappears and the behaviour of f (x) is dominated by that of (log x)α′–β′ , unless α′ = β′, when it is dominated by that of (log log x)α′′–β′′ . Thus f (x) → ∞ if α > β, or α = β, α′ > β′, or α = β, α′ = β′, α′′ > β′′, and f (x) → 0 if α < β, or α = β, α′ < β′, or α = β, α′ = β′, α′′ < β′′.] 5. Arrange the functions x/√log x, x√log x/ log log x, x log log x/√log x, (x log log log x)/√log log x according to the rapidity with which they tend to infinity as x → ∞. 6. Arrange log log x/(x log x), (log x)/x, x log log x/px2 + 1, {√x + 1}/x(log x)2 according to the rapidity with which they tend to zero as x → ∞. 7. Arrange x log log(1/x), √x/{log(1/x)}, px sin x log(1/x), (1 – cos x) log(1/x) according to the rapidity with which they tend to zero as x → +0. 8. Show that Dx log log x = 1/(x log x), Dx log log log x = 1/(x log x log log x), [IX : 203] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 452 and so on. 9. Show that Dx(log x)α = α/{x(log x)1–α}, Dx(log log x)α = α/{x log x(log log x)1–α}, and so on. 203. The number e. We shall now introduce a number, usually denoted by e, which is of immense importance in higher mathematics. It is, like π, one of the fundamental constants of analysis. We define e as the number whose logarithm is 1. In other words e is defined by the equation 1 = Z e 1 dt t . Since log x is an increasing function of x, in the stricter sense of § 95, it can only pass once through the value 1. Hence our definition does in fact define one definite number. Now log xy = log x + log y and so log x2 = 2 log x, log x3 = 3 log x, . . . , log xn = n log x, where n is any positive integer. Hence log en = n log e = n. Again, if p and q are any positive integers, and ep/q denotes the positive qth root of ep, we have p = log ep = log(ep/q)q = q log ep/q, so that log ep/q = p/q. Thus, if y has any positive rational value, and ey denotes the positive yth power of e, we have log ey = y, (1) and log e–y = – log ey = –y. Hence the equation (1) is true for all

rational values of y, positive or negative. In other words the equations y = log x, x = ey (2) [IX : 204] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 453 are consequences of one another so long as y is rational and ey has its positive value. At present we have not given any definition of a power such as ey in which the index is irrational, and the function ey is defined for rational values of y only. Example. Prove that 2 < e < 3. [In the first place it is evident that Z 2 1 dt t < 1, and so 2 < e. Also Z 3 1 dt t = Z 2 1 dt t + Z 3 2 dt t = Z 1 0 du 2 – u + Z 1 0 du 2 + u = 4 Z 1 0 du 4 – u2 > 1, so that e < 3.] 204. The exponential function. We now define the exponential function ey for all real values of y as the inverse of the logarithmic function. In other words we write x = ey if y = log x. We saw that, as x varies from 0 towards ∞, y increases steadily, in the stricter sense, from –∞ towards ∞. Thus to one value of x corresponds one value of y, and conversely. Also y is a continuous function of x, and it follows from § 109 that x is likewise a continuous function of y. It is easy to give a direct proof of the continuity of the exponential function. For if x = ey and x + ξ = ey+η then η = Z x+ξ x dt t . Thus |η| is greater than ξ/(x + ξ) if ξ > 0, and than |ξ|/x if ξ < 0; and if η is very small ξ must also be very small. Thus ey is a positive and continuous function of y which increases steadily from 0 towards ∞ as y increases from –∞ towards ∞. More- over ey is the positive yth power of the number e, in accordance with [IX : 205] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 454 the elementary definitions, whenever y is a rational number. In particular ey = 1 when y = 0. The general form of the graph of ey is as shown in Fig. 53.0 X Y 1 Fig. 53. 205. The principal properties of the exponential function. (1) If x = ey, so that y = log x, then dy/dx = 1/x and dx dy = x = ey. Thus the derivative of the exponential function is equal to the function itself. More generally, if x = eay then dx/dy = aeay. (2) The exponential function satisfies the functional equation f (y + z) = f (y)f (z). This follows, when y and z are rational, from the ordinary rules of indices. If y or z, or both, are irrational then we can choose two sequences y1, y2, . . . , yn, . . . and z1, z2, . . . , zn, . . . of rational numbers such that lim yn = y, lim zn = z. Then, since the exponential function is continuous, we have ey × ez = lim eyn × lim ezn = lim eyn+zn = ey+z . In particular ey × e–y = e0 = 1, or e–y = 1/ey. [IX : 206] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 455 We may also deduce the functional equation satisfied by ey from that satisfied by log x. For if y1 = log x1, y2 = log x2, so that x1 = ey1 , x2 = ey2 , then y1 + y2 = log x1 + log x2 = log x1x2 and ey1+y2 = elog x1x2 = x1x2 = ey1 × ey2 . Examples LXXXV. 1. If dx/dy = ax then x = Keay, where K is a constant. 2. There is no solution of the equation f (y + z) = f (y)f (z) fundamentally distinct from the exponential function. [We assume that f (y) has a differential coefficient. Differentiating the equation with respect to y and z in turn, we obtain f ′(y + z) = f ′(y)f (z), f ′(y + z) = f (y)f ′(z) and so f ′(y)/f (y) = f ′(z)/f (z), and therefore each is constant. Thus if x = f (y) then dx/dy = ax, where a is a constant, so that x = Keay (Ex. 1).] 3. Prove that (eay – 1)/y → a as y → 0. [Applying the Mean Value Theorem, we obtain eay – 1 = ayeaη, where 0 < |η| < |y|.] 206. (3) The function ey tends to infinity with y more rapidly than any power of y, or lim yα/ey = lim e–yyα = 0 as y → ∞, for all values of α however great. We saw that (log x)/xβ → 0 as x → ∞, for any positive value of β however small. Writing α for 1/β, we see that (log x)α/x → 0 for any value of α however large. The result follows on putting x = ey. It is clear also that eγy tends to ∞ if γ > 0, and to 0 if γ < 0, and in each case more rapidly than any power of y. From this result it follows that we can construct a ‘scale of infinity’ similar to that constructed in § 202, but extending in the opposite direction; i.e. a scale [IX : 207] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 456 of functions which tend to ∞ more and more rapidly as x → ∞.* The scale is x, x2, x3, . . . ex, e2x, . . . ex2 , . . . , ex3 , . . . , eex , . . . , where of course ex2 , . . . , eex , . . . denote e(x2), . . . , e(ex), ... The reader should try to apply the remarks about the logarithmic scale, made in § 202 and Exs. lxxxiv, to this ‘exponential scale’ also. The two scales may of course (if the order of one is reversed) be combined into one scale . . . log log x, . . . log x, . . . x, . . . ex, . . . eex , ... 207. The general power ax. The function ax has been defined only for rational values of x, except in the particular case when a = e. We shall now consider the case in which a is any positive number. Suppose that x is a positive rational number p/q. Then the positive value y of the power ap/q is given by yq = ap; from which it follows that q log y = p log a, log y = (p/q) log a = x log a, and so y = ex log a. We take this as our definition of ax when x is irrational. Thus 10√2 = e√2 log 10. It is to be observed that ax, when x is irrational, is defined only for positive values of a, and is itself essentially positive; and that log ax = x log a. The most important properties of the function ax are as follows. *The exponential function was introduced by inverting the equation y = log x into x = ey ; and we have accordingly, up to the present, used y as the independent and x as the dependent variable in discussing its properties. We shall now revert to the more natural plan of taking x as the independent variable, except when it is necessary to consider a pair of equations of the type y = log x, x = ey simultaneously, or when there is some other special reason to the contrary. [IX : 208] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 457 (1) Whatever value a may have, ax × ay = ax+y and (ax)y = axy. In other words the laws of indices hold for irrational no less than for rational indices. For, in the first place, ax × ay = ex log a × ey log a = e(x+y) log a = ax+y; and in the second (ax)y = ey log ax = exy log a = axy. (2) If a > 1 then ax = ex log a = eαx, where α is positive. The graph of ax is in this case similar to that of ex, and ax → ∞ as x → ∞, more rapidly than any power of x. If a < 1 then ax = ex log a = e–βx, where β is positive. The graph of ax is then similar in shape to that of ex, but reversed as regards right and left, and ax → 0 as x → ∞, more rapidly than any power of 1/x. (3) ax is a continuous function of x, and Dxax = Dxex log a = ex log a log a = ax log a. (4) ax is also a continuous function of a, and Daax = Daex log a = ex log a(x/a) = xax–1. (5) (ax – 1)/x → log a as x → 0. This of

course is a mere corollary from the fact that Dxax = ax log a, but the particular form of the result is often useful; it is of course equivalent to the result (Ex. lxxxv. 3) that (eαx – 1)/x → α as x → 0. In the course of the preceding chapters a great many results involving the function ax have been stated with the limitation that x is rational. The definition and theorems given in this section enable us to remove this restriction. 208. The representation of ex as a limit. In Ch. IV, § 73, we proved that {1 + (1/n)}n tends, as n → ∞, to a limit which we denoted provisionally by e. We shall now identify this limit with the number e of [IX : 208] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 458 the preceding sections. We can however establish a more general result, viz. that expressed by the equations lim n→∞

1 + x n n = lim n→∞

1 – x n –n = ex. (1) As the result is of very great importance, we shall indicate alternative lines of proof. (1) Since d dt log(1 + xt) = x 1 + xt, it follows that lim h→0 log(1 + xh) h = x. If we put h = 1/ξ, we see that lim ξ log

1 + x ξ

= x as ξ → ∞ or ξ → –∞. Since the exponential function is continuous it follows that 1 + x ξ ξ = eξ log{1+(x/ξ)} → ex as ξ → ∞ or ξ → –∞: i.e. that lim ξ→∞

1 + x ξ ξ = lim ξ→–∞

1 + x ξ ξ = ex. (2) If we suppose that ξ → ∞ or ξ → –∞ through integral values only, we obtain the result expressed by the equations (1). (2) If n is any positive integer, however large, and x > 1, we have Z x 1 dt t1+(1/n) < Z x 1 dt t < Z x 1 dt t1–(1/n) , or n(1 – x–1/n) < log x < n(x1/n – 1). (3) [IX : 209] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 459 Writing y for log x, so that y is positive and x = ey, we obtain, after some simple transformations, 1 + y n n < x <

1 – y n –n . (4) Now let 1 + y n = η1, 1 – y n = 1 η2 . Then 0 < η1 < η2, at any rate for sufficiently large values of n; and, by (9) of § 74, ηn 2 – ηn 1 < nηn–1 2 (η2 – η1) = y2ηn 2 /n, which evidently tends to 0 as n → ∞. The result now follows from the inequal- ities (4). The more general result (2) may be proved in the same way, if we replace 1/n by a continuous variable h. 209. The representation of log x as a limit. We can also prove (cf. § 75) that lim n(1 – x–1/n) = lim n(x1/n – 1) = log x. For n(x1/n – 1) – n(1 – x–1/n) = n(x1/n – 1)(1 – x–1/n), which tends to zero as n → ∞, since n(x1/n – 1) tends to a limit (§ 75) and x–1/n to 1 (Ex. xxvii. 10). The result now follows from the inequalities (3) of § 208. Examples LXXXVI. 1. Prove, by taking y = 1 and n = 6 in the inequalities (4) of § 208, that 2.5 < e < 2.9. 2. Prove that if t > 1 then (t1/n – t–1/n)/(t – t–1) < 1/n, and so that if x > 1 then Z x 1 dt t1–(1/n) – Z x 1 dt t1+(1/n) < 1 n Z x 1

t – 1 t dt t = 1 n

x + 1 x – 2

. Hence deduce the results of § 209. 3. If ξn is a function of n such that nξn → l as n → ∞, then (1 + ξn)n → el. [Writing n log(1 + ξn) in the form l nξn l log(1 + ξn) ξn , [IX : 210] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 460 and using Ex. lxxxii. 4, we see that n log(1 + ξn) → l.] 4. If nξn → ∞, then (1 + ξn)n → ∞; and if 1 + ξn > 0 and nξn → –∞, then (1 + ξn)n → 0. 5. Deduce from (1) of § 208 the theorem that ey tends to infinity more rapidly than any power of y. 210. Common logarithms. The reader is probably familiar with the idea of a logarithm and its use in numerical calculation. He will re- member that in elementary algebra loga x, the logarithm of x to the base a, is defined by the equations x = ay, y = loga x. This definition is of course applicable only when y is rational, though this point is often passed over in silence. Our logarithms are therefore logarithms to the base e. For numerical work logarithms to the base 10 are used. If y = log x = loge x, z = log10 x, then x = ey and also x = 10z = ez log 10, so that log10 x = (loge x)/(loge 10). Thus it is easy to pass from one system to the other when once loge 10 has been calculated. It is no part of our purpose in this book to go into details concerning the practical uses of logarithms. If the reader is not familiar with them he should consult some text-book on Elementary Algebra or Trigonometry.* *See for example Chrystal's Algebra, vol. i, ch. xxi. The value of loge 10 is 2.302 . . . and that of its reciprocal .434 . . . . [IX : 210] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 461 Examples LXXXVII. 1. Show that Dxeax cos bx = reax cos(bx + θ), Dxeax sin bx = reax sin(bx + θ) where r = √a2 + b2, cos θ = a/r, sin θ = b/r. Hence determine the nth deriva- tives of the functions eax cos bx, eax sin bx, and show in particular that Dn x eax = aneax. 2. Trace the curve y = e–ax sin bx, where a and b are positive. Show that y has an infinity of maxima whose values form a geometrical progression and which lie on the curve y = b √a2 + b2 e–ax. (Math. Trip. 1912.) 3. Integrals containing the exponential function. Prove that Z eax cos bx dx = a cos bx + b sin bx a2 + b2 eax, Z eax sin bx dx = a sin bx – b cos bx a2 + b2 eax. [Denoting the two integrals by I, J, and integrating by parts, we obtain aI = eax cos bx + bJ, aJ = eax sin bx – bI. Solve these equations for I

and J.] 4. Prove that the successive areas bounded by the curve of Ex. 2 and the positive half of the axis of x form a geometrical progression, and that their sum is b a2 + b2 1 + e–aπ/b 1 – e–aπ/b . 5. Prove that if a > 0 then Z ∞ 0 e–ax cos bx dx = a a2 + b2 , Z ∞ 0 e–ax sin bx dx = b a2 + b2 . 6. If In = Z eaxxn dx then aIn = eaxxn – nIn–1. [Integrate by parts. It follows that In can be calculated for all positive integral values of n.] [IX : 210] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 462 7. Prove that, if n is a positive integer, then Z ξ 0 e–xxn dx = n! e–ξ

eξ – 1 – ξ – ξ2 2! – · · · – ξn n!

and Z ∞ 0 e–xxn dx = n!. 8. Show how to find the integral of any rational function of ex. [Put x = log u, when ex = u, dx/du = 1/u, and the integral is transformed into that of a rational function of u.] 9. Integrate e2x (c2ex + a2e–x)(c2ex + b2e–x) , distinguishing the cases in which a is and is not equal to b. 10. Prove that we can integrate any function of the form P (x, eax, ebx, . . .), where P denotes a polynomial. [This follows from the fact that P can be ex- pressed as the sum of a number of terms of the type Axmekx, where m is a positive integer.] 11. Show how to integrate any function of the form P (x, eax, ebx, . . . , cos lx, cos mx, . . . , sin lx, sin mx, . . .). 12. Prove that Z ∞ a e–λxR(x) dx, where λ > 0 and a is greater than the greatest root of the denominator of R(x), is convergent. [This follows from the fact that eλx tends to infinity more rapidly than any power of x.] 13. Prove that Z ∞ –∞ e–λx2+µx dx, where λ > 0, is convergent for all values of µ, and that the same is true of Z ∞ –∞ e–λx2+µxxn dx, where n is any positive integer. 14. Draw the graphs of ex2 , e–x2 , xex, xe–x, xex2 , xe–x2 , and x log x, de- termining any maxima and minima of the functions and any points of inflexion on their graphs. 15. Show that the equation eax = bx, where a and b are positive, has two real roots, one, or none, according as b > ae, b = ae, or b < ae. [The tangent to [IX : 210] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 463 the curve y = eax at the point (ξ, eaξ) is y – eaξ = aeaξ(x – ξ), which passes through the origin if aξ = 1, so that the line y = aex touches the curve at the point (1/a, e). The result now becomes obvious when we draw the line y = bx. The reader should discuss the cases in which a or b or both are negative.] 16. Show that the equation ex = 1 + x has no real root except x = 0, and that ex = 1 + x + 1 2 x2 has three real roots. 17. Draw the graphs of the functions log(x + px2 + 1), log 1 + x 1 – x

, e–ax cos2 bx, e–(1/x)2 , e–(1/x)2 p1/x, e– cot x, e– cot2 x. 18. Determine roughly the positions of the real roots of the equations log(x+px2 + 1) = x 100 , ex– 2 + x 2 – x = 1 10,000 , ex sin x = 7, ex2 sin x = 10,000. 19. The hyperbolic functions. The hyperbolic functions cosh x,* sinh x, . . . are defined by the equations cosh x = 1 2 (ex + e–x), sinh x = 1 2 (ex – e–x), tanh x = (sinh x)/(cosh x), coth x = (cosh x)/(sinh x), sech x = 1/(cosh x), cosech x = 1/(sinh x). Draw the graphs of these functions. 20. Establish the formulae cosh(–x) = cosh x, sinh(–x) = – sinh x, tanh(–x) = – tanh x, cosh2 x – sinh2 x = 1, sech2 x + tanh2 x = 1, coth2 x – cosech2 x = 1, cosh 2x = cosh2 x + sinh2 x, sinh 2x = 2 sinh x cosh x, *‘Hyperbolic cosine’: for an explanation of this phrase see Hobson’s Trigonometry, ch. xvi. [IX : 210] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 464 cosh(x + y) = cosh x cosh y + sinh x sinh y, sinh(x + y) = sinh x cosh y + cosh x sinh y. 21. Verify that these formulae may be deduced from the corresponding for- mulae in cos x and sin x, by writing cosh x for cos x and i sinh x for sin x. [It follows that the same is true of all the formulae involving cos nx and sin nx which are deduced from the corresponding elementary properties of cos x and sin x. The reason of this analogy will appear in Ch. X.] 22. Express cosh x and sinh x in terms (a) of cosh 2x (b) of sinh 2x. Discuss any ambiguities of sign that may occur. (Math. Trip. 1908.) 23. Prove that Dx cosh x = sinh x, Dx sinh x = cosh x, Dx tanh x = sech2 x, Dx coth x = – cosech2 x, Dx sech x = – sech x tanh x, Dx cosech x = – cosech x coth x, Dx log cosh x = tanh x, Dx log | sinh x| = coth x, Dx arc tan ex = 1 2 sech x, Dx log | tanh 1 2 x| = cosech x. [All these formulae may of course be transformed into formulae in integra- tion.] 24. Prove that cosh x > 1 and –1 < tanh x < 1. 25. Prove that if y = cosh x then x = log{y ± py2 – 1}, if y = sinh x then x = log{y + py2 + 1}, and if y = tanh x then x = 1 2 log{(1 + y)/(1 – y)}. Account for the ambiguity of sign in the first case. 26. We shall denote the functions inverse to cosh x, sinh x, tanh x by arg cosh x, arg sinh x, arg tanh x. Show that arg cosh x is defined only when x ■ 1, and is in general two-valued, while arg sinh x is defined for all real values of x, and arg tanh x when –1 < x < 1, and both of the two latter functions are one-valued. Sketch the graphs of the functions. 27. Show that if – 1 2 π < x < 1 2 π and y is positive, and cos x cosh y = 1, then y = log(sec x + tan x), Dxy = sec x, Dyx = sech y. 28. Prove that if a > 0 then Z dx √x2 + a2 = arg sinh(x/a), and Z dx √x2 – a2 is equal to arg cosh(x/a) or to – arg cosh(–x/a), according as x > 0 or x < 0. [IX : 210] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 465 29. Prove that if a > 0 then Z dx x2 – a2 is equal to –(1/a) arg tanh(x/a) or to –(1/a) arg coth(x/a), according as |x| is less than or greater than a. [The results of Exs. 28 and 29 furnish us with an alternative method of writing a good many of the formulae of Ch. VI.] 30. Prove that Z dx p(x – a)(x – b) = 2 log{√x – a + √x – b} (a < b < x), Z dx p(a – x)(b – x) = –2 log{√a – x + √b – x} (x < a < b), Z dx p(x – a)(b – x) = 2 arc tan r x – a b – x (a < x < b). 31. Prove that Z 1 0 x log(1 + 1 2 x) dx = 3 4 – 3 2 log 3 2 < 1 2 Z 1 0 x2 dx = 1 6 . (Math. Trip. 1913.) 32. Solve the equation a cosh x + b sinh x = c, where c > 0, showing that it has no real roots if b2 + c2 – a2 < 0, while if b2 + c2 – a2 > 0 it has two, one, or no real roots according as a + b and a – b are both positive, of opposite signs, or both negative. Discuss the case in which b2 + c2 – a2 = 0. 33. Solve the simultaneous equations cosh x cosh y = a, sinh x sinh y = b. 34. x1/x → 1 as x → ∞. [For x1/x = e(log x)/x, and (log x)/x → 0. Cf. Ex. xxvii. 11.] Show also that the function x1/x has a

maximum when x = e, and draw the graph of the function for positive values of x. 35. xx → 1 as x → +0. 36. If {f (n + 1)}/{f (n)} → l, where l > 0, as n → ∞, then n pf (n) → l. [For log f (n + 1) – log f (n) → log l, and so (1/n) log f (n) → log l (Ch. IV, Misc. Ex. 27).] 37. n √n!/n → 1/e as n → ∞. [If f (n) = n–nn! then {f (n + 1)}/{f (n)} = {1 + (1/n)}–n → 1/e. Now use Ex. 36.] 38. n p(2n)!/(n!)2 → 4 as n → ∞. [IX : 211] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 466 39. Discuss the approximate solution of the equation ex = x1,000,000. [It is easy to see by general graphical considerations that the equation has two positive roots, one a little greater than 1 and one very large,* and one negative root a little greater than –1. To determine roughly the size of the large positive root we may proceed as follows. If ex = x1,000,000 then x = 106 log x, log x = 13.82 + log log x, log log x = 2.63 + log

1 + log log x 13.82

, roughly, since 13.82 and 2.63 are approximate values of log 106 and log log 106 respectively. It is easy to see from these equations that the ratios log x : 13.82 and log log x : 2.63 do not differ greatly from unity, and that x = 106(13.82 + log log x) = 106(13.82 + 2.63) = 16,450,000 gives a tolerable approximation to the root, the error involved being roughly measured by 106(log log x – 2.63) or (106 log log x)/13.82 or (106 × 2.63)/13.82, which is less than 200,000. The approximations are of course very rough, but suffice to give us a good idea of the scale of magnitude of the root.] 40. Discuss similarly the equations ex = 1,000,000x1,000,000, ex2 = x1,000,000,000. 211. Logarithmic tests of convergence for series and integrals. We showed in Ch. VIII (§§ 175 et seq.) that ∞X 1 1 ns , Z ∞ a dx xs (a > 0) are convergent if s > 1 and divergent if s ■ 1. Thus P(1/n) is divergent, but P n–1–α is convergent for all positive values of α. *The phrase ‘very large’ is of course not used here in the technical sense explained in Ch. IV. It means ‘a good deal larger than the roots of such equations as usually occur in elementary mathematics’. The phrase ‘a little greater than’ must be interpreted similarly. [IX : 211] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 467 We saw however in § 200 that with the aid of logarithms we can con- struct functions which tend to zero, as n → ∞, more rapidly than 1/n, yet less rapidly than n–1–α, however small α may be, provided of course that it is positive. For example 1/(n log n) is such a function, and the question as to whether the series X 1 n log n is convergent or divergent cannot be settled by comparison with any series of the type P n–s. The same is true of such series as X 1 n(log n)2 , X log log n n√log n. It is a question of some interest to find tests which shall enable us to decide whether series such as these are convergent or divergent; and such tests are easily deduced from the Integral Test of § 174. For since Dx(log x)1–s = 1 – s x(log x)s , Dx log log x = 1 x log x, we have Z ξ a dx x(log x)s = (log ξ)1–s – (log a)1–s 1 – s , Z ξ a dx x log x = log log ξ – log log a, if a > 1. The first integral tends to the limit –(log a)1–s/(1 – s) as ξ → ∞, if s > 1, and to ∞ if s < 1. The second integral tends to ∞. Hence the series and integral ∞X n0 1 n(log n)s , Z ∞ a dx x(log x)s , where n0 and a are greater than unity, are convergent if s > 1, divergent if s ■ 1. [IX : 211] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 468 It follows, of course, that P φ(n) is convergent if φ(n) is positive and less than K/{n(log n)s}, where s > 1, for all values of n greater than some definite value, and divergent if φ(n) is positive and greater than K/(n log n) for all values of n greater than some definite value. And there is a corresponding theorem for integrals which we may leave to the reader. Examples LXXXVIII. 1. The series X 1 n(log n)2 , X (log n)100 n101/100 , X n2 – 1 n2 + 1 1 n(log n)7/6 are convergent. [The convergence of the first series is a direct consequence of the theorem of the preceding section. That of the second follows from the fact that (log n)100 is less than nβ for sufficiently large values of n, however small β may be, provided that it is positive. And so, taking β = 1/200, (log n)100n–101/100 is less than n–201/200 for sufficiently large values of n. The convergence of the third series follows from the comparison test at the end of the last section.] 2. The series X 1 n(log n)6/7 , X 1 n100/101(log n)100 , X n log n (n log n)2 + 1 are divergent. 3. The series X (log n)p n1+s , X (log n)p(log log n)q n1+s , X (log log n)p n(log n)1+s , where s > 0, are convergent for all values of p and q; similarly the series X 1 n1–s(log n)p , X 1 n1–s(log n)p(log log n)q , X 1 n(log n)1–s(log log n)p are divergent. 4. The question of the convergence or divergence of such series as X 1 n log n log log n , X log log log n n log n√log log n cannot be settled by the theorem of p. 467, since in each case the function under the sign of summation tends to zero more rapidly than 1/(n log n) yet less rapidly [IX : 211] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 469 than n–1(log n)–1–α, where α is any positive number however small. For such series we need a still more delicate test. The reader should be able, starting from the equations Dx(logk x)1–s = 1 – s x log x log2 x . . . logk–1 x(logk x)s , Dx logk+1 x = 1 x log x log2 x . . . logk–1 x logk x , where log2 x = log log x, log3 x = log log log x, . . . , to prove the following theo- rem: the series and integral ∞X n0 1 n log n log2 n . . . logk–1 n(logk n)s , Z ∞ a dx x log x log2 x . . . logk–1 x(logk x)s are convergent if s > 1 and divergent if s ■ 1, n0 and a being any numbers sufficiently great to ensure that logk n and logk x are positive when n ■ n0 or x ■ a. These values of n0 and a increase very rapidly as k increases: thus log x > 0 requires x > 1, log2 x > 0 requires x > e, log3 x > 0 requires x > ee, and so on; and it is easy to see that ee > 10, eee > e10 > 20,000, eeee > e20,000 > 108000. The reader should observe the extreme rapidity with which the higher ex- ponential functions, such as eex and eeex , increase with x. The same remark of course applies to such functions as aax and aaax , where a has any value greater than unity. It has been computed that 999 has 369,693,100 figures, while 101010 has of course 10,000,000,000. Conversely, the rate of increase of the higher log- arithmic functions is extremely slow.

Thus to make log log log log x > 1 we have to suppose x a number with over 8000 figures.* 5. Prove that the integral Z a 0 1 x

log 1 x s dx, where 0 < a < 1, is convergent if s < –1, divergent if s ■ –1. [Consider the behaviour of Z a ■ 1 x

log 1 x s dx as ■ → +0. This result also may be refined upon by the introduction of higher logarithmic factors.] *See the footnote to p. 450. [IX : 211] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 470 6. Prove that Z 1 0 1 x

log 1 x s dx has no meaning for any value of s. [The last example shows that s < –1 is a necessary condition for convergence at the lower limit: but {log(1/x)}s tends to ∞ like (1 – x)s, as x → 1 – 0, if s is negative, and so the integral diverges at the upper limit when s < –1.] 7. The necessary and sufficient conditions for the convergence ofZ 1 0 xa–1

log 1 x s dx are a > 0, s > –1. Examples LXXXIX. 1. Euler's limit. Show that φ(n) = 1 + 1 2 + 1 3 + · · · + 1 n – 1 – log n tends to a limit γ as n → ∞, and that 0 < γ ■ 1. [This follows at once from § 174. The value of γ is in fact .577 . . . , and γ is usually called Euler's constant.] 2. If a and b are positive then 1 a + 1 a + b + 1 a + 2b + · · · + 1 a + (n – 1)b – 1 b log(a + nb) tends to a limit as n → ∞. 3. If 0 < s < 1 then φ(n) = 1 + 2–s + 3–s + · · · + (n – 1)–s – n1–s 1 – s tends to a limit as n → ∞. 4. Show that the series 1 1 + 1 2(1 + 1 2) + 1 3(1 + 1 2 + 1 3) + . . . is divergent. [Compare the general term of the series with 1/(n log n).] Show also that the series derived from P n–s, in the same way that the above series is derived from P(1/n), is convergent if s > 1 and otherwise divergent. 5. Prove generally that if P un is a series of positive terms, and sn = u1 + u2 + · · · + un, [IX : 212] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 471 then P(un/sn–1) is convergent or divergent according as P un is convergent or divergent. [If P un is convergent then sn–1 tends to a positive limit l, and soP(un/sn–1) is convergent. If P un is divergent then sn–1 → ∞, and un/sn–1 > log{1 + (un/sn–1)} = log(sn/sn–1) (Ex. lxxxii. 1); and it is evident that log(s2/s1) + log(s3/s2) + · · · + log(sn/sn–1) = log(sn/s1) tends to ∞ as n → ∞.] 6. Prove that the same result holds for the series P(un/sn). [The proof is the same in the case of convergence. If P un is divergent, and un < sn–1 from a certain value of n onwards, then sn < 2sn–1, and the divergence of P(un/sn) follows from that of P(un/sn–1). If on the other hand un ■ sn–1 for an infinity of values of n, as might happen with a rapidly divergent series, then un/sn ■ 1 2 for all these values of n.] 7. Sum the series 1 – 1 2 + 1 3 – . . . . [We have 1+ 1 2 +· · ·+ 1 2n = log(2n+1)+γ+■n, 2 1 2 + 1 4 + · · · + 1 2n

= log(n+1)+γ+■′ n, by Ex. 1, γ denoting Euler's constant, and ■n, ■′ n being numbers which tend to zero as n → ∞. Subtracting and making n → ∞ we see that the sum of the given series is log 2. See also § 213.] 8. Prove that the series ∞X 0 (–1)n

1 + 1 2 + · · · + 1 n + 1 – log n – C

oscillates finitely except when C = γ, when it converges. 212. Series connected with the exponential and logarithmic functions. Expansion of ex by Taylor's Theorem. Since all the derivatives of the exponential function are equal to the function itself, we have ex = 1 + x + x2 2! + · · · + xn–1 (n – 1)! + xn n! eθx [IX : 212] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 472 where 0 < θ < 1. But xn/n! → 0 as n → ∞, whatever be the value of x (Ex. xxvii. 12); and eθx < ex. Hence, making n tend to ∞, we have ex = 1 + x + x2 2! + · · · + xn n! + ... (1) The series on the right-hand side of this equation is known as the ex- ponential series. In particular we have e = 1 + 1 + 1 2! + · · · + 1 n! + . . . ; (2) and so

1 + 1 + 1 2! + · · · + 1 n! + . . . x = 1 + x + x2 2! + · · · + xn n! + . . . , (3) a result known as the exponential theorem. Also ax = ex log a = 1 + (x log a) + (x log a)2 2! + . . . (4) for all positive values of a. The reader will observe that the exponential series has the property of repro- ducing itself when every term is differentiated, and that no other series of powers of x would possess this property: for some further remarks in this connection see Appendix II. The power series for ex is so important that it is worth while to investigate it by an alternative method which does not depend upon Taylor's Theorem. Let En(x) = 1 + x + x2 2! + · · · + xn n! , and suppose that x > 0. Then

1 + x n n = 1 + n x n

+ n(n – 1) 1 · 2 x n 2 + · · · + n(n – 1) . . . 1 1 · 2 . . . n x n n , which is less than En(x). And, provided n > x, we have also, by the binomial theorem for a negative integral exponent,

1 – x n –n = 1 + n x n

+ n(n + 1) 1 · 2 x n 2 + · · · > En(x). [IX : 212] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 473 Thus 1 + x n n < En(x) <

1 – x n –n . But (§ 208) the first and last functions tend to the limit ex as n → ∞, and therefore En(x) must do the same. From this the equation (1) follows when x is positive; its truth when x is negative follows from the fact that the exponential series, as was

shown in Ex. lxxxi. 7, satisfies the functional equation f (x)f (y) = f (x + y), so that f (x)f (–x) = f (0) = 1. Examples XC. 1. Show that cosh x = 1 + x2 2! + x4 4! + . . . , sinh x = x + x3 3! + x5 5! + ... 2. If x is positive then the greatest term in the exponential series is the ([x] + 1)-th, unless x is an integer, when the preceding term is equal to it. 3. Show that n! > (n/e)n. [For nn/n! is one term in the series for en.] 4. Prove that en = (nn/n!)(2 + S1 + S2), where S1 = 1 1 + ν + 1 (1 + ν)(1 + 2ν) + . . . , S2 = (1 – ν) + (1 – ν)(1 – 2ν) + . . . , and ν = 1/n; and deduce that n! lies between 2(n/e)n and 2(n + 1)(n/e)n. 5. Employ the exponential series to prove that ex tends to infinity more rapidly than any power of x. [Use the inequality ex > xn/n!.] 6. Show that e is not a rational number. [If e = p/q, where p and q are integers, we must have p q = 1 + 1 + 1 2! + 1 3! + · · · + 1 q! + . . . or, multiplying up by q!, q! p q – 1 – 1 – 1 2! – · · · – 1 q!

= 1 q + 1 + 1 (q + 1)(q + 2) + . . . and this is absurd, since the left-hand side is integral, and the right-hand side less than {1/(q + 1)} + {1/(q + 1)}2 + · · · = 1/q.] [IX : 212] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 474 7. Sum the series ∞P 0 Pr(n) xn n! , where Pr(n) is a polynomial of degree r in n. [We can express Pr(n) in the form A0 + A1n + A2n(n – 1) + · · · + Arn(n – 1) . . . (n – r + 1), and ∞X 0 Pr(n) xn n! = A0 ∞X 0 xn n! + A1 ∞X 1 xn (n – 1)! + · · · + Ar ∞X r xn (n – r)! = (A0 + A1x + A2x2 + · · · + Arxr)ex.] 8. Show that ∞X 1 n3 n! xn = (x + 3x2 + x3)ex, ∞X 1 n4 n! xn = (x + 7x2 + 6x3 + x4)ex; and that if Sn = 13 + 23 + · · · + n3 then ∞X 1 Sn xn n! = 1 4 (4x + 14x2 + 8x3 + x4)ex. In particular the last series is equal to zero when x = –2. (Math. Trip. 1904.) 9. Prove that P(n/n!) = e, P(n2/n!) = 2e, P(n3/n!) = 5e, and thatP(nk/n!), where k is any positive integer, is a positive integral multiple of e. 10. Prove that ∞P 1 (n – 1)xn (n + 2)n! = (x2 – 3x + 3)ex + 1 2 x2 – 3 /x2. [Multiply numerator and denominator by n + 1, and proceed as in Ex. 7.] 11. Determine a, b, c so that {(x + a)ex + (bx + c)}/x3 tends to a limit as x → 0, evaluate the limit, and draw the graph of the function ex + bx + c x + a . 12. Draw the graphs of 1 + x, 1 + x + 1 2 x2, 1 + x + 1 2 x2 + 1 6 x3, and compare them with that of ex. 13. Prove that e–x – 1 + x – xn 2! + · · · – (–1)n xn n! is positive or negative according as n is odd or even. Deduce the exponential theorem. 14. If X0 = ex, X1 = ex – 1, X2 = ex – 1 – x, X3 = ex – 1 – x – (x2/2!), . . . , [IX : 213] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 475 then dXν /dx = Xν–1. Hence prove that if t > 0 then X1(t) = Z t 0 X0 dx < tet, X2(t) = Z t 0 X1 dx < Z t 0 xex dx < et Z t 0 x dx = t2 2! et, and generally Xν (t) < tν ν! et. Deduce the exponential theorem. 15. Show that the expansion in powers of p of the positive root of x2+p = a2 begins with the terms a{1 – 1 2 p log a + 1 8 p2 log a(2 + log a)}. (Math. Trip. 1909.) 213. The logarithmic series. Another very important expansion in powers of x is that for log(1 + x). Since log(1 + x) = Z x 0 dt 1 + t, and 1/(1 + t) = 1 – t + t2 – . . . if t is numerically less than unity, it is natural to expect* that log(1 + x) will be equal, when –1 < x < 1, to the series obtained by integrating each term of the series 1 – t + t2 – . . . from t = 0 to t = x, i.e. to the series x – 1 2 x2 + 1 3 x3 – . . . . And this is in fact the case. For 1/(1 + t) = 1 – t + t2 – · · · + (–1)m–1tm–1 + (–1)mtm 1 + t , and so, if x > –1, log(1 + x) = Z x 0 dt 1 + t = x – x2 2 + · · · + (–1)m–1 xm m + (–1)mRm, where Rm = Z x 0 tm dt 1 + t. *See Appendix II for some further remarks on this subject. [IX : 214] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 476 We require to show that the limit of Rm, when m tends to ∞, is zero. This is almost obvious when 0 < x ■ 1; for then Rm is positive and less than Z x 0 tm dt = xm+1 m + 1, and therefore less than 1/(m + 1). If on the other hand –1 < x < 0, we put t = –u and x = –ξ, so that Rm = (–1)m Z ξ 0 um du 1 – u , which shows that Rm has the sign of (–1)m. Also, since the greatest value of 1/(1 – u) in the range of integration is 1/(1 – ξ), we have 0 < |Rm| < 1 1 – ξ Z ξ 0 um du = ξm (m + 1)(1 – ξ) < 1 (m + 1)(1 – ξ) : and so Rm → 0. Hence log(1 + x) = x – 1 2 x2 + 1 3 x3 – . . . , provided that –1 < x ■ 1. If x lies outside these limits the series is not convergent. If x = 1 we obtain log 2 = 1 – 1 2 + 1 3 – . . . , a result already proved otherwise (Ex. lxxxix. 7). 214. The series for the inverse tangent. It is easy to prove in a similar manner that arc tan x = Z x 0 dt 1 + t2 = Z x 0 (1 – t2 + t4 – . . .) dt = x – 1 3 x3 + 1 5 x5 – . . . , provided that –1 ■ x ■ 1. The only difference is that the proof is a little simpler; for, since arc tan x is an odd function of x, we need only consider [IX : 214] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 477 positive values of x. And the series is convergent when x = –1 as well as when x = 1. We leave the discussion to the reader. The value of arc tan x which is represented by the series is of course that which lies between –1 4 π and 1 4 π when –1 ■ x ■ 1, and which we saw in Ch. VII (Ex. lxiii. 3) to be the value represented by the integral. If x = 1, we obtain the formula 1 4 π = 1 – 1 3 + 1 5 – . . . . Examples XCI. 1. log 1 1 – x

= x + 1 2 x2 + 1 3 x3 + . . . if –1 ■ x < 1. 2. arg tanh x = 1 2 log 1 + x 1 – x

= x + 1 3 x3 + 1 5 x5 + . . . if –1 < x < 1. 3. Prove that if x is positive then log(1 + x) = x 1 + x + 1 2 x 1 + x 2 + 1 3 x 1 + x 3 + ... (Math. Trip. 1911.) 4. Obtain the series for log(1 + x) and arc tan x by means of Taylor's the- orem. [A difficulty presents itself in the discussion of the remainder in the first series when x is negative, if Lagrange's form Rn = (–1)n–1xn/{n(1 + θx)n} is used; Cauchy's form, viz. Rn = (–1)n–1(1 – θ)n–1xn/(1 + θx)n, should be used (cf. the corresponding discussion for the Binomial Series, Ex. lvi. 2 and § 163). In the case of the second series we have Dn x arc tan x = Dn–1 x {1/(1 + x2)} = (–1)n–1(n – 1)!(x2 + 1)–n/2 sin{n arc tan(1/x)} (Ex. xlv. 11), and there is no difficulty about the remainder, which is obviously not greater in absolute value than 1/n.*] *The formula for Dn x arc tan x fails when x = 0, as arc tan(1/x) is then undefined. It is easy to see (cf. Ex. xlv. 11) that arc tan(1/x) must then be interpreted as meaning 1 2 π. [IX : 214] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 478 5. If y > 0 then

log y = 2 (y – 1 y + 1 + 1 3 y – 1 y + 1 3 + 1 5 y – 1 y + 1 5 + . . .) . [Use the identity y =

1 + y – 1 y + 1

1 – y – 1 y + 1

. This series may be used to calculate log 2, a purpose for which the series 1 – 1 2 + 1 3 – . . . , owing to the slowness of its convergence, is practically useless. Put y = 2 and find log 2 to 3 places of decimals.] 6. Find log 10 to 3 places of decimals from the formula log 10 = 3 log 2 + log(1 + 1 4). 7. Prove that log x + 1 x

= 2 1 2x + 1 + 1 3(2x + 1)3 + 1 5(2x + 1)5 + . . .

if x > 0, and that log (x – 1)2(x + 2) (x + 1)2(x – 2) = 2 (2 x3 – 3x + 1 3 2 x3 – 3x 3 + 1 5 2 x3 – 3x 5 + . . .) if x > 2. Given that log 2 = .693 147 1 . . . and log 3 = 1.098 612 3 . . . , show, by putting x = 10 in the second formula, that log 11 = 2.397 895 . . . . (Math. Trip. 1912.) 8. Show that if log 2, log 5, and log 11 are known, then the formula log 13 = 3 log 11 + log 5 – 9 log 2 gives log 13 with an error practically equal to .000 15. (Math. Trip. 1910.) 9. Show that 1 2 log 2 = 7a + 5b + 3c, 1 2 log 3 = 11a + 8b + 5c, 1 2 log 5 = 16a + 12b + 7c, where a = arg tanh(1/31), b = arg tanh(1/49), c = arg tanh(1/161). [These formulae enable us to find log 2, log 3, and log 5 rapidly and with any degree of accuracy.] [IX : 214] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 479 10. Show that 1 4 π = arc tan(1/2) + arc tan(1/3) = 4 arc tan(1/5) – arc tan(1/239), and calculate π to 6 places of decimals. 11. Show that the expansion of (1 + x)1+x in powers of x begins with the terms 1 + x + x2 + 1/2x3. (Math. Trip. 1910.) 12. Show that log10 e – px(x + 1) log10 1 + x x

= log10 e 24x2 , approximately, for large values of x. Apply the formula, when x = 10, to obtain an approximate value of log10 e, and estimate the accuracy of the result. (Math. Trip. 1910.) 13. Show that 1 1 – x log 1 1 – x

= x + 1 + 1 2 x2 + 1 + 1 2 + 1 3 x3 + . . . , if –1 < x < 1. [Use Ex. lxxxi. 2.] 14. Using the logarithmic series and the facts that log10 2.3758 = .375 809 9 . . . and log10 e = .4343 . . . , show that an approximate solution of the equation x = 100 log10 x is 237.581 21. (Math. Trip. 1910.) 15. Expand log cos x and log(sin x/x) in powers of x as far as x4, and verify that, to this order, log sin x = log x – 1 45 log cos x + 64 45 log cos 1 2 x. (Math. Trip. 1908.) 16. Show that Z x 0 dt 1 + t4 = x – 1 5 x5 + 1 9 x9 – . . . if –1 ■ x ■ 1. Deduce that 1 – 1 5 + 1 9 – · · · = {π + 2 log(√2 + 1)}/4√2. (Math. Trip. 1896.) [IX : 215] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 480 [Proceed as in § 214 and use the result of Ex. xlviii. 7.] 17. Prove similarly that 1 3 – 1 7 + 1 11 – · · · = Z 1 0 t2 dt 1 + t4 = {π – 2 log(√2 + 1)}/4√2. 18. Prove generally that if a and b are positive integers then 1 a – 1 a + b + 1 a + 2b – · · · = Z 1 0 ta–1 dt 1 + tb , and so that the sum of the series can be found. Calculate in this way the sums of 1 – 1 4 + 1 7 – . . . and 1 2 – 1 5 + 1 8 – . . . . 215. The Binomial Series. We have already (§ 163) investigated the Binomial Theorem (1 + x)m = 1 + m 1

x + m 2

x2 + . . . , assuming that –1 < x < 1 and that m is rational. When m is irrational we have (1 + x)m = em log(1+x), Dx(1 + x)m = {m/(1 + x)}em log(1+x) = m(1 + x)m–1, so that the rule for the differentiation of (1+x)m remains the same, and the proof of the theorem given in § 163 retains its validity. We shall not discuss the question of the convergence of the series when x = 1 or x = –1.* Examples XCII. 1. Prove that if –1 < x < 1 then 1 √1 + x2 = 1 – 1 2 x2 + 1 · 3 2 · 4 x4 – . . . , 1 √1 – x2 = 1 + 1 2 x2 + 1 · 3 2 · 4 x4 + ... *See Bromwich, Infinite Series, pp. 150 et seq.; Hobson, Plane Trigonometry (3rd edition), p. 271. [IX : 215] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 481 2. Approximation to quadratic and other surds. Let √M be a quadratic surd whose numerical value is required. Let N 2 be the square nearest to M ; and let M = N 2 + x or M = N 2 – x, x being positive. Since x cannot be greater than N , x/N 2 is comparatively small and the surd√M = N p1 ± (x/N 2) can be expressed in a series = N

1 ± 1 2 x N 2

– 1 · 1 2 · 4 x N 2 2 ± . . .

, which is at any rate fairly rapidly convergent, and may be very rapidly so. Thus √67 = √64 + 3 = 8 (1 + 1 2 3 64

– 1 · 1 2 · 4 3 64 2 + . . .) . Let us consider the error committed in taking 8 3 16 (the value given by the first two terms) as an approximate value. After the second term the terms alternate in sign and decrease. Hence the error is one of excess, and is less than 32/642, which is less than .003. 3. If x is small compared with N 2 then pN 2 + x = N + x 4N + N x 2(2N 2 + x) , the error being of the order x4/N 7. Apply the process to √907. [Expanding by the binomial theorem, we have pN 2 + x = N + x 2N – x2 8N 3 + x3 16N 5 , the error being less than the numerical value of the next term, viz. 5x4/128N 7. Also N x 2(2N 2 + x) = x 4N

1 + x 2N 2 –1 = x 4N – x2 8N 3 + x3 16N 5 , the error being less than x4/32N 7. The result follows. The same method may be applied to surds other than quadratic surds, e.g. to 3 √1031.] 4. If M differs from N 3 by less than 1 per cent. of either then 3 √M differs from 2 3 N + 1 3 (M/N 2) by less than N/90,000. (Math. Trip. 1882.) [IX : 216] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 482 5. If M = N 4 + x, and x is small compared with N , then a good approxi- mation for 4 √M is 51 56 N + 5 56 M N 3 + 27N x 14(7M + 5N 4) . Show that when N = 10, x = 1, this approximation is accurate to 16 places of decimals. (Math. Trip. 1886.) 6. Show how to sum the series ∞X 0 Pr(n) m n

xn, where Pr(n) is a polynomial of degree r in n. [Express Pr(n) in the form A0 + A1n + A2n(n – 1) + . . . as in Ex. xc. 7.] 7. Sum the series ∞P 0 n m n

xn, ∞P 0 n2 m n

xn and prove that ∞X 0 n3 m n

xn = {m3x3 + m(3m – 1)x2 + mx}(1 + x)m–3. 216. An alternative method of development of the theory of the exponential and logarithmic functions. We shall now give an outline of a method of investigation of the properties of ex and log x entirely different in logical order from that followed in the preceding pages. This method starts from the exponential series 1 + x + x2 2! + ... We know that this series is convergent for all values of x, and we may therefore define the function exp x by the equation exp x = 1 + x + x2 2! + ... (1) We then prove, as in Ex. lxxxi. 7, that exp x × exp y = exp(x + y). (2) Again exp h – 1 h = 1 + h 2! + h2 3! + · · · = 1 + ρ(h), [IX : 216] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 483 where ρ(h) is numerically less than | 1 2 h| + | 1 2 h|2 + | 1 2 h|3 + · · · = | 1 2 h|/(1 – | 1 2 h|), so that ρ(h) → 0 as h → 0. And so exp(x + h) – exp x h = exp x exp h – 1 h

→ exp x as h → 0, or Dx exp x = exp x. (3) Incidentally we have proved that exp x is a continuous function. We have now a choice of procedure. Writing y = exp x and observing that exp 0 = 1, we have dy dx = y, x = Z y 1 dt t , and, if we define the logarithmic function as the function inverse to the expo- nential function, we are brought back to the point of view adopted earlier in this chapter. But we may proceed differently. From (2) it follows that if n is a positive integer then (exp x)n = exp nx, (exp 1)n = exp n. If x is a positive rational fraction m/n, then {exp(m/n)}n = exp m = (exp 1)m, and so exp(m/n) is equal to the positive value of (exp 1)m/n. This result may be extended to negative rational values of x by means of the equation exp x exp(–x) = 1; and so we have exp x = (exp 1)x = ex, say, where e = exp 1 = 1 + 1 + 1 2! + 1 3! + . . . , for all rational values of x. Finally we define ex, when x is irrational, as being equal to exp x. The logarithm is then defined as the function inverse to exp x or ex. [IX : 216] THE LOGARITHMIC AND EXPONENTIAL FUNCTIONS 484 Example. Develop the theory of the binomial series 1 + m 1

x + m 2

x2 + · · · = f (m, x), where –1 < x < 1, in a similar manner, starting from the equation f (m, x)f (m′, x) = f (m + m′, x) (Ex. lxxxi. 6). MISCELLANEOUS EXAMPLES ON CHAPTER IX* 1. Given that log10 e = .4343 and that 210 and 321 are nearly equal to powers of 10, calculate log10 2 and log10 3 to four places of decimals. (Math. Trip. 1905.) 2. Determine which of (1 2 e)√3 and (√2) 1 2 π is the greater. [Take logarithms and observe that √3/(√3 + 1 4 π) < 2 5 √3 < .6929 < log 2.] 3. Show that log10 n cannot be a rational number if n is any positive integer not a power of 10. [If n is not divisible by 10, and log10 n = p/q, we have 10p = nq, which is impossible, since 10p ends with 0 and nq does not. If n = 10aN , where N is not divisible by 10, then log10 N and therefore log10 n = a + log10 N cannot be rational.] 4. For what values of x are the functions log x, log log x, log log log x

PREFATORY NOTE BY THE AUTHOR

If this Discourse appear too long to be read at once, it may be divided into six Parts: and, in the first, will be found various considerations touching the Sciences; in the second, the principal rules of the Method which the Author has discovered, in the third, certain of the rules of Morals which he has deduced from this Method; in the fourth, the reasonings by which he establishes the existence of God and of the Human Soul, which are the foundations of his Metaphysic; in the fifth, the order of the Physical questions which he has investigated, and, in particular, the explication of the motion of the heart and of some other difficulties pertaining to Medicine, as also the difference between the soul of man and that of the brutes; and, in the last, what the Author believes to be required in order to greater advancement in the investigation of Nature than has yet been made, with the reasons that have induced him to write.

PART I

Good sense is, of all things among men, the most equally distributed; for every one thinks himself so abundantly provided with it, that those even who are the most difficult to satisfy in everything else, do not usually desire a larger measure of this quality than they already possess. And in this it is not likely that all are mistaken the conviction is rather to be held as testifying that the power of judging aright and of distinguishing truth from error, which is properly what is called good sense or reason, is by nature equal in all men; and that the diversity of our opinions, consequently, does not arise from some being endowed with a larger share of reason than others, but solely from this, that we conduct our thoughts along different ways, and do not fix our attention on the same objects. For to be possessed of a vigorous mind is not enough; the prime requisite is rightly to apply it. The greatest minds, as they are capable of the highest excellences, are open likewise to the greatest aberrations; and those who travel very slowly may yet make far greater progress, provided they keep always to the straight road, than those who, while they run, forsake it.

For myself, I have never fancied my mind to be in any respect more perfect than those of the generality; on the contrary, I have often wished that I were equal to some others in promptitude of thought, or in clearness and distinctness of imagination, or in fullness and readiness of memory. And besides these, I know of no other qualities that contribute to the perfection of the mind; for as to the reason or sense, inasmuch as it is that alone which constitutes us men, and distinguishes us from the brutes, I am disposed to believe that it is to be found complete in each individual; and on this point to adopt the common opinion of philosophers, who say that the difference of greater and less holds only among the accidents, and not among the forms or natures of individuals of the same species.

I will not hesitate, however, to avow my belief that it has been my singular good fortune to have very early in life fallen in with certain tracks which have conducted me to considerations and maxims, of which I have formed a method that gives me the means, as I think, of gradually augmenting my knowledge, and of raising it by little and little to the highest point which the mediocrity of my talents and the brief duration of my life will permit me to reach. For I have already reaped from it such fruits that, although I have been accustomed to think lowly enough of myself, and although when I look with the eye of a philosopher at the varied courses and

pursuits of mankind at large, I find scarcely one which does not appear in vain and useless, I nevertheless derive the highest satisfaction from the progress I conceive myself to have already made in the search after truth, and cannot help entertaining such expectations of the future as to believe that if, among the occupations of men as men, there is any one really excellent and important, it is that which I have chosen.

After all, it is possible I may be mistaken; and it is but a little copper and glass, perhaps, that I take for gold and diamonds. I know how very liable we are to delusion in what relates to ourselves, and also how much the judgments of our friends are to be suspected when given in our favor. But I shall endeavor in this discourse to describe the paths I have followed, and to delineate my life as in a picture, in order that each one may also be able to judge of them for himself, and that in the general opinion entertained of them, as gathered from current report, I myself may have a new help towards instruction to be added to those I have been in the habit of employing.

My present design, then, is not to teach the method which each ought to follow for the right conduct of his reason, but solely to describe the way in which I have endeavored to conduct my own. They who set themselves to give precepts must of course regard themselves as possessed of greater skill than those to whom they prescribe; and if they err in the slightest particular, they subject themselves to censure. But as this tract is put forth merely as a history, or, if you will, as a tale, in which, amid some examples worthy of imitation, there will be found, perhaps, as many more which it were advisable not to follow, I hope it will prove useful to some without being hurtful to any, and that my openness will find some favor with all.

From my childhood, I have been familiar with letters; and as I was given to believe that by their help a clear and certain knowledge of all that is useful in life might be acquired, I was ardently desirous of instruction. But as soon as I had finished the entire course of study, at the close of which it is customary to be admitted into the order of the learned, I completely changed my opinion. For I found myself involved in so many doubts and errors, that I was convinced I had advanced no farther in all my attempts at learning, than the discovery at every turn of my own ignorance. And yet I was studying in one of the most celebrated schools in Europe, in which I thought there must be learned men, if such were anywhere to be found. I had been taught all that others learned there; and not contented with the sciences actually taught us, I had, in addition, read all the books that had fallen into my hands, treating of such branches as are esteemed the most curious and rare. I knew the judgment which others had formed of me; and I did not find that I was considered inferior to my fellows, although there were among them some who were already marked out to fill the places of our instructors. And, in fine, our age appeared to me as flourishing, and as fertile in powerful minds as any preceding one. I was thus led to take the liberty of judging of all other men by myself, and of concluding that there was no science in existence that was of such a nature as I had previously been given to believe.

I still continued, however, to hold in esteem the studies of the schools. I was aware that the languages taught in them are necessary to the understanding of the writings of the ancients; that the grace of fable stirs the mind; that the memorable deeds of history elevate it; and, if read with discretion, aid in forming the judgment; that the perusal of all excellent books is, as it were, to interview with the noblest men of past ages, who have written them, and even a studied interview, in which are discovered to us only their choicest thoughts; that eloquence has incomparable force and beauty; that poesy has its ravishing graces and delights; that in the mathematics there are many refined discoveries eminently suited to gratify the inquisitive, as well as further all the arts an lessen the labour of man; that numerous highly useful precepts and exhortations to virtue are contained in treatises on morals; that theology points out the path to heaven; that philosophy affords the means of discoursing with an appearance of truth on all matters, and commands the admiration of the more simple; that jurisprudence, medicine, and the other sciences, secure for their cultivators honors and riches; and, in fine, that it is useful to bestow some attention upon all, even upon those abounding the most in superstition and error, that we may be in a position to determine their real value, and guard against being deceived.

But I believed that I had already given sufficient time to languages, and likewise to the reading of the writings of the ancients, to their histories and fables. For to hold converse with those of other ages and to travel, are almost the same thing. It is useful to know something of the manners of different nations, that we may be enabled to form a more correct judgment regarding our own, and be prevented from thinking that everything contrary to our customs is ridiculous and irrational, a conclusion usually come to by those whose experience has been limited to their own country. On the other hand, when too much time is occupied in traveling, we become strangers to our native country; and the over curious in the customs of the past are generally ignorant of those of the present. Besides, fictitious narratives lead us to imagine the possibility of many events that are impossible; and even the most faithful histories, if they do not wholly misrepresent matters, or exaggerate their importance to render the account of them more worthy of perusal, omit, at least, almost always the meanest and least striking of the attendant circumstances; hence it happens that the remainder does not represent the truth, and that such as regulate their conduct by examples drawn from this source, are

apt to fall into the extravagances of the knight-errants of romance, and to entertain projects that exceed their powers.

I esteemed eloquence highly, and was in raptures with poesy; but I thought that both were gifts of nature rather than fruits of study. Those in whom the faculty of reason is predominant, and who most skillfully dispose their thoughts with a view to render them clear and intelligible, are always the best able to persuade others of the truth of what they lay down, though they should speak only in the language of Lower Brittany, and be wholly ignorant of the rules of rhetoric; and those whose minds are stored with the most agreeable fancies, and who can give expression to them with the greatest embellishment and harmony, are still the best poets, though unacquainted with the art of poetry.

I was especially delighted with the mathematics, on account of the certitude and evidence of their reasonings; but I had not as yet a precise knowledge of their true use; and thinking that they but contributed to the advancement of the mechanical arts, I was astonished that foundations, so strong and solid, should have had no loftier superstructure reared on them. On the other hand, I compared the disquisitions of the ancient moralists to very towering and magnificent palaces with no better foundation than sand and mud: they laud the virtues very highly, and exhibit them as estimable far above anything on earth; but they give us no adequate criterion of virtue, and frequently that which they designate with so fine a name is but apathy, or pride, or despair, or parricide.

I revered our theology, and aspired as much as any one to reach heaven: but being given assuredly to understand that the way is not less open to the most ignorant than to the most learned, and that the revealed truths which lead to heaven are above our comprehension, I did not presume to subject them to the impotency of my reason; and I thought that in order competently to undertake their examination, there was need of some special help from heaven, and of being more than man.

Of philosophy I will say nothing, except that when I saw that it had been cultivated for many ages by the most distinguished men, and that yet there is not a single matter within its sphere which is not still in dispute, and nothing, therefore, which is above doubt, I did not presume to anticipate that my success would be greater in it than that of others; and further, when I considered the number of conflicting opinions touching a single matter that may be upheld by learned men, while there can be but one true, I reckoned as well-nigh false all that was only probable.

As to the other sciences, inasmuch as these borrow their principles from philosophy, I judged that no solid superstructures could be reared on foundations so infirm; and neither the honor nor the gain held out by them was sufficient to determine me to their cultivation: for I was not, thank Heaven, in a condition which compelled me to make merchandise of science for the bettering of my fortune; and though I might not profess to scorn glory as a cynic, I yet made very slight account of that honor which I hoped to acquire only through fictitious titles. And, in fine, of false sciences I thought I knew the worth sufficiently to escape being deceived by the professions of an alchemist, the predictions of an astrologer, the impostures of a magician, or by the artifices and boasting of any of those who profess to know things of which they are ignorant.

For these reasons, as soon as my age permitted me to pass from under the control of my instructors, I entirely abandoned the study of letters, and resolved no longer to seek any other science than the knowledge of myself, or of the great book of the world. I spent the remainder of my youth in traveling, in visiting courts and armies, in holding intercourse with men of different dispositions and ranks, in collecting varied experience, in proving myself in the different situations into which fortune threw me, and, above all, in making such reflection on the matter of my experience as to secure my improvement. For it occurred to me that I should find much more truth in the reasonings of each individual with reference to the affairs in which he is personally interested, and the issue of which must presently punish him if he has judged amiss, than in those conducted by a man of letters in his study, regarding speculative matters that are of no practical moment, and followed by no consequences to himself, farther, perhaps, than that they foster his vanity the better the more remote they are from common sense; requiring, as they must in this case, the exercise of greater ingenuity and art to render them probable. In addition, I had always a most earnest desire to know how to distinguish the true from the false, in order that I might be able clearly to discriminate the right path in life, and proceed in it with confidence.

It is true that, while busied only in considering the manners of other men, I found here, too, scarce any ground for settled conviction, and remarked hardly less contradiction among them than in the opinions of the philosophers. So that the greatest advantage I derived from the study consisted in this, that, observing many things which, however extravagant and ridiculous to our apprehension, are yet by common consent received and approved by other great nations, I learned to entertain too decided a belief in regard to nothing of the truth of which I had been persuaded merely by example and custom; and thus I gradually extricated myself from many errors powerful enough to darken our natural intelligence, and incapacitate us in great measure from listening to reason. But after I had been occupied several years in thus studying the book of the world, and in essaying to gather some

experience, I at length resolved to make myself an object of study, and to employ all the powers of my mind in choosing the paths I ought to follow, an undertaking which was accompanied with greater success than it would have been had I never quitted my country or my books.

PART II

I was then in Germany, attracted thither by the wars in that country, which have not yet been brought to a termination; and as I was returning to the army from the coronation of the emperor, the setting in of winter arrested me in a locality where, as I found no society to interest me, and was besides fortunately undisturbed by any cares or passions, I remained the whole day in seclusion, with full opportunity to occupy my attention with my own thoughts. Of these one of the very first that occurred to me was, that there is seldom so much perfection in works composed of many separate parts, upon which different hands had been employed, as in those completed by a single master. Thus it is observable that the buildings which a single architect has planned and executed, are generally more elegant and commodious than those which several have attempted to improve, by making old walls serve for purposes for which they were not originally built. Thus also, those ancient cities which, from being at first only villages, have become, in course of time, large towns, are usually but ill laid out compared with the regularity constructed towns which a professional architect has freely planned on an open plain; so that although the several buildings of the former may often equal or surpass in beauty those of the latter, yet when one observes their indiscriminate juxtaposition, there a large one and here a small, and the consequent crookedness and irregularity of the streets, one is disposed to allege that chance rather than any human will guided by reason must have led to such an arrangement. And if we consider that nevertheless there have been at all times certain officers whose duty it was to see that private buildings contributed to public ornament, the difficulty of reaching high perfection with but the materials of others to operate on, will be readily acknowledged. In the same way I fancied that those nations which, starting from a semi-barbarous state and advancing to civilization by slow degrees, have had their laws successively determined, and, as it were, forced upon them simply by experience of the hurtfulness of particular crimes and disputes, would by this process come to be possessed of less perfect institutions than those which, from the commencement of their association as communities, have followed the appointments of some wise legislator. It is thus quite certain that the constitution of the true religion, the ordinances of which are derived from God, must be incomparably superior to that of every other. And, to speak of human affairs, I believe that the pre-eminence of Sparta was due not to the goodness of each of its laws in particular, for many of these were very strange, and even opposed to good morals, but to the circumstance that, originated by a single individual, they all tended to a single end. In the same way I thought that the sciences contained in books (such of them at least as are made up of probable reasonings, without demonstrations), composed as they are of the opinions of many different individuals massed together, are farther removed from truth than the simple inferences which a man of good sense using his natural and unprejudiced judgment draws respecting the matters of his experience. And because we have all to pass through a state of infancy to manhood, and have been of necessity, for a length of time, governed by our desires and preceptors (whose dictates were frequently conflicting, while neither perhaps always counseled us for the best), I farther concluded that it is almost impossible that our judgments can be so correct or solid as they would have been, had our reason been mature from the moment of our birth, and had we always been guided by it alone.

It is true, however, that it is not customary to pull down all the houses of a town with the single design of rebuilding them differently, and thereby rendering the streets more handsome; but it often happens that a private individual takes down his own with the view of erecting it anew, and that people are even sometimes constrained to this when their houses are in danger of falling from age, or when the foundations are insecure. With this before me by way of example, I was persuaded that it would indeed be preposterous for a private individual to think of reforming a state by fundamentally changing it throughout, and overturning it in order to set it up amended; and the same I thought was true of any similar project for reforming the body of the sciences, or the order of teaching them established in the schools: but as for the opinions which up to that time I had embraced, I thought that I could not do better than resolve at once to sweep them wholly away, that I might afterwards be in a position to admit either others more correct, or even perhaps the same when they had undergone the scrutiny of reason. I firmly believed that in this way I should much better succeed in the conduct of my life, than if I built only upon old foundations, and leaned upon principles which, in my youth, I had taken upon trust. For although I recognized various difficulties in this undertaking, these were not, however, without remedy, nor once to be compared with such as attend the slightest reformation in public affairs. Large bodies, if once overthrown, are with great difficulty set up again, or even kept erect when once seriously shaken, and the fall of such is always disastrous. Then if there are any imperfections in the constitutions of states (and that many such exist the diversity of constitutions is alone sufficient to assure us), custom has without doubt materially smoothed their inconveniences, and has even managed to steer altogether clear of, or insensibly corrected a number which sagacity could not have provided against with equal effect; and, in fine, the defects are almost

always more tolerable than the change necessary for their removal; in the same manner that highways which wind among mountains, by being much frequented, become gradually so smooth and commodious, that it is much better to follow them than to seek a straighter path by climbing over the tops of rocks and descending to the bottoms of precipices.

Hence it is that I cannot in any degree approve of those restless and busy meddlers who, called neither by birth nor fortune to take part in the management of public affairs, are yet always projecting reforms; and if I thought that this tract contained aught which might justify the suspicion that I was a victim of such folly, I would by no means permit its publication. I have never contemplated anything higher than the reformation of my own opinions, and basing them on a foundation wholly my own. And although my own satisfaction with my work has led me to present here a draft of it, I do not by any means therefore recommend to every one else to make a similar attempt. Those whom God has endowed with a larger measure of genius will entertain, perhaps, designs still more exalted; but for the many I am much afraid lest even the present undertaking be more than they can safely venture to imitate. The single design to strip one's self of all past beliefs is one that ought not to be taken by every one. The majority of men is composed of two classes, for neither of which would this be at all a befitting resolution: in the first place, of those who with more than a due confidence in their own powers, are precipitate in their judgments and want the patience requisite for orderly and circumspect thinking; whence it happens, that if men of this class once take the liberty to doubt of their accustomed opinions, and quit the beaten highway, they will never be able to thread the byway that would lead them by a shorter course, and will lose themselves and continue to wander for life; in the second place, of those who, possessed of sufficient sense or modesty to determine that there are others who excel them in the power of discriminating between truth and error, and by whom they may be instructed, ought rather to content themselves with the opinions of such than trust for more correct to their own reason.

For my own part, I should doubtless have belonged to the latter class, had I received instruction from but one master, or had I never known the diversities of opinion that from time immemorial have prevailed among men of the greatest learning. But I had become aware, even so early as during my college life, that no opinion, however absurd and incredible, can be imagined, which has not been maintained by some on of the philosophers; and afterwards in the course of my travels I remarked that all those whose opinions are decidedly repugnant to ours are not in that account barbarians and savages, but on the contrary that many of these nations make an equally good, if not better, use of their reason than we do. I took into account also the very different character which a person brought up from infancy in France or Germany exhibits, from that which, with the same mind originally, this individual would have possessed had he lived always among the Chinese or with savages, and the circumstance that in dress itself the fashion which pleased us ten years ago, and which may again, perhaps, be received into favor before ten years have gone, appears to us at this moment extravagant and ridiculous. I was thus led to infer that the ground of our opinions is far more custom and example than any certain knowledge. And, finally, although such be the ground of our opinions, I remarked that a plurality of suffrages is no guarantee of truth where it is at all of difficult discovery, as in such cases it is much more likely that it will be found by one than by many. I could, however, select from the crowd no one whose opinions seemed worthy of preference, and thus I found myself constrained, as it were, to use my own reason in the conduct of my life.

But like one walking alone and in the dark, I resolved to proceed so slowly and with such circumspection, that if I did not advance far, I would at least guard against falling. I did not even choose to dismiss summarily any of the opinions that had crept into my belief without having been introduced by reason, but first of all took sufficient time carefully to satisfy myself of the general nature of the task I was setting myself, and ascertain the true method by which to arrive at the knowledge of whatever lay within the compass of my powers.

Among the branches of philosophy, I had, at an earlier period, given some attention to logic, and among those of the mathematics to geometrical analysis and algebra,--three arts or sciences which ought, as I conceived, to contribute something to my design. But, on examination, I found that, as for logic, its syllogisms and the majority of its other precepts are of avail--rather in the communication of what we already know, or even as the art of Lully, in speaking without judgment of things of which we are ignorant, than in the investigation of the unknown; and although this science contains indeed a number of correct and very excellent precepts, there are, nevertheless, so many others, and these either injurious or superfluous, mingled with the former, that it is almost quite as difficult to effect a severance of the true from the false as it is to extract a Diana or a Minerva from a rough block of marble. Then as to the analysis of the ancients and the algebra of the moderns, besides that they embrace only matters highly abstract, and, to appearance, of no use, the former is so exclusively restricted to the consideration of figures, that it can exercise the understanding only on condition of greatly fatiguing the imagination; and, in the latter, there is so complete a subjection to certain rules and formulas, that there results an art full of confusion and obscurity calculated to embarrass, instead of a science fitted to cultivate the mind. By these considerations I was induced to seek some other method which would comprise the

advantages of the three and be exempt from their defects. And as a multitude of laws often only hampers justice, so that a state is best governed when, with few laws, these are rigidly administered; in like manner, instead of the great number of precepts of which logic is composed, I believed that the four following would prove perfectly sufficient for me, provided I took the firm and unwavering resolution never in a single instance to fail in observing them.

The first was never to accept anything for true which I did not clearly know to be such; that is to say, carefully to avoid precipitancy and prejudice, and to comprise nothing more in my judgement than what was presented to my mind so clearly and distinctly as to exclude all ground of doubt.

The second, to divide each of the difficulties under examination into as many parts as possible, and as might be necessary for its adequate solution.

The third, to conduct my thoughts in such order that, by commencing with objects the simplest and easiest to know, I might ascend by little and little, and, as it were, step by step, to the knowledge of the more complex; assigning in thought a certain order even to those objects which in their own nature do not stand in a relation of antecedence and sequence.

And the _last_, in every case to make enumerations so complete, and reviews so general, that I might be assured that nothing was omitted.

The long chains of simple and easy reasonings by means of which geometers are accustomed to reach the conclusions of their most difficult demonstrations, had led me to imagine that all things, to the knowledge of which man is competent, are mutually connected in the same way, and that there is nothing so far removed from us as to be beyond our reach, or so hidden that we cannot discover it, provided only we abstain from accepting the false for the true, and always preserve in our thoughts the order necessary for the deduction of one truth from another. And I had little difficulty in determining the objects with which it was necessary to commence, for I was already persuaded that it must be with the simplest and easiest to know, and, considering that of all those who have hitherto sought truth in the sciences, the mathematicians alone have been able to find any demonstrations, that is, any certain and evident reasons, I did not doubt but that such must have been the rule of their investigations. I resolved to commence, therefore, with the examination of the simplest objects, not anticipating, however, from this any other advantage than that to be found in accustoming my mind to the love and nourishment of truth, and to a distaste for all such reasonings as were unsound. But I had no intention on that account of attempting to master all the particular sciences commonly denominated mathematics: but observing that, however different their objects, they all agree in considering only the various relations or proportions subsisting among those objects, I thought it best for my purpose to consider these proportions in the most general form possible, without referring them to any objects in particular, except such as would most facilitate the knowledge of them, and without by any means restricting them to these, that afterwards I might thus be the better able to apply them to every other class of objects to which they are legitimately applicable. Perceiving further, that in order to understand these relations I should sometimes have to consider them one by one and sometimes only to bear them in mind, or embrace them in the aggregate, I thought that, in order the better to consider them individually, I should view them as subsisting between straight lines, than which I could find no objects more simple, or capable of being more distinctly represented to my imagination and senses; and on the other hand, that in order to retain them in the memory or embrace an aggregate of many, I should express them by certain characters the briefest possible. In this way I believed that I could borrow all that was best both in geometrical analysis and in algebra, and correct all the defects of the one by help of the other.

And, in point of fact, the accurate observance of these few precepts gave me, I take the liberty of saying, such ease in unraveling all the questions embraced in these two sciences, that in the two or three months I devoted to their examination, not only did I reach solutions of questions I had formerly deemed exceedingly difficult but even as regards questions of the solution of which I continued ignorant, I was enabled, as it appeared to me, to determine the means whereby, and the extent to which a solution was possible; results attributable to the circumstance that I commenced with the simplest and most general truths, and that thus each truth discovered was a rule available in the discovery of subsequent ones Nor in this perhaps shall I appear too vain, if it be considered that, as the truth on any particular point is one whoever apprehends the truth, knows all that on that point can be known. The child, for example, who has been instructed in the elements of arithmetic, and has made a particular addition, according to rule, may be assured that he has found, with respect to the sum of the numbers before him, and that in this instance is within the reach of human genius. Now, in conclusion, the method which teaches adherence to the true order, and an exact enumeration of all the conditions of the thing sought includes all that gives certitude to the rules of arithmetic.

But the chief ground of my satisfaction with thus method, was the assurance I had of thereby exercising my reason in all matters, if not with absolute perfection, at least with the greatest attainable by me: besides, I was conscious that by its use my mind was becoming gradually habituated to clearer and more distinct conceptions of its objects; and I hoped also, from not having restricted this method to any particular matter, to apply it to the difficulties of the other sciences, with not less success than to those of algebra. I should not, however, on this account have ventured at once on the examination of all the difficulties of the sciences which presented themselves to me, for this would have been contrary to the order prescribed in the method, but observing that the knowledge of such is dependent on principles borrowed from philosophy, in which I found nothing certain, I thought it necessary first of all to endeavor to establish its principles. And because I observed, besides, that an inquiry of this kind was of all others of the greatest moment, and one in which precipitancy and anticipation in judgment were most to be dreaded, I thought that I ought not to approach it till I had reached a more mature age (being at that time but twenty-three), and had first of all employed much of my time in preparation for the work, as well by eradicating from my mind all the erroneous opinions I had up to that moment accepted, as by amassing variety of experience to afford materials for my reasonings, and by continually exercising myself in my chosen method with a view to increased skill in its application.

PART III

And finally, as it is not enough, before commencing to rebuild the house in which we live, that it be pulled down, and materials and builders provided, or that we engage in the work ourselves, according to a plan which we have beforehand carefully drawn out, but as it is likewise necessary that we be furnished with some other house in which we may live commodiously during the operations, so that I might not remain irresolute in my actions, while my reason compelled me to suspend my judgement, and that I might not be prevented from living thenceforward in the greatest possible felicity, I formed a provisory code of morals, composed of three or four maxims, with which I am desirous to make you acquainted.

The _first_ was to obey the laws and customs of my country, adhering firmly to the faith in which, by the grace of God, I had been educated from my childhood and regulating my conduct in every other matter according to the most moderate opinions, and the farthest removed from extremes, which should happen to be adopted in practice with general consent of the most judicious of those among whom I might be living. For as I had from that time begun to hold my own opinions for nought because I wished to subject them all to examination, I was convinced that I could not do better than follow in the meantime the opinions of the most judicious; and although there are some perhaps among the Persians and Chinese as judicious as among ourselves, expediency seemed to dictate that I should regulate my practice conformably to the opinions of those with whom I should have to live; and it appeared to me that, in order to ascertain the real opinions of such, I ought rather to take cognizance of what they practised than of what they said, not only because, in the corruption of our manners, there are few disposed to speak exactly as they believe, but also because very many are not aware of what it is that they really believe; for, as the act of mind by which a thing is believed is different from that by which we know that we believe it, the one act is often found without the other. Also, amid many opinions held in equal repute, I chose always the most moderate, as much for the reason that these are always the most convenient for practice, and probably the best (for all excess is generally vicious), as that, in the event of my falling into error, I might be at less distance from the truth than if, having chosen one of the extremes, it should turn out to be the other which I ought to have adopted. And I placed in the class of extremes especially all promises by which somewhat of our freedom is abridged; not that I disapproved of the laws which, to provide against the instability of men of feeble resolution, when what is sought to be accomplished is some good, permit engagements by vows and contracts binding the parties to persevere in it, or even, for the security of commerce, sanction similar engagements where the purpose sought to be realized is indifferent: but because I did not find anything on earth which was wholly superior to change, and because, for myself in particular, I hoped gradually to perfect my judgments, and not to suffer them to deteriorate, I would have deemed it a grave sin against good sense, if, for the reason that I approved of something at a particular time, I therefore bound myself to hold it for good at a subsequent time, when perhaps it had ceased to be so, or I had ceased to esteem it such.

My _second_ maxim was to be as firm and resolute in my actions as I was able, and not to adhere less steadfastly to the most doubtful opinions, when once adopted, than if they had been highly certain; imitating in this the example of travelers who, when they have lost their way in a forest, ought not to wander from side to side, far less remain in one place, but proceed constantly towards the same side in as straight a line as possible, without changing their direction for slight reasons, although perhaps it might be chance alone which at first determined the selection; for in this way, if they do not exactly reach the point they desire, they will come at least in the end to some place that will probably be preferable to the middle of a forest. In the same way, since in action it

frequently happens that no delay is permissible, it is very certain that, when it is not in our power to determine what is true, we ought to act according to what is most probable; and even although we should not remark a greater probability in one opinion than in another, we ought notwithstanding to choose one or the other, and afterwards consider it, in so far as it relates to practice, as no longer dubious, but manifestly true and certain, since the reason by which our choice has been determined is itself possessed of these qualities. This principle was sufficient thenceforward to rid me of all those repentings and pangs of remorse that usually disturb the consciences of such feeble and uncertain minds as, destitute of any clear and determinate principle of choice, allow themselves one day to adopt a course of action as the best, which they abandon the next, as the opposite.

My _third_ maxim was to endeavor always to conquer myself rather than fortune, and change my desires rather than the order of the world, and in general, accustom myself to the persuasion that, except our own thoughts, there is nothing absolutely in our power; so that when we have done our best in things external to us, all wherein we fail of success is to be held, as regards us, absolutely impossible: and this single principle seemed to me sufficient to prevent me from desiring for the future anything which I could not obtain, and thus render me contented; for since our will naturally seeks those objects alone which the understanding represents as in some way possible of attainment, it is plain, that if we consider all external goods as equally beyond our power, we shall no more regret the absence of such goods as seem due to our birth, when deprived of them without any fault of ours, than our not possessing the kingdoms of China or Mexico, and thus making, so to speak, a virtue of necessity, we shall no more desire health in disease, or freedom in imprisonment, than we now do bodies incorruptible as diamonds, or the wings of birds to fly with. But I confess there is need of prolonged discipline and frequently repeated meditation to accustom the mind to view all objects in this light; and I believe that in this chiefly consisted the secret of the power of such philosophers as in former times were enabled to rise superior to the influence of fortune, and, amid suffering and poverty, enjoy a happiness which their gods might have envied. For, occupied incessantly with the consideration of the limits prescribed to their power by nature, they became so entirely convinced that nothing was at their disposal except their own thoughts, that this conviction was of itself sufficient to prevent their entertaining any desire of other objects; and over their thoughts they acquired a sway so absolute, that they had some ground on this account for esteeming themselves more rich and more powerful, more free and more happy, than other men who, whatever be the favors heaped on them by nature and fortune, if destitute of this philosophy, can never command the realization of all their desires.

In fine, to conclude this code of morals, I thought of reviewing the different occupations of men in this life, with the view of making choice of the best. And, without wishing to offer any remarks on the employments of others, I may state that it was my conviction that I could not do better than continue in that in which I was engaged, viz., in devoting my whole life to the culture of my reason, and in making the greatest progress I was able in the knowledge of truth, on the principles of the method which I had prescribed to myself. This method, from the time I had begun to apply it, had been to me the source of satisfaction so intense as to lead me to, believe that more perfect or more innocent could not be enjoyed in this life; and as by its means I daily discovered truths that appeared to me of some importance, and of which other men were generally ignorant, the gratification thence arising so occupied my mind that I was wholly indifferent to every other object. Besides, the three preceding maxims were founded singly on the design of continuing the work of self-instruction. For since God has endowed each of us with some light of reason by which to distinguish truth from error, I could not have believed that I ought for a single moment to rest satisfied with the opinions of another, unless I had resolved to exercise my own judgment in examining these whenever I should be duly qualified for the task. Nor could I have proceeded on such opinions without scruple, had I supposed that I should thereby forfeit any advantage for attaining still more accurate, should such exist. And, in fine, I could not have restrained my desires, nor remained satisfied had I not followed a path in which I thought myself certain of attaining all the knowledge to the acquisition of which I was competent, as well as the largest amount of what is truly good which I could ever hope to secure Inasmuch as we neither seek nor shun any object except in so far as our understanding represents it as good or bad, all that is necessary to right action is right judgment, and to the best action the most correct judgment, that is, to the acquisition of all the virtues with all else that is truly valuable and within our reach; and the assurance of such an acquisition cannot fail to render us contented.

Having thus provided myself with these maxims, and having placed them in reserve along with the truths of faith, which have ever occupied the first place in my belief, I came to the conclusion that I might with freedom set about ridding myself of what remained of my opinions. And, inasmuch as I hoped to be better able successfully to accomplish this work by holding intercourse with mankind, than by remaining longer shut up in the retirement where these thoughts had occurred to me, I betook me again to traveling before the winter was well ended. And, during the nine subsequent years, I did nothing but roam from one place to another, desirous of being a spectator rather than an actor in the plays exhibited on the theater of the world; and, as I made it my business in each matter to reflect particularly upon what might fairly be doubted and prove a source of error, I gradually rooted out from my mind all

the errors which had hitherto crept into it. Not that in this I imitated the sceptics who doubt only that they may doubt, and seek nothing beyond uncertainty itself; for, on the contrary, my design was singly to find ground of assurance, and cast aside the loose earth and sand, that I might reach the rock or the clay. In this, as appears to me, I was successful enough; for, since I endeavored to discover the falsehood or incertitude of the propositions I examined, not by feeble conjectures, but by clear and certain reasonings, I met with nothing so doubtful as not to yield some conclusion of adequate certainty, although this were merely the inference, that the matter in question contained nothing certain. And, just as in pulling down an old house, we usually reserve the ruins to contribute towards the erection, so, in destroying such of my opinions as I judged to be Ill-founded, I made a variety of observations and acquired an amount of experience of which I availed myself in the establishment of more certain. And further, I continued to exercise myself in the method I had prescribed; for, besides taking care in general to conduct all my thoughts according to its rules, I reserved some hours from time to time which I expressly devoted to the employment of the method in the solution of mathematical difficulties, or even in the solution likewise of some questions belonging to other sciences, but which, by my having detached them from such principles of these sciences as were of inadequate certainty, were rendered almost mathematical: the truth of this will be manifest from the numerous examples contained in this volume. And thus, without in appearance living otherwise than those who, with no other occupation than that of spending their lives agreeably and innocently, study to sever pleasure from vice, and who, that they may enjoy their leisure without ennui, have recourse to such pursuits as are honorable, I was nevertheless prosecuting my design, and making greater progress in the knowledge of truth, than I might, perhaps, have made had I been engaged in the perusal of books merely, or in holding converse with men of letters.

These nine years passed away, however, before I had come to any determinate judgment respecting the difficulties which form matter of dispute among the learned, or had commenced to seek the principles of any philosophy more certain than the vulgar. And the examples of many men of the highest genius, who had, in former times, engaged in this inquiry, but, as appeared to me, without success, led me to imagine it to be a work of so much difficulty, that I would not perhaps have ventured on it so soon had I not heard it currently rumored that I had already completed the inquiry. I know not what were the grounds of this opinion; and, if my conversation contributed in any measure to its rise, this must have happened rather from my having confessed my Ignorance with greater freedom than those are accustomed to do who have studied a little, and expounded perhaps, the reasons that led me to doubt of many of those things that by others are esteemed certain, than from my having boasted of any system of philosophy. But, as I am of a disposition that makes me unwilling to be esteemed different from what I really am, I thought it necessary to endeavor by all means to render myself worthy of the reputation accorded to me; and it is now exactly eight years since this desire constrained me to remove from all those places where interruption from any of my acquaintances was possible, and betake myself to this country, in which the long duration of the war has led to the establishment of such discipline, that the armies maintained seem to be of use only in enabling the inhabitants to enjoy more securely the blessings of peace and where, in the midst of a great crowd actively engaged in business, and more careful of their own affairs than curious about those of others, I have been enabled to live without being deprived of any of the conveniences to be had in the most populous cities, and yet as solitary and as retired as in the midst of the most remote deserts.

PART IV

I am in doubt as to the propriety of making my first meditations in the place above mentioned matter of discourse; for these are so metaphysical, and so uncommon, as not, perhaps, to be acceptable to every one. And yet, that it may be determined whether the foundations that I have laid are sufficiently secure, I find myself in a measure constrained to advert to them. I had long before remarked that, in relation to practice, it is sometimes necessary to adopt, as if above doubt, opinions which we discern to be highly uncertain, as has been already said; but as I then desired to give my attention solely to the search after truth, I thought that a procedure exactly the opposite was called for, and that I ought to reject as absolutely false all opinions in regard to which I could suppose the least ground for doubt, in order to ascertain whether after that there remained aught in my belief that was wholly indubitable. Accordingly, seeing that our senses sometimes deceive us, I was willing to suppose that there existed nothing really such as they presented to us; and because some men err in reasoning, and fall into paralogisms, even on the simplest matters of geometry, I, convinced that I was as open to error as any other, rejected as false all the reasonings I had hitherto taken for demonstrations; and finally, when I considered that the very same thoughts (presentations) which we experience when awake may also be experienced when we are asleep, while there is at that time not one of them true, I supposed that all the objects (presentations) that had ever entered into my mind when awake, had in them no more truth than the illusions of my dreams. But immediately upon this I observed that, whilst I thus wished to think that all was false, it was absolutely necessary that I, who thus thought, should be somewhat; and as I observed that this truth, I think, therefore I am (COGITO ERGO SUM), was so certain and

of such evidence that no ground of doubt, however extravagant, could be alleged by the sceptics capable of shaking it, I concluded that I might, without scruple, accept it as the first principle of the philosophy of which I was in search.

In the next place, I attentively examined what I was and as I observed that I could suppose that I had no body, and that there was no world nor any place in which I might be; but that I could not therefore suppose that I was not; and that, on the contrary, from the very circumstance that I thought to doubt of the truth of other things, it most clearly and certainly followed that I was; while, on the other hand, if I had only ceased to think, although all the other objects which I had ever imagined had been in reality existent, I would have had no reason to believe that I existed; I thence concluded that I was a substance whose whole essence or nature consists only in thinking, and which, that it may exist, has need of no place, nor is dependent on any material thing; so that "I," that is to say, the mind by which I am what I am, is wholly distinct from the body, and is even more easily known than the latter, and is such, that although the latter were not, it would still continue to be all that it is.

After this I inquired in general into what is essential to the truth and certainty of a proposition; for since I had discovered one which I knew to be true, I thought that I must likewise be able to discover the ground of this certitude. And as I observed that in the words I think, therefore I am, there is nothing at all which gives me assurance of their truth beyond this, that I see very clearly that in order to think it is necessary to exist, I concluded that I might take, as a general rule, the principle, that all the things which we very clearly and distinctly conceive are true, only observing, however, that there is some difficulty in rightly determining the objects which we distinctly conceive.

In the next place, from reflecting on the circumstance that I doubted, and that consequently my being was not wholly perfect (for I clearly saw that it was a greater perfection to know than to doubt), I was led to inquire whence I had learned to think of something more perfect than myself; and I clearly recognized that I must hold this notion from some nature which in reality was more perfect. As for the thoughts of many other objects external to me, as of the sky, the earth, light, heat, and a thousand more, I was less at a loss to know whence these came; for since I remarked in them nothing which seemed to render them superior to myself, I could believe that, if these were true, they were dependencies on my own nature, in so far as it possessed a certain perfection, and, if they were false, that I held them from nothing, that is to say, that they were in me because of a certain imperfection of my nature. But this could not be the case with-the idea of a nature more perfect than myself; for to receive it from nothing was a thing manifestly impossible; and, because it is not less repugnant that the more perfect should be an effect of, and dependence on the less perfect, than that something should proceed from nothing, it was equally impossible that I could hold it from myself: accordingly, it but remained that it had been placed in me by a nature which was in reality more perfect than mine, and which even possessed within itself all the perfections of which I could form any idea; that is to say, in a single word, which was God. And to this I added that, since I knew some perfections which I did not possess, I was not the only being in existence (I will here, with your permission, freely use the terms of the schools); but, on the contrary, that there was of necessity some other more perfect Being upon whom I was dependent, and from whom I had received all that I possessed; for if I had existed alone, and independently of every other being, so as to have had from myself all the perfection, however little, which I actually possessed, I should have been able, for the same reason, to have had from myself the whole remainder of perfection, of the want of which I was conscious, and thus could of myself have become infinite, eternal, immutable, omniscient, all-powerful, and, in fine, have possessed all the perfections which I could recognize in God. For in order to know the nature of God (whose existence has been established by the preceding reasonings), as far as my own nature permitted, I had only to consider in reference to all the properties of which I found in my mind some idea, whether their possession was a mark of perfection; and I was assured that no one which indicated any imperfection was in him, and that none of the rest was awanting. Thus I perceived that doubt, inconstancy, sadness, and such like, could not be found in God, since I myself would have been happy to be free from them. Besides, I had ideas of many sensible and corporeal things; for although I might suppose that I was dreaming, and that all which I saw or imagined was false, I could not, nevertheless, deny that the ideas were in reality in my thoughts. But, because I had already very clearly recognized in myself that the intelligent nature is distinct from the corporeal, and as I observed that all composition is an evidence of dependency, and that a state of dependency is manifestly a state of imperfection, I therefore determined that it could not be a perfection in God to be compounded of these two natures and that consequently he was not so compounded; but that if there were any bodies in the world, or even any intelligences, or other natures that were not wholly perfect, their existence depended on his power in such a way that they could not subsist without him for a single moment.

I was disposed straightway to search for other truths and when I had represented to myself the object of the geometers, which I conceived to be a continuous body or a space indefinitely extended in length, breadth, and height or depth, divisible into divers parts which admit of different figures and sizes, and of being moved or transposed in all manner of ways (for all this the geometers

suppose to be in the object they contemplate), I went over some of their simplest demonstrations. And, in the first place, I observed, that the great certitude which by common consent is accorded to these demonstrations, is founded solely upon this, that they are clearly conceived in accordance with the rules I have already laid down In the next place, I perceived that there was nothing at all in these demonstrations which could assure me of the existence of their object: thus, for example, supposing a triangle to be given, I distinctly perceived that its three angles were necessarily equal to two right angles, but I did not on that account perceive anything which could assure me that any triangle existed: while, on the contrary, recurring to the examination of the idea of a Perfect Being, I found that the existence of the Being was comprised in the idea in the same way that the equality of its three angles to two right angles is comprised in the idea of a triangle, or as in the idea of a sphere, the equidistance of all points on its surface from the center, or even still more clearly; and that consequently it is at least as certain that God, who is this Perfect Being, is, or exists, as any demonstration of geometry can be.

But the reason which leads many to persuade them selves that there is a difficulty in knowing this truth, and even also in knowing what their mind really is, is that they never raise their thoughts above sensible objects, and are so accustomed to consider nothing except by way of imagination, which is a mode of thinking limited to material objects, that all that is not imaginable seems to them not intelligible. The truth of this is sufficiently manifest from the single circumstance, that the philosophers of the schools accept as a maxim that there is nothing in the understanding which was not previously in the senses, in which however it is certain that the ideas of God and of the soul have never been; and it appears to me that they who make use of their imagination to comprehend these ideas do exactly the some thing as if, in order to hear sounds or smell odors, they strove to avail themselves of their eyes; unless indeed that there is this difference, that the sense of sight does not afford us an inferior assurance to those of smell or hearing; in place of which, neither our imagination nor our senses can give us assurance of anything unless our understanding intervene.

Finally, if there be still persons who are not sufficiently persuaded of the existence of God and of the soul, by the reasons I have adduced, I am desirous that they should know that all the other propositions, of the truth of which they deem themselves perhaps more assured, as that we have a body, and that there exist stars and an earth, and such like, are less certain; for, although we have a moral assurance of these things, which is so strong that there is an appearance of extravagance in doubting of their existence, yet at the same time no one, unless his intellect is impaired, can deny, when the question relates to a metaphysical certitude, that there is sufficient reason to exclude entire assurance, in the observation that when asleep we can in the same way imagine ourselves possessed of another body and that we see other stars and another earth, when there is nothing of the kind. For how do we know that the thoughts which occur in dreaming are false rather than those other which we experience when awake, since the former are often not less vivid and distinct than the latter? And though men of the highest genius study this question as long as they please, I do not believe that they will be able to give any reason which can be sufficient to remove this doubt, unless they presuppose the existence of God. For, in the first place even the principle which I have already taken as a rule, viz., that all the things which we clearly and distinctly conceive are true, is certain only because God is or exists and because he is a Perfect Being, and because all that we possess is derived from him: whence it follows that our ideas or notions, which to the extent of their clearness and distinctness are real, and proceed from God, must to that extent be true. Accordingly, whereas we not infrequently have ideas or notions in which some falsity is contained, this can only be the case with such as are to some extent confused and obscure, and in this proceed from nothing (participate of negation), that is, exist in us thus confused because we are not wholly perfect. And it is evident that it is not less repugnant that falsity or imperfection, in so far as it is imperfection, should proceed from God, than that truth or perfection should proceed from nothing. But if we did not know that all which we possess of real and true proceeds from a Perfect and Infinite Being, however clear and distinct our ideas might be, we should have no ground on that account for the assurance that they possessed the perfection of being true.

But after the knowledge of God and of the soul has rendered us certain of this rule, we can easily understand that the truth of the thoughts we experience when awake, ought not in the slightest degree to be called in question on account of the illusions of our dreams. For if it happened that an individual, even when asleep, had some very distinct idea, as, for example, if a geometer should discover some new demonstration, the circumstance of his being asleep would not militate against its truth; and as for the most ordinary error of our dreams, which consists in their representing to us various objects in the same way as our external senses, this is not prejudicial, since it leads us very properly to suspect the truth of the ideas of sense; for we are not infrequently deceived in the same manner when awake; as when persons in the jaundice see all objects yellow, or when the stars or bodies at a great distance appear to us much smaller than they are. For, in fine, whether awake or asleep, we ought never to allow ourselves to be persuaded of the truth of anything unless on the evidence of our reason. And it must be noted that I say of our reason, and not of our imagination or of our senses: thus, for example, although we very clearly see the sun, we ought not therefore to determine that

it is only of the size which our sense of sight presents; and we may very distinctly imagine the head of a lion joined to the body of a goat, without being therefore shut up to the conclusion that a chimaera exists; for it is not a dictate of reason that what we thus see or imagine is in reality existent; but it plainly tells us that all our ideas or notions contain in them some truth; for otherwise it could not be that God, who is wholly perfect and veracious, should have placed them in us. And because our reasonings are never so clear or so complete during sleep as when we are awake, although sometimes the acts of our imagination are then as lively and distinct, if not more so than in our waking moments, reason further dictates that, since all our thoughts cannot be true because of our partial imperfection, those possessing truth must infallibly be found in the experience of our waking moments rather than in that of our dreams.

PART V

I would here willingly have proceeded to exhibit the whole chain of truths which I deduced from these primary but as with a view to this it would have been necessary now to treat of many questions in dispute among the earned, with whom I do not wish to be embroiled, I believe that it will be better for me to refrain from this exposition, and only mention in general what these truths are, that the more judicious may be able to determine whether a more special account of them would conduce to the public advantage. I have ever remained firm in my original resolution to suppose no other principle than that of which I have recently availed myself in demonstrating the existence of God and of the soul, and to accept as true nothing that did not appear to me more clear and certain than the demonstrations of the geometers had formerly appeared; and yet I venture to state that not only have I found means to satisfy myself in a short time on all the principal difficulties which are usually treated of in philosophy, but I have also observed certain laws established in nature by God in such a manner, and of which he has impressed on our minds such notions, that after we have reflected sufficiently upon these, we cannot doubt that they are accurately observed in all that exists or takes place in the world and farther, by considering the concatenation of these laws, it appears to me that I have discovered many truths more useful and more important than all I had before learned, or even had expected to learn.

But because I have essayed to expound the chief of these discoveries in a treatise which certain considerations prevent me from publishing, I cannot make the results known more conveniently than by here giving a summary of the contents of this treatise. It was my design to comprise in it all that, before I set myself to write it, I thought I knew of the nature of material objects. But like the painters who, finding themselves unable to represent equally well on a plain surface all the different faces of a solid body, select one of the chief, on which alone they make the light fall, and throwing the rest into the shade, allow them to appear only in so far as they can be seen while looking at the principal one; so, fearing lest I should not be able to compense in my discourse all that was in my mind, I resolved to expound singly, though at considerable length, my opinions regarding light; then to take the opportunity of adding something on the sun and the fixed stars, since light almost wholly proceeds from them; on the heavens since they transmit it; on the planets, comets, and earth, since they reflect it; and particularly on all the bodies that are upon the earth, since they are either colored, or transparent, or luminous; and finally on man, since he is the spectator of these objects. Further, to enable me to cast this variety of subjects somewhat into the shade, and to express my judgment regarding them with greater freedom, without being necessitated to adopt or refute the opinions of the learned, I resolved to leave all the people here to their disputes, and to speak only of what would happen in a new world, if God were now to create somewhere in the imaginary spaces matter sufficient to compose one, and were to agitate variously and confusedly the different parts of this matter, so that there resulted a chaos as disordered as the poets ever feigned, and after that did nothing more than lend his ordinary concurrence to nature, and allow her to act in accordance with the laws which he had established. On this supposition, I, in the first place, described this matter, and essayed to represent it in such a manner that to my mind there can be nothing clearer and more intelligible, except what has been recently said regarding God and the soul; for I even expressly supposed that it possessed none of those forms or qualities which are so debated in the schools, nor in general anything the knowledge of which is not so natural to our minds that no one can so much as imagine himself ignorant of it. Besides, I have pointed out what are the laws of nature; and, with no other principle upon which to found my reasonings except the infinite perfection of God, I endeavored to demonstrate all those about which there could be any room for doubt, and to prove that they are such, that even if God had created more worlds, there could have been none in which these laws were not observed. Thereafter, I showed how the greatest part of the matter of this chaos must, in accordance with these laws, dispose and arrange itself in such a way as to present the appearance of heavens; how in the meantime some of its parts must compose an earth and some planets and comets, and others a sun and fixed stars. And, making a digression at this stage on the subject of light, I expounded at considerable length what the nature of that light must be which is found in the sun and the stars, and how thence in an instant of time it traverses the immense spaces of the heavens, and how from the planets and comets it is reflected towards the earth. To this I likewise added much respecting the substance, the situation, the motions, and all

the different qualities of these heavens and stars; so that I thought I had said enough respecting them to show that there is nothing observable in the heavens or stars of our system that must not, or at least may not appear precisely alike in those of the system which I described. I came next to speak of the earth in particular, and to show how, even though I had expressly supposed that God had given no weight to the matter of which it is composed, this should not prevent all its parts from tending exactly to its center; how with water and air on its surface, the disposition of the heavens and heavenly bodies, more especially of the moon, must cause a flow and ebb, like in all its circumstances to that observed in our seas, as also a certain current both of water and air from east to west, such as is likewise observed between the tropics; how the mountains, seas, fountains, and rivers might naturally be formed in it, and the metals produced in the mines, and the plants grow in the fields and in general, how all the bodies which are commonly denominated mixed or composite might be generated and, among other things in the discoveries alluded to inasmuch as besides the stars, I knew nothing except fire which produces light, I spared no pains to set forth all that pertains to its nature,--the manner of its production and support, and to explain how heat is sometimes found without light, and light without heat; to show how it can induce various colors upon different bodies and other diverse qualities; how it reduces some to a liquid state and hardens others; how it can consume almost all bodies, or convert them into ashes and smoke; and finally, how from these ashes, by the mere intensity of its action, it forms glass: for as this transmutation of ashes into glass appeared to me as wonderful as any other in nature, I took a special pleasure in describing it. I was not, however, disposed, from these circumstances, to conclude that this world had been created in the manner I described; for it is much more likely that God made it at the first such as it was to be. But this is certain, and an opinion commonly received among theologians, that the action by which he now sustains it is the same with that by which he originally created it; so that even although he had from the beginning given it no other form than that of chaos, provided only he had established certain laws of nature, and had lent it his concurrence to enable it to act as it is wont to do, it may be believed, without discredit to the miracle of creation, that, in this way alone, things purely material might, in course of time, have become such as we observe them at present; and their nature is much more easily conceived when they are beheld coming in this manner gradually into existence, than when they are only considered as produced at once in a finished and perfect state.

From the description of inanimate bodies and plants, I passed to animals, and particularly to man. But since I had not as yet sufficient knowledge to enable me to treat of these in the same manner as of the rest, that is to say, by deducing effects from their causes, and by showing from what elements and in what manner nature must produce them, I remained satisfied with the supposition that God formed the body of man wholly like to one of ours, as well in the external shape of the members as in the internal conformation of the organs, of the same matter with that I had described, and at first placed in it no rational soul, nor any other principle, in room of the vegetative or sensitive soul, beyond kindling in the heart one of those fires without light, such as I had already described, and which I thought was not different from the heat in hay that has been heaped together before it is dry, or that which causes fermentation in new wines before they are run clear of the fruit. For, when I examined the kind of functions which might, as consequences of this supposition, exist in this body, I found precisely all those which may exist in us independently of all power of thinking, and consequently without being in any measure owing to the soul; in other words, to that part of us which is distinct from the body, and of which it has been said above that the nature distinctively consists in thinking, functions in which the animals void of reason may be said wholly to resemble us; but among which I could not discover any of those that, as dependent on thought alone, belong to us as men, while, on the other hand, I did afterwards discover these as soon as I supposed God to have created a rational soul, and to have annexed it to this body in a particular manner which I described.

But, in order to show how I there handled this matter, I mean here to give the explication of the motion of the heart and arteries, which, as the first and most general motion observed in animals, will afford the means of readily determining what should be thought of all the rest. And that there may be less difficulty in understanding what I am about to say on this subject, I advise those who are not versed in anatomy, before they commence the perusal of these observations, to take the trouble of getting dissected in their presence the heart of some large animal possessed of lungs (for this is throughout sufficiently like the human), and to have shown to them its two ventricles or cavities: in the first place, that in the right side, with which correspond two very ample tubes, viz., the hollow vein (_vena cava_), which is the principal receptacle of the blood, and the trunk of the tree, as it were, of which all the other veins in the body are branches; and the arterial vein (_vena arteriosa_), inappropriately so denominated, since it is in truth only an artery, which, taking its rise in the heart, is divided, after passing out from it, into many branches which presently disperse themselves all over the lungs; in the second place, the cavity in the left side, with which correspond in the same manner two canals in size equal to or larger than the preceding, viz., the venous artery (_arteria venosa_), likewise inappropriately thus designated, because it is simply a vein which comes from the lungs, where it is divided into many branches, interlaced with those of the arterial vein, and those of the tube called the windpipe, through which the air we breathe enters; and the great artery which, issuing from the heart, sends its branches all over the body. I should wish also that such persons were carefully shown the eleven pellicles

which, like so many small valves, open and shut the four orifices that are in these two cavities, viz., three at the entrance of the hollow veins where they are disposed in such a manner as by no means to prevent the blood which it contains from flowing into the right ventricle of the heart, and yet exactly to prevent its flowing out; three at the entrance to the arterial vein, which, arranged in a manner exactly the opposite of the former, readily permit the blood contained in this cavity to pass into the lungs, but hinder that contained in the lungs from returning to this cavity; and, in like manner, two others at the mouth of the venous artery, which allow the blood from the lungs to flow into the left cavity of the heart, but preclude its return; and three at the mouth of the great artery, which suffer the blood to flow from the heart, but prevent its reflux. Nor do we need to seek any other reason for the number of these pellicles beyond this that the orifice of the venous artery being of an oval shape from the nature of its situation, can be adequately closed with two, whereas the others being round are more conveniently closed with three. Besides, I wish such persons to observe that the grand artery and the arterial vein are of much harder and firmer texture than the venous artery and the hollow vein; and that the two last expand before entering the heart, and there form, as it were, two pouches denominated the auricles of the heart, which are composed of a substance similar to that of the heart itself; and that there is always more warmth in the heart than in any other part of the body--and finally, that this heat is capable of causing any drop of blood that passes into the cavities rapidly to expand and dilate, just as all liquors do when allowed to fall drop by drop into a highly heated vessel.

For, after these things, it is not necessary for me to say anything more with a view to explain the motion of the heart, except that when its cavities are not full of blood, into these the blood of necessity flows,--from the hollow vein into the right, and from the venous artery into the left; because these two vessels are always full of blood, and their orifices, which are turned towards the heart, cannot then be closed. But as soon as two drops of blood have thus passed, one into each of the cavities, these drops which cannot but be very large, because the orifices through which they pass are wide, and the vessels from which they come full of blood, are immediately rarefied, and dilated by the heat they meet with. In this way they cause the whole heart to expand, and at the same time press home and shut the five small valves that are at the entrances of the two vessels from which they flow, and thus prevent any more blood from coming down into the heart, and becoming more and more rarefied, they push open the six small valves that are in the orifices of the other two vessels, through which they pass out, causing in this way all the branches of the arterial vein and of the grand artery to expand almost simultaneously with the heart which immediately thereafter begins to contract, as do also the arteries, because the blood that has entered them has cooled, and the six small valves close, and the five of the hollow vein and of the venous artery open anew and allow a passage to other two drops of blood, which cause the heart and the arteries again to expand as before. And, because the blood which thus enters into the heart passes through these two pouches called auricles, it thence happens that their motion is the contrary of that of the heart, and that when it expands they contract. But lest those who are ignorant of the force of mathematical demonstrations and who are not accustomed to distinguish true reasons from mere verisimilitudes, should venture, without examination, to deny what has been said, I wish it to be considered that the motion which I have now explained follows as necessarily from the very arrangement of the parts, which may be observed in the heart by the eye alone, and from the heat which may be felt with the fingers, and from the nature of the blood as learned from experience, as does the motion of a clock from the power, the situation, and shape of its counterweights and wheels.

But if it be asked how it happens that the blood in the veins, flowing in this way continually into the heart, is not exhausted, and why the arteries do not become too full, since all the blood which passes through the heart flows into them, I need only mention in reply what has been written by a physician of England, who has the honor of having broken the ice on this subject, and of having been the first to teach that there are many small passages at the extremities of the arteries, through which the blood received by them from the heart passes into the small branches of the veins, whence it again returns to the heart; so that its course amounts precisely to a perpetual circulation. Of this we have abundant proof in the ordinary experience of surgeons, who, by binding the arm with a tie of moderate straitness above the part where they open the vein, cause the blood to flow more copiously than it would have done without any ligature; whereas quite the contrary would happen were they to bind it below; that is, between the hand and the opening, or were to make the ligature above the opening very tight. For it is manifest that the tie, moderately straightened, while adequate to hinder the blood already in the arm from returning towards the heart by the veins, cannot on that account prevent new blood from coming forward through the arteries, because these are situated below the veins, and their coverings, from their greater consistency, are more difficult to compress; and also that the blood which comes from the heart tends to pass through them to the hand with greater force than it does to return from the hand to the heart through the veins. And since the latter current escapes from the arm by the opening made in one of the veins, there must of necessity be certain passages below the ligature, that is, towards the extremities of the arm through which it can come thither from the arteries. This physician likewise abundantly establishes what he has advanced respecting the motion of the blood, from the existence of certain pellicles, so disposed in various places along the course of the veins, in the manner of small valves, as not to permit the blood to pass from the middle of the body towards the

extremities, but only to return from the extremities to the heart; and farther, from experience which shows that all the blood which is in the body may flow out of it in a very short time through a single artery that has been cut, even although this had been closely tied in the immediate neighborhood of the heart and cut between the heart and the ligature, so as to prevent the supposition that the blood flowing out of it could come from any other quarter than the heart.

But there are many other circumstances which evince that what I have alleged is the true cause of the motion of the blood: thus, in the first place, the difference that is observed between the blood which flows from the veins, and that from the arteries, can only arise from this, that being rarefied, and, as it were, distilled by passing through the heart, it is thinner, and more vivid, and warmer immediately after leaving the heart, in other words, when in the arteries, than it was a short time before passing into either, in other words, when it was in the veins; and if attention be given, it will be found that this difference is very marked only in the neighborhood of the heart; and is not so evident in parts more remote from it. In the next place, the consistency of the coats of which the arterial vein and the great artery are composed, sufficiently shows that the blood is impelled against them with more force than against the veins. And why should the left cavity of the heart and the great artery be wider and larger than the right cavity and the arterial vein, were it not that the blood of the venous artery, having only been in the lungs after it has passed through the heart, is thinner, and rarefies more readily, and in a higher degree, than the blood which proceeds immediately from the hollow vein? And what can physicians conjecture from feeling the pulse unless they know that according as the blood changes its nature it can be rarefied by the warmth of the heart, in a higher or lower degree, and more or less quickly than before? And if it be inquired how this heat is communicated to the other members, must it not be admitted that this is effected by means of the blood, which, passing through the heart, is there heated anew, and thence diffused over all the body? Whence it happens, that if the blood be withdrawn from any part, the heat is likewise withdrawn by the same means; and although the heart were as-hot as glowing iron, it would not be capable of warming the feet and hands as at present, unless it continually sent thither new blood. We likewise perceive from this, that the true use of respiration is to bring sufficient fresh air into the lungs, to cause the blood which flows into them from the right ventricle of the heart, where it has been rarefied and, as it were, changed into vapors, to become thick, and to convert it anew into blood, before it flows into the left cavity, without which process it would be unfit for the nourishment of the fire that is there. This receives confirmation from the circumstance, that it is observed of animals destitute of lungs that they have also but one cavity in the heart, and that in children who cannot use them while in the womb, there is a hole through which the blood flows from the hollow vein into the left cavity of the heart, and a tube through which it passes from the arterial vein into the grand artery without passing through the lung. In the next place, how could digestion be carried on in the stomach unless the heart communicated heat to it through the arteries, and along with this certain of the more fluid parts of the blood, which assist in the dissolution of the food that has been taken in? Is not also the operation which converts the juice of food into blood easily comprehended, when it is considered that it is distilled by passing and repassing through the heart perhaps more than one or two hundred times in a day? And what more need be adduced to explain nutrition, and the production of the different humors of the body, beyond saying, that the force with which the blood, in being rarefied, passes from the heart towards the extremities of the arteries, causes certain of its parts to remain in the members at which they arrive, and there occupy the place of some others expelled by them; and that according to the situation, shape, or smallness of the pores with which they meet, some rather than others flow into certain parts, in the same way that some sieves are observed to act, which, by being variously perforated, serve to separate different species of grain? And, in the last place, what above all is here worthy of observation, is the generation of the animal spirits, which are like a very subtle wind, or rather a very pure and vivid flame which, continually ascending in great abundance from the heart to the brain, thence penetrates through the nerves into the muscles, and gives motion to all the members; so that to account for other parts of the blood which, as most agitated and penetrating, are the fittest to compose these spirits, proceeding towards the brain, it is not necessary to suppose any other cause, than simply, that the arteries which carry them thither proceed from the heart in the most direct lines, and that, according to the rules of mechanics which are the same with those of nature, when many objects tend at once to the same point where there is not sufficient room for all (as is the case with the parts of the blood which flow forth from the left cavity of the heart and tend towards the brain), the weaker and less agitated parts must necessarily be driven aside from that point by the stronger which alone in this way reach it I had expounded all these matters with sufficient minuteness in the treatise which I formerly thought of publishing. And after these, I had shown what must be the fabric of the nerves and muscles of the human body to give the animal spirits contained in it the power to move the members, as when we see heads shortly after they have been struck off still move and bite the earth, although no longer animated; what changes must take place in the brain to produce waking, sleep, and dreams; how light, sounds, odors, tastes, heat, and all the other qualities of external objects impress it with different ideas by means of the senses; how hunger, thirst, and the other internal affections can likewise impress upon it divers ideas; what must be understood by the common sense (_sensus communis_) in which these ideas are received, by the memory which retains them, by the fantasy which can change them in various ways, and out of them compose new ideas, and which, by the same means,

distributing the animal spirits through the muscles, can cause the members of such a body to move in as many different ways, and in a manner as suited, whether to the objects that are presented to its senses or to its internal affections, as can take place in our own case apart from the guidance of the will. Nor will this appear at all strange to those who are acquainted with the variety of movements performed by the different automata, or moving machines fabricated by human industry, and that with help of but few pieces compared with the great multitude of bones, muscles, nerves, arteries, veins, and other parts that are found in the body of each animal. Such persons will look upon this body as a machine made by the hands of God, which is incomparably better arranged, and adequate to movements more admirable than is any machine of human invention. And here I specially stayed to show that, were there such machines exactly resembling organs and outward form an ape or any other irrational animal, we could have no means of knowing that they were in any respect of a different nature from these animals; but if there were machines bearing the image of our bodies, and capable of imitating our actions as far as it is morally possible, there would still remain two most certain tests whereby to know that they were not therefore really men. Of these the first is that they could never use words or other signs arranged in such a manner as is competent to us in order to declare our thoughts to others: for we may easily conceive a machine to be so constructed that it emits vocables, and even that it emits some correspondent to the action upon it of external objects which cause a change in its organs; for example, if touched in a particular place it may demand what we wish to say to it; if in another it may cry out that it is hurt, and such like; but not that it should arrange them variously so as appositely to reply to what is said in its presence, as men of the lowest grade of intellect can do. The second test is, that although such machines might execute many things with equal or perhaps greater perfection than any of us, they would, without doubt, fail in certain others from which it could be discovered that they did not act from knowledge, but solely from the disposition of their organs: for while reason is an universal instrument that is alike available on every occasion, these organs, on the contrary, need a particular arrangement for each particular action; whence it must be morally impossible that there should exist in any machine a diversity of organs sufficient to enable it to act in all the occurrences of life, in the way in which our reason enables us to act. Again, by means of these two tests we may likewise know the difference between men and brutes. For it is highly deserving of remark, that there are no men so dull and stupid, not even idiots, as to be incapable of joining together different words, and thereby constructing a declaration by which to make their thoughts understood; and that on the other hand, there is no other animal, however perfect or happily circumstanced, which can do the like. Nor does this inability arise from want of organs: for we observe that magpies and parrots can utter words like ourselves, and are yet unable to speak as we do, that is, so as to show that they understand what they say; in place of which men born deaf and dumb, and thus not less, but rather more than the brutes, destitute of the organs which others use in speaking, are in the habit of spontaneously inventing certain signs by which they discover their thoughts to those who, being usually in their company, have leisure to learn their language. And this proves not only that the brutes have less reason than man, but that they have none at all: for we see that very little is required to enable a person to speak; and since a certain inequality of capacity is observable among animals of the same species, as well as among men, and since some are more capable of being instructed than others, it is incredible that the most perfect ape or parrot of its species, should not in this be equal to the most stupid infant of its kind or at least to one that was crack-brained, unless the soul of brutes were of a nature wholly different from ours. And we ought not to confound speech with the natural movements which indicate the passions, and can be imitated by machines as well as manifested by animals; nor must it be thought with certain of the ancients, that the brutes speak, although we do not understand their language. For if such were the case, since they are endowed with many organs analogous to ours, they could as easily communicate their thoughts to us as to their fellows. It is also very worthy of remark, that, though there are many animals which manifest more industry than we in certain of their actions, the same animals are yet observed to show none at all in many others: so that the circumstance that they do better than we does not prove that they are endowed with mind, for it would thence follow that they possessed greater reason than any of us, and could surpass us in all things; on the contrary, it rather proves that they are destitute of reason, and that it is nature which acts in them according to the disposition of their organs: thus it is seen, that a clock composed only of wheels and weights can number the hours and measure time more exactly than we with all our skin.

I had after this described the reasonable soul, and shown that it could by no means be educed from the power of matter, as the other things of which I had spoken, but that it must be expressly created; and that it is not sufficient that it be lodged in the human body exactly like a pilot in a ship, unless perhaps to move its members, but that it is necessary for it to be joined and united more closely to the body, in order to have sensations and appetites similar to ours, and thus constitute a real man. I here entered, in conclusion, upon the subject of the soul at considerable length, because it is of the greatest moment: for after the error of those who deny the existence of God, an error which I think I have already sufficiently refuted, there is none that is more powerful in leading feeble minds astray from the straight path of virtue than the supposition that the soul of the brutes is of the same nature with our own; and consequently that after this life we have nothing to hope for or fear, more than flies and ants; in place of which, when we know how far they differ we much better comprehend the reasons which establish that the soul is of a nature wholly

independent of the body, and that consequently it is not liable to die with the latter and, finally, because no other causes are observed capable of destroying it, we are naturally led thence to judge that it is immortal.

PART VI

Three years have now elapsed since I finished the treatise containing all these matters; and I was beginning to revise it, with the view to put it into the hands of a printer, when I learned that persons to whom I greatly defer, and whose authority over my actions is hardly less influential than is my own reason over my thoughts, had condemned a certain doctrine in physics, published a short time previously by another individual to which I will not say that I adhered, but only that, previously to their censure I had observed in it nothing which I could imagine to be prejudicial either to religion or to the state, and nothing therefore which would have prevented me from giving expression to it in writing, if reason had persuaded me of its truth; and this led me to fear lest among my own doctrines likewise some one might be found in which I had departed from the truth, notwithstanding the great care I have always taken not to accord belief to new opinions of which I had not the most certain demonstrations, and not to give expression to aught that might tend to the hurt of any one. This has been sufficient to make me alter my purpose of publishing them; for although the reasons by which I had been induced to take this resolution were very strong, yet my inclination, which has always been hostile to writing books, enabled me immediately to discover other considerations sufficient to excuse me for not undertaking the task. And these reasons, on one side and the other, are such, that not only is it in some measure my interest here to state them, but that of the public, perhaps, to know them.

I have never made much account of what has proceeded from my own mind; and so long as I gathered no other advantage from the method I employ beyond satisfying myself on some difficulties belonging to the speculative sciences, or endeavoring to regulate my actions according to the principles it taught me, I never thought myself bound to publish anything respecting it. For in what regards manners, every one is so full of his own wisdom, that there might be found as many reformers as heads, if any were allowed to take upon themselves the task of mending them, except those whom God has constituted the supreme rulers of his people or to whom he has given sufficient grace and zeal to be prophets; and although my speculations greatly pleased myself, I believed that others had theirs, which perhaps pleased them still more. But as soon as I had acquired some general notions respecting physics, and beginning to make trial of them in various particular difficulties, had observed how far they can carry us, and how much they differ from the principles that have been employed up to the present time, I believed that I could not keep them concealed without sinning grievously against the law by which we are bound to promote, as far as in us lies, the general good of mankind. For by them I perceived it to be possible to arrive at knowledge highly useful in life; and in room of the speculative philosophy usually taught in the schools, to discover a practical, by means of which, knowing the force and action of fire, water, air the stars, the heavens, and all the other bodies that surround us, as distinctly as we know the various crafts of our artisans, we might also apply them in the same way to all the uses to which they are adapted, and thus render ourselves the lords and possessors of nature. And this is a result to be desired, not only in order to the invention of an infinity of arts, by which we might be enabled to enjoy without any trouble the fruits of the earth, and all its comforts, but also and especially for the preservation of health, which is without doubt, of all the blessings of this life, the first and fundamental one; for the mind is so intimately dependent upon the condition and relation of the organs of the body, that if any means can ever be found to render men wiser and more ingenious than hitherto, I believe that it is in medicine they must be sought for. It is true that the science of medicine, as it now exists, contains few things whose utility is very remarkable: but without any wish to depreciate it, I am confident that there is no one, even among those whose profession it is, who does not admit that all at present known in it is almost nothing in comparison of what remains to be discovered; and that we could free ourselves from an infinity of maladies of body as well as of mind, and perhaps also even from the debility of age, if we had sufficiently ample knowledge of their causes, and of all the remedies provided for us by nature. But since I designed to employ my whole life in the search after so necessary a science, and since I had fallen in with a path which seems to me such, that if any one follow it he must inevitably reach the end desired, unless he be hindered either by the shortness of life or the want of experiments, I judged that there could be no more effectual provision against these two impediments than if I were faithfully to communicate to the public all the little I might myself have found, and incite men of superior genius to strive to proceed farther, by contributing, each according to his inclination and ability, to the experiments which it would be necessary to make, and also by informing the public of all they might discover, so that, by the last beginning where those before them had left off, and thus connecting the lives and labours of many, we might collectively proceed much farther than each by himself could do.

I remarked, moreover, with respect to experiments, that they become always more necessary the more one is advanced in knowledge; for, at the commencement, it is better to make use only of what is spontaneously presented to our senses, and of which we cannot remain ignorant, provided we bestow on it any reflection, however slight, than to concern ourselves about more uncommon and recondite phenomena: the reason of which is, that the more uncommon often only mislead us so long as the causes of the more ordinary are still unknown; and the circumstances upon which they depend are almost always so special and minute as to be highly difficult to detect. But in this I have adopted the following order: first, I have essayed to find in general the principles, or first causes of all that is or can be in the world, without taking into consideration for this end anything but God himself who has created it, and without educing them from any other source than from certain germs of truths naturally existing in our minds In the second place, I examined what were the first and most ordinary effects that could be deduced from these causes; and it appears to me that, in this way, I have found heavens, stars, an earth, and even on the earth water, air, fire, minerals, and some other things of this kind, which of all others are the most common and simple, and hence the easiest to know. Afterwards when I wished to descend to the more particular, so many diverse objects presented themselves to me, that I believed it to be impossible for the human mind to distinguish the forms or species of bodies that are upon the earth, from an infinity of others which might have been, if it had pleased God to place them there, or consequently to apply them to our use, unless we rise to causes through their effects, and avail ourselves of many particular experiments. Thereupon, turning over in my mind I the objects that had ever been presented to my senses I freely venture to state that I have never observed any which I could not satisfactorily explain by the principles had discovered. But it is necessary also to confess that the power of nature is so ample and vast, and these principles so simple and general, that I have hardly observed a single particular effect which I cannot at once recognize as capable of being deduced in man different modes from the principles, and that my greatest difficulty usually is to discover in which of these modes the effect is dependent upon them; for out of this difficulty cannot otherwise extricate myself than by again seeking certain experiments, which may be such that their result is not the same, if it is in the one of these modes at we must explain it, as it would be if it were to be explained in the other. As to what remains, I am now in a position to discern, as I think, with sufficient clearness what course must be taken to make the majority those experiments which may conduce to this end: but I perceive likewise that they are such and so numerous, that neither my hands nor my income, though it were a thousand times larger than it is, would be sufficient for them all; so that according as henceforward I shall have the means of making more or fewer experiments, I shall in the same proportion make greater or less progress in the knowledge of nature. This was what I had hoped to make known by the treatise I had written, and so clearly to exhibit the advantage that would thence accrue to the public, as to induce all who have the common good of man at heart, that is, all who are virtuous in truth, and not merely in appearance, or according to opinion, as well to communicate to me the experiments they had already made, as to assist me in those that remain to be made.

But since that time other reasons have occurred to me, by which I have been led to change my opinion, and to think that I ought indeed to go on committing to writing all the results which I deemed of any moment, as soon as I should have tested their truth, and to bestow the same care upon them as I would have done had it been my design to publish them. This course commended itself to me, as well because I thus afforded myself more ample inducement to examine them thoroughly, for doubtless that is always more narrowly scrutinized which we believe will be read by many, than that which is written merely for our private use (and frequently what has seemed to me true when I first conceived it, has appeared false when I have set about committing it to writing), as because I thus lost no opportunity of advancing the interests of the public, as far as in me lay, and since thus likewise, if my writings possess any value, those into whose hands they may fall after my death may be able to put them to what use they deem proper. But I resolved by no means to consent to their publication during my lifetime, lest either the oppositions or the controversies to which they might give rise, or even the reputation, such as it might be, which they would acquire for me, should be any occasion of my losing the time that I had set apart for my own improvement. For though it be true that every one is bound to promote to the extent of his ability the good of others, and that to be useful to no one is really to be worthless, yet it is likewise true that our cares ought to extend beyond the present, and it is good to omit doing what might perhaps bring some profit to the living, when we have in view the accomplishment of other ends that will be of much greater advantage to posterity. And in truth, I am quite willing it should be known that the little I have hitherto learned is almost nothing in comparison with that of which I am ignorant, and to the knowledge of which I do not despair of being able to attain; for it is much the same with those who gradually discover truth in the sciences, as with those who when growing rich find less difficulty in making great acquisitions, than they formerly experienced when poor in making acquisitions of much smaller amount. Or they may be compared to the commanders of armies, whose forces usually increase in proportion to their victories, and who need greater prudence to keep together the residue of their troops after a defeat than after a victory to take towns and provinces. For he truly engages in battle who endeavors to surmount all the difficulties and errors which prevent him from reaching the knowledge of truth, and he is overcome in fight who admits a false opinion touching a matter of any generality and importance, and he requires thereafter much more skill to recover his former position than to make

great advances when once in possession of thoroughly ascertained principles. As for myself, if I have succeeded in discovering any truths in the sciences (and I trust that what is contained in this volume I will show that I have found some), I can declare that they are but the consequences and results of five or six principal difficulties which I have surmounted, and my encounters with which I reckoned as battles in which victory declared for me. I will not hesitate even to avow my belief that nothing further is wanting to enable me fully to realize my designs than to gain two or three similar victories; and that I am not so far advanced in years but that, according to the ordinary course of nature, I may still have sufficient leisure for this end. But I conceive myself the more bound to husband the time that remains the greater my expectation of being able to employ it aright, and I should doubtless have much to rob me of it, were I to publish the principles of my physics: for although they are almost all so evident that to assent to them no more is needed than simply to understand them, and although there is not one of them of which I do not expect to be able to give demonstration, yet, as it is impossible that they can be in accordance with all the diverse opinions of others, I foresee that I should frequently be turned aside from my grand design, on occasion of the opposition which they would be sure to awaken.

It may be said, that these oppositions would be useful both in making me aware of my errors, and, if my speculations contain anything of value, in bringing others to a fuller understanding of it; and still farther, as many can see better than one, in leading others who are now beginning to avail themselves of my principles, to assist me in turn with their discoveries. But though I recognize my extreme liability to error, and scarce ever trust to the first thoughts which occur to me, yet-the experience I have had of possible objections to my views prevents me from anticipating any profit from them. For I have already had frequent proof of the judgments, as well of those I esteemed friends, as of some others to whom I thought I was an object of indifference, and even of some whose malignancy and envy would, I knew, determine them to endeavor to discover what partiality concealed from the eyes of my friends. But it has rarely happened that anything has been objected to me which I had myself altogether overlooked, unless it were something far removed from the subject: so that I have never met with a single critic of my opinions who did not appear to me either less rigorous or less equitable than myself. And further, I have never observed that any truth before unknown has been brought to light by the disputations that are practised in the schools; for while each strives for the victory, each is much more occupied in making the best of mere verisimilitude, than in weighing the reasons on both sides of the question; and those who have been long good advocates are not afterwards on that account the better judges.

As for the advantage that others would derive from the communication of my thoughts, it could not be very great; because I have not yet so far prosecuted them as that much does not remain to be added before they can be applied to practice. And I think I may say without vanity, that if there is any one who can carry them out that length, it must be myself rather than another: not that there may not be in the world many minds incomparably superior to mine, but because one cannot so well seize a thing and make it one’s own, when it has been learned from another, as when one has himself discovered it. And so true is this of the present subject that, though I have often explained some of my opinions to persons of much acuteness, who, whilst I was speaking, appeared to understand them very distinctly, yet, when they repeated them, I have observed that they almost always changed them to such an extent that I could no longer acknowledge them as mine. I am glad, by the way, to take this opportunity of requesting posterity never to believe on hearsay that anything has proceeded from me which has not been published by myself; and I am not at all astonished at the extravagances attributed to those ancient philosophers whose own writings we do not possess; whose thoughts, however, I do not on that account suppose to have been really absurd, seeing they were among the ablest men of their times, but only that these have been falsely represented to us. It is observable, accordingly, that scarcely in a single instance has any one of their disciples surpassed them; and I am quite sure that the most devoted of the present followers of Aristotle would think themselves happy if they had as much knowledge of nature as he possessed, were it even under the condition that they should never afterwards attain to higher. In this respect they are like the ivy which never strives to rise above the tree that sustains it, and which frequently even returns downwards when it has reached the top; for it seems to me that they also sink, in other words, render themselves less wise than they would be if they gave up study, who, not contented with knowing all that is intelligibly explained in their author, desire in addition to find in him the solution of many difficulties of which he says not a word, and never perhaps so much as thought. Their fashion of philosophizing, however, is well suited to persons whose abilities fall below mediocrity; for the obscurity of the distinctions and principles of which they make use enables them to speak of all things with as much confidence as if they really knew them, and to defend all that they say on any subject against the most subtle and skillful, without its being possible for any one to convict them of error. In this they seem to me to be like a blind man, who, in order to fight on equal terms with a person that sees, should have made him descend to the bottom of an intensely dark cave: and I may say that such persons have an interest in my refraining from publishing the principles of the philosophy of which I make use; for, since these are of a kind the simplest and most evident, I should, by publishing them, do much the same as if I were to throw open the windows, and allow the light of day to enter the cave into which the combatants had descended. But even superior men have no reason for any great

anxiety to know these principles, for if what they desire is to be able to speak of all things, and to acquire a reputation for learning, they will gain their end more easily by remaining satisfied with the appearance of truth, which can be found without much difficulty in all sorts of matters, than by seeking the truth itself which unfolds itself but slowly and that only in some departments, while it obliges us, when we have to speak of others, freely to confess our ignorance. If, however, they prefer the knowledge of some few truths to the vanity of appearing ignorant of none, as such knowledge is undoubtedly much to be preferred, and, if they choose to follow a course similar to mine, they do not require for this that I should say anything more than I have already said in this discourse. For if they are capable of making greater advancement than I have made, they will much more be able of themselves to discover all that I believe myself to have found; since as I have never examined aught except in order, it is certain that what yet remains to be discovered is in itself more difficult and recondite, than that which I have already been enabled to find, and the gratification would be much less in learning it from me than in discovering it for themselves. Besides this, the habit which they will acquire, by seeking first what is easy, and then passing onward slowly and step by step to the more difficult, will benefit them more than all my instructions. Thus, in my own case, I am persuaded that if I had been taught from my youth all the truths of which I have since sought out demonstrations, and had thus learned them without labour, I should never, perhaps, have known any beyond these; at least, I should never have acquired the habit and the facility which I think I possess in always discovering new truths in proportion as I give myself to the search. And, in a single word, if there is any work in the world which cannot be so well finished by another as by him who has commenced it, it is that at which I labour.

It is true, indeed, as regards the experiments which may conduce to this end, that one man is not equal to the task of making them all; but yet he can advantageously avail himself, in this work, of no hands besides his own, unless those of artisans, or parties of the same kind, whom he could pay, and whom the hope of gain (a means of great efficacy) might stimulate to accuracy in the performance of what was prescribed to them. For as to those who, through curiosity or a desire of learning, of their own accord, perhaps, offer him their services, besides that in general their promises exceed their performance, and that they sketch out fine designs of which not one is ever realized, they will, without doubt, expect to be compensated for their trouble by the explication of some difficulties, or, at least, by compliments and useless speeches, in which he cannot spend any portion of his time without loss to himself. And as for the experiments that others have already made, even although these parties should be willing of themselves to communicate them to him (which is what those who esteem them secrets will never do), the experiments are, for the most part, accompanied with so many circumstances and superfluous elements, as to make it exceedingly difficult to disentangle the truth from its adjuncts--besides, he will find almost all of them so ill described, or even so false (because those who made them have wished to see in them only such facts as they deemed conformable to their principles), that, if in the entire number there should be some of a nature suited to his purpose, still their value could not compensate for the time what would be necessary to make the selection. So that if there existed any one whom we assuredly knew to be capable of making discoveries of the highest kind, and of the greatest possible utility to the public; and if all other men were therefore eager by all means to assist him in successfully prosecuting his designs, I do not see that they could do aught else for him beyond contributing to defray the expenses of the experiments that might be necessary; and for the rest, prevent his being deprived of his leisure by the unseasonable interruptions of any one. But besides that I neither have so high an opinion of myself as to be willing to make promise of anything extraordinary, nor feed on imaginations so vain as to fancy that the public must be much interested in my designs; I do not, on the other hand, own a soul so mean as to be capable of accepting from any one a favor of which it could be supposed that I was unworthy.

These considerations taken together were the reason why, for the last three years, I have been unwilling to publish the treatise I had on hand, and why I even resolved to give publicity during my life to no other that was so general, or by which the principles of my physics might be understood. But since then, two other reasons have come into operation that have determined me here to subjoin some particular specimens, and give the public some account of my doings and designs. Of these considerations, the first is, that if I failed to do so, many who were cognizant of my previous intention to publish some writings, might have imagined that the reasons which induced me to refrain from so doing, were less to my credit than they really are; for although I am not immoderately desirous of glory, or even, if I may venture so to say, although I am averse from it in so far as I deem it hostile to repose which I hold in greater account than aught else, yet, at the same time, I have never sought to conceal my actions as if they were crimes, nor made use of many precautions that I might remain unknown; and this partly because I should have thought such a course of conduct a wrong against myself, and partly because it would have occasioned me some sort of uneasiness which would again have been contrary to the perfect mental tranquillity which I court. And forasmuch as, while thus indifferent to the thought alike of fame or of forgetfulness, I have yet been unable to prevent myself from acquiring some sort of reputation, I have thought it incumbent on me to do my best to save myself at least from being ill-spoken of. The other reason that has determined me to commit to writing these specimens of philosophy is, that I am becoming daily more and more alive to the delay which my design of self-instruction suffers,

for want of the infinity of experiments I require, and which it is impossible for me to make without the assistance of others: and, without flattering myself so much as to expect the public to take a large share in my interests, I am yet unwilling to be found so far wanting in the duty I owe to myself, as to give occasion to those who shall survive me to make it matter of reproach against me some day, that I might have left them many things in a much more perfect state than I have done, had I not too much neglected to make them aware of the ways in which they could have promoted the accomplishment of my designs.

And I thought that it was easy for me to select some matters which should neither be obnoxious to much controversy, nor should compel me to expound more of my principles than I desired, and which should yet be sufficient clearly to exhibit what I can or cannot accomplish in the sciences. Whether or not I have succeeded in this it is not for me to say; and I do not wish to forestall the judgments of others by speaking myself of my writings; but it will gratify me if they be examined, and, to afford the greater inducement to this I request all who may have any objections to make to them, to take the trouble of forwarding these to my publisher, who will give me notice of them, that I may endeavor to subjoin at the same time my reply; and in this way readers seeing both at once will more easily determine where the truth lies; for I do not engage in any case to make prolix replies, but only with perfect frankness to avow my errors if I am convinced of them, or if I cannot perceive them, simply to state what I think is required for defense of the matters I have written, adding thereto no explication of any new matte that it may not be necessary to pass without end from one thing to another.

If some of the matters of which I have spoken in the beginning of the “Dioptrics” and “Meteorics” should offend at first sight, because I call them hypotheses and seem indifferent about giving proof of them, I request a patient and attentive reading of the whole, from which I hope those hesitating will derive satisfaction; for it appears to me that the reasonings are so mutually connected in these treatises, that, as the last are demonstrated by the first which are their causes, the first are in their turn demonstrated by the last which are their effects. Nor must it be imagined that I here commit the fallacy which the logicians call a circle; for since experience renders the majority of these effects most certain, the causes from which I deduce them do not serve so much to establish their reality as to explain their existence; but on the contrary, the reality of the causes is established by the reality of the effects. Nor have I called them hypotheses with any other end in view except that it may be known that I think I am able to deduce them from those first truths which I have already expounded; and yet that I have expressly determined not to do so, to prevent a certain class of minds from thence taking occasion to build some extravagant philosophy upon what they may take to be my principles, and my being blamed for it. I refer to those who imagine that they can master in a day all that another has taken twenty years to think out, as soon as he has spoken two or three words to them on the subject; or who are the more liable to error and the less capable of perceiving truth in very proportion as they are more subtle and lively. As to the opinions which are truly and wholly mine, I offer no apology for them as new,--persuaded as I am that if their reasons be well considered they will be found to be so simple and so conformed, to common sense as to appear less extraordinary and less paradoxical than any others which can be held on the same subjects; nor do I even boast of being the earliest discoverer of any of them, but only of having adopted them, neither because they had nor because they had not been held by others, but solely because reason has convinced me of their truth.

Though artisans may not be able at once to execute the invention which is explained in the “Dioptrics,” I do not think that any one on that account is entitled to condemn it; for since address and practice are required in order so to make and adjust the machines described by me as not to overlook the smallest particular, I should not be less astonished if they succeeded on the first attempt than if a person were in one day to become an accomplished performer on the guitar, by merely having excellent sheets of music set up before him. And if I write in French, which is the language of my country, in preference to Latin, which is that of my preceptors, it is because I expect that those who make use of their unprejudiced natural reason will be better judges of my opinions than those who give heed to the writings of the ancients only; and as for those who unite good sense with habits of study, whom alone I desire for judges, they will not, I feel assured, be so partial to Latin as to refuse to listen to my reasonings merely because I expound them in the vulgar tongue.

In conclusion, I am unwilling here to say anything very specific of the progress which I expect to make for the future in the sciences, or to bind myself to the public by any promise which I am not certain of being able to fulfill; but this only will I say, that I have resolved to devote what time I may still have to live to no other occupation than that of endeavoring to acquire some knowledge of Nature, which shall be of such a kind as to enable us therefrom to deduce rules in medicine of greater certainty than those at present in use; and that my inclination is so much opposed to all other pursuits, especially to such as cannot be useful to some without being hurtful to others, that if, by any circumstances, I had been constrained to engage in such, I do not believe that I should have been able to succeed. Of this I here make a public declaration, though well aware that it cannot serve to procure for

me any consideration in the world, which, however, I do not in the least affect; and I shall always hold myself more obliged to those through whose favor I am permitted to enjoy my retirement without interruption than to any who might offer me the highest earthly preferments.

DISCOURSE ON THE METHOD OF RIGHTLY CONDUCTING THE REASON, AND SEEKING TRUTH IN THE SCIENCES

by René Descartes

Contents

PREFATORY NOTE PART I PART II PART III PART IV PART V PART VI

PREFATORY NOTE BY THE AUTHOR

If this Discourse appear too long to be read at once, it may be divided into six Parts: and, in the first, will be found various considerations touching the Sciences; in the second, the principal rules of the Method which the Author has discovered, in the third, certain of the rules of Morals which he has deduced from this Method; in the fourth, the reasonings by which he establishes the existence of God and of the Human Soul, which are the foundations of his Metaphysic; in the fifth, the order of the Physical questions which he has investigated, and, in particular, the explication of the motion of the heart and of some other difficulties pertaining to Medicine, as also the difference between the soul of man and that of the brutes; and, in the last, what the Author believes to be required in order to greater advancement in the investigation of Nature than has yet been made, with the reasons that have induced him to write.

PART I

Good sense is, of all things among men, the most equally distributed; for every one thinks himself so abundantly provided with it, that those even who are the most difficult to satisfy in everything else, do not usually desire a larger measure of this quality than they already possess. And in this it is not likely that all are mistaken the conviction is rather to be held as testifying that the power of judging aright and of distinguishing truth from error, which is properly what is called good sense or reason, is by nature equal in all men; and that the diversity of our opinions, consequently, does not arise from some being endowed with a larger share of reason than others, but solely from this, that we conduct our thoughts along different ways, and do not fix our attention on the same objects. For to be possessed of a vigorous mind is not enough; the prime requisite is rightly to apply it. The greatest minds, as they are capable of the highest excellences, are open likewise to the greatest aberrations; and those who travel very slowly may yet make far greater progress, provided they keep always to the straight road, than those who, while they run, forsake it.

For myself, I have never fancied my mind to be in any respect more perfect than those of the generality; on the contrary, I have often wished that I were equal to some others in promptitude of thought, or in clearness and distinctness of imagination, or in fullness and readiness of memory. And besides these, I know of no other qualities that contribute to the perfection of the mind; for as to the reason or sense, inasmuch as it is that alone which constitutes us men, and distinguishes us from the brutes, I am disposed to believe that it is to be found complete in each individual; and on this point to adopt the common opinion of philosophers, who say that the difference of greater and less holds only among the accidents, and not among the forms or natures of individuals of the same species.

I will not hesitate, however, to avow my belief that it has been my singular good fortune to have very early in life fallen in with certain tracks which have conducted me to considerations and maxims, of which I have formed a method that gives me the means, as I think, of gradually augmenting my knowledge, and of raising it by little and little to the highest point which the mediocrity of my talents and the brief duration of my life will permit me to reach. For I have already reaped from it such fruits that, although I have been accustomed to think lowly enough of myself, and although when I look with the eye of a philosopher at the varied courses and pursuits of mankind at large, I find scarcely one which does not appear in vain and useless, I nevertheless derive the highest satisfaction from the progress I conceive myself to have already made in the search after truth, and cannot help entertaining such

expectations of the future as to believe that if, among the occupations of men as men, there is any one really excellent and important, it is that which I have chosen.

After all, it is possible I may be mistaken; and it is but a little copper and glass, perhaps, that I take for gold and diamonds. I know how very liable we are to delusion in what relates to ourselves, and also how much the judgments of our friends are to be suspected when given in our favor. But I shall endeavor in this discourse to describe the paths I have followed, and to delineate my life as in a picture, in order that each one may also be able to judge of them for himself, and that in the general opinion entertained of them, as gathered from current report, I myself may have a new help towards instruction to be added to those I have been in the habit of employing.

My present design, then, is not to teach the method which each ought to follow for the right conduct of his reason, but solely to describe the way in which I have endeavored to conduct my own. They who set themselves to give precepts must of course regard themselves as possessed of greater skill than those to whom they prescribe; and if they err in the slightest particular, they subject themselves to censure. But as this tract is put forth merely as a history, or, if you will, as a tale, in which, amid some examples worthy of imitation, there will be found, perhaps, as many more which it were advisable not to follow, I hope it will prove useful to some without being hurtful to any, and that my openness will find some favor with all.

From my childhood, I have been familiar with letters; and as I was given to believe that by their help a clear and certain knowledge of all that is useful in life might be acquired, I was ardently desirous of instruction. But as soon as I had finished the entire course of study, at the close of which it is customary to be admitted into the order of the learned, I completely changed my opinion. For I found myself involved in so many doubts and errors, that I was convinced I had advanced no farther in all my attempts at learning, than the discovery at every turn of my own ignorance. And yet I was studying in one of the most celebrated schools in Europe, in which I thought there must be learned men, if such were anywhere to be found. I had been taught all that others learned there; and not contented with the sciences actually taught us, I had, in addition, read all the books that had fallen into my hands, treating of such branches as are esteemed the most curious and rare. I knew the judgment which others had formed of me; and I did not find that I was considered inferior to my fellows, although there were among them some who were already marked out to fill the places of our instructors. And, in fine, our age appeared to me as flourishing, and as fertile in powerful minds as any preceding one. I was thus led to take the liberty of judging of all other men by myself, and of concluding that there was no science in existence that was of such a nature as I had previously been given to believe.

I still continued, however, to hold in esteem the studies of the schools. I was aware that the languages taught in them are necessary to the understanding of the writings of the ancients; that the grace of fable stirs the mind; that the memorable deeds of history elevate it; and, if read with discretion, aid in forming the judgment; that the perusal of all excellent books is, as it were, to interview with the noblest men of past ages, who have written them, and even a studied interview, in which are discovered to us only their choicest thoughts; that eloquence has incomparable force and beauty; that poesy has its ravishing graces and delights; that in the mathematics there are many refined discoveries eminently suited to gratify the inquisitive, as well as further all the arts an lessen the labour of man; that numerous highly useful precepts and exhortations to virtue are contained in treatises on morals; that theology points out the path to heaven; that philosophy affords the means of discoursing with an appearance of truth on all matters, and commands the admiration of the more simple; that jurisprudence, medicine, and the other sciences, secure for their cultivators honors and riches; and, in fine, that it is useful to bestow some attention upon all, even upon those abounding the most in superstition and error, that we may be in a position to determine their real value, and guard against being deceived.

But I believed that I had already given sufficient time to languages, and likewise to the reading of the writings of the ancients, to their histories and fables. For to hold converse with those of other ages and to travel, are almost the same thing. It is useful to know something of the manners of different nations, that we may be enabled to form a more correct judgment regarding our own, and be prevented from thinking that everything contrary to our customs is ridiculous and irrational, a conclusion usually come to by those whose experience has been limited to their own country. On the other hand, when too much time is occupied in traveling, we become strangers to our native country; and the over curious in the customs of the past are generally ignorant of those of the present. Besides, fictitious narratives lead us to imagine the possibility of many events that are impossible; and even the most faithful histories, if they do not wholly misrepresent matters, or exaggerate their importance to render the account of them more worthy of perusal, omit, at least, almost always the meanest and least striking of the attendant circumstances; hence it happens that the remainder does not represent the truth, and that such as regulate their conduct by examples drawn from this source, are apt to fall into the extravagances of the knight-errants of romance, and to entertain projects that exceed their powers.

I esteemed eloquence highly, and was in raptures with poesy; but I thought that both were gifts of nature rather than fruits of study. Those in whom the faculty of reason is predominant, and who most skillfully dispose their thoughts with a view to render them clear and intelligible, are always the best able to persuade others of the truth of what they lay down, though they should speak only in the language of Lower Brittany, and be wholly ignorant of the rules of rhetoric; and those whose minds are stored with the most agreeable fancies, and who can give expression to them with the greatest embellishment and harmony, are still the best poets, though unacquainted with the art of poetry.

I was especially delighted with the mathematics, on account of the certitude and evidence of their reasonings; but I had not as yet a precise knowledge of their true use; and thinking that they but contributed to the advancement of the mechanical arts, I was astonished that foundations, so strong and solid, should have had no loftier superstructure reared on them. On the other hand, I compared the disquisitions of the ancient moralists to very towering and magnificent palaces with no better foundation than sand and mud: they laud the virtues very highly, and exhibit them as estimable far above anything on earth; but they give us no adequate criterion of virtue, and frequently that which they designate with so fine a name is but apathy, or pride, or despair, or parricide.

I revered our theology, and aspired as much as any one to reach heaven: but being given assuredly to understand that the way is not less open to the most ignorant than to the most learned, and that the revealed truths which lead to heaven are above our comprehension, I did not presume to subject them to the impotency of my reason; and I thought that in order competently to undertake their examination, there was need of some special help from heaven, and of being more than man.

Of philosophy I will say nothing, except that when I saw that it had been cultivated for many ages by the most distinguished men, and that yet there is not a single matter within its sphere which is not still in dispute, and nothing, therefore, which is above doubt, I did not presume to anticipate that my success would be greater in it than that of others; and further, when I considered the number of conflicting opinions touching a single matter that may be upheld by learned men, while there can be but one true, I reckoned as well-nigh false all that was only probable.

As to the other sciences, inasmuch as these borrow their principles from philosophy, I judged that no solid superstructures could be reared on foundations so infirm; and neither the honor nor the gain held out by them was sufficient to determine me to their cultivation: for I was not, thank Heaven, in a condition which compelled me to make merchandise of science for the bettering of my fortune; and though I might not profess to scorn glory as a cynic, I yet made very slight account of that honor which I hoped to acquire only through fictitious titles. And, in fine, of false sciences I thought I knew the worth sufficiently to escape being deceived by the professions of an alchemist, the predictions of an astrologer, the impostures of a magician, or by the artifices and boasting of any of those who profess to know things of which they are ignorant.

For these reasons, as soon as my age permitted me to pass from under the control of my instructors, I entirely abandoned the study of letters, and resolved no longer to seek any other science than the knowledge of myself, or of the great book of the world. I spent the remainder of my youth in traveling, in visiting courts and armies, in holding intercourse with men of different dispositions and ranks, in collecting varied experience, in proving myself in the different situations into which fortune threw me, and, above all, in making such reflection on the matter of my experience as to secure my improvement. For it occurred to me that I should find much more truth in the reasonings of each individual with reference to the affairs in which he is personally interested, and the issue of which must presently punish him if he has judged amiss, than in those conducted by a man of letters in his study, regarding speculative matters that are of no practical moment, and followed by no consequences to himself, farther, perhaps, than that they foster his vanity the better the more remote they are from common sense; requiring, as they must in this case, the exercise of greater ingenuity and art to render them probable. In addition, I had always a most earnest desire to know how to distinguish the true from the false, in order that I might be able clearly to discriminate the right path in life, and proceed in it with confidence.

It is true that, while busied only in considering the manners of other men, I found here, too, scarce any ground for settled conviction, and remarked hardly less contradiction among them than in the opinions of the philosophers. So that the greatest advantage I derived from the study consisted in this, that, observing many things which, however extravagant and ridiculous to our apprehension, are yet by common consent received and approved by other great nations, I learned to entertain too decided a belief in regard to nothing of the truth of which I had been persuaded merely by example and custom; and thus I gradually extricated myself from many errors powerful enough to darken our natural intelligence, and incapacitate us in great measure from listening to reason. But after I had been occupied several years in thus studying the book of the world, and in essaying to gather some experience, I at length resolved to make myself an object of study, and to employ all the powers of my mind in choosing the paths I ought to follow, an undertaking which was accompanied with greater success than it would have been had I never quitted my

country or my books.

PART II

I was then in Germany, attracted thither by the wars in that country, which have not yet been brought to a termination; and as I was returning to the army from the coronation of the emperor, the setting in of winter arrested me in a locality where, as I found no society to interest me, and was besides fortunately undisturbed by any cares or passions, I remained the whole day in seclusion, with full opportunity to occupy my attention with my own thoughts. Of these one of the very first that occurred to me was, that there is seldom so much perfection in works composed of many separate parts, upon which different hands had been employed, as in those completed by a single master. Thus it is observable that the buildings which a single architect has planned and executed, are generally more elegant and commodious than those which several have attempted to improve, by making old walls serve for purposes for which they were not originally built. Thus also, those ancient cities which, from being at first only villages, have become, in course of time, large towns, are usually but ill laid out compared with the regularity constructed towns which a professional architect has freely planned on an open plain; so that although the several buildings of the former may often equal or surpass in beauty those of the latter, yet when one observes their indiscriminate juxtaposition, there a large one and here a small, and the consequent crookedness and irregularity of the streets, one is disposed to allege that chance rather than any human will guided by reason must have led to such an arrangement. And if we consider that nevertheless there have been at all times certain officers whose duty it was to see that private buildings contributed to public ornament, the difficulty of reaching high perfection with but the materials of others to operate on, will be readily acknowledged. In the same way I fancied that those nations which, starting from a semi-barbarous state and advancing to civilization by slow degrees, have had their laws successively determined, and, as it were, forced upon them simply by experience of the hurtfulness of particular crimes and disputes, would by this process come to be possessed of less perfect institutions than those which, from the commencement of their association as communities, have followed the appointments of some wise legislator. It is thus quite certain that the constitution of the true religion, the ordinances of which are derived from God, must be incomparably superior to that of every other. And, to speak of human affairs, I believe that the pre-eminence of Sparta was due not to the goodness of each of its laws in particular, for many of these were very strange, and even opposed to good morals, but to the circumstance that, originated by a single individual, they all tended to a single end. In the same way I thought that the sciences contained in books (such of them at least as are made up of probable reasonings, without demonstrations), composed as they are of the opinions of many different individuals massed together, are farther removed from truth than the simple inferences which a man of good sense using his natural and unprejudiced judgment draws respecting the matters of his experience. And because we have all to pass through a state of infancy to manhood, and have been of necessity, for a length of time, governed by our desires and preceptors (whose dictates were frequently conflicting, while neither perhaps always counseled us for the best), I farther concluded that it is almost impossible that our judgments can be so correct or solid as they would have been, had our reason been mature from the moment of our birth, and had we always been guided by it alone.

It is true, however, that it is not customary to pull down all the houses of a town with the single design of rebuilding them differently, and thereby rendering the streets more handsome; but it often happens that a private individual takes down his own with the view of erecting it anew, and that people are even sometimes constrained to this when their houses are in danger of falling from age, or when the foundations are insecure. With this before me by way of example, I was persuaded that it would indeed be preposterous for a private individual to think of reforming a state by fundamentally changing it throughout, and overturning it in order to set it up amended; and the same I thought was true of any similar project for reforming the body of the sciences, or the order of teaching them established in the schools: but as for the opinions which up to that time I had embraced, I thought that I could not do better than resolve at once to sweep them wholly away, that I might afterwards be in a position to admit either others more correct, or even perhaps the same when they had undergone the scrutiny of reason. I firmly believed that in this way I should much better succeed in the conduct of my life, than if I built only upon old foundations, and leaned upon principles which, in my youth, I had taken upon trust. For although I recognized various difficulties in this undertaking, these were not, however, without remedy, nor once to be compared with such as attend the slightest reformation in public affairs. Large bodies, if once overthrown, are with great difficulty set up again, or even kept erect when once seriously shaken, and the fall of such is always disastrous. Then if there are any imperfections in the constitutions of states (and that many such exist the diversity of constitutions is alone sufficient to assure us), custom has without doubt materially smoothed their inconveniences, and has even managed to steer altogether clear of, or insensibly corrected a number which sagacity could not have provided against with equal effect; and, in fine, the defects are almost always more tolerable than the change necessary for their removal; in the same manner that highways which wind among mountains, by being much frequented, become gradually so smooth and commodious, that it is much better to follow them than to

seek a straighter path by climbing over the tops of rocks and descending to the bottoms of precipices.

Hence it is that I cannot in any degree approve of those restless and busy meddlers who, called neither by birth nor fortune to take part in the management of public affairs, are yet always projecting reforms; and if I thought that this tract contained aught which might justify the suspicion that I was a victim of such folly, I would by no means permit its publication. I have never contemplated anything higher than the reformation of my own opinions, and basing them on a foundation wholly my own. And although my own satisfaction with my work has led me to present here a draft of it, I do not by any means therefore recommend to every one else to make a similar attempt. Those whom God has endowed with a larger measure of genius will entertain, perhaps, designs still more exalted; but for the many I am much afraid lest even the present undertaking be more than they can safely venture to imitate. The single design to strip one's self of all past beliefs is one that ought not to be taken by every one. The majority of men is composed of two classes, for neither of which would this be at all a befitting resolution: in the first place, of those who with more than a due confidence in their own powers, are precipitate in their judgments and want the patience requisite for orderly and circumspect thinking; whence it happens, that if men of this class once take the liberty to doubt of their accustomed opinions, and quit the beaten highway, they will never be able to thread the byway that would lead them by a shorter course, and will lose themselves and continue to wander for life; in the second place, of those who, possessed of sufficient sense or modesty to determine that there are others who excel them in the power of discriminating between truth and error, and by whom they may be instructed, ought rather to content themselves with the opinions of such than trust for more correct to their own reason.

For my own part, I should doubtless have belonged to the latter class, had I received instruction from but one master, or had I never known the diversities of opinion that from time immemorial have prevailed among men of the greatest learning. But I had become aware, even so early as during my college life, that no opinion, however absurd and incredible, can be imagined, which has not been maintained by some on of the philosophers; and afterwards in the course of my travels I remarked that all those whose opinions are decidedly repugnant to ours are not in that account barbarians and savages, but on the contrary that many of these nations make an equally good, if not better, use of their reason than we do. I took into account also the very different character which a person brought up from infancy in France or Germany exhibits, from that which, with the same mind originally, this individual would have possessed had he lived always among the Chinese or with savages, and the circumstance that in dress itself the fashion which pleased us ten years ago, and which may again, perhaps, be received into favor before ten years have gone, appears to us at this moment extravagant and ridiculous. I was thus led to infer that the ground of our opinions is far more custom and example than any certain knowledge. And, finally, although such be the ground of our opinions, I remarked that a plurality of suffrages is no guarantee of truth where it is at all of difficult discovery, as in such cases it is much more likely that it will be found by one than by many. I could, however, select from the crowd no one whose opinions seemed worthy of preference, and thus I found myself constrained, as it were, to use my own reason in the conduct of my life.

But like one walking alone and in the dark, I resolved to proceed so slowly and with such circumspection, that if I did not advance far, I would at least guard against falling. I did not even choose to dismiss summarily any of the opinions that had crept into my belief without having been introduced by reason, but first of all took sufficient time carefully to satisfy myself of the general nature of the task I was setting myself, and ascertain the true method by which to arrive at the knowledge of whatever lay within the compass of my powers.

Among the branches of philosophy, I had, at an earlier period, given some attention to logic, and among those of the mathematics to geometrical analysis and algebra,--three arts or sciences which ought, as I conceived, to contribute something to my design. But, on examination, I found that, as for logic, its syllogisms and the majority of its other precepts are of avail--rather in the communication of what we already know, or even as the art of Lully, in speaking without judgment of things of which we are ignorant, than in the investigation of the unknown; and although this science contains indeed a number of correct and very excellent precepts, there are, nevertheless, so many others, and these either injurious or superfluous, mingled with the former, that it is almost quite as difficult to effect a severance of the true from the false as it is to extract a Diana or a Minerva from a rough block of marble. Then as to the analysis of the ancients and the algebra of the moderns, besides that they embrace only matters highly abstract, and, to appearance, of no use, the former is so exclusively restricted to the consideration of figures, that it can exercise the understanding only on condition of greatly fatiguing the imagination; and, in the latter, there is so complete a subjection to certain rules and formulas, that there results an art full of confusion and obscurity calculated to embarrass, instead of a science fitted to cultivate the mind. By these considerations I was induced to seek some other method which would comprise the advantages of the three and be exempt from their defects. And as a multitude of laws often only hampers justice, so that a state is best governed when, with few laws, these are rigidly administered; in like manner, instead of the great number of precepts of which

logic is composed, I believed that the four following would prove perfectly sufficient for me, provided I took the firm and unwavering resolution never in a single instance to fail in observing them.

The first was never to accept anything for true which I did not clearly know to be such; that is to say, carefully to avoid precipitancy and prejudice, and to comprise nothing more in my judgement than what was presented to my mind so clearly and distinctly as to exclude all ground of doubt.

The second, to divide each of the difficulties under examination into as many parts as possible, and as might be necessary for its adequate solution.

The third, to conduct my thoughts in such order that, by commencing with objects the simplest and easiest to know, I might ascend by little and little, and, as it were, step by step, to the knowledge of the more complex; assigning in thought a certain order even to those objects which in their own nature do not stand in a relation of antecedence and sequence.

And the _last_, in every case to make enumerations so complete, and reviews so general, that I might be assured that nothing was omitted.

The long chains of simple and easy reasonings by means of which geometers are accustomed to reach the conclusions of their most difficult demonstrations, had led me to imagine that all things, to the knowledge of which man is competent, are mutually connected in the same way, and that there is nothing so far removed from us as to be beyond our reach, or so hidden that we cannot discover it, provided only we abstain from accepting the false for the true, and always preserve in our thoughts the order necessary for the deduction of one truth from another. And I had little difficulty in determining the objects with which it was necessary to commence, for I was already persuaded that it must be with the simplest and easiest to know, and, considering that of all those who have hitherto sought truth in the sciences, the mathematicians alone have been able to find any demonstrations, that is, any certain and evident reasons, I did not doubt but that such must have been the rule of their investigations. I resolved to commence, therefore, with the examination of the simplest objects, not anticipating, however, from this any other advantage than that to be found in accustoming my mind to the love and nourishment of truth, and to a distaste for all such reasonings as were unsound. But I had no intention on that account of attempting to master all the particular sciences commonly denominated mathematics: but observing that, however different their objects, they all agree in considering only the various relations or proportions subsisting among those objects, I thought it best for my purpose to consider these proportions in the most general form possible, without referring them to any objects in particular, except such as would most facilitate the knowledge of them, and without by any means restricting them to these, that afterwards I might thus be the better able to apply them to every other class of objects to which they are legitimately applicable. Perceiving further, that in order to understand these relations I should sometimes have to consider them one by one and sometimes only to bear them in mind, or embrace them in the aggregate, I thought that, in order the better to consider them individually, I should view them as subsisting between straight lines, than which I could find no objects more simple, or capable of being more distinctly represented to my imagination and senses; and on the other hand, that in order to retain them in the memory or embrace an aggregate of many, I should express them by certain characters the briefest possible. In this way I believed that I could borrow all that was best both in geometrical analysis and in algebra, and correct all the defects of the one by help of the other.

And, in point of fact, the accurate observance of these few precepts gave me, I take the liberty of saying, such ease in unraveling all the questions embraced in these two sciences, that in the two or three months I devoted to their examination, not only did I reach solutions of questions I had formerly deemed exceedingly difficult but even as regards questions of the solution of which I continued ignorant, I was enabled, as it appeared to me, to determine the means whereby, and the extent to which a solution was possible; results attributable to the circumstance that I commenced with the simplest and most general truths, and that thus each truth discovered was a rule available in the discovery of subsequent ones Nor in this perhaps shall I appear too vain, if it be considered that, as the truth on any particular point is one whoever apprehends the truth, knows all that on that point can be known. The child, for example, who has been instructed in the elements of arithmetic, and has made a particular addition, according to rule, may be assured that he has found, with respect to the sum of the numbers before him, and that in this instance is within the reach of human genius. Now, in conclusion, the method which teaches adherence to the true order, and an exact enumeration of all the conditions of the thing sought includes all that gives certitude to the rules of arithmetic.

But the chief ground of my satisfaction with thus method, was the assurance I had of thereby exercising my reason in all matters, if not with absolute perfection, at least with the greatest attainable by me: besides, I was conscious that by its use my mind was

becoming gradually habituated to clearer and more distinct conceptions of its objects; and I hoped also, from not having restricted this method to any particular matter, to apply it to the difficulties of the other sciences, with not less success than to those of algebra. I should not, however, on this account have ventured at once on the examination of all the difficulties of the sciences which presented themselves to me, for this would have been contrary to the order prescribed in the method, but observing that the knowledge of such is dependent on principles borrowed from philosophy, in which I found nothing certain, I thought it necessary first of all to endeavor to establish its principles. And because I observed, besides, that an inquiry of this kind was of all others of the greatest moment, and one in which precipitancy and anticipation in judgment were most to be dreaded, I thought that I ought not to approach it till I had reached a more mature age (being at that time but twenty-three), and had first of all employed much of my time in preparation for the work, as well by eradicating from my mind all the erroneous opinions I had up to that moment accepted, as by amassing variety of experience to afford materials for my reasonings, and by continually exercising myself in my chosen method with a view to increased skill in its application.

PART III

And finally, as it is not enough, before commencing to rebuild the house in which we live, that it be pulled down, and materials and builders provided, or that we engage in the work ourselves, according to a plan which we have beforehand carefully drawn out, but as it is likewise necessary that we be furnished with some other house in which we may live commodiously during the operations, so that I might not remain irresolute in my actions, while my reason compelled me to suspend my judgement, and that I might not be prevented from living thenceforward in the greatest possible felicity, I formed a provisory code of morals, composed of three or four maxims, with which I am desirous to make you acquainted.

The _first_ was to obey the laws and customs of my country, adhering firmly to the faith in which, by the grace of God, I had been educated from my childhood and regulating my conduct in every other matter according to the most moderate opinions, and the farthest removed from extremes, which should happen to be adopted in practice with general consent of the most judicious of those among whom I might be living. For as I had from that time begun to hold my own opinions for nought because I wished to subject them all to examination, I was convinced that I could not do better than follow in the meantime the opinions of the most judicious; and although there are some perhaps among the Persians and Chinese as judicious as among ourselves, expediency seemed to dictate that I should regulate my practice conformably to the opinions of those with whom I should have to live; and it appeared to me that, in order to ascertain the real opinions of such, I ought rather to take cognizance of what they practised than of what they said, not only because, in the corruption of our manners, there are few disposed to speak exactly as they believe, but also because very many are not aware of what it is that they really believe; for, as the act of mind by which a thing is believed is different from that by which we know that we believe it, the one act is often found without the other. Also, amid many opinions held in equal repute, I chose always the most moderate, as much for the reason that these are always the most convenient for practice, and probably the best (for all excess is generally vicious), as that, in the event of my falling into error, I might be at less distance from the truth than if, having chosen one of the extremes, it should turn out to be the other which I ought to have adopted. And I placed in the class of extremes especially all promises by which somewhat of our freedom is abridged; not that I disapproved of the laws which, to provide against the instability of men of feeble resolution, when what is sought to be accomplished is some good, permit engagements by vows and contracts binding the parties to persevere in it, or even, for the security of commerce, sanction similar engagements where the purpose sought to be realized is indifferent: but because I did not find anything on earth which was wholly superior to change, and because, for myself in particular, I hoped gradually to perfect my judgments, and not to suffer them to deteriorate, I would have deemed it a grave sin against good sense, if, for the reason that I approved of something at a particular time, I therefore bound myself to hold it for good at a subsequent time, when perhaps it had ceased to be so, or I had ceased to esteem it such.

My _second_ maxim was to be as firm and resolute in my actions as I was able, and not to adhere less steadfastly to the most doubtful opinions, when once adopted, than if they had been highly certain; imitating in this the example of travelers who, when they have lost their way in a forest, ought not to wander from side to side, far less remain in one place, but proceed constantly towards the same side in as straight a line as possible, without changing their direction for slight reasons, although perhaps it might be chance alone which at first determined the selection; for in this way, if they do not exactly reach the point they desire, they will come at least in the end to some place that will probably be preferable to the middle of a forest. In the same way, since in action it frequently happens that no delay is permissible, it is very certain that, when it is not in our power to determine what is true, we ought to act according to what is most probable; and even although we should not remark a greater probability in one opinion than

in another, we ought notwithstanding to choose one or the other, and afterwards consider it, in so far as it relates to practice, as no longer dubious, but manifestly true and certain, since the reason by which our choice has been determined is itself possessed of these qualities. This principle was sufficient thenceforward to rid me of all those repentings and pangs of remorse that usually disturb the consciences of such feeble and uncertain minds as, destitute of any clear and determinate principle of choice, allow themselves one day to adopt a course of action as the best, which they abandon the next, as the opposite.

My _third_ maxim was to endeavor always to conquer myself rather than fortune, and change my desires rather than the order of the world, and in general, accustom myself to the persuasion that, except our own thoughts, there is nothing absolutely in our power; so that when we have done our best in things external to us, all wherein we fail of success is to be held, as regards us, absolutely impossible: and this single principle seemed to me sufficient to prevent me from desiring for the future anything which I could not obtain, and thus render me contented; for since our will naturally seeks those objects alone which the understanding represents as in some way possible of attainment, it is plain, that if we consider all external goods as equally beyond our power, we shall no more regret the absence of such goods as seem due to our birth, when deprived of them without any fault of ours, than our not possessing the kingdoms of China or Mexico, and thus making, so to speak, a virtue of necessity, we shall no more desire health in disease, or freedom in imprisonment, than we now do bodies incorruptible as diamonds, or the wings of birds to fly with. But I confess there is need of prolonged discipline and frequently repeated meditation to accustom the mind to view all objects in this light; and I believe that in this chiefly consisted the secret of the power of such philosophers as in former times were enabled to rise superior to the influence of fortune, and, amid suffering and poverty, enjoy a happiness which their gods might have envied. For, occupied incessantly with the consideration of the limits prescribed to their power by nature, they became so entirely convinced that nothing was at their disposal except their own thoughts, that this conviction was of itself sufficient to prevent their entertaining any desire of other objects; and over their thoughts they acquired a sway so absolute, that they had some ground on this account for esteeming themselves more rich and more powerful, more free and more happy, than other men who, whatever be the favors heaped on them by nature and fortune, if destitute of this philosophy, can never command the realization of all their desires.

In fine, to conclude this code of morals, I thought of reviewing the different occupations of men in this life, with the view of making choice of the best. And, without wishing to offer any remarks on the employments of others, I may state that it was my conviction that I could not do better than continue in that in which I was engaged, viz., in devoting my whole life to the culture of my reason, and in making the greatest progress I was able in the knowledge of truth, on the principles of the method which I had prescribed to myself. This method, from the time I had begun to apply it, had been to me the source of satisfaction so intense as to lead me to, believe that more perfect or more innocent could not be enjoyed in this life; and as by its means I daily discovered truths that appeared to me of some importance, and of which other men were generally ignorant, the gratification thence arising so occupied my mind that I was wholly indifferent to every other object. Besides, the three preceding maxims were founded singly on the design of continuing the work of self-instruction. For since God has endowed each of us with some light of reason by which to distinguish truth from error, I could not have believed that I ought for a single moment to rest satisfied with the opinions of another, unless I had resolved to exercise my own judgment in examining these whenever I should be duly qualified for the task. Nor could I have proceeded on such opinions without scruple, had I supposed that I should thereby forfeit any advantage for attaining still more accurate, should such exist. And, in fine, I could not have restrained my desires, nor remained satisfied had I not followed a path in which I thought myself certain of attaining all the knowledge to the acquisition of which I was competent, as well as the largest amount of what is truly good which I could ever hope to secure Inasmuch as we neither seek nor shun any object except in so far as our understanding represents it as good or bad, all that is necessary to right action is right judgment, and to the best action the most correct judgment, that is, to the acquisition of all the virtues with all else that is truly valuable and within our reach; and the assurance of such an acquisition cannot fail to render us contented.

Having thus provided myself with these maxims, and having placed them in reserve along with the truths of faith, which have ever occupied the first place in my belief, I came to the conclusion that I might with freedom set about ridding myself of what remained of my opinions. And, inasmuch as I hoped to be better able successfully to accomplish this work by holding intercourse with mankind, than by remaining longer shut up in the retirement where these thoughts had occurred to me, I betook me again to traveling before the winter was well ended. And, during the nine subsequent years, I did nothing but roam from one place to another, desirous of being a spectator rather than an actor in the plays exhibited on the theater of the world; and, as I made it my business in each matter to reflect particularly upon what might fairly be doubted and prove a source of error, I gradually rooted out from my mind all the errors which had hitherto crept into it. Not that in this I imitated the sceptics who doubt only that they may doubt, and seek nothing beyond uncertainty itself; for, on the contrary, my design was singly to find ground of assurance, and cast aside the loose

earth and sand, that I might reach the rock or the clay. In this, as appears to me, I was successful enough; for, since I endeavored to discover the falsehood or incertitude of the propositions I examined, not by feeble conjectures, but by clear and certain reasonings, I met with nothing so doubtful as not to yield some conclusion of adequate certainty, although this were merely the inference, that the matter in question contained nothing certain. And, just as in pulling down an old house, we usually reserve the ruins to contribute towards the erection, so, in destroying such of my opinions as I judged to be Ill-founded, I made a variety of observations and acquired an amount of experience of which I availed myself in the establishment of more certain. And further, I continued to exercise myself in the method I had prescribed; for, besides taking care in general to conduct all my thoughts according to its rules, I reserved some hours from time to time which I expressly devoted to the employment of the method in the solution of mathematical difficulties, or even in the solution likewise of some questions belonging to other sciences, but which, by my having detached them from such principles of these sciences as were of inadequate certainty, were rendered almost mathematical: the truth of this will be manifest from the numerous examples contained in this volume. And thus, without in appearance living otherwise than those who, with no other occupation than that of spending their lives agreeably and innocently, study to sever pleasure from vice, and who, that they may enjoy their leisure without ennui, have recourse to such pursuits as are honorable, I was nevertheless prosecuting my design, and making greater progress in the knowledge of truth, than I might, perhaps, have made had I been engaged in the perusal of books merely, or in holding converse with men of letters.

These nine years passed away, however, before I had come to any determinate judgment respecting the difficulties which form matter of dispute among the learned, or had commenced to seek the principles of any philosophy more certain than the vulgar. And the examples of many men of the highest genius, who had, in former times, engaged in this inquiry, but, as appeared to me, without success, led me to imagine it to be a work of so much difficulty, that I would not perhaps have ventured on it so soon had I not heard it currently rumored that I had already completed the inquiry. I know not what were the grounds of this opinion; and, if my conversation contributed in any measure to its rise, this must have happened rather from my having confessed my Ignorance with greater freedom than those are accustomed to do who have studied a little, and expounded perhaps, the reasons that led me to doubt of many of those things that by others are esteemed certain, than from my having boasted of any system of philosophy. But, as I am of a disposition that makes me unwilling to be esteemed different from what I really am, I thought it necessary to endeavor by all means to render myself worthy of the reputation accorded to me; and it is now exactly eight years since this desire constrained me to remove from all those places where interruption from any of my acquaintances was possible, and betake myself to this country, in which the long duration of the war has led to the establishment of such discipline, that the armies maintained seem to be of use only in enabling the inhabitants to enjoy more securely the blessings of peace and where, in the midst of a great crowd actively engaged in business, and more careful of their own affairs than curious about those of others, I have been enabled to live without being deprived of any of the conveniences to be had in the most populous cities, and yet as solitary and as retired as in the midst of the most remote deserts.

PART IV

I am in doubt as to the propriety of making my first meditations in the place above mentioned matter of discourse; for these are so metaphysical, and so uncommon, as not, perhaps, to be acceptable to every one. And yet, that it may be determined whether the foundations that I have laid are sufficiently secure, I find myself in a measure constrained to advert to them. I had long before remarked that, in relation to practice, it is sometimes necessary to adopt, as if above doubt, opinions which we discern to be highly uncertain, as has been already said; but as I then desired to give my attention solely to the search after truth, I thought that a procedure exactly the opposite was called for, and that I ought to reject as absolutely false all opinions in regard to which I could suppose the least ground for doubt, in order to ascertain whether after that there remained aught in my belief that was wholly indubitable. Accordingly, seeing that our senses sometimes deceive us, I was willing to suppose that there existed nothing really such as they presented to us; and because some men err in reasoning, and fall into paralogisms, even on the simplest matters of geometry, I, convinced that I was as open to error as any other, rejected as false all the reasonings I had hitherto taken for demonstrations; and finally, when I considered that the very same thoughts (presentations) which we experience when awake may also be experienced when we are asleep, while there is at that time not one of them true, I supposed that all the objects (presentations) that had ever entered into my mind when awake, had in them no more truth than the illusions of my dreams. But immediately upon this I observed that, whilst I thus wished to think that all was false, it was absolutely necessary that I, who thus thought, should be somewhat; and as I observed that this truth, I think, therefore I am (COGITO ERGO SUM), was so certain and of such evidence that no ground of doubt, however extravagant, could be alleged by the sceptics capable of shaking it, I concluded that I might, without scruple, accept it as the first principle of the philosophy of which I was in search.

In the next place, I attentively examined what I was and as I observed that I could suppose that I had no body, and that there was no world nor any place in which I might be; but that I could not therefore suppose that I was not; and that, on the contrary, from the very circumstance that I thought to doubt of the truth of other things, it most clearly and certainly followed that I was; while, on the other hand, if I had only ceased to think, although all the other objects which I had ever imagined had been in reality existent, I would have had no reason to believe that I existed; I thence concluded that I was a substance whose whole essence or nature consists only in thinking, and which, that it may exist, has need of no place, nor is dependent on any material thing; so that "I," that is to say, the mind by which I am what I am, is wholly distinct from the body, and is even more easily known than the latter, and is such, that although the latter were not, it would still continue to be all that it is.

After this I inquired in general into what is essential to the truth and certainty of a proposition; for since I had discovered one which I knew to be true, I thought that I must likewise be able to discover the ground of this certitude. And as I observed that in the words I think, therefore I am, there is nothing at all which gives me assurance of their truth beyond this, that I see very clearly that in order to think it is necessary to exist, I concluded that I might take, as a general rule, the principle, that all the things which we very clearly and distinctly conceive are true, only observing, however, that there is some difficulty in rightly determining the objects which we distinctly conceive.

In the next place, from reflecting on the circumstance that I doubted, and that consequently my being was not wholly perfect (for I clearly saw that it was a greater perfection to know than to doubt), I was led to inquire whence I had learned to think of something more perfect than myself; and I clearly recognized that I must hold this notion from some nature which in reality was more perfect. As for the thoughts of many other objects external to me, as of the sky, the earth, light, heat, and a thousand more, I was less at a loss to know whence these came; for since I remarked in them nothing which seemed to render them superior to myself, I could believe that, if these were true, they were dependencies on my own nature, in so far as it possessed a certain perfection, and, if they were false, that I held them from nothing, that is to say, that they were in me because of a certain imperfection of my nature. But this could not be the case with-the idea of a nature more perfect than myself; for to receive it from nothing was a thing manifestly impossible; and, because it is not less repugnant that the more perfect should be an effect of, and dependence on the less perfect, than that something should proceed from nothing, it was equally impossible that I could hold it from myself: accordingly, it but remained that it had been placed in me by a nature which was in reality more perfect than mine, and which even possessed within itself all the perfections of which I could form any idea; that is to say, in a single word, which was God. And to this I added that, since I knew some perfections which I did not possess, I was not the only being in existence (I will here, with your permission, freely use the terms of the schools); but, on the contrary, that there was of necessity some other more perfect Being upon whom I was dependent, and from whom I had received all that I possessed; for if I had existed alone, and independently of every other being, so as to have had from myself all the perfection, however little, which I actually possessed, I should have been able, for the same reason, to have had from myself the whole remainder of perfection, of the want of which I was conscious, and thus could of myself have become infinite, eternal, immutable, omniscient, all-powerful, and, in fine, have possessed all the perfections which I could recognize in God. For in order to know the nature of God (whose existence has been established by the preceding reasonings), as far as my own nature permitted, I had only to consider in reference to all the properties of which I found in my mind some idea, whether their possession was a mark of perfection; and I was assured that no one which indicated any imperfection was in him, and that none of the rest was awanting. Thus I perceived that doubt, inconstancy, sadness, and such like, could not be found in God, since I myself would have been happy to be free from them. Besides, I had ideas of many sensible and corporeal things; for although I might suppose that I was dreaming, and that all which I saw or imagined was false, I could not, nevertheless, deny that the ideas were in reality in my thoughts. But, because I had already very clearly recognized in myself that the intelligent nature is distinct from the corporeal, and as I observed that all composition is an evidence of dependency, and that a state of dependency is manifestly a state of imperfection, I therefore determined that it could not be a perfection in God to be compounded of these two natures and that consequently he was not so compounded; but that if there were any bodies in the world, or even any intelligences, or other natures that were not wholly perfect, their existence depended on his power in such a way that they could not subsist without him for a single moment.

I was disposed straightway to search for other truths and when I had represented to myself the object of the geometers, which I conceived to be a continuous body or a space indefinitely extended in length, breadth, and height or depth, divisible into divers parts which admit of different figures and sizes, and of being moved or transposed in all manner of ways (for all this the geometers suppose to be in the object they contemplate), I went over some of their simplest demonstrations. And, in the first place, I observed, that the great certitude which by common consent is accorded to these demonstrations, is founded solely upon this, that they are

clearly conceived in accordance with the rules I have already laid down In the next place, I perceived that there was nothing at all in these demonstrations which could assure me of the existence of their object: thus, for example, supposing a triangle to be given, I distinctly perceived that its three angles were necessarily equal to two right angles, but I did not on that account perceive anything which could assure me that any triangle existed: while, on the contrary, recurring to the examination of the idea of a Perfect Being, I found that the existence of the Being was comprised in the idea in the same way that the equality of its three angles to two right angles is comprised in the idea of a triangle, or as in the idea of a sphere, the equidistance of all points on its surface from the center, or even still more clearly; and that consequently it is at least as certain that God, who is this Perfect Being, is, or exists, as any demonstration of geometry can be.

But the reason which leads many to persuade them selves that there is a difficulty in knowing this truth, and even also in knowing what their mind really is, is that they never raise their thoughts above sensible objects, and are so accustomed to consider nothing except by way of imagination, which is a mode of thinking limited to material objects, that all that is not imaginable seems to them not intelligible. The truth of this is sufficiently manifest from the single circumstance, that the philosophers of the schools accept as a maxim that there is nothing in the understanding which was not previously in the senses, in which however it is certain that the ideas of God and of the soul have never been; and it appears to me that they who make use of their imagination to comprehend these ideas do exactly the some thing as if, in order to hear sounds or smell odors, they strove to avail themselves of their eyes; unless indeed that there is this difference, that the sense of sight does not afford us an inferior assurance to those of smell or hearing; in place of which, neither our imagination nor our senses can give us assurance of anything unless our understanding intervene.

Finally, if there be still persons who are not sufficiently persuaded of the existence of God and of the soul, by the reasons I have adduced, I am desirous that they should know that all the other propositions, of the truth of which they deem themselves perhaps more assured, as that we have a body, and that there exist stars and an earth, and such like, are less certain; for, although we have a moral assurance of these things, which is so strong that there is an appearance of extravagance in doubting of their existence, yet at the same time no one, unless his intellect is impaired, can deny, when the question relates to a metaphysical certitude, that there is sufficient reason to exclude entire assurance, in the observation that when asleep we can in the same way imagine ourselves possessed of another body and that we see other stars and another earth, when there is nothing of the kind. For how do we know that the thoughts which occur in dreaming are false rather than those other which we experience when awake, since the former are often not less vivid and distinct than the latter? And though men of the highest genius study this question as long as they please, I do not believe that they will be able to give any reason which can be sufficient to remove this doubt, unless they presuppose the existence of God. For, in the first place even the principle which I have already taken as a rule, viz., that all the things which we clearly and distinctly conceive are true, is certain only because God is or exists and because he is a Perfect Being, and because all that we possess is derived from him: whence it follows that our ideas or notions, which to the extent of their clearness and distinctness are real, and proceed from God, must to that extent be true. Accordingly, whereas we not infrequently have ideas or notions in which some falsity is contained, this can only be the case with such as are to some extent confused and obscure, and in this proceed from nothing (participate of negation), that is, exist in us thus confused because we are not wholly perfect. And it is evident that it is not less repugnant that falsity or imperfection, in so far as it is imperfection, should proceed from God, than that truth or perfection should proceed from nothing. But if we did not know that all which we possess of real and true proceeds from a Perfect and Infinite Being, however clear and distinct our ideas might be, we should have no ground on that account for the assurance that they possessed the perfection of being true.

But after the knowledge of God and of the soul has rendered us certain of this rule, we can easily understand that the truth of the thoughts we experience when awake, ought not in the slightest degree to be called in question on account of the illusions of our dreams. For if it happened that an individual, even when asleep, had some very distinct idea, as, for example, if a geometer should discover some new demonstration, the circumstance of his being asleep would not militate against its truth; and as for the most ordinary error of our dreams, which consists in their representing to us various objects in the same way as our external senses, this is not prejudicial, since it leads us very properly to suspect the truth of the ideas of sense; for we are not infrequently deceived in the same manner when awake; as when persons in the jaundice see all objects yellow, or when the stars or bodies at a great distance appear to us much smaller than they are. For, in fine, whether awake or asleep, we ought never to allow ourselves to be persuaded of the truth of anything unless on the evidence of our reason. And it must be noted that I say of our reason, and not of our imagination or of our senses: thus, for example, although we very clearly see the sun, we ought not therefore to determine that it is only of the size which our sense of sight presents; and we may very distinctly imagine the head of a lion joined to the body of a goat, without being therefore shut up to the conclusion that a chimaera exists; for it is not a dictate of reason that what we thus see

or imagine is in reality existent; but it plainly tells us that all our ideas or notions contain in them some truth; for otherwise it could not be that God, who is wholly perfect and veracious, should have placed them in us. And because our reasonings are never so clear or so complete during sleep as when we are awake, although sometimes the acts of our imagination are then as lively and distinct, if not more so than in our waking moments, reason further dictates that, since all our thoughts cannot be true because of our partial imperfection, those possessing truth must infallibly be found in the experience of our waking moments rather than in that of our dreams.

PART V

I would here willingly have proceeded to exhibit the whole chain of truths which I deduced from these primary but as with a view to this it would have been necessary now to treat of many questions in dispute among the earned, with whom I do not wish to be embroiled, I believe that it will be better for me to refrain from this exposition, and only mention in general what these truths are, that the more judicious may be able to determine whether a more special account of them would conduce to the public advantage. I have ever remained firm in my original resolution to suppose no other principle than that of which I have recently availed myself in demonstrating the existence of God and of the soul, and to accept as true nothing that did not appear to me more clear and certain than the demonstrations of the geometers had formerly appeared; and yet I venture to state that not only have I found means to satisfy myself in a short time on all the principal difficulties which are usually treated of in philosophy, but I have also observed certain laws established in nature by God in such a manner, and of which he has impressed on our minds such notions, that after we have reflected sufficiently upon these, we cannot doubt that they are accurately observed in all that exists or takes place in the world and farther, by considering the concatenation of these laws, it appears to me that I have discovered many truths more useful and more important than all I had before learned, or even had expected to learn.

But because I have essayed to expound the chief of these discoveries in a treatise which certain considerations prevent me from publishing, I cannot make the results known more conveniently than by here giving a summary of the contents of this treatise. It was my design to comprise in it all that, before I set myself to write it, I thought I knew of the nature of material objects. But like the painters who, finding themselves unable to represent equally well on a plain surface all the different faces of a solid body, select one of the chief, on which alone they make the light fall, and throwing the rest into the shade, allow them to appear only in so far as they can be seen while looking at the principal one; so, fearing lest I should not be able to compense in my discourse all that was in my mind, I resolved to expound singly, though at considerable length, my opinions regarding light; then to take the opportunity of adding something on the sun and the fixed stars, since light almost wholly proceeds from them; on the heavens since they transmit it; on the planets, comets, and earth, since they reflect it; and particularly on all the bodies that are upon the earth, since they are either colored, or transparent, or luminous; and finally on man, since he is the spectator of these objects. Further, to enable me to cast this variety of subjects somewhat into the shade, and to express my judgment regarding them with greater freedom, without being necessitated to adopt or refute the opinions of the learned, I resolved to leave all the people here to their disputes, and to speak only of what would happen in a new world, if God were now to create somewhere in the imaginary spaces matter sufficient to compose one, and were to agitate variously and confusedly the different parts of this matter, so that there resulted a chaos as disordered as the poets ever feigned, and after that did nothing more than lend his ordinary concurrence to nature, and allow her to act in accordance with the laws which he had established. On this supposition, I, in the first place, described this matter, and essayed to represent it in such a manner that to my mind there can be nothing clearer and more intelligible, except what has been recently said regarding God and the soul; for I even expressly supposed that it possessed none of those forms or qualities which are so debated in the schools, nor in general anything the knowledge of which is not so natural to our minds that no one can so much as imagine himself ignorant of it. Besides, I have pointed out what are the laws of nature; and, with no other principle upon which to found my reasonings except the infinite perfection of God, I endeavored to demonstrate all those about which there could be any room for doubt, and to prove that they are such, that even if God had created more worlds, there could have been none in which these laws were not observed. Thereafter, I showed how the greatest part of the matter of this chaos must, in accordance with these laws, dispose and arrange itself in such a way as to present the appearance of heavens; how in the meantime some of its parts must compose an earth and some planets and comets, and others a sun and fixed stars. And, making a digression at this stage on the subject of light, I expounded at considerable length what the nature of that light must be which is found in the sun and the stars, and how thence in an instant of time it traverses the immense spaces of the heavens, and how from the planets and comets it is reflected towards the earth. To this I likewise added much respecting the substance, the situation, the motions, and all the different qualities of these heavens and stars; so that I thought I had said enough respecting them to show that there is nothing observable in the heavens or stars of our system that must not, or at least may not appear precisely alike in those of the system

which I described. I came next to speak of the earth in particular, and to show how, even though I had expressly supposed that God had given no weight to the matter of which it is composed, this should not prevent all its parts from tending exactly to its center; how with water and air on its surface, the disposition of the heavens and heavenly bodies, more especially of the moon, must cause a flow and ebb, like in all its circumstances to that observed in our seas, as also a certain current both of water and air from east to west, such as is likewise observed between the tropics; how the mountains, seas, fountains, and rivers might naturally be formed in it, and the metals produced in the mines, and the plants grow in the fields and in general, how all the bodies which are commonly denominated mixed or composite might be generated and, among other things in the discoveries alluded to inasmuch as besides the stars, I knew nothing except fire which produces light, I spared no pains to set forth all that pertains to its nature,--the manner of its production and support, and to explain how heat is sometimes found without light, and light without heat; to show how it can induce various colors upon different bodies and other diverse qualities; how it reduces some to a liquid state and hardens others; how it can consume almost all bodies, or convert them into ashes and smoke; and finally, how from these ashes, by the mere intensity of its action, it forms glass: for as this transmutation of ashes into glass appeared to me as wonderful as any other in nature, I took a special pleasure in describing it. I was not, however, disposed, from these circumstances, to conclude that this world had been created in the manner I described; for it is much more likely that God made it at the first such as it was to be. But this is certain, and an opinion commonly received among theologians, that the action by which he now sustains it is the same with that by which he originally created it; so that even although he had from the beginning given it no other form than that of chaos, provided only he had established certain laws of nature, and had lent it his concurrence to enable it to act as it is wont to do, it may be believed, without discredit to the miracle of creation, that, in this way alone, things purely material might, in course of time, have become such as we observe them at present; and their nature is much more easily conceived when they are beheld coming in this manner gradually into existence, than when they are only considered as produced at once in a finished and perfect state.

From the description of inanimate bodies and plants, I passed to animals, and particularly to man. But since I had not as yet sufficient knowledge to enable me to treat of these in the same manner as of the rest, that is to say, by deducing effects from their causes, and by showing from what elements and in what manner nature must produce them, I remained satisfied with the supposition that God formed the body of man wholly like to one of ours, as well in the external shape of the members as in the internal conformation of the organs, of the same matter with that I had described, and at first placed in it no rational soul, nor any other principle, in room of the vegetative or sensitive soul, beyond kindling in the heart one of those fires without light, such as I had already described, and which I thought was not different from the heat in hay that has been heaped together before it is dry, or that which causes fermentation in new wines before they are run clear of the fruit. For, when I examined the kind of functions which might, as consequences of this supposition, exist in this body, I found precisely all those which may exist in us independently of all power of thinking, and consequently without being in any measure owing to the soul; in other words, to that part of us which is distinct from the body, and of which it has been said above that the nature distinctively consists in thinking, functions in which the animals void of reason may be said wholly to resemble us; but among which I could not discover any of those that, as dependent on thought alone, belong to us as men, while, on the other hand, I did afterwards discover these as soon as I supposed God to have created a rational soul, and to have annexed it to this body in a particular manner which I described.

But, in order to show how I there handled this matter, I mean here to give the explication of the motion of the heart and arteries, which, as the first and most general motion observed in animals, will afford the means of readily determining what should be thought of all the rest. And that there may be less difficulty in understanding what I am about to say on this subject, I advise those who are not versed in anatomy, before they commence the perusal of these observations, to take the trouble of getting dissected in their presence the heart of some large animal possessed of lungs (for this is throughout sufficiently like the human), and to have shown to them its two ventricles or cavities: in the first place, that in the right side, with which correspond two very ample tubes, viz., the hollow vein (_vena cava_), which is the principal receptacle of the blood, and the trunk of the tree, as it were, of which all the other veins in the body are branches; and the arterial vein (_vena arteriosa_), inappropriately so denominated, since it is in truth only an artery, which, taking its rise in the heart, is divided, after passing out from it, into many branches which presently disperse themselves all over the lungs; in the second place, the cavity in the left side, with which correspond in the same manner two canals in size equal to or larger than the preceding, viz., the venous artery (_arteria venosa_), likewise inappropriately thus designated, because it is simply a vein which comes from the lungs, where it is divided into many branches, interlaced with those of the arterial vein, and those of the tube called the windpipe, through which the air we breathe enters; and the great artery which, issuing from the heart, sends its branches all over the body. I should wish also that such persons were carefully shown the eleven pellicles which, like so many small valves, open and shut the four orifices that are in these two cavities, viz., three at the entrance of the hollow veins where they are disposed in such a manner as by no means to prevent the blood which it contains from flowing into the

right ventricle of the heart, and yet exactly to prevent its flowing out; three at the entrance to the arterial vein, which, arranged in a manner exactly the opposite of the former, readily permit the blood contained in this cavity to pass into the lungs, but hinder that contained in the lungs from returning to this cavity; and, in like manner, two others at the mouth of the venous artery, which allow the blood from the lungs to flow into the left cavity of the heart, but preclude its return; and three at the mouth of the great artery, which suffer the blood to flow from the heart, but prevent its reflux. Nor do we need to seek any other reason for the number of these pellicles beyond this that the orifice of the venous artery being of an oval shape from the nature of its situation, can be adequately closed with two, whereas the others being round are more conveniently closed with three. Besides, I wish such persons to observe that the grand artery and the arterial vein are of much harder and firmer texture than the venous artery and the hollow vein; and that the two last expand before entering the heart, and there form, as it were, two pouches denominated the auricles of the heart, which are composed of a substance similar to that of the heart itself; and that there is always more warmth in the heart than in any other part of the body--and finally, that this heat is capable of causing any drop of blood that passes into the cavities rapidly to expand and dilate, just as all liquors do when allowed to fall drop by drop into a highly heated vessel.

For, after these things, it is not necessary for me to say anything more with a view to explain the motion of the heart, except that when its cavities are not full of blood, into these the blood of necessity flows,--from the hollow vein into the right, and from the venous artery into the left; because these two vessels are always full of blood, and their orifices, which are turned towards the heart, cannot then be closed. But as soon as two drops of blood have thus passed, one into each of the cavities, these drops which cannot but be very large, because the orifices through which they pass are wide, and the vessels from which they come full of blood, are immediately rarefied, and dilated by the heat they meet with. In this way they cause the whole heart to expand, and at the same time press home and shut the five small valves that are at the entrances of the two vessels from which they flow, and thus prevent any more blood from coming down into the heart, and becoming more and more rarefied, they push open the six small valves that are in the orifices of the other two vessels, through which they pass out, causing in this way all the branches of the arterial vein and of the grand artery to expand almost simultaneously with the heart which immediately thereafter begins to contract, as do also the arteries, because the blood that has entered them has cooled, and the six small valves close, and the five of the hollow vein and of the venous artery open anew and allow a passage to other two drops of blood, which cause the heart and the arteries again to expand as before. And, because the blood which thus enters into the heart passes through these two pouches called auricles, it thence happens that their motion is the contrary of that of the heart, and that when it expands they contract. But lest those who are ignorant of the force of mathematical demonstrations and who are not accustomed to distinguish true reasons from mere verisimilitudes, should venture, without examination, to deny what has been said, I wish it to be considered that the motion which I have now explained follows as necessarily from the very arrangement of the parts, which may be observed in the heart by the eye alone, and from the heat which may be felt with the fingers, and from the nature of the blood as learned from experience, as does the motion of a clock from the power, the situation, and shape of its counterweights and wheels.

But if it be asked how it happens that the blood in the veins, flowing in this way continually into the heart, is not exhausted, and why the arteries do not become too full, since all the blood which passes through the heart flows into them, I need only mention in reply what has been written by a physician of England, who has the honor of having broken the ice on this subject, and of having been the first to teach that there are many small passages at the extremities of the arteries, through which the blood received by them from the heart passes into the small branches of the veins, whence it again returns to the heart; so that its course amounts precisely to a perpetual circulation. Of this we have abundant proof in the ordinary experience of surgeons, who, by binding the arm with a tie of moderate straitness above the part where they open the vein, cause the blood to flow more copiously than it would have done without any ligature; whereas quite the contrary would happen were they to bind it below; that is, between the hand and the opening, or were to make the ligature above the opening very tight. For it is manifest that the tie, moderately straightened, while adequate to hinder the blood already in the arm from returning towards the heart by the veins, cannot on that account prevent new blood from coming forward through the arteries, because these are situated below the veins, and their coverings, from their greater consistency, are more difficult to compress; and also that the blood which comes from the heart tends to pass through them to the hand with greater force than it does to return from the hand to the heart through the veins. And since the latter current escapes from the arm by the opening made in one of the veins, there must of necessity be certain passages below the ligature, that is, towards the extremities of the arm through which it can come thither from the arteries. This physician likewise abundantly establishes what he has advanced respecting the motion of the blood, from the existence of certain pellicles, so disposed in various places along the course of the veins, in the manner of small valves, as not to permit the blood to pass from the middle of the body towards the extremities, but only to return from the extremities to the heart; and farther, from experience which shows that all the blood which is in the body may flow out of it in a very short time through a single artery that has been cut, even although this had been closely tied

in the immediate neighborhood of the heart and cut between the heart and the ligature, so as to prevent the supposition that the blood flowing out of it could come from any other quarter than the heart.

But there are many other circumstances which evince that what I have alleged is the true cause of the motion of the blood: thus, in the first place, the difference that is observed between the blood which flows from the veins, and that from the arteries, can only arise from this, that being rarefied, and, as it were, distilled by passing through the heart, it is thinner, and more vivid, and warmer immediately after leaving the heart, in other words, when in the arteries, than it was a short time before passing into either, in other words, when it was in the veins; and if attention be given, it will be found that this difference is very marked only in the neighborhood of the heart; and is not so evident in parts more remote from it. In the next place, the consistency of the coats of which the arterial vein and the great artery are composed, sufficiently shows that the blood is impelled against them with more force than against the veins. And why should the left cavity of the heart and the great artery be wider and larger than the right cavity and the arterial vein, were it not that the blood of the venous artery, having only been in the lungs after it has passed through the heart, is thinner, and rarefies more readily, and in a higher degree, than the blood which proceeds immediately from the hollow vein? And what can physicians conjecture from feeling the pulse unless they know that according as the blood changes its nature it can be rarefied by the warmth of the heart, in a higher or lower degree, and more or less quickly than before? And if it be inquired how this heat is communicated to the other members, must it not be admitted that this is effected by means of the blood, which, passing through the heart, is there heated anew, and thence diffused over all the body? Whence it happens, that if the blood be withdrawn from any part, the heat is likewise withdrawn by the same means; and although the heart were as-hot as glowing iron, it would not be capable of warming the feet and hands as at present, unless it continually sent thither new blood. We likewise perceive from this, that the true use of respiration is to bring sufficient fresh air into the lungs, to cause the blood which flows into them from the right ventricle of the heart, where it has been rarefied and, as it were, changed into vapors, to become thick, and to convert it anew into blood, before it flows into the left cavity, without which process it would be unfit for the nourishment of the fire that is there. This receives confirmation from the circumstance, that it is observed of animals destitute of lungs that they have also but one cavity in the heart, and that in children who cannot use them while in the womb, there is a hole through which the blood flows from the hollow vein into the left cavity of the heart, and a tube through which it passes from the arterial vein into the grand artery without passing through the lung. In the next place, how could digestion be carried on in the stomach unless the heart communicated heat to it through the arteries, and along with this certain of the more fluid parts of the blood, which assist in the dissolution of the food that has been taken in? Is not also the operation which converts the juice of food into blood easily comprehended, when it is considered that it is distilled by passing and repassing through the heart perhaps more than one or two hundred times in a day? And what more need be adduced to explain nutrition, and the production of the different humors of the body, beyond saying, that the force with which the blood, in being rarefied, passes from the heart towards the extremities of the arteries, causes certain of its parts to remain in the members at which they arrive, and there occupy the place of some others expelled by them; and that according to the situation, shape, or smallness of the pores with which they meet, some rather than others flow into certain parts, in the same way that some sieves are observed to act, which, by being variously perforated, serve to separate different species of grain? And, in the last place, what above all is here worthy of observation, is the generation of the animal spirits, which are like a very subtle wind, or rather a very pure and vivid flame which, continually ascending in great abundance from the heart to the brain, thence penetrates through the nerves into the muscles, and gives motion to all the members; so that to account for other parts of the blood which, as most agitated and penetrating, are the fittest to compose these spirits, proceeding towards the brain, it is not necessary to suppose any other cause, than simply, that the arteries which carry them thither proceed from the heart in the most direct lines, and that, according to the rules of mechanics which are the same with those of nature, when many objects tend at once to the same point where there is not sufficient room for all (as is the case with the parts of the blood which flow forth from the left cavity of the heart and tend towards the brain), the weaker and less agitated parts must necessarily be driven aside from that point by the stronger which alone in this way reach it I had expounded all these matters with sufficient minuteness in the treatise which I formerly thought of publishing. And after these, I had shown what must be the fabric of the nerves and muscles of the human body to give the animal spirits contained in it the power to move the members, as when we see heads shortly after they have been struck off still move and bite the earth, although no longer animated; what changes must take place in the brain to produce waking, sleep, and dreams; how light, sounds, odors, tastes, heat, and all the other qualities of external objects impress it with different ideas by means of the senses; how hunger, thirst, and the other internal affections can likewise impress upon it divers ideas; what must be understood by the common sense (_sensus communis_) in which these ideas are received, by the memory which retains them, by the fantasy which can change them in various ways, and out of them compose new ideas, and which, by the same means, distributing the animal spirits through the muscles, can cause the members of such a body to move in as many different ways, and in a manner as suited, whether to the objects that are presented to its senses or to its internal affections, as can take place in our

own case apart from the guidance of the will. Nor will this appear at all strange to those who are acquainted with the variety of movements performed by the different automata, or moving machines fabricated by human industry, and that with help of but few pieces compared with the great multitude of bones, muscles, nerves, arteries, veins, and other parts that are found in the body of each animal. Such persons will look upon this body as a machine made by the hands of God, which is incomparably better arranged, and adequate to movements more admirable than is any machine of human invention. And here I specially stayed to show that, were there such machines exactly resembling organs and outward form an ape or any other irrational animal, we could have no means of knowing that they were in any respect of a different nature from these animals; but if there were machines bearing the image of our bodies, and capable of imitating our actions as far as it is morally possible, there would still remain two most certain tests whereby to know that they were not therefore really men. Of these the first is that they could never use words or other signs arranged in such a manner as is competent to us in order to declare our thoughts to others: for we may easily conceive a machine to be so constructed that it emits vocables, and even that it emits some correspondent to the action upon it of external objects which cause a change in its organs; for example, if touched in a particular place it may demand what we wish to say to it; if in another it may cry out that it is hurt, and such like; but not that it should arrange them variously so as appositely to reply to what is said in its presence, as men of the lowest grade of intellect can do. The second test is, that although such machines might execute many things with equal or perhaps greater perfection than any of us, they would, without doubt, fail in certain others from which it could be discovered that they did not act from knowledge, but solely from the disposition of their organs: for while reason is an universal instrument that is alike available on every occasion, these organs, on the contrary, need a particular arrangement for each particular action; whence it must be morally impossible that there should exist in any machine a diversity of organs sufficient to enable it to act in all the occurrences of life, in the way in which our reason enables us to act. Again, by means of these two tests we may likewise know the difference between men and brutes. For it is highly deserving of remark, that there are no men so dull and stupid, not even idiots, as to be incapable of joining together different words, and thereby constructing a declaration by which to make their thoughts understood; and that on the other hand, there is no other animal, however perfect or happily circumstanced, which can do the like. Nor does this inability arise from want of organs: for we observe that magpies and parrots can utter words like ourselves, and are yet unable to speak as we do, that is, so as to show that they understand what they say; in place of which men born deaf and dumb, and thus not less, but rather more than the brutes, destitute of the organs which others use in speaking, are in the habit of spontaneously inventing certain signs by which they discover their thoughts to those who, being usually in their company, have leisure to learn their language. And this proves not only that the brutes have less reason than man, but that they have none at all: for we see that very little is required to enable a person to speak; and since a certain inequality of capacity is observable among animals of the same species, as well as among men, and since some are more capable of being instructed than others, it is incredible that the most perfect ape or parrot of its species, should not in this be equal to the most stupid infant of its kind or at least to one that was crack-brained, unless the soul of brutes were of a nature wholly different from ours. And we ought not to confound speech with the natural movements which indicate the passions, and can be imitated by machines as well as manifested by animals; nor must it be thought with certain of the ancients, that the brutes speak, although we do not understand their language. For if such were the case, since they are endowed with many organs analogous to ours, they could as easily communicate their thoughts to us as to their fellows. It is also very worthy of remark, that, though there are many animals which manifest more industry than we in certain of their actions, the same animals are yet observed to show none at all in many others: so that the circumstance that they do better than we does not prove that they are endowed with mind, for it would thence follow that they possessed greater reason than any of us, and could surpass us in all things; on the contrary, it rather proves that they are destitute of reason, and that it is nature which acts in them according to the disposition of their organs: thus it is seen, that a clock composed only of wheels and weights can number the hours and measure time more exactly than we with all our skin.

I had after this described the reasonable soul, and shown that it could by no means be educed from the power of matter, as the other things of which I had spoken, but that it must be expressly created; and that it is not sufficient that it be lodged in the human body exactly like a pilot in a ship, unless perhaps to move its members, but that it is necessary for it to be joined and united more closely to the body, in order to have sensations and appetites similar to ours, and thus constitute a real man. I here entered, in conclusion, upon the subject of the soul at considerable length, because it is of the greatest moment: for after the error of those who deny the existence of God, an error which I think I have already sufficiently refuted, there is none that is more powerful in leading feeble minds astray from the straight path of virtue than the supposition that the soul of the brutes is of the same nature with our own; and consequently that after this life we have nothing to hope for or fear, more than flies and ants; in place of which, when we know how far they differ we much better comprehend the reasons which establish that the soul is of a nature wholly independent of the body, and that consequently it is not liable to die with the latter and, finally, because no other causes are observed capable of destroying it, we are naturally led thence to judge that it is immortal.

PART VI

Three years have now elapsed since I finished the treatise containing all these matters; and I was beginning to revise it, with the view to put it into the hands of a printer, when I learned that persons to whom I greatly defer, and whose authority over my actions is hardly less influential than is my own reason over my thoughts, had condemned a certain doctrine in physics, published a short time previously by another individual to which I will not say that I adhered, but only that, previously to their censure I had observed in it nothing which I could imagine to be prejudicial either to religion or to the state, and nothing therefore which would have prevented me from giving expression to it in writing, if reason had persuaded me of its truth; and this led me to fear lest among my own doctrines likewise some one might be found in which I had departed from the truth, notwithstanding the great care I have always taken not to accord belief to new opinions of which I had not the most certain demonstrations, and not to give expression to aught that might tend to the hurt of any one. This has been sufficient to make me alter my purpose of publishing them; for although the reasons by which I had been induced to take this resolution were very strong, yet my inclination, which has always been hostile to writing books, enabled me immediately to discover other considerations sufficient to excuse me for not undertaking the task. And these reasons, on one side and the other, are such, that not only is it in some measure my interest here to state them, but that of the public, perhaps, to know them.

I have never made much account of what has proceeded from my own mind; and so long as I gathered no other advantage from the method I employ beyond satisfying myself on some difficulties belonging to the speculative sciences, or endeavoring to regulate my actions according to the principles it taught me, I never thought myself bound to publish anything respecting it. For in what regards manners, every one is so full of his own wisdom, that there might be found as many reformers as heads, if any were allowed to take upon themselves the task of mending them, except those whom God has constituted the supreme rulers of his people or to whom he has given sufficient grace and zeal to be prophets; and although my speculations greatly pleased myself, I believed that others had theirs, which perhaps pleased them still more. But as soon as I had acquired some general notions respecting physics, and beginning to make trial of them in various particular difficulties, had observed how far they can carry us, and how much they differ from the principles that have been employed up to the present time, I believed that I could not keep them concealed without sinning grievously against the law by which we are bound to promote, as far as in us lies, the general good of mankind. For by them I perceived it to be possible to arrive at knowledge highly useful in life; and in room of the speculative philosophy usually taught in the schools, to discover a practical, by means of which, knowing the force and action of fire, water, air the stars, the heavens, and all the other bodies that surround us, as distinctly as we know the various crafts of our artisans, we might also apply them in the same way to all the uses to which they are adapted, and thus render ourselves the lords and possessors of nature. And this is a result to be desired, not only in order to the invention of an infinity of arts, by which we might be enabled to enjoy without any trouble the fruits of the earth, and all its comforts, but also and especially for the preservation of health, which is without doubt, of all the blessings of this life, the first and fundamental one; for the mind is so intimately dependent upon the condition and relation of the organs of the body, that if any means can ever be found to render men wiser and more ingenious than hitherto, I believe that it is in medicine they must be sought for. It is true that the science of medicine, as it now exists, contains few things whose utility is very remarkable: but without any wish to depreciate it, I am confident that there is no one, even among those whose profession it is, who does not admit that all at present known in it is almost nothing in comparison of what remains to be discovered; and that we could free ourselves from an infinity of maladies of body as well as of mind, and perhaps also even from the debility of age, if we had sufficiently ample knowledge of their causes, and of all the remedies provided for us by nature. But since I designed to employ my whole life in the search after so necessary a science, and since I had fallen in with a path which seems to me such, that if any one follow it he must inevitably reach the end desired, unless he be hindered either by the shortness of life or the want of experiments, I judged that there could be no more effectual provision against these two impediments than if I were faithfully to communicate to the public all the little I might myself have found, and incite men of superior genius to strive to proceed farther, by contributing, each according to his inclination and ability, to the experiments which it would be necessary to make, and also by informing the public of all they might discover, so that, by the last beginning where those before them had left off, and thus connecting the lives and labours of many, we might collectively proceed much farther than each by himself could do.

I remarked, moreover, with respect to experiments, that they become always more necessary the more one is advanced in knowledge; for, at the commencement, it is better to make use only of what is spontaneously presented to our senses, and of which we cannot remain ignorant, provided we bestow on it any reflection, however slight, than to concern ourselves about more uncommon and recondite phenomena: the reason of which is, that the more uncommon often only mislead us so long as the

causes of the more ordinary are still unknown; and the circumstances upon which they depend are almost always so special and minute as to be highly difficult to detect. But in this I have adopted the following order: first, I have essayed to find in general the principles, or first causes of all that is or can be in the world, without taking into consideration for this end anything but God himself who has created it, and without educing them from any other source than from certain germs of truths naturally existing in our minds In the second place, I examined what were the first and most ordinary effects that could be deduced from these causes; and it appears to me that, in this way, I have found heavens, stars, an earth, and even on the earth water, air, fire, minerals, and some other things of this kind, which of all others are the most common and simple, and hence the easiest to know. Afterwards when I wished to descend to the more particular, so many diverse objects presented themselves to me, that I believed it to be impossible for the human mind to distinguish the forms or species of bodies that are upon the earth, from an infinity of others which might have been, if it had pleased God to place them there, or consequently to apply them to our use, unless we rise to causes through their effects, and avail ourselves of many particular experiments. Thereupon, turning over in my mind I the objects that had ever been presented to my senses I freely venture to state that I have never observed any which I could not satisfactorily explain by the principles had discovered. But it is necessary also to confess that the power of nature is so ample and vast, and these principles so simple and general, that I have hardly observed a single particular effect which I cannot at once recognize as capable of being deduced in man different modes from the principles, and that my greatest difficulty usually is to discover in which of these modes the effect is dependent upon them; for out of this difficulty cannot otherwise extricate myself than by again seeking certain experiments, which may be such that their result is not the same, if it is in the one of these modes at we must explain it, as it would be if it were to be explained in the other. As to what remains, I am now in a position to discern, as I think, with sufficient clearness what course must be taken to make the majority those experiments which may conduce to this end: but I perceive likewise that they are such and so numerous, that neither my hands nor my income, though it were a thousand times larger than it is, would be sufficient for them all; so that according as henceforward I shall have the means of making more or fewer experiments, I shall in the same proportion make greater or less progress in the knowledge of nature. This was what I had hoped to make known by the treatise I had written, and so clearly to exhibit the advantage that would thence accrue to the public, as to induce all who have the common good of man at heart, that is, all who are virtuous in truth, and not merely in appearance, or according to opinion, as well to communicate to me the experiments they had already made, as to assist me in those that remain to be made.

But since that time other reasons have occurred to me, by which I have been led to change my opinion, and to think that I ought indeed to go on committing to writing all the results which I deemed of any moment, as soon as I should have tested their truth, and to bestow the same care upon them as I would have done had it been my design to publish them. This course commended itself to me, as well because I thus afforded myself more ample inducement to examine them thoroughly, for doubtless that is always more narrowly scrutinized which we believe will be read by many, than that which is written merely for our private use (and frequently what has seemed to me true when I first conceived it, has appeared false when I have set about committing it to writing), as because I thus lost no opportunity of advancing the interests of the public, as far as in me lay, and since thus likewise, if my writings possess any value, those into whose hands they may fall after my death may be able to put them to what use they deem proper. But I resolved by no means to consent to their publication during my lifetime, lest either the oppositions or the controversies to which they might give rise, or even the reputation, such as it might be, which they would acquire for me, should be any occasion of my losing the time that I had set apart for my own improvement. For though it be true that every one is bound to promote to the extent of his ability the good of others, and that to be useful to no one is really to be worthless, yet it is likewise true that our cares ought to extend beyond the present, and it is good to omit doing what might perhaps bring some profit to the living, when we have in view the accomplishment of other ends that will be of much greater advantage to posterity. And in truth, I am quite willing it should be known that the little I have hitherto learned is almost nothing in comparison with that of which I am ignorant, and to the knowledge of which I do not despair of being able to attain; for it is much the same with those who gradually discover truth in the sciences, as with those who when growing rich find less difficulty in making great acquisitions, than they formerly experienced when poor in making acquisitions of much smaller amount. Or they may be compared to the commanders of armies, whose forces usually increase in proportion to their victories, and who need greater prudence to keep together the residue of their troops after a defeat than after a victory to take towns and provinces. For he truly engages in battle who endeavors to surmount all the difficulties and errors which prevent him from reaching the knowledge of truth, and he is overcome in fight who admits a false opinion touching a matter of any generality and importance, and he requires thereafter much more skill to recover his former position than to make great advances when once in possession of thoroughly ascertained principles. As for myself, if I have succeeded in discovering any truths in the sciences (and I trust that what is contained in this volume I will show that I have found some), I can declare that they are but the consequences and results of five or six principal difficulties which I have surmounted, and my encounters with which I reckoned as battles in which victory declared for me. I will not hesitate even to avow my belief that nothing further is wanting to

enable me fully to realize my designs than to gain two or three similar victories; and that I am not so far advanced in years but that, according to the ordinary course of nature, I may still have sufficient leisure for this end. But I conceive myself the more bound to husband the time that remains the greater my expectation of being able to employ it aright, and I should doubtless have much to rob me of it, were I to publish the principles of my physics: for although they are almost all so evident that to assent to them no more is needed than simply to understand them, and although there is not one of them of which I do not expect to be able to give demonstration, yet, as it is impossible that they can be in accordance with all the diverse opinions of others, I foresee that I should frequently be turned aside from my grand design, on occasion of the opposition which they would be sure to awaken.

It may be said, that these oppositions would be useful both in making me aware of my errors, and, if my speculations contain anything of value, in bringing others to a fuller understanding of it; and still farther, as many can see better than one, in leading others who are now beginning to avail themselves of my principles, to assist me in turn with their discoveries. But though I recognize my extreme liability to error, and scarce ever trust to the first thoughts which occur to me, yet-the experience I have had of possible objections to my views prevents me from anticipating any profit from them. For I have already had frequent proof of the judgments, as well of those I esteemed friends, as of some others to whom I thought I was an object of indifference, and even of some whose malignancy and envy would, I knew, determine them to endeavor to discover what partiality concealed from the eyes of my friends. But it has rarely happened that anything has been objected to me which I had myself altogether overlooked, unless it were something far removed from the subject: so that I have never met with a single critic of my opinions who did not appear to me either less rigorous or less equitable than myself. And further, I have never observed that any truth before unknown has been brought to light by the disputations that are practised in the schools; for while each strives for the victory, each is much more occupied in making the best of mere verisimilitude, than in weighing the reasons on both sides of the question; and those who have been long good advocates are not afterwards on that account the better judges.

As for the advantage that others would derive from the communication of my thoughts, it could not be very great; because I have not yet so far prosecuted them as that much does not remain to be added before they can be applied to practice. And I think I may say without vanity, that if there is any one who can carry them out that length, it must be myself rather than another: not that there may not be in the world many minds incomparably superior to mine, but because one cannot so well seize a thing and make it one’s own, when it has been learned from another, as when one has himself discovered it. And so true is this of the present subject that, though I have often explained some of my opinions to persons of much acuteness, who, whilst I was speaking, appeared to understand them very distinctly, yet, when they repeated them, I have observed that they almost always changed them to such an extent that I could no longer acknowledge them as mine. I am glad, by the way, to take this opportunity of requesting posterity never to believe on hearsay that anything has proceeded from me which has not been published by myself; and I am not at all astonished at the extravagances attributed to those ancient philosophers whose own writings we do not possess; whose thoughts, however, I do not on that account suppose to have been really absurd, seeing they were among the ablest men of their times, but only that these have been falsely represented to us. It is observable, accordingly, that scarcely in a single instance has any one of their disciples surpassed them; and I am quite sure that the most devoted of the present followers of Aristotle would think themselves happy if they had as much knowledge of nature as he possessed, were it even under the condition that they should never afterwards attain to higher. In this respect they are like the ivy which never strives to rise above the tree that sustains it, and which frequently even returns downwards when it has reached the top; for it seems to me that they also sink, in other words, render themselves less wise than they would be if they gave up study, who, not contented with knowing all that is intelligibly explained in their author, desire in addition to find in him the solution of many difficulties of which he says not a word, and never perhaps so much as thought. Their fashion of philosophizing, however, is well suited to persons whose abilities fall below mediocrity; for the obscurity of the distinctions and principles of which they make use enables them to speak of all things with as much confidence as if they really knew them, and to defend all that they say on any subject against the most subtle and skillful, without its being possible for any one to convict them of error. In this they seem to me to be like a blind man, who, in order to fight on equal terms with a person that sees, should have made him descend to the bottom of an intensely dark cave: and I may say that such persons have an interest in my refraining from publishing the principles of the philosophy of which I make use; for, since these are of a kind the simplest and most evident, I should, by publishing them, do much the same as if I were to throw open the windows, and allow the light of day to enter the cave into which the combatants had descended. But even superior men have no reason for any great anxiety to know these principles, for if what they desire is to be able to speak of all things, and to acquire a reputation for learning, they will gain their end more easily by remaining satisfied with the appearance of truth, which can be found without much difficulty in all sorts of matters, than by seeking the truth itself which unfolds itself but slowly and that only in some departments, while it obliges us, when we have to speak of others, freely to confess our ignorance. If, however, they prefer the knowledge of some few

truths to the vanity of appearing ignorant of none, as such knowledge is undoubtedly much to be preferred, and, if they choose to follow a course similar to mine, they do not require for this that I should say anything more than I have already said in this discourse. For if they are capable of making greater advancement than I have made, they will much more be able of themselves to discover all that I believe myself to have found; since as I have never examined aught except in order, it is certain that what yet remains to be discovered is in itself more difficult and recondite, than that which I have already been enabled to find, and the gratification would be much less in learning it from me than in discovering it for themselves. Besides this, the habit which they will acquire, by seeking first what is easy, and then passing onward slowly and step by step to the more difficult, will benefit them more than all my instructions. Thus, in my own case, I am persuaded that if I had been taught from my youth all the truths of which I have since sought out demonstrations, and had thus learned them without labour, I should never, perhaps, have known any beyond these; at least, I should never have acquired the habit and the facility which I think I possess in always discovering new truths in proportion as I give myself to the search. And, in a single word, if there is any work in the world which cannot be so well finished by another as by him who has commenced it, it is that at which I labour.

It is true, indeed, as regards the experiments which may conduce to this end, that one man is not equal to the task of making them all; but yet he can advantageously avail himself, in this work, of no hands besides his own, unless those of artisans, or parties of the same kind, whom he could pay, and whom the hope of gain (a means of great efficacy) might stimulate to accuracy in the performance of what was prescribed to them. For as to those who, through curiosity or a desire of learning, of their own accord, perhaps, offer him their services, besides that in general their promises exceed their performance, and that they sketch out fine designs of which not one is ever realized, they will, without doubt, expect to be compensated for their trouble by the explication of some difficulties, or, at least, by compliments and useless speeches, in which he cannot spend any portion of his time without loss to himself. And as for the experiments that others have already made, even although these parties should be willing of themselves to communicate them to him (which is what those who esteem them secrets will never do), the experiments are, for the most part, accompanied with so many circumstances and superfluous elements, as to make it exceedingly difficult to disentangle the truth from its adjuncts--besides, he will find almost all of them so ill described, or even so false (because those who made them have wished to see in them only such facts as they deemed conformable to their principles), that, if in the entire number there should be some of a nature suited to his purpose, still their value could not compensate for the time what would be necessary to make the selection. So that if there existed any one whom we assuredly knew to be capable of making discoveries of the highest kind, and of the greatest possible utility to the public; and if all other men were therefore eager by all means to assist him in successfully prosecuting his designs, I do not see that they could do aught else for him beyond contributing to defray the expenses of the experiments that might be necessary; and for the rest, prevent his being deprived of his leisure by the unseasonable interruptions of any one. But besides that I neither have so high an opinion of myself as to be willing to make promise of anything extraordinary, nor feed on imaginations so vain as to fancy that the public must be much interested in my designs; I do not, on the other hand, own a soul so mean as to be capable of accepting from any one a favor of which it could be supposed that I was unworthy.

These considerations taken together were the reason why, for the last three years, I have been unwilling to publish the treatise I had on hand, and why I even resolved to give publicity during my life to no other that was so general, or by which the principles of my physics might be understood. But since then, two other reasons have come into operation that have determined me here to subjoin some particular specimens, and give the public some account of my doings and designs. Of these considerations, the first is, that if I failed to do so, many who were cognizant of my previous intention to publish some writings, might have imagined that the reasons which induced me to refrain from so doing, were less to my credit than they really are; for although I am not immoderately desirous of glory, or even, if I may venture so to say, although I am averse from it in so far as I deem it hostile to repose which I hold in greater account than aught else, yet, at the same time, I have never sought to conceal my actions as if they were crimes, nor made use of many precautions that I might remain unknown; and this partly because I should have thought such a course of conduct a wrong against myself, and partly because it would have occasioned me some sort of uneasiness which would again have been contrary to the perfect mental tranquillity which I court. And forasmuch as, while thus indifferent to the thought alike of fame or of forgetfulness, I have yet been unable to prevent myself from acquiring some sort of reputation, I have thought it incumbent on me to do my best to save myself at least from being ill-spoken of. The other reason that has determined me to commit to writing these specimens of philosophy is, that I am becoming daily more and more alive to the delay which my design of self-instruction suffers, for want of the infinity of experiments I require, and which it is impossible for me to make without the assistance of others: and, without flattering myself so much as to expect the public to take a large share in my interests, I am yet unwilling to be found so far wanting in the duty I owe to myself, as to give occasion to those who shall survive me to make it matter of reproach against me some day, that I might have left them many things in a much more perfect state than I have done, had I not too much neglected to

make them aware of the ways in which they could have promoted the accomplishment of my designs.

And I thought that it was easy for me to select some matters which should neither be obnoxious to much controversy, nor should compel me to expound more of my principles than I desired, and which should yet be sufficient clearly to exhibit what I can or cannot accomplish in the sciences. Whether or not I have succeeded in this it is not for me to say; and I do not wish to forestall the judgments of others by speaking myself of my writings; but it will gratify me if they be examined, and, to afford the greater inducement to this I request all who may have any objections to make to them, to take the trouble of forwarding these to my publisher, who will give me notice of them, that I may endeavor to subjoin at the same time my reply; and in this way readers seeing both at once will more easily determine where the truth lies; for I do not engage in any case to make prolix replies, but only with perfect frankness to avow my errors if I am convinced of them, or if I cannot perceive them, simply to state what I think is required for defense of the matters I have written, adding thereto no explication of any new matte that it may not be necessary to pass without end from one thing to another.

If some of the matters of which I have spoken in the beginning of the “Dioptrics” and “Meteorics” should offend at first sight, because I call them hypotheses and seem indifferent about giving proof of them, I request a patient and attentive reading of the whole, from which I hope those hesitating will derive satisfaction; for it appears to me that the reasonings are so mutually connected in these treatises, that, as the last are demonstrated by the first which are their causes, the first are in their turn demonstrated by the last which are their effects. Nor must it be imagined that I here commit the fallacy which the logicians call a circle; for since experience renders the majority of these effects most certain, the causes from which I deduce them do not serve so much to establish their reality as to explain their existence; but on the contrary, the reality of the causes is established by the reality of the effects. Nor have I called them hypotheses with any other end in view except that it may be known that I think I am able to deduce them from those first truths which I have already expounded; and yet that I have expressly determined not to do so, to prevent a certain class of minds from thence taking occasion to build some extravagant philosophy upon what they may take to be my principles, and my being blamed for it. I refer to those who imagine that they can master in a day all that another has taken twenty years to think out, as soon as he has spoken two or three words to them on the subject; or who are the more liable to error and the less capable of perceiving truth in very proportion as they are more subtle and lively. As to the opinions which are truly and wholly mine, I offer no apology for them as new,--persuaded as I am that if their reasons be well considered they will be found to be so simple and so conformed, to common sense as to appear less extraordinary and less paradoxical than any others which can be held on the same subjects; nor do I even boast of being the earliest discoverer of any of them, but only of having adopted them, neither because they had nor because they had not been held by others, but solely because reason has convinced me of their truth.

Though artisans may not be able at once to execute the invention which is explained in the “Dioptrics,” I do not think that any one on that account is entitled to condemn it; for since address and practice are required in order so to make and adjust the machines described by me as not to overlook the smallest particular, I should not be less astonished if they succeeded on the first attempt than if a person were in one day to become an accomplished performer on the guitar, by merely having excellent sheets of music set up before him. And if I write in French, which is the language of my country, in preference to Latin, which is that of my preceptors, it is because I expect that those who make use of their unprejudiced natural reason will be better judges of my opinions than those who give heed to the writings of the ancients only; and as for those who unite good sense with habits of study, whom alone I desire for judges, they will not, I feel assured, be so partial to Latin as to refuse to listen to my reasonings merely because I expound them in the vulgar tongue.

In conclusion, I am unwilling here to say anything very specific of the progress which I expect to make for the future in the sciences, or to bind myself to the public by any promise which I am not certain of being able to fulfill; but this only will I say, that I have resolved to devote what time I may still have to live to no other occupation than that of endeavoring to acquire some knowledge of Nature, which shall be of such a kind as to enable us therefrom to deduce rules in medicine of greater certainty than those at present in use; and that my inclination is so much opposed to all other pursuits, especially to such as cannot be useful to some without being hurtful to others, that if, by any circumstances, I had been constrained to engage in such, I do not believe that I should have been able to succeed. Of this I here make a public declaration, though well aware that it cannot serve to procure for me any consideration in the world, which, however, I do not in the least affect; and I shall always hold myself more obliged to those through whose favor I am permitted to enjoy my retirement without interruption than to any who might offer me the highest earthly preferments.

My Escape from Slavery Reconstruction

Douglass, Frederick. “My Escape from Slavery.” The Century Illustrated Magazine 23, n.s. 1 (Nov. 1881): 125-131.

My Escape from Slavery

In the first narrative of my experience in slavery, written nearly forty years ago, and in various writings since, I have given the public what I considered very good reasons for withholding the manner of my escape. In substance these reasons were, first, that such publication at any time during the existence of slavery might be used by the master against the slave, and prevent the future escape of any who might adopt the same means that I did. The second reason was, if possible, still more binding to silence: the publication of details would certainly have put in peril the persons and property of those who assisted. Murder itself was not more sternly and certainly punished in the State of Maryland than that of aiding and abetting the escape of a slave. Many colored men, for no other crime than that of giving aid to a fugitive slave, have, like Charles T. Torrey, perished in prison. The abolition of slavery in my native State and throughout the country, and the lapse of time, render the caution hitherto observed no longer necessary. But even since the abolition of slavery, I have sometimes thought it well enough to baffle curiosity by saying that while slavery existed there were good reasons for not telling the manner of my escape, and since slavery had ceased to exist, there was no reason for telling it. I shall now, however, cease to avail myself of this formula, and, as far as I can, endeavor to satisfy this very natural curiosity. I should, perhaps, have yielded to that feeling sooner, had there been anything very heroic or thrilling in the incidents connected with my escape, for I am sorry to say I have nothing of that sort to tell; and yet the courage that could risk betrayal and the bravery which was ready to encounter death, if need be, in pursuit of freedom, were essential features in the undertaking. My success was due to address rather than courage, to good luck rather than bravery. My means of escape were provided for me by the very men who were making laws to hold and bind me more securely in slavery.

It was the custom in the State of Maryland to require the free colored people to have what were called free papers. These instruments they were required to renew very often, and by charging a fee for this writing, considerable sums from time to time were collected by the State. In these papers the name, age, color, height, and form of the freeman were described, together with any scars or other marks upon his person which could assist in his identification. This device in some measure defeated itself—since more than one man could be found to answer the same general description. Hence many slaves could escape by personating the owner of one set of papers; and this was often done as follows: A slave, nearly or sufficiently answering the description set forth in the papers, would borrow or hire them till by means of them he could escape to a free State, and then, by mail or otherwise, would return them to the owner. The operation was a hazardous one for the lender as well as for the borrower. A failure on the part of the fugitive to send back the papers would imperil his benefactor, and the discovery of the papers in possession of the wrong man would imperil both the fugitive and his friend. It was, therefore, an act of supreme trust on the part of a freeman of color thus to put in jeopardy his own liberty that another might be free. It was, however, not unfrequently bravely done, and was seldom discovered. I was not so fortunate as to resemble any of my free acquaintances sufficiently to answer the description of their papers. But I had a friend—a sailor—who owned a sailor’s protection, which answered somewhat the purpose of free papers—describing his person, and certifying to the fact that he was a free American sailor. The instrument had at its head the American eagle, which gave it the appearance at once of an authorized document. This protection, when in my hands, did not describe its bearer very accurately. Indeed, it called for a man much darker than myself, and close examination of it would have caused my arrest at the start.

In order to avoid this fatal scrutiny on the part of railroad officials, I arranged with Isaac Rolls, a Baltimore hackman, to bring my baggage to the Philadelphia train just on the moment of starting, and jumped upon the car myself when the train was in motion. Had I gone into the station and offered to purchase a ticket, I should have been instantly and carefully examined, and undoubtedly arrested. In choosing this plan I considered the jostle of the train, and the natural haste of the conductor, in a train crowded with passengers, and relied upon my skill and address in playing the sailor, as described in my protection, to do the rest. One element in my favor was the kind feeling which prevailed in Baltimore and other sea-ports at the time, toward “those who go down to the sea in ships.” “Free trade and sailors’ rights” just then expressed the sentiment of the country. In my clothing I was rigged out in sailor style. I had on a red shirt and a tarpaulin hat, and a black cravat tied in sailor fashion carelessly and loosely about my neck. My knowledge of ships and sailor’s talk came much to my assistance, for I knew a ship from stem to stern, and from keelson to cross-trees, and could talk sailor like an “old salt.” I was well on the way to Havre de Grace before the conductor came into the negro car to collect tickets and examine the papers of his black passengers. This was a critical moment in the drama. My whole future depended upon the decision of this conductor. Agitated though I was while this ceremony was proceeding, still, externally, at least, I was apparently calm and self-possessed. He went on with his duty—examining several colored passengers before reaching me. He was somewhat harsh in tome and peremptory in manner until he reached me, when, strange enough, and to my surprise and relief, his whole manner changed. Seeing that I did not readily produce my free papers, as the other colored persons in the car had done, he said to me, in friendly contrast with his bearing toward the others:

“I suppose you have your free papers?”

To which I answered:

“No sir; I never carry my free papers to sea with me.”

“But you have something to show that you are a freeman, haven’t you?”

“Yes, sir,” I answered; “I have a paper with the American Eagle on it, and that will carry me around the world.”

With this I drew from my deep sailor’s pocket my seaman’s protection, as before described. The merest glance at the paper satisfied him, and he took my fare and went on about his business. This moment of time was one of the most anxious I ever experienced. Had the conductor looked closely at the paper, he could not have failed to discover that it called for a very different-looking person from myself, and in that case it would have been his duty to arrest me on the instant, and send me back to Baltimore from the first station. When he left me with the assurance that I was all right, though much relieved, I realized that I was still in great danger: I was still in Maryland, and subject to arrest at any moment. I saw on the train several persons who would have known me in any other clothes, and I feared they might recognize me, even in my sailor “rig,” and report me to the conductor, who would then subject me to a closer examination, which I knew well would be fatal to me.

Though I was not a murderer fleeing from justice, I felt perhaps quite as miserable as such a criminal. The train was moving at a very high rate of speed for that epoch of railroad travel, but to my anxious mind it was moving far too slowly. Minutes were hours, and hours were days during this part of my flight. After Maryland, I was to pass through Delaware—another slave State, where slave-catchers generally awaited their prey, for it was not in the interior of the State, but on its borders, that these human hounds were most vigilant and active. The border lines between slavery and freedom were the dangerous ones for the fugitives. The heart of no fox or deer, with hungry hounds on his trail in full chase, could have beaten more anxiously or noisily than did mine from the time I left Baltimore till I reached Philadelphia. The passage of the Susquehanna River at Havre de Grace was at that time made by ferry-boat, on board of which I met a young colored man by the name of Nichols, who came very near betraying me. He was a “hand” on the boat, but, instead of minding his business, he insisted upon knowing me, and asking me dangerous questions as to where I was going, when I was coming back, etc. I got away from my old and inconvenient acquaintance as soon as I could decently do so, and went to another part of the boat. Once across the river, I encountered a new danger. Only a few days before, I had been at work on a revenue cutter, in Mr. Price’s ship-yard in Baltimore, under the care of Captain McGowan. On the meeting at this point of the two trains, the one going south stopped on the track just opposite to the one going north, and it so happened that this Captain McGowan sat at a window where he could see me very distinctly, and would certainly have recognized me had he looked at me but for a second. Fortunately, in the hurry of the moment, he did not see me; and the trains soon passed each other on their respective ways. But this was not my only hair-breadth escape. A German blacksmith whom I knew well was on the train with me, and looked at me very intently, as if he thought he had seen me somewhere before in his travels. I really believe he knew me, but had no heart to betray me. At any rate, he saw me escaping and held his peace.

The last point of imminent danger, and the one I dreaded most, was Wilmington. Here we left the train and took the steam-boat for Philadelphia. In making the change here I again apprehended arrest, but no one disturbed me, and I was soon on the broad and beautiful Delaware, speeding away to the Quaker City. On reaching Philadelphia in the afternoon, I inquired of a colored man how I could get on to New York. He directed me to the William-street depot, and thither I went, taking the train that night. I reached New York Tuesday morning, having completed the journey in less than twenty-four hours.

My free life began on the third of September, 1838. On the morning of the fourth of that month, after an anxious and most perilous but safe journey, I found myself in the big city of New York, a _free man_—one more added to the mighty throng which, like the confused waves of the troubled sea, surged to and fro between the lofty walls of Broadway. Though dazzled with the wonders which met me on every hand, my thoughts could not be much withdrawn from my strange situation. For the moment, the dreams of my youth and the hopes of my manhood were completely fulfilled. The bonds that had held me to “old master” were broken. No man now had a right to call me his slave or assert mastery over me. I was in the rough and tumble of an outdoor world, to take my chance with the rest of its busy number. I have often been asked how I felt when first I found myself on free soil. There is scarcely anything in my experience about which I could not give a more satisfactory answer. A new world had opened upon me. If life is more than breath and the “quick round of blood,” I lived more in that one day than in a year of my slave life. It was a time of joyous excitement which words can but tamely describe. In a letter written to a friend soon after reaching New York, I said: “I felt as one might feel upon escape from a den of hungry lions.” Anguish and grief, like darkness and rain, may be depicted; but gladness and joy, like the rainbow, defy the skill of pen or pencil. During ten or fifteen years I had been, as it were, dragging a heavy chain which no strength of mine could break; I was not only a slave, but a slave for life. I might become a husband, a father, an aged man, but through all, from birth to death, from the cradle to the grave, I had felt myself doomed. All efforts I had previously made to secure my freedom had not only failed, but had seemed only to rivet my fetters the more firmly, and to render my escape more difficult. Baffled, entangled, and discouraged, I had at times asked myself the question, May not my condition after all be God’s work, and ordered for a wise purpose, and if so, Is not submission my duty? A contest had in fact been going on in my mind for a long time, between the clear consciousness of right and the plausible make-shifts of theology and superstition. The one held me an abject slave—a prisoner for life, punished for some transgression in which I had no lot nor part; and the other counseled me to manly endeavor to secure my freedom. This contest was now ended; my chains were broken, and the victory brought me unspeakable joy.

But my gladness was short-lived, for I was not yet out of the reach and power of the slave-holders. I soon found that New York was not quite so free or so safe a refuge as I had supposed, and a sense of loneliness and insecurity again oppressed me most sadly. I chanced to meet on the street, a few hours after my landing, a fugitive slave whom I had once known well in slavery. The information received from him alarmed me. The fugitive in question was known in Baltimore as “Allender’s Jake,” but in New York he wore the more respectable name of “William Dixon.” Jake, in law, was the property of Doctor Allender, and Tolly Allender, the son of the doctor, had once made an effort to recapture _Mr. Dixon_, but had failed for want of evidence to support his claim. Jake told me the circumstances of this attempt, and how narrowly he escaped being sent back to slavery and torture. He told me that New York was then full of Southerners returning from the Northern watering-places; that the colored people of New York were not to be trusted; that there were hired men of my own color who would betray me for a few dollars; that there were hired men ever on the lookout for fugitives; that I must trust no man with my secret; that I must not think of going either upon the wharves or into any colored boarding-house, for all such places were closely watched; that he was himself unable to help me; and, in fact, he seemed while speaking to me to fear lest I myself might be a spy and a betrayer. Under this apprehension, as I suppose, he showed signs of wishing to be rid of me, and with whitewash brush in hand, in search of work, he soon disappeared.

This picture, given by poor “Jake,” of New York, was a damper to my enthusiasm. My little store of money would soon be exhausted, and since it would be unsafe for me to go on the wharves for work, and I had no introductions elsewhere, the prospect for me was far from cheerful. I saw the wisdom of keeping away from the ship-yards, for, if pursued, as I felt certain I should be, Mr. Auld, my “master,” would naturally seek me there among the calkers. Every door seemed closed against me. I was in the midst of an ocean of my fellow-men, and yet a perfect stranger to every one. I was without home, without acquaintance, without money, without credit, without work, and without any definite knowledge as to what course to take, or where to look for succor. In such an extremity, a man had something besides his new-born freedom to think of. While wandering about the streets of New York, and lodging at least one night among the barrels on one of the wharves, I was indeed free—from slavery, but free from food and shelter as well. I kept my secret to myself as long as I could, but I was compelled at last to seek some one who would befriend me without taking advantage of my destitution to betray me. Such a person I found in a sailor named Stuart, a warm-hearted and generous fellow, who, from his humble home on Centre street, saw me standing on the opposite sidewalk, near the Tombs prison. As he

approached me, I ventured a remark to him which at once enlisted his interest in me. He took me to his home to spend the night, and in the morning went with me to Mr. David Ruggles, the secretary of the New York Vigilance Committee, a co-worker with Isaac T. Hopper, Lewis and Arthur Tappan, Theodore S. Wright, Samuel Cornish, Thomas Downing, Philip A. Bell, and other true men of their time. All these (save Mr. Bell, who still lives, and is editor and publisher of a paper called the “Elevator,” in San Francisco) have finished their work on earth. Once in the hands of these brave and wise men, I felt comparatively safe. With Mr. Ruggles, on the corner of Lispenard and Church streets, I was hidden several days, during which time my intended wife came on from Baltimore at my call, to share the burdens of life with me. She was a free woman, and came at once on getting the good news of my safety. We were married by Rev. J. W. C. Pennington, then a well-known and respected Presbyterian minister. I had no money with which to pay the marriage fee, but he seemed well pleased with our thanks.

Mr. Ruggles was the first officer on the “Underground Railroad” whom I met after coming North, and was, indeed, the only one with whom I had anything to do till I became such an officer myself. Learning that my trade was that of a calker, he promptly decided that the best place for me was in New Bedford, Mass. He told me that many ships for whaling voyages were fitted out there, and that I might there find work at my trade and make a good living. So, on the day of the marriage ceremony, we took our little luggage to the steamer _John W. Richmond_, which, at that time, was one of the line running between New York and Newport, R. I. Forty-three years ago colored travelers were not permitted in the cabin, nor allowed abaft the paddle-wheels of a steam vessel. They were compelled, whatever the weather might be,—whether cold or hot, wet or dry,—to spend the night on deck. Unjust as this regulation was, it did not trouble us much; we had fared much harder before. We arrived at Newport the next morning, and soon after an old fashioned stage-coach, with “New Bedford” in large yellow letters on its sides, came down to the wharf. I had not money enough to pay our fare, and stood hesitating what to do. Fortunately for us, there were two Quaker gentlemen who were about to take passage on the stage,—Friends William C. Taber and Joseph Ricketson,—who at once discerned our true situation, and, in a peculiarly quiet way, addressing me, Mr. Taber said: “Thee get in.” I never obeyed an order with more alacrity, and we were soon on our way to our new home. When we reached “Stone Bridge” the passengers alighted for breakfast, and paid their fares to the driver. We took no breakfast, and, when asked for our fares, I told the driver I would make it right with him when we reached New Bedford. I expected some objection to this on his part, but he made none. When, however, we reached New Bedford, he took our baggage, including three music-books,—two of them collections by Dyer, and one by Shaw,—and held them until I was able to redeem them by paying to him the amount due for our rides. This was soon done, for Mr. Nathan Johnson not only received me kindly and hospitably, but, on being informed about our baggage, at once loaned me the two dollars with which to square accounts with the stage-driver. Mr. and Mrs. Nathan Johnson reached a good old age, and now rest from their labors. I am under many grateful obligations to them. They not only “took me in when a stranger” and “fed me when hungry,” but taught me how to make an honest living. Thus, in a fortnight after my flight from Maryland, I was safe in New Bedford, a citizen of the grand old commonwealth of Massachusetts.

Once initiated into my new life of freedom and assured by Mr. Johnson that I need not fear recapture in that city, a comparatively unimportant question arose as to the name by which I should be known thereafter in my new relation as a free man. The name given me by my dear mother was no less pretentious and long than Frederick Augustus Washington Bailey. I had, however, while living in Maryland, dispensed with the Augustus Washington, and retained only Frederick Bailey. Between Baltimore and New Bedford, the better to conceal myself from the slave-hunters, I had parted with Bailey and called myself Johnson; but in New Bedford I found that the Johnson family was already so numerous as to cause some confusion in distinguishing them, hence a change in this name seemed desirable. Nathan Johnson, mine host, placed great emphasis upon this necessity, and wished me to allow him to select a name for me. I consented, and he called me by my present name—the one by which I have been known for three and forty years—Frederick Douglass. Mr. Johnson had just been reading the “Lady of the Lake,” and so pleased was he with its great character that he wished me to bear his name. Since reading that charming poem myself, I have often thought that, considering the noble hospitality and manly character of Nathan Johnson—black man though he was—he, far more than I, illustrated the virtues of the Douglas of Scotland. Sure am I that, if any slave-catcher had entered his domicile with a view to my recapture, Johnson would have shown himself like him of the “stalwart hand.”

The reader may be surprised at the impressions I had in some way conceived of the social and material condition of the people at the North. I had no proper idea of the wealth, refinement, enterprise, and high civilization of this section of the country. My “Columbian Orator,” almost my only book, had done nothing to enlighten me concerning Northern society. I had been taught that slavery was the bottom fact of all wealth. With this foundation idea, I came naturally to the conclusion that poverty must be the general condition of the people of the free States. In the country from which I came, a white man holding no slaves was usually an ignorant and poverty-stricken man, and men of this class were contemptuously called “poor white trash.” Hence I supposed that,

since the non-slave-holders at the South were ignorant, poor, and degraded as a class, the non-slave-holders at the North must be in a similar condition. I could have landed in no part of the United States where I should have found a more striking and gratifying contrast, not only to life generally in the South, but in the condition of the colored people there, than in New Bedford. I was amazed when Mr. Johnson told me that there was nothing in the laws or constitution of Massachusetts that would prevent a colored man from being governor of the State, if the people should see fit to elect him. There, too, the black man's children attended the public schools with the white man's children, and apparently without objection from any quarter. To impress me with my security from recapture and return to slavery, Mr. Johnson assured me that no slave-holder could take a slave out of New Bedford; that there were men there who would lay down their lives to save me from such a fate.

The fifth day after my arrival, I put on the clothes of a common laborer, and went upon the wharves in search of work. On my way down Union street I saw a large pile of coal in front of the house of Rev. Ephraim Peabody, the Unitarian minister. I went to the kitchen door and asked the privilege of bringing in and putting away this coal. "What will you charge?" said the lady. "I will leave that to you, madam." "You may put it away," she said. I was not long in accomplishing the job, when the dear lady put into my hand _two silver half-dollars_. To understand the emotion which swelled my heart as I clasped this money, realizing that I had no master who could take it from me,—_that it was mine—that my hands were my own_, and could earn more of the precious coin,—one must have been in some sense himself a slave. My next job was stowing a sloop at Uncle Gid. Howland's wharf with a cargo of oil for New York. I was not only a freeman, but a free working-man, and no "master" stood ready at the end of the week to seize my hard earnings.

The season was growing late and work was plenty. Ships were being fitted out for whaling, and much wood was used in storing them. The sawing this wood was considered a good job. With the help of old Friend Johnson (blessings on his memory) I got a saw and "buck," and went at it. When I went into a store to buy a cord with which to brace up my saw in the frame, I asked for a "fip's" worth of cord. The man behind the counter looked rather sharply at me, and said with equal sharpness, "You don't belong about here." I was alarmed, and thought I had betrayed myself. A fip in Maryland was six and a quarter cents, called fourpence in Massachusetts. But no harm came from the "fi'penny-bit" blunder, and I confidently and cheerfully went to work with my saw and buck. It was new business to me, but I never did better work, or more of it, in the same space of time on the plantation for Covey, the negro-breaker, than I did for myself in these earliest years of my freedom.

Notwithstanding the just and humane sentiment of New Bedford three and forty years ago, the place was not entirely free from race and color prejudice. The good influence of the Roaches, Rodmans, Arnolds, Grinnells, and Robesons did not pervade all classes of its people. The test of the real civilization of the community came when I applied for work at my trade, and then my repulse was emphatic and decisive. It so happened that Mr. Rodney French, a wealthy and enterprising citizen, distinguished as an anti-slavery man, was fitting out a vessel for a whaling voyage, upon which there was a heavy job of calking and coppering to be done. I had some skill in both branches, and applied to Mr. French for work. He, generous man that he was, told me he would employ me, and I might go at once to the vessel. I obeyed him, but upon reaching the float-stage, where others [sic] calkers were at work, I was told that every white man would leave the ship, in her unfinished condition, if I struck a blow at my trade upon her. This uncivil, inhuman, and selfish treatment was not so shocking and scandalous in my eyes at the time as it now appears to me. Slavery had inured me to hardships that made ordinary trouble sit lightly upon me. Could I have worked at my trade I could have earned two dollars a day, but as a common laborer I received but one dollar. The difference was of great importance to me, but if I could not get two dollars, I was glad to get one; and so I went to work for Mr. French as a common laborer. The consciousness that I was free—no longer a slave—kept me cheerful under this, and many similar proscriptions, which I was destined to meet in New Bedford and elsewhere on the free soil of Massachusetts. For instance, though colored children attended the schools, and were treated kindly by their teachers, the New Bedford Lyceum refused, till several years after my residence in that city, to allow any colored person to attend the lectures delivered in its hall. Not until such men as Charles Sumner, Theodore Parker, Ralph Waldo Emerson, and Horace Mann refused to lecture in their course while there was such a restriction, was it abandoned.

Becoming satisfied that I could not rely on my trade in New Bedford to give me a living, I prepared myself to do any kind of work that came to hand. I sawed wood, shoveled coal, dug cellars, moved rubbish from back yards, worked on the wharves, loaded and unloaded vessels, and scoured their cabins.

I afterward got steady work at the brass-foundry owned by Mr. Richmond. My duty here was to blow the bellows, swing the crane, and empty the flasks in which castings were made; and at times this was hot and heavy work. The articles produced here were mostly for ship work, and in the busy season the foundry was in operation night and day. I have often worked two nights and every working day of the week. My foreman, Mr. Cobb, was a good man, and more than once protected me from abuse that one or more

of the hands was disposed to throw upon me. While in this situation I had little time for mental improvement. Hard work, night and day, over a furnace hot enough to keep the metal running like water, was more favorable to action than thought; yet here I often nailed a newspaper to the post near my bellows, and read while I was performing the up and down motion of the heavy beam by which the bellows was inflated and discharged. It was the pursuit of knowledge under difficulties, and I look back to it now, after so many years, with some complacency and a little wonder that I could have been so earnest and persevering in any pursuit other than for my daily bread. I certainly saw nothing in the conduct of those around to inspire me with such interest: they were all devoted exclusively to what their hands found to do. I am glad to be able to say that, during my engagement in this foundry, no complaint was ever made against me that I did not do my work, and do it well. The bellows which I worked by main strength was, after I left, moved by a steam-engine.

Douglass, Frederick. “Reconstruction.” Atlantic Monthly 18 (1866): 761-765.

Reconstruction

The assembling of the Second Session of the Thirty-ninth Congress may very properly be made the occasion of a few earnest words on the already much-worn topic of reconstruction.

Seldom has any legislative body been the subject of a solicitude more intense, or of aspirations more sincere and ardent. There are the best of reasons for this profound interest. Questions of vast moment, left undecided by the last session of Congress, must be manfully grappled with by this. No political skirmishing will avail. The occasion demands statesmanship.

Whether the tremendous war so heroically fought and so victoriously ended shall pass into history a miserable failure, barren of permanent results,—a scandalous and shocking waste of blood and treasure,—a strife for empire, as Earl Russell characterized it, of no value to liberty or civilization,—an attempt to re-establish a Union by force, which must be the merest mockery of a Union,—an effort to bring under Federal authority States into which no loyal man from the North may safely enter, and to bring men into the national councils who deliberate with daggers and vote with revolvers, and who do not even conceal their deadly hate of the country that conquered them; or whether, on the other hand, we shall, as the rightful reward of victory over treason, have a solid nation, entirely delivered from all contradictions and social antagonisms, based upon loyalty, liberty, and equality, must be determined one way or the other by the present session of Congress. The last session really did nothing which can be considered final as to these questions. The Civil Rights Bill and the Freedmen’s Bureau Bill and the proposed constitutional amendments, with the amendment already adopted and recognized as the law of the land, do not reach the difficulty, and cannot, unless the whole structure of the government is changed from a government by States to something like a despotic central government, with power to control even the municipal regulations of States, and to make them conform to its own despotic will. While there remains such an idea as the right of each State to control its own local affairs,—an idea, by the way, more deeply rooted in the minds of men of all sections of the country than perhaps any one other political idea,—no general assertion of human rights can be of any practical value. To change the character of the government at this point is neither possible nor desirable. All that is necessary to be done is to make the government consistent with itself, and render the rights of the States compatible with the sacred rights of human nature.

The arm of the Federal government is long, but it is far too short to protect the rights of individuals in the interior of distant States. They must have the power to protect themselves, or they will go unprotected, spite of all the laws the Federal government can put upon the national statute-book.

Slavery, like all other great systems of wrong, founded in the depths of human selfishness, and existing for ages, has not neglected its own conservation. It has steadily exerted an influence upon all around it favorable to its own continuance. And to-day it is so strong that it could exist, not only without law, but even against law. Custom, manners, morals, religion, are all on its side everywhere in the South; and when you add the ignorance and servility of the ex-slave to the intelligence and accustomed authority of the master, you have the conditions, not out of which slavery will again grow, but under which it is impossible for the Federal government to wholly destroy it, unless the Federal government be armed with despotic power, to blot out State authority, and to station a Federal officer at every cross-road. This, of course, cannot be done, and ought not even if it could. The true way and the easiest way is to make our government entirely consistent with itself, and give to every loyal citizen the elective franchise,—a right and power which will be ever present, and will form a wall of fire for his protection.

One of the invaluable compensations of the late Rebellion is the highly instructive disclosure it made of the true source of danger to republican government. Whatever may be tolerated in monarchical and despotic governments, no republic is safe that tolerates a privileged class, or denies to any of its citizens equal rights and equal means to maintain them. What was theory before the war has been made fact by the war.

There is cause to be thankful even for rebellion. It is an impressive teacher, though a stern and terrible one. In both characters it has come to us, and it was perhaps needed in both. It is an instructor never a day before its time, for it comes only when all other means of progress and enlightenment have failed. Whether the oppressed and despairing bondman, no longer able to repress his deep yearnings for manhood, or the tyrant, in his pride and impatience, takes the initiative, and strikes the blow for a firmer hold and a longer lease of oppression, the result is the same,—society is instructed, or may be.

Such are the limitations of the common mind, and so thoroughly engrossing are the cares of common life, that only the few among men can discern through the glitter and dazzle of present prosperity the dark outlines of approaching disasters, even though they may have come up to our very gates, and are already within striking distance. The yawning seam and corroded bolt conceal their defects from the mariner until the storm calls all hands to the pumps. Prophets, indeed, were abundant before the war; but who cares for prophets while their predictions remain unfulfilled, and the calamities of which they tell are masked behind a blinding blaze of national prosperity?

It is asked, said Henry Clay, on a memorable occasion, Will slavery never come to an end? That question, said he, was asked fifty years ago, and it has been answered by fifty years of unprecedented prosperity. Spite of the eloquence of the earnest Abolitionists,—poured out against slavery during thirty years,—even they must confess, that, in all the probabilities of the case, that system of barbarism would have continued its horrors far beyond the limits of the nineteenth century but for the Rebellion, and perhaps only have disappeared at last in a fiery conflict, even more fierce and bloody than that which has now been suppressed.

It is no disparagement to truth, that it can only prevail where reason prevails. War begins where reason ends. The thing worse than rebellion is the thing that causes rebellion. What that thing is, we have been taught to our cost. It remains now to be seen whether we have the needed courage to have that cause entirely removed from the Republic. At any rate, to this grand work of national regeneration and entire purification Congress must now address Itself, with full purpose that the work shall this time be thoroughly done. The deadly upas, root and branch, leaf and fibre, body and sap, must be utterly destroyed. The country is evidently not in a condition to listen patiently to pleas for postponement, however plausible, nor will it permit the responsibility to be shifted to other shoulders. Authority and power are here commensurate with the duty imposed. There are no cloud-flung shadows to obscure the way. Truth shines with brighter light and intenser heat at every moment, and a country torn and rent and bleeding implores relief from its distress and agony.

If time was at first needed, Congress has now had time. All the requisite materials from which to form an intelligent judgment are now before it. Whether its members look at the origin, the progress, the termination of the war, or at the mockery of a peace now existing, they will find only one unbroken chain of argument in favor of a radical policy of reconstruction. For the omissions of the last session, some excuses may be allowed. A treacherous President stood in the way; and it can be easily seen how reluctant good men might be to admit an apostasy which involved so much of baseness and ingratitude. It was natural that they should seek to save him by bending to him even when he leaned to the side of error. But all is changed now. Congress knows now that it must go on without his aid, and even against his machinations. The advantage of the present session over the last is immense. Where that investigated, this has the facts. Where that walked by faith, this may walk by sight. Where that halted, this must go forward, and where that failed, this must succeed, giving the country whole measures where that gave us half-measures, merely as a means of saving the elections in a few doubtful districts. That Congress saw what was right, but distrusted the enlightenment of the loyal masses; but what was forborne in distrust of the people must now be done with a full knowledge that the people expect and require it. The members go to Washington fresh from the inspiring presence of the people. In every considerable public meeting, and in almost every conceivable way, whether at court-house, school-house, or cross-roads, in doors and out, the subject has been discussed, and the people have emphatically pronounced in favor of a radical policy. Listening to the doctrines of expediency and compromise with pity, impatience, and disgust, they have everywhere broken into demonstrations of the wildest enthusiasm when a brave word has been spoken in favor of equal rights and impartial suffrage. Radicalism, so far from being odious, is not the popular passport to power. The men most bitterly charged with it go to Congress with the largest majorities, while the timid and doubtful are sent by lean majorities, or else left at home. The strange controversy between the President and the Congress, at one time so threatening, is disposed of by the people. The high reconstructive powers which he so confidently, ostentatiously, and haughtily claimed, have been disallowed, denounced, and utterly repudiated; while those claimed by Congress have been confirmed.

Of the spirit and magnitude of the canvass nothing need be said. The appeal was to the people, and the verdict was worthy of the tribunal. Upon an occasion of his own selection, with the advice and approval of his astute Secretary, soon after the members of the Congress had returned to their constituents, the President quitted the executive mansion, sandwiched himself between two recognized heroes,—men whom the whole country delighted to honor,—and, with all the advantage which such company could give him, stumped the country from the Atlantic to the Mississippi, advocating everywhere his policy as against that of Congress. It was a strange sight, and perhaps the most disgraceful exhibition ever made by any President; but, as no evil is entirely unmixed, good has come of this, as from many others. Ambitious, unscrupulous, energetic, indefatigable, voluble, and plausible,—a political gladiator, ready for a “set-to” in any crowd,—he is beaten in his own chosen field, and stands to-day before the country as a convicted usurper, a political criminal, guilty of a bold and persistent attempt to possess himself of the legislative powers solemnly secured to Congress by the Constitution. No vindication could be more complete, no condemnation could be more absolute and humiliating. Unless reopened by the sword, as recklessly threatened in some circles, this question is now closed for all time.

Without attempting to settle here the metaphysical and somewhat theological question (about which so much has already been said and written), whether once in the Union means always in the Union,—agreeably to the formula, Once in grace always in grace,—it is obvious to common sense that the rebellious States stand to-day, in point of law, precisely where they stood when, exhausted, beaten, conquered, they fell powerless at the feet of Federal authority. Their State governments were overthrown, and the lives and property of the leaders of the Rebellion were forfeited. In reconstructing the institutions of these shattered and overthrown States, Congress should begin with a clean slate, and make clean work of it. Let there be no hesitation. It would be a cowardly deference to a defeated and treacherous President, if any account were made of the illegitimate, one-sided, sham governments hurried into existence for a malign purpose in the absence of Congress. These pretended governments, which were never submitted to the people, and from participation in which four millions of the loyal people were excluded by Presidential order, should now be treated according to their true character, as shams and impositions, and supplanted by true and legitimate governments, in the formation of which loyal men, black and white, shall participate.

It is not, however, within the scope of this paper to point out the precise steps to be taken, and the means to be employed. The people are less concerned about these than the grand end to be attained. They demand such a reconstruction as shall put an end to the present anarchical state of things in the late rebellious States,—where frightful murders and wholesale massacres are perpetrated in the very presence of Federal soldiers. This horrible business they require shall cease. They want a reconstruction such as will protect loyal men, black and white, in their persons and property; such a one as will cause Northern industry, Northern capital, and Northern civilization to flow into the South, and make a man from New England as much at home in Carolina as elsewhere in the Republic. No Chinese wall can now be tolerated. The South must be opened to the light of law and liberty, and this session of Congress is relied upon to accomplish this important work.

The plain, common-sense way of doing this work, as intimated at the beginning, is simply to establish in the South one law, one government, one administration of justice, one condition to the exercise of the elective franchise, for men of all races and colors alike. This great measure is sought as earnestly by loyal white men as by loyal blacks, and is needed alike by both. Let sound political prescience but take the place of an unreasoning prejudice, and this will be done.

Men denounce the negro for his prominence in this discussion; but it is no fault of his that in peace as in war, that in conquering Rebel armies as in reconstructing the rebellious States, the right of the negro is the true solution of our national troubles. The stern logic of events, which goes directly to the point, disdaining all concern for the color or features of men, has determined the interests of the country as identical with and inseparable from those of the negro.

The policy that emancipated and armed the negro—now seen to have been wise and proper by the dullest—was not certainly more sternly demanded than is now the policy of enfranchisement. If with the negro was success in war, and without him failure, so in peace it will be found that the nation must fall or flourish with the negro.

Fortunately, the Constitution of the United States knows no distinction between citizens on account of color. Neither does it know any difference between a citizen of a State and a citizen of the United States. Citizenship evidently includes all the rights of citizens, whether State or national. If the Constitution knows none, it is clearly no part of the duty of a Republican Congress now to institute one. The mistake of the last session was the attempt to do this very thing, by a renunciation of its power to secure political rights to any class of citizens, with the obvious purpose to allow the rebellious States to disfranchise, if they should see fit, their colored citizens. This unfortunate blunder must now be retrieved, and the emasculated citizenship given to the negro supplanted by that contemplated in the Constitution of the United States, which declares that the citizens of each State shall enjoy all the rights and

immunities of citizens of the several States,—so that a legal voter in any State shall be a legal voter in all the States.

VOLUME ONE

Chapter 1. Marseilles—The Arrival

On the 24th of February, 1815, the look-out at Notre-Dame de la Garde signalled the three-master, the _Pharaon_ from Smyrna, Trieste, and Naples.

As usual, a pilot put off immediately, and rounding the Château d'If, got on board the vessel between Cape Morgiou and Rion island.

Immediately, and according to custom, the ramparts of Fort Saint-Jean were covered with spectators; it is always an event at Marseilles for a ship to come into port, especially when this ship, like the _Pharaon_, has been built, rigged, and laden at the old Phocee docks, and belongs to an owner of the city.

The ship drew on and had safely passed the strait, which some volcanic shock has made between the Calasareigne and Jaros islands; had doubled Pomègue, and approached the harbor under topsails, jib, and spanker, but so slowly and sedately that the idlers, with that instinct which is the forerunner of evil, asked one another what misfortune could have happened on board. However, those experienced in navigation saw plainly that if any accident had occurred, it was not to the vessel herself, for she bore down with all the evidence of being skilfully handled, the anchor a-cockbill, the jib-boom guys already eased off, and standing by the side of the pilot, who was steering the _Pharaon_ towards the narrow entrance of the inner port, was a young man, who, with activity and vigilant eye, watched every motion of the ship, and repeated each direction of the pilot.

The vague disquietude which prevailed among the spectators had so much affected one of the crowd that he did not await the arrival of the vessel in harbor, but jumping into a small skiff, desired to be pulled alongside the _Pharaon_, which he reached as she rounded into La Réserve basin.

When the young man on board saw this person approach, he left his station by the pilot, and, hat in hand, leaned over the ship's bulwarks.

He was a fine, tall, slim young fellow of eighteen or twenty, with black eyes, and hair as dark as a raven's wing; and his whole appearance bespoke that calmness and resolution peculiar to men accustomed from their cradle to contend with danger.

"Ah, is it you, Dantès?" cried the man in the skiff. "What's the matter? and why have you such an air of sadness aboard?"

"A great misfortune, M. Morrel," replied the young man, "a great misfortune, for me especially! Off Civita Vecchia we lost our brave Captain Leclere."

"And the cargo?" inquired the owner, eagerly.

"Is all safe, M. Morrel; and I think you will be satisfied on that head. But poor Captain Leclere——"

"What happened to him?" asked the owner, with an air of considerable resignation. "What happened to the worthy captain?"

"He died."

"Fell into the sea?"

"No, sir, he died of brain-fever in dreadful agony." Then turning to the crew, he said, "Bear a hand there, to take in sail!"

All hands obeyed, and at once the eight or ten seamen who composed the crew, sprang to their respective stations at the spanker brails and outhaul, topsail sheets and halyards, the jib downhaul, and the topsail clewlines and buntlines. The young sailor gave a look to see that his orders were promptly and accurately obeyed, and then turned again to the owner.

"And how did this misfortune occur?" inquired the latter, resuming the interrupted conversation.

0023m

"Alas, sir, in the most unexpected manner. After a long talk with the harbor-master, Captain Leclere left Naples greatly disturbed in mind. In twenty-four hours he was attacked by a fever, and died three days afterwards. We performed the usual burial service, and he is at his rest, sewn up in his hammock with a thirty-six-pound shot at his head and his heels, off El Giglio island. We bring to his widow his sword and cross of honor. It was worth while, truly," added the young man with a melancholy smile, "to make war against the English for ten years, and to die in his bed at last, like everybody else."

“Why, you see, Edmond,” replied the owner, who appeared more comforted at every moment, “we are all mortal, and the old must make way for the young. If not, why, there would be no promotion; and since you assure me that the cargo——”

“Is all safe and sound, M. Morrel, take my word for it; and I advise you not to take 25,000 francs for the profits of the voyage.”

Then, as they were just passing the Round Tower, the young man shouted: “Stand by there to lower the topsails and jib; brail up the spanker!”

The order was executed as promptly as it would have been on board a man-of-war.

“Let go—and clue up!” At this last command all the sails were lowered, and the vessel moved almost imperceptibly onwards.

“Now, if you will come on board, M. Morrel,” said Dantès, observing the owner’s impatience, “here is your supercargo, M. Danglars, coming out of his cabin, who will furnish you with every particular. As for me, I must look after the anchoring, and dress the ship in mourning.”

The owner did not wait for a second invitation. He seized a rope which Dantès flung to him, and with an activity that would have done credit to a sailor, climbed up the side of the ship, while the young man, going to his task, left the conversation to Danglars, who now came towards the owner. He was a man of twenty-five or twenty-six years of age, of unprepossessing countenance, obsequious to his superiors, insolent to his subordinates; and this, in addition to his position as responsible agent on board, which is always obnoxious to the sailors, made him as much disliked by the crew as Edmond Dantès was beloved by them.

“Well, M. Morrel,” said Danglars, “you have heard of the misfortune that has befallen us?”

“Yes—yes: poor Captain Leclere! He was a brave and an honest man.”

“And a first-rate seaman, one who had seen long and honorable service, as became a man charged with the interests of a house so important as that of Morrel & Son,” replied Danglars.

“But,” replied the owner, glancing after Dantès, who was watching the anchoring of his vessel, “it seems to me that a sailor needs not be so old as you say, Danglars, to understand his business, for our friend Edmond seems to understand it thoroughly, and not to require instruction from anyone.”

“Yes,” said Danglars, darting at Edmond a look gleaming with hate. “Yes, he is young, and youth is invariably self-confident. Scarcely was the captain’s breath out of his body when he assumed the command without consulting anyone, and he caused us to lose a day and a half at the Island of Elba, instead of making for Marseilles direct.”

0025m

“As to taking command of the vessel,” replied Morrel, “that was his duty as captain’s mate; as to losing a day and a half off the Island of Elba, he was wrong, unless the vessel needed repairs.”

“The vessel was in as good condition as I am, and as, I hope you are, M. Morrel, and this day and a half was lost from pure whim, for the pleasure of going ashore, and nothing else.”

“Dantès,” said the shipowner, turning towards the young man, “come this way!”

“In a moment, sir,” answered Dantès, “and I’m with you.” Then calling to the crew, he said, “Let go!”

The anchor was instantly dropped, and the chain ran rattling through the port-hole. Dantès continued at his post in spite of the presence of the pilot, until this manœuvre was completed, and then he added, “Half-mast the colors, and square the yards!”

“You see,” said Danglars, “he fancies himself captain already, upon my word.”

“And so, in fact, he is,” said the owner.

“Except your signature and your partner’s, M. Morrel.”

“And why should he not have this?” asked the owner; “he is young, it is true, but he seems to me a thorough seaman, and of full experience.”

A cloud passed over Danglars' brow.

"Your pardon, M. Morrel," said Dantès, approaching, "the vessel now rides at anchor, and I am at your service. You hailed me, I think?"

Danglars retreated a step or two. "I wished to inquire why you stopped at the Island of Elba?"

"I do not know, sir; it was to fulfil the last instructions of Captain Leclere, who, when dying, gave me a packet for Marshal Bertrand."

"Then did you see him, Edmond?"

"Who?"

"The marshal."

"Yes."

Morrel looked around him, and then, drawing Dantès on one side, he said suddenly—

"And how is the emperor?"

"Very well, as far as I could judge from the sight of him."

"You saw the emperor, then?"

"He entered the marshal's apartment while I was there."

"And you spoke to him?"

"Why, it was he who spoke to me, sir," said Dantès, with a smile.

"And what did he say to you?"

"Asked me questions about the vessel, the time she left Marseilles, the course she had taken, and what was her cargo. I believe, if she had not been laden, and I had been her master, he would have bought her. But I told him I was only mate, and that she belonged to the firm of Morrel & Son. 'Ah, yes,' he said, 'I know them. The Morrels have been shipowners from father to son; and there was a Morrel who served in the same regiment with me when I was in garrison at Valence.'"

"_Pardieu!_ and that is true!" cried the owner, greatly delighted. "And that was Policar Morrel, my uncle, who was afterwards a captain. Dantès, you must tell my uncle that the emperor remembered him, and you will see it will bring tears into the old soldier's eyes. Come, come," continued he, patting Edmond's shoulder kindly, "you did very right, Dantès, to follow Captain Leclere's instructions, and touch at Elba, although if it were known that you had conveyed a packet to the marshal, and had conversed with the emperor, it might bring you into trouble."

0027m

"How could that bring me into trouble, sir?" asked Dantès; "for I did not even know of what I was the bearer; and the emperor merely made such inquiries as he would of the first comer. But, pardon me, here are the health officers and the customs inspectors coming alongside." And the young man went to the gangway. As he departed, Danglars approached, and said,—

"Well, it appears that he has given you satisfactory reasons for his landing at Porto-Ferrajo?"

"Yes, most satisfactory, my dear Danglars."

"Well, so much the better," said the supercargo; "for it is not pleasant to think that a comrade has not done his duty."

"Dantès has done his," replied the owner, "and that is not saying much. It was Captain Leclere who gave orders for this delay."

"Talking of Captain Leclere, has not Dantès given you a letter from him?"

"To me?—no—was there one?"

"I believe that, besides the packet, Captain Leclere confided a letter to his care."

“Of what packet are you speaking, Danglars?”

“Why, that which Dantès left at Porto-Ferrajo.”

“How do you know he had a packet to leave at Porto-Ferrajo?”

Danglars turned very red.

“I was passing close to the door of the captain’s cabin, which was half open, and I saw him give the packet and letter to Dantès.”

“He did not speak to me of it,” replied the shipowner; “but if there be any letter he will give it to me.”

Danglars reflected for a moment. “Then, M. Morrel, I beg of you,” said he, “not to say a word to Dantès on the subject. I may have been mistaken.”

At this moment the young man returned; Danglars withdrew.

“Well, my dear Dantès, are you now free?” inquired the owner.

“Yes, sir.”

“You have not been long detained.”

“No. I gave the custom-house officers a copy of our bill of lading; and as to the other papers, they sent a man off with the pilot, to whom I gave them.”

“Then you have nothing more to do here?”

“No—everything is all right now.”

“Then you can come and dine with me?”

“I really must ask you to excuse me, M. Morrel. My first visit is due to my father, though I am not the less grateful for the honor you have done me.”

0029m

“Right, Dantès, quite right. I always knew you were a good son.”

“And,” inquired Dantès, with some hesitation, “do you know how my father is?”

“Well, I believe, my dear Edmond, though I have not seen him lately.”

“Yes, he likes to keep himself shut up in his little room.”

“That proves, at least, that he has wanted for nothing during your absence.”

Dantès smiled. “My father is proud, sir, and if he had not a meal left, I doubt if he would have asked anything from anyone, except from Heaven.”

“Well, then, after this first visit has been made we shall count on you.”

“I must again excuse myself, M. Morrel, for after this first visit has been paid I have another which I am most anxious to pay.”

“True, Dantès, I forgot that there was at the Catalans someone who expects you no less impatiently than your father—the lovely Mercédès.”

Dantès blushed.

“Ah, ha,” said the shipowner, “I am not in the least surprised, for she has been to me three times, inquiring if there were any news of the _Pharaon_. _Peste!_ Edmond, you have a very handsome mistress!”

“She is not my mistress,” replied the young sailor, gravely; “she is my betrothed.”

“Sometimes one and the same thing,” said Morrel, with a smile.

“Not with us, sir,” replied Dantès.

“Well, well, my dear Edmond,” continued the owner, “don’t let me detain you. You have managed my affairs so well that I ought to allow you all the time you require for your own. Do you want any money?”

“No, sir; I have all my pay to take—nearly three months’ wages.”

“You are a careful fellow, Edmond.”

“Say I have a poor father, sir.”

“Yes, yes, I know how good a son you are, so now hasten away to see your father. I have a son too, and I should be very wroth with those who detained him from me after a three months’ voyage.”

“Then I have your leave, sir?”

“Yes, if you have nothing more to say to me.”

“Nothing.”

“Captain Leclere did not, before he died, give you a letter for me?”

“He was unable to write, sir. But that reminds me that I must ask your leave of absence for some days.”

“To get married?”

“Yes, first, and then to go to Paris.”

“Very good; have what time you require, Dantès. It will take quite six weeks to unload the cargo, and we cannot get you ready for sea until three months after that; only be back again in three months, for the _Pharaon_,” added the owner, patting the young sailor on the back, “cannot sail without her captain.”

“Without her captain!” cried Dantès, his eyes sparkling with animation; “pray mind what you say, for you are touching on the most secret wishes of my heart. Is it really your intention to make me captain of the _Pharaon_?”

“If I were sole owner we’d shake hands on it now, my dear Dantès, and call it settled; but I have a partner, and you know the Italian proverb—_Chi ha compagno ha padrone_—‘He who has a partner has a master.’ But the thing is at least half done, as you have one out of two votes. Rely on me to procure you the other; I will do my best.”

“Ah, M. Morrel,” exclaimed the young seaman, with tears in his eyes, and grasping the owner’s hand, “M. Morrel, I thank you in the name of my father and of Mercédès.”

“That’s all right, Edmond. There’s a providence that watches over the deserving. Go to your father; go and see Mercédès, and afterwards come to me.”

“Shall I row you ashore?”

“No, thank you; I shall remain and look over the accounts with Danglars. Have you been satisfied with him this voyage?”

“That is according to the sense you attach to the question, sir. Do you mean is he a good comrade? No, for I think he never liked me since the day when I was silly enough, after a little quarrel we had, to propose to him to stop for ten minutes at the island of Monte Cristo to settle the dispute—a proposition which I was wrong to suggest, and he quite right to refuse. If you mean as responsible agent when you ask me the question, I believe there is nothing to say against him, and that you will be content with the way in which he has performed his duty.”

“But tell me, Dantès, if you had command of the _Pharaon_ should you be glad to see Danglars remain?”

“Captain or mate, M. Morrel, I shall always have the greatest respect for those who possess the owners’ confidence.”

“That’s right, that’s right, Dantès! I see you are a thoroughly good fellow, and will detain you no longer. Go, for I see how impatient you are.”

“Then I have leave?”

“Go, I tell you.”

“May I have the use of your skiff?”

“Certainly.”

“Then, for the present, M. Morrel, farewell, and a thousand thanks!”

“I hope soon to see you again, my dear Edmond. Good luck to you.”

The young sailor jumped into the skiff, and sat down in the stern sheets, with the order that he be put ashore at La Canebière. The two oarsmen bent to their work, and the little boat glided away as rapidly as possible in the midst of the thousand vessels which choke up the narrow way which leads between the two rows of ships from the mouth of the harbor to the Quai d’Orléans.

The shipowner, smiling, followed him with his eyes until he saw him spring out on the quay and disappear in the midst of the throng, which from five o’clock in the morning until nine o’clock at night, swarms in the famous street of La Canebière,—a street of which the modern Phocéens are so proud that they say with all the gravity in the world, and with that accent which gives so much character to what is said, “If Paris had La Canebière, Paris would be a second Marseilles.” On turning round the owner saw Danglars behind him, apparently awaiting orders, but in reality also watching the young sailor,—but there was a great difference in the expression of the two men who thus followed the movements of Edmond Dantès.

Chapter 2. Father and Son

We will leave Danglars struggling with the demon of hatred, and endeavoring to insinuate in the ear of the shipowner some evil suspicions against his comrade, and follow Dantès, who, after having traversed La Canebière, took the Rue de Noailles, and entering a small house, on the left of the Allées de Meilhan, rapidly ascended four flights of a dark staircase, holding the baluster with one hand, while with the other he repressed the beatings of his heart, and paused before a half-open door, from which he could see the whole of a small room.

This room was occupied by Dantès’ father. The news of the arrival of the _Pharaon_ had not yet reached the old man, who, mounted on a chair, was amusing himself by training with trembling hand the nasturtiums and sprays of clematis that clambered over the trellis at his window. Suddenly, he felt an arm thrown around his body, and a well-known voice behind him exclaimed, “Father—dear father!”

The old man uttered a cry, and turned round; then, seeing his son, he fell into his arms, pale and trembling.

“What ails you, my dearest father? Are you ill?” inquired the young man, much alarmed.

“No, no, my dear Edmond—my boy—my son!—no; but I did not expect you; and joy, the surprise of seeing you so suddenly—Ah, I feel as if I were going to die.”

“Come, come, cheer up, my dear father! ’Tis I—really I! They say joy never hurts, and so I came to you without any warning. Come now, do smile, instead of looking at me so solemnly. Here I am back again, and we are going to be happy.”

“Yes, yes, my boy, so we will—so we will,” replied the old man; “but how shall we be happy? Shall you never leave me again? Come, tell me all the good fortune that has befallen you.”

“God forgive me,” said the young man, “for rejoicing at happiness derived from the misery of others, but, Heaven knows, I did not seek this good fortune; it has happened, and I really cannot pretend to lament it. The good Captain Leclere is dead, father, and it is probable that, with the aid of M. Morrel, I shall have his place. Do you understand, father? Only imagine me a captain at twenty, with a hundred louis pay, and a share in the profits! Is this not more than a poor sailor like me could have hoped for?”

“Yes, my dear boy,” replied the old man, “it is very fortunate.”

“Well, then, with the first money I touch, I mean you to have a small house, with a garden in which to plant clematis, nasturtiums, and honeysuckle. But what ails you, father? Are you not well?”

“’Tis nothing, nothing; it will soon pass away”—and as he said so the old man’s strength failed him, and he fell backwards.

“Come, come,” said the young man, “a glass of wine, father, will revive you. Where do you keep your wine?”

“No, no; thanks. You need not look for it; I do not want it,” said the old man.

“Yes, yes, father, tell me where it is,” and he opened two or three cupboards.

“It is no use,” said the old man, “there is no wine.”

“What, no wine?” said Dantès, turning pale, and looking alternately at the hollow cheeks of the old man and the empty cupboards. “What, no wine? Have you wanted money, father?”

“I want nothing now that I have you,” said the old man.

“Yet,” stammered Dantès, wiping the perspiration from his brow,—“yet I gave you two hundred francs when I left, three months ago.”

“Yes, yes, Edmond, that is true, but you forgot at that time a little debt to our neighbor, Caderousse. He reminded me of it, telling me if I did not pay for you, he would be paid by M. Morrel; and so, you see, lest he might do you an injury——”

“Well?”

“Why, I paid him.”

“But,” cried Dantès, “it was a hundred and forty francs I owed Caderousse.”

“Yes,” stammered the old man.

“And you paid him out of the two hundred francs I left you?”

The old man nodded.

“So that you have lived for three months on sixty francs,” muttered Edmond.

“You know how little I require,” said the old man.

“Heaven pardon me,” cried Edmond, falling on his knees before his father.

“What are you doing?”

“You have wounded me to the heart.”

“Never mind it, for I see you once more,” said the old man; “and now it’s all over—everything is all right again.”

0035m

“Yes, here I am,” said the young man, “with a promising future and a little money. Here, father, here!” he said, “take this—take it, and send for something immediately.” And he emptied his pockets on the table, the contents consisting of a dozen gold pieces, five or six five-franc pieces, and some smaller coin. The countenance of old Dantès brightened.

“Whom does this belong to?” he inquired.

“To me, to you, to us! Take it; buy some provisions; be happy, and tomorrow we shall have more.”

“Gently, gently,” said the old man, with a smile; “and by your leave I will use your purse moderately, for they would say, if they saw me buy too many things at a time, that I had been obliged to await your return, in order to be able to purchase them.”

“Do as you please; but, first of all, pray have a servant, father. I will not have you left alone so long. I have some smuggled coffee and most capital tobacco, in a small chest in the hold, which you shall have tomorrow. But, hush, here comes somebody.”

“’Tis Caderousse, who has heard of your arrival, and no doubt comes to congratulate you on your fortunate return.”

“Ah, lips that say one thing, while the heart thinks another,” murmured Edmond. “But, never mind, he is a neighbor who has done us a service on a time, so he’s welcome.”

As Edmond paused, the black and bearded head of Caderousse appeared at the door. He was a man of twenty-five or six, and held a piece of cloth, which, being a tailor, he was about to make into a coat-lining.

“What, is it you, Edmond, back again?” said he, with a broad Marseillaise accent, and a grin that displayed his ivory-white teeth.

“Yes, as you see, neighbor Caderousse; and ready to be agreeable to you in any and every way,” replied Dantès, but ill-concealing his coldness under this cloak of civility.

“Thanks—thanks; but, fortunately, I do not want for anything; and it chances that at times there are others who have need of me.” Dantès made a gesture. “I do not allude to you, my boy. No!—no! I lent you money, and you returned it; that’s like good neighbors, and we are quits.”

“We are never quits with those who oblige us,” was Dantès’ reply; “for when we do not owe them money, we owe them gratitude.”

“What’s the use of mentioning that? What is done is done. Let us talk of your happy return, my boy. I had gone on the quay to match a piece of mulberry cloth, when I met friend Danglars. ‘You at Marseilles?’—‘Yes,’ says he.

“‘I thought you were at Smyrna.’—‘I was; but am now back again.’

“‘And where is the dear boy, our little Edmond?’

“‘Why, with his father, no doubt,’ replied Danglars. And so I came,” added Caderousse, “as fast as I could to have the pleasure of shaking hands with a friend.”

0037m

“Worthy Caderousse!” said the old man, “he is so much attached to us.”

“Yes, to be sure I am. I love and esteem you, because honest folks are so rare. But it seems you have come back rich, my boy,” continued the tailor, looking askance at the handful of gold and silver which Dantès had thrown on the table.

The young man remarked the greedy glance which shone in the dark eyes of his neighbor. “Eh,” he said, negligently, “this money is not mine. I was expressing to my father my fears that he had wanted many things in my absence, and to convince me he emptied his purse on the table. Come, father” added Dantès, “put this money back in your box—unless neighbor Caderousse wants anything, and in that case it is at his service.”

“No, my boy, no,” said Caderousse. “I am not in any want, thank God, my living is suited to my means. Keep your money—keep it, I say;—one never has too much;—but, at the same time, my boy, I am as much obliged by your offer as if I took advantage of it.”

“It was offered with good will,” said Dantès.

“No doubt, my boy; no doubt. Well, you stand well with M. Morrel I hear,—you insinuating dog, you!”

“M. Morrel has always been exceedingly kind to me,” replied Dantès.

“Then you were wrong to refuse to dine with him.”

“What, did you refuse to dine with him?” said old Dantès; “and did he invite you to dine?”

“Yes, my dear father,” replied Edmond, smiling at his father’s astonishment at the excessive honor paid to his son.

“And why did you refuse, my son?” inquired the old man.

“That I might the sooner see you again, my dear father,” replied the young man. “I was most anxious to see you.”

“But it must have vexed M. Morrel, good, worthy man,” said Caderousse. “And when you are looking forward to be captain, it was wrong to annoy the owner.”

“But I explained to him the cause of my refusal,” replied Dantès, “and I hope he fully understood it.”

“Yes, but to be captain one must do a little flattery to one’s patrons.”

“I hope to be captain without that,” said Dantès.

“So much the better—so much the better! Nothing will give greater pleasure to all your old friends; and I know one down there behind the Saint Nicolas citadel who will not be sorry to hear it.”

“Mercédès?” said the old man.

“Yes, my dear father, and with your permission, now I have seen you, and know you are well and have all you require, I will ask your consent to go and pay a visit to the Catalans.”

“Go, my dear boy,” said old Dantès; “and Heaven bless you in your wife, as it has blessed me in my son!”

“His wife!” said Caderousse; “why, how fast you go on, father Dantès; she is not his wife yet, as it seems to me.”

“No, but according to all probability she soon will be,” replied Edmond.

“Yes—yes,” said Caderousse; “but you were right to return as soon as possible, my boy.”

“And why?”

“Because Mercédès is a very fine girl, and fine girls never lack followers; she particularly has them by dozens.”

“Really?” answered Edmond, with a smile which had in it traces of slight uneasiness.

0039m

“Ah, yes,” continued Caderousse, “and capital offers, too; but you know, you will be captain, and who could refuse you then?”

“Meaning to say,” replied Dantès, with a smile which but ill-concealed his trouble, “that if I were not a captain——”

“Eh—eh!” said Caderousse, shaking his head.

“Come, come,” said the sailor, “I have a better opinion than you of women in general, and of Mercédès in particular; and I am certain that, captain or not, she will remain ever faithful to me.”

“So much the better—so much the better,” said Caderousse. “When one is going to be married, there is nothing like implicit confidence; but never mind that, my boy,—go and announce your arrival, and let her know all your hopes and prospects.”

“I will go directly,” was Edmond’s reply; and, embracing his father, and nodding to Caderousse, he left the apartment.

Caderousse lingered for a moment, then taking leave of old Dantès, he went downstairs to rejoin Danglars, who awaited him at the corner of the Rue Senac.

“Well,” said Danglars, “did you see him?”

“I have just left him,” answered Caderousse.

“Did he allude to his hope of being captain?”

“He spoke of it as a thing already decided.”

“Indeed!” said Danglars, “he is in too much hurry, it appears to me.”

“Why, it seems M. Morrel has promised him the thing.”

“So that he is quite elated about it?”

“Why, yes, he is actually insolent over the matter—has already offered me his patronage, as if he were a grand personage, and proffered me a loan of money, as though he were a banker.”

“Which you refused?”

“Most assuredly; although I might easily have accepted it, for it was I who put into his hands the first silver he ever earned; but now M. Dantès has no longer any occasion for assistance—he is about to become a captain.”

“Pooh!” said Danglars, “he is not one yet.”

“_Ma foi!_ it will be as well if he is not,” answered Caderousse; “for if he should be, there will be really no speaking to him.”

“If we choose,” replied Danglars, “he will remain what he is; and perhaps become even less than he is.”

“What do you mean?”

“Nothing—I was speaking to myself. And is he still in love with the Catalane?”

“Over head and ears; but, unless I am much mistaken, there will be a storm in that quarter.”

0041m

“Explain yourself.”

“Why should I?”

“It is more important than you think, perhaps. You do not like Dantès?”

“I never like upstarts.”

“Then tell me all you know about the Catalane.”

“I know nothing for certain; only I have seen things which induce me to believe, as I told you, that the future captain will find some annoyance in the vicinity of the Vieilles Infirmeries.”

“What have you seen?—come, tell me!”

“Well, every time I have seen Mercédès come into the city she has been accompanied by a tall, strapping, black-eyed Catalan, with a red complexion, brown skin, and fierce air, whom she calls cousin.”

“Really; and you think this cousin pays her attentions?”

“I only suppose so. What else can a strapping chap of twenty-one mean with a fine wench of seventeen?”

“And you say that Dantès has gone to the Catalans?”

“He went before I came down.”

“Let us go the same way; we will stop at La Réserve, and we can drink a glass of La Malgue, whilst we wait for news.”

“Come along,” said Caderousse; “but you pay the score.”

“Of course,” replied Danglars; and going quickly to the designated place, they called for a bottle of wine, and two glasses.

Père Pamphile had seen Dantès pass not ten minutes before; and assured that he was at the Catalans, they sat down under the budding foliage of the planes and sycamores, in the branches of which the birds were singing their welcome to one of the first days of spring.

Chapter 3. The Catalans

Beyond a bare, weather-worn wall, about a hundred paces from the spot where the two friends sat looking and listening as they drank their wine, was the village of the Catalans. Long ago this mysterious colony quitted Spain, and settled on the tongue of land on which it is to this day. Whence it came no one knew, and it spoke an unknown tongue. One of its chiefs, who understood Provençal, begged the commune of Marseilles to give them this bare and barren promontory, where, like the sailors of old, they had run their boats ashore. The request was granted; and three months afterwards, around the twelve or fifteen small vessels which

had brought these gypsies of the sea, a small village sprang up. This village, constructed in a singular and picturesque manner, half Moorish, half Spanish, still remains, and is inhabited by descendants of the first comers, who speak the language of their fathers. For three or four centuries they have remained upon this small promontory, on which they had settled like a flight of seabirds, without mixing with the Marseillaise population, intermarrying, and preserving their original customs and the costume of their mother-country as they have preserved its language.

Our readers will follow us along the only street of this little village, and enter with us one of the houses, which is sunburned to the beautiful dead-leaf color peculiar to the buildings of the country, and within coated with whitewash, like a Spanish posada. A young and beautiful girl, with hair as black as jet, her eyes as velvety as the gazelle's, was leaning with her back against the wainscot, rubbing in her slender delicately moulded fingers a bunch of heath blossoms, the flowers of which she was picking off and strewing on the floor; her arms, bare to the elbow, brown, and modelled after those of the Arlesian Venus, moved with a kind of restless impatience, and she tapped the earth with her arched and supple foot, so as to display the pure and full shape of her well-turned leg, in its red cotton, gray and blue clocked, stocking. At three paces from her, seated in a chair which he balanced on two legs, leaning his elbow on an old worm-eaten table, was a tall young man of twenty, or two-and-twenty, who was looking at her with an air in which vexation and uneasiness were mingled. He questioned her with his eyes, but the firm and steady gaze of the young girl controlled his look.

"You see, Mercédès," said the young man, "here is Easter come round again; tell me, is this the moment for a wedding?"

"I have answered you a hundred times, Fernand, and really you must be very stupid to ask me again."

"Well, repeat it,—repeat it, I beg of you, that I may at last believe it! Tell me for the hundredth time that you refuse my love, which had your mother's sanction. Make me understand once for all that you are trifling with my happiness, that my life or death are nothing to you. Ah, to have dreamed for ten years of being your husband, Mercédès, and to lose that hope, which was the only stay of my existence!"

"At least it was not I who ever encouraged you in that hope, Fernand," replied Mercédès; "you cannot reproach me with the slightest coquetry. I have always said to you, 'I love you as a brother; but do not ask from me more than sisterly affection, for my heart is another's.' Is not this true, Fernand?"

"Yes, that is very true, Mercédès," replied the young man, "Yes, you have been cruelly frank with me; but do you forget that it is among the Catalans a sacred law to intermarry?"

0045m

"You mistake, Fernand; it is not a law, but merely a custom, and, I pray of you, do not cite this custom in your favor. You are included in the conscription, Fernand, and are only at liberty on sufferance, liable at any moment to be called upon to take up arms. Once a soldier, what would you do with me, a poor orphan, forlorn, without fortune, with nothing but a half-ruined hut and a few ragged nets, the miserable inheritance left by my father to my mother, and by my mother to me? She has been dead a year, and you know, Fernand, I have subsisted almost entirely on public charity. Sometimes you pretend I am useful to you, and that is an excuse to share with me the produce of your fishing, and I accept it, Fernand, because you are the son of my father's brother, because we were brought up together, and still more because it would give you so much pain if I refuse. But I feel very deeply that this fish which I go and sell, and with the produce of which I buy the flax I spin,—I feel very keenly, Fernand, that this is charity."

"And if it were, Mercédès, poor and lone as you are, you suit me as well as the daughter of the first shipowner or the richest banker of Marseilles! What do such as we desire but a good wife and careful housekeeper, and where can I look for these better than in you?"

"Fernand," answered Mercédès, shaking her head, "a woman becomes a bad manager, and who shall say she will remain an honest woman, when she loves another man better than her husband? Rest content with my friendship, for I say once more that is all I can promise, and I will promise no more than I can bestow."

"I understand," replied Fernand, "you can endure your own wretchedness patiently, but you are afraid to share mine. Well, Mercédès, beloved by you, I would tempt fortune; you would bring me good luck, and I should become rich. I could extend my occupation as a fisherman, might get a place as clerk in a warehouse, and become in time a dealer myself."

“You could do no such thing, Fernand; you are a soldier, and if you remain at the Catalans it is because there is no war; so remain a fisherman, and contented with my friendship, as I cannot give you more.”

“Well, I will do better, Mercédès. I will be a sailor; instead of the costume of our fathers, which you despise, I will wear a varnished hat, a striped shirt, and a blue jacket, with an anchor on the buttons. Would not that dress please you?”

“What do you mean?” asked Mercédès, with an angry glance,—“what do you mean? I do not understand you?”

“I mean, Mercédès, that you are thus harsh and cruel with me, because you are expecting someone who is thus attired; but perhaps he whom you await is inconstant, or if he is not, the sea is so to him.”

“Fernand,” cried Mercédès, “I believed you were good-hearted, and I was mistaken! Fernand, you are wicked to call to your aid jealousy and the anger of God! Yes, I will not deny it, I do await, and I do love him of whom you speak; and, if he does not return, instead of accusing him of the inconstancy which you insinuate, I will tell you that he died loving me and me only.” The young girl made a gesture of rage. “I understand you, Fernand; you would be revenged on him because I do not love you; you would cross your Catalan knife with his dirk. What end would that answer? To lose you my friendship if he were conquered, and see that friendship changed into hate if you were victor. Believe me, to seek a quarrel with a man is a bad method of pleasing the woman who loves that man. No, Fernand, you will not thus give way to evil thoughts. Unable to have me for your wife, you will content yourself with having me for your friend and sister; and besides,” she added, her eyes troubled and moistened with tears, “wait, wait, Fernand; you said just now that the sea was treacherous, and he has been gone four months, and during these four months there have been some terrible storms.”

Fernand made no reply, nor did he attempt to check the tears which flowed down the cheeks of Mercédès, although for each of these tears he would have shed his heart’s blood; but these tears flowed for another. He arose, paced a while up and down the hut, and then, suddenly stopping before Mercédès, with his eyes glowing and his hands clenched,—“Say, Mercédès,” he said, “once for all, is this your final determination?”

“I love Edmond Dantès,” the young girl calmly replied, “and none but Edmond shall ever be my husband.”

“And you will always love him?”

“As long as I live.”

Fernand let fall his head like a defeated man, heaved a sigh that was like a groan, and then suddenly looking her full in the face, with clenched teeth and expanded nostrils, said,—“But if he is dead——”

“If he is dead, I shall die too.”

“If he has forgotten you——”

“Mercédès!” called a joyous voice from without,—“Mercédès!”

“Ah,” exclaimed the young girl, blushing with delight, and fairly leaping in excess of love, “you see he has not forgotten me, for here he is!” And rushing towards the door, she opened it, saying, “Here, Edmond, here I am!”

Fernand, pale and trembling, drew back, like a traveller at the sight of a serpent, and fell into a chair beside him. Edmond and Mercédès were clasped in each other’s arms. The burning Marseilles sun, which shot into the room through the open door, covered them with a flood of light. At first they saw nothing around them. Their intense happiness isolated them from all the rest of the world, and they only spoke in broken words, which are the tokens of a joy so extreme that they seem rather the expression of sorrow. Suddenly Edmond saw the gloomy, pale, and threatening countenance of Fernand, as it was defined in the shadow. By a movement for which he could scarcely account to himself, the young Catalan placed his hand on the knife at his belt.

“Ah, your pardon,” said Dantès, frowning in his turn; “I did not perceive that there were three of us.” Then, turning to Mercédès, he inquired, “Who is this gentleman?”

“One who will be your best friend, Dantès, for he is my friend, my cousin, my brother; it is Fernand—the man whom, after you, Edmond, I love the best in the world. Do you not remember him?”

“Yes!” said Dantès, and without relinquishing Mercédès’ hand clasped in one of his own, he extended the other to the Catalan with a cordial air. But Fernand, instead of responding to this amiable gesture, remained mute and trembling. Edmond then cast his eyes scrutinizingly at the agitated and embarrassed Mercédès, and then again on the gloomy and menacing Fernand. This look told him all, and his anger waxed hot.

“I did not know, when I came with such haste to you, that I was to meet an enemy here.”

“An enemy!” cried Mercédès, with an angry look at her cousin. “An enemy in my house, do you say, Edmond! If I believed that, I would place my arm under yours and go with you to Marseilles, leaving the house to return to it no more.”

Fernand’s eye darted lightning. “And should any misfortune occur to you, dear Edmond,” she continued with the same calmness which proved to Fernand that the young girl had read the very innermost depths of his sinister thought, “if misfortune should occur to you, I would ascend the highest point of the Cape de Morgiou and cast myself headlong from it.”

Fernand became deadly pale. “But you are deceived, Edmond,” she continued. “You have no enemy here—there is no one but Fernand, my brother, who will grasp your hand as a devoted friend.”

And at these words the young girl fixed her imperious look on the Catalan, who, as if fascinated by it, came slowly towards Edmond, and offered him his hand. His hatred, like a powerless though furious wave, was broken against the strong ascendancy which Mercédès exercised over him. Scarcely, however, had he touched Edmond’s hand when he felt he had done all he could do, and rushed hastily out of the house.

“Oh,” he exclaimed, running furiously and tearing his hair—“Oh, who will deliver me from this man? Wretched—wretched that I am!”

“Hallo, Catalan! Hallo, Fernand! where are you running to?” exclaimed a voice.

The young man stopped suddenly, looked around him, and perceived Caderousse sitting at table with Danglars, under an arbor.

“Well”, said Caderousse, “why don’t you come? Are you really in such a hurry that you have no time to pass the time of day with your friends?”

“Particularly when they have still a full bottle before them,” added Danglars. Fernand looked at them both with a stupefied air, but did not say a word.

“He seems besotted,” said Danglars, pushing Caderousse with his knee. “Are we mistaken, and is Dantès triumphant in spite of all we have believed?”

“Why, we must inquire into that,” was Caderousse’s reply; and turning towards the young man, said, “Well, Catalan, can’t you make up your mind?”

Fernand wiped away the perspiration steaming from his brow, and slowly entered the arbor, whose shade seemed to restore somewhat of calmness to his senses, and whose coolness somewhat of refreshment to his exhausted body.

“Good-day,” said he. “You called me, didn’t you?” And he fell, rather than sat down, on one of the seats which surrounded the table.

“I called you because you were running like a madman, and I was afraid you would throw yourself into the sea,” said Caderousse, laughing. “Why, when a man has friends, they are not only to offer him a glass of wine, but, moreover, to prevent his swallowing three or four pints of water unnecessarily!”

Fernand gave a groan, which resembled a sob, and dropped his head into his hands, his elbows leaning on the table.

“Well, Fernand, I must say,” said Caderousse, beginning the conversation, with that brutality of the common people in which curiosity destroys all diplomacy, “you look uncommonly like a rejected lover;” and he burst into a hoarse laugh.

“Bah!” said Danglars, “a lad of his make was not born to be unhappy in love. You are laughing at him, Caderousse.”

“No,” he replied, “only hark how he sighs! Come, come, Fernand,” said Caderousse, “hold up your head, and answer us. It’s not polite not to reply to friends who ask news of your health.”

“My health is well enough,” said Fernand, clenching his hands without raising his head.

“Ah, you see, Danglars,” said Caderousse, winking at his friend, “this is how it is; Fernand, whom you see here, is a good and brave Catalan, one of the best fishermen in Marseilles, and he is in love with a very fine girl, named Mercédès; but it appears, unfortunately, that the fine girl is in love with the mate of the _Pharaon_; and as the _Pharaon_ arrived today—why, you understand!”

“No; I do not understand,” said Danglars.

“Poor Fernand has been dismissed,” continued Caderousse.

“Well, and what then?” said Fernand, lifting up his head, and looking at Caderousse like a man who looks for someone on whom to vent his anger; “Mercédès is not accountable to any person, is she? Is she not free to love whomsoever she will?”

“Oh, if you take it in that sense,” said Caderousse, “it is another thing. But I thought you were a Catalan, and they told me the Catalans were not men to allow themselves to be supplanted by a rival. It was even told me that Fernand, especially, was terrible in his vengeance.”

Fernand smiled piteously. “A lover is never terrible,” he said.

“Poor fellow!” remarked Danglars, affecting to pity the young man from the bottom of his heart. “Why, you see, he did not expect to see Dantès return so suddenly—he thought he was dead, perhaps; or perchance faithless! These things always come on us more severely when they come suddenly.”

“Ah, _ma foi_, under any circumstances!” said Caderousse, who drank as he spoke, and on whom the fumes of the wine began to take effect,—“under any circumstances Fernand is not the only person put out by the fortunate arrival of Dantès; is he, Danglars?”

“No, you are right—and I should say that would bring him ill-luck.”

“Well, never mind,” answered Caderousse, pouring out a glass of wine for Fernand, and filling his own for the eighth or ninth time, while Danglars had merely sipped his. “Never mind—in the meantime he marries Mercédès—the lovely Mercédès—at least he returns to do that.”

During this time Danglars fixed his piercing glance on the young man, on whose heart Caderousse’s words fell like molten lead.

“And when is the wedding to be?” he asked.

“Oh, it is not yet fixed!” murmured Fernand.

“No, but it will be,” said Caderousse, “as surely as Dantès will be captain of the _Pharaon_—eh, Danglars?”

Danglars shuddered at this unexpected attack, and turned to Caderousse, whose countenance he scrutinized, to try and detect whether the blow was premeditated; but he read nothing but envy in a countenance already rendered brutal and stupid by drunkenness.

“Well,” said he, filling the glasses, “let us drink to Captain Edmond Dantès, husband of the beautiful Catalane!”

Caderousse raised his glass to his mouth with unsteady hand, and swallowed the contents at a gulp. Fernand dashed his on the ground.

“Eh, eh, eh!” stammered Caderousse. “What do I see down there by the wall, in the direction of the Catalans? Look, Fernand, your eyes are better than mine. I believe I see double. You know wine is a deceiver; but I should say it was two lovers walking side by side, and hand in hand. Heaven forgive me, they do not know that we can see them, and they are actually embracing!”

Danglars did not lose one pang that Fernand endured.

“Do you know them, Fernand?” he said.

“Yes,” was the reply, in a low voice. “It is Edmond and Mercédès!”

“Ah, see there, now!” said Caderousse; “and I did not recognize them! Hallo, Dantès! hello, lovely damsel! Come this way, and let us know when the wedding is to be, for Fernand here is so obstinate he will not tell us.”

“Hold your tongue, will you?” said Danglars, pretending to restrain Caderousse, who, with the tenacity of drunkards, leaned out of the arbor. “Try to stand upright, and let the lovers make love without interruption. See, look at Fernand, and follow his example; he is well-behaved!”

0051m

Fernand, probably excited beyond bearing, pricked by Danglars, as the bull is by the bandilleros, was about to rush out; for he had risen from his seat, and seemed to be collecting himself to dash headlong upon his rival, when Mercédès, smiling and graceful, lifted up her lovely head, and looked at them with her clear and bright eyes. At this Fernand recollected her threat of dying if Edmond died, and dropped again heavily on his seat. Danglars looked at the two men, one after the other, the one brutalized by liquor, the other overwhelmed with love.

“I shall get nothing from these fools,” he muttered; “and I am very much afraid of being here between a drunkard and a coward. Here’s an envious fellow making himself boozy on wine when he ought to be nursing his wrath, and here is a fool who sees the woman he loves stolen from under his nose and takes on like a big baby. Yet this Catalan has eyes that glisten like those of the vengeful Spaniards, Sicilians, and Calabrians, and the other has fists big enough to crush an ox at one blow. Unquestionably, Edmond’s star is in the ascendant, and he will marry the splendid girl—he will be captain, too, and laugh at us all, unless”—a sinister smile passed over Danglars’ lips—“unless I take a hand in the affair,” he added.

“Hallo!” continued Caderousse, half-rising, and with his fist on the table, “hallo, Edmond! do you not see your friends, or are you too proud to speak to them?”

“No, my dear fellow!” replied Dantès, “I am not proud, but I am happy, and happiness blinds, I think, more than pride.”

“Ah, very well, that’s an explanation!” said Caderousse. “How do you do, Madame Dantès?”

Mercédès courtesied gravely, and said—“That is not my name, and in my country it bodes ill fortune, they say, to call a young girl by the name of her betrothed before he becomes her husband. So call me Mercédès, if you please.”

“We must excuse our worthy neighbor, Caderousse,” said Dantès, “he is so easily mistaken.”

“So, then, the wedding is to take place immediately, M. Dantès,” said Danglars, bowing to the young couple.

“As soon as possible, M. Danglars; today all preliminaries will be arranged at my father’s, and tomorrow, or next day at latest, the wedding festival here at La Réserve. My friends will be there, I hope; that is to say, you are invited, M. Danglars, and you, Caderousse.”

“And Fernand,” said Caderousse with a chuckle; “Fernand, too, is invited!”

“My wife’s brother is my brother,” said Edmond; “and we, Mercédès and I, should be very sorry if he were absent at such a time.”

Fernand opened his mouth to reply, but his voice died on his lips, and he could not utter a word.

“Today the preliminaries, tomorrow or next day the ceremony! You are in a hurry, captain!”

“Danglars,” said Edmond, smiling, “I will say to you as Mercédès said just now to Caderousse, ‘Do not give me a title which does not belong to me’; that may bring me bad luck.”

“Your pardon,” replied Danglars, “I merely said you seemed in a hurry, and we have lots of time; the _Pharaon_ cannot be under weigh again in less than three months.”

“We are always in a hurry to be happy, M. Danglars; for when we have suffered a long time, we have great difficulty in believing in good fortune. But it is not selfishness alone that makes me thus in haste; I must go to Paris.”

“Ah, really?—to Paris! and will it be the first time you have ever been there, Dantès?”

“Yes.”

“Have you business there?”

“Not of my own; the last commission of poor Captain Leclere; you know to what I allude, Danglars—it is sacred. Besides, I shall only take the time to go and return.”

“Yes, yes, I understand,” said Danglars, and then in a low tone, he added, “To Paris, no doubt to deliver the letter which the grand marshal gave him. Ah, this letter gives me an idea—a capital idea! Ah; Dantès, my friend, you are not yet registered number one on board the good ship _Pharaon_;” then turning towards Edmond, who was walking away, “A pleasant journey,” he cried.

“Thank you,” said Edmond with a friendly nod, and the two lovers continued on their way, as calm and joyous as if they were the very elect of heaven.

Chapter 4. Conspiracy

Danglars followed Edmond and Mercédès with his eyes until the two lovers disappeared behind one of the angles of Fort Saint Nicolas; then, turning round, he perceived Fernand, who had fallen, pale and trembling, into his chair, while Caderousse stammered out the words of a drinking-song.

“Well, my dear sir,” said Danglars to Fernand, “here is a marriage which does not appear to make everybody happy.”

“It drives me to despair,” said Fernand.

“Do you, then, love Mercédès?”

“I adore her!”

“For long?”

“As long as I have known her—always.”

“And you sit there, tearing your hair, instead of seeking to remedy your condition; I did not think that was the way of your people.”

“What would you have me do?” said Fernand.

“How do I know? Is it my affair? I am not in love with Mademoiselle Mercédès; but for you—in the words of the gospel, seek, and you shall find.”

“I have found already.”

“What?”

“I would stab the man, but the woman told me that if any misfortune happened to her betrothed, she would kill herself.”

“Pooh! Women say those things, but never do them.”

“You do not know Mercédès; what she threatens she will do.”

“Idiot!” muttered Danglars; “whether she kill herself or not, what matter, provided Dantès is not captain?”

“Before Mercédès should die,” replied Fernand, with the accents of unshaken resolution, “I would die myself!”

“That’s what I call love!” said Caderousse with a voice more tipsy than ever. “That’s love, or I don’t know what love is.”

“Come,” said Danglars, “you appear to me a good sort of fellow, and hang me, I should like to help you, but——”

“Yes,” said Caderousse, “but how?”

“My dear fellow,” replied Danglars, “you are three parts drunk; finish the bottle, and you will be completely so. Drink then, and do not meddle with what we are discussing, for that requires all one’s wit and cool judgment.”

“I—drunk!” said Caderousse; “well that’s a good one! I could drink four more such bottles; they are no bigger than cologne flasks. Père Pamphile, more wine!”

And Caderousse rattled his glass upon the table.

“You were saying, sir——” said Fernand, awaiting with great anxiety the end of this interrupted remark.

“What was I saying? I forget. This drunken Caderousse has made me lose the thread of my sentence.”

“Drunk, if you like; so much the worse for those who fear wine, for it is because they have bad thoughts which they are afraid the liquor will extract from their hearts;” and Caderousse began to sing the two last lines of a song very popular at the time:

‘Tous les méchants sont buveurs d’eau;

C’est bien prouvé par le déluge.’1

“You said, sir, you would like to help me, but——”

“Yes; but I added, to help you it would be sufficient that Dantès did not marry her you love; and the marriage may easily be thwarted, methinks, and yet Dantès need not die.”

“Death alone can separate them,” remarked Fernand.

“You talk like a noodle, my friend,” said Caderousse; “and here is Danglars, who is a wide-awake, clever, deep fellow, who will prove to you that you are wrong. Prove it, Danglars. I have answered for you. Say there is no need why Dantès should die; it would, indeed, be a pity he should. Dantès is a good fellow; I like Dantès. Dantès, your health.”

Fernand rose impatiently. “Let him run on,” said Danglars, restraining the young man; “drunk as he is, he is not much out in what he says. Absence severs as well as death, and if the walls of a prison were between Edmond and Mercédès they would be as effectually separated as if he lay under a tombstone.”

0056m

“Yes; but one gets out of prison,” said Caderousse, who, with what sense was left him, listened eagerly to the conversation, “and when one gets out and one’s name is Edmond Dantès, one seeks revenge——”

“What matters that?” muttered Fernand.

“And why, I should like to know,” persisted Caderousse, “should they put Dantès in prison? he has neither robbed, nor killed, nor murdered.”

“Hold your tongue!” said Danglars.

“I won’t hold my tongue!” replied Caderousse; “I say I want to know why they should put Dantès in prison; I like Dantès; Dantès, your health!” and he swallowed another glass of wine.

0057m

Danglars saw in the muddled look of the tailor the progress of his intoxication, and turning towards Fernand, said, “Well, you understand there is no need to kill him.”

“Certainly not, if, as you said just now, you have the means of having Dantès arrested. Have you that means?”

“It is to be found for the searching. But why should I meddle in the matter? it is no affair of mine.”

“I know not why you meddle,” said Fernand, seizing his arm; “but this I know, you have some motive of personal hatred against Dantès, for he who himself hates is never mistaken in the sentiments of others.”

“I! motives of hatred against Dantès? None, on my word! I saw you were unhappy, and your unhappiness interested me; that’s all; but since you believe I act for my own account, adieu, my dear friend, get out of the affair as best you may;” and Danglars rose as if he meant to depart.

“No, no,” said Fernand, restraining him, “stay! It is of very little consequence to me at the end of the matter whether you have any angry feeling or not against Dantès. I hate him! I confess it openly. Do you find the means, I will execute it, provided it is not to kill the man, for Mercédès has declared she will kill herself if Dantès is killed.”

Caderousse, who had let his head drop on the table, now raised it, and looking at Fernand with his dull and fishy eyes, he said, “Kill Dantès! who talks of killing Dantès? I won’t have him killed—I won’t! He’s my friend, and this morning offered to share his money with me, as I shared mine with him. I won’t have Dantès killed—I won’t!”

“And who has said a word about killing him, muddlehead?” replied Danglars. “We were merely joking; drink to his health,” he added, filling Caderousse’s glass, “and do not interfere with us.”

“Yes, yes, Dantès’ good health!” said Caderousse, emptying his glass, “here’s to his health! his health—hurrah!”

“But the means—the means?” said Fernand.

“Have you not hit upon any?” asked Danglars.

“No!—you undertook to do so.”

“True,” replied Danglars; “the French have the superiority over the Spaniards, that the Spaniards ruminate, while the French invent.”

“Do you invent, then,” said Fernand impatiently.

“Waiter,” said Danglars, “pen, ink, and paper.”

“Pen, ink, and paper,” muttered Fernand.

“Yes; I am a supercargo; pen, ink, and paper are my tools, and without my tools I am fit for nothing.”

“Pen, ink, and paper, then,” called Fernand loudly.

“There’s what you want on that table,” said the waiter.

“Bring them here.” The waiter did as he was desired.

0059m

“When one thinks,” said Caderousse, letting his hand drop on the paper, “there is here wherewithal to kill a man more sure than if we waited at the corner of a wood to assassinate him! I have always had more dread of a pen, a bottle of ink, and a sheet of paper, than of a sword or pistol.”

“The fellow is not so drunk as he appears to be,” said Danglars. “Give him some more wine, Fernand.” Fernand filled Caderousse’s glass, who, like the confirmed toper he was, lifted his hand from the paper and seized the glass.

The Catalan watched him until Caderousse, almost overcome by this fresh assault on his senses, rested, or rather dropped, his glass upon the table.

“Well!” resumed the Catalan, as he saw the final glimmer of Caderousse’s reason vanishing before the last glass of wine.

“Well, then, I should say, for instance,” resumed Danglars, “that if after a voyage such as Dantès has just made, in which he touched at the Island of Elba, someone were to denounce him to the king’s procureur as a Bonapartist agent——”

“I will denounce him!” exclaimed the young man hastily.

“Yes, but they will make you then sign your declaration, and confront you with him you have denounced; I will supply you with the means of supporting your accusation, for I know the fact well. But Dantès cannot remain forever in prison, and one day or other he will leave it, and the day when he comes out, woe betide him who was the cause of his incarceration!”

“Oh, I should wish nothing better than that he would come and seek a quarrel with me.”

“Yes, and Mercédès! Mercédès, who will detest you if you have only the misfortune to scratch the skin of her dearly beloved Edmond!”

“True!” said Fernand.

“No, no,” continued Danglars; “if we resolve on such a step, it would be much better to take, as I now do, this pen, dip it into this ink, and write with the left hand (that the writing may not be recognized) the denunciation we propose.” And Danglars, uniting practice with theory, wrote with his left hand, and in a writing reversed from his usual style, and totally unlike it, the following lines, which he handed to Fernand, and which Fernand read in an undertone:

“The honorable, the king’s attorney, is informed by a friend of the throne and religion, that one Edmond Dantès, mate of the ship _Pharaon_, arrived this morning from Smyrna, after having touched at Naples and Porto-Ferrajo, has been intrusted by Murat with a letter for the usurper, and by the usurper with a letter for the Bonapartist committee in Paris. Proof of this crime will be found on arresting him, for the letter will be found upon him, or at his father’s, or in his cabin on board the _Pharaon_.”

“Very good,” resumed Danglars; “now your revenge looks like common sense, for in no way can it revert to yourself, and the matter will thus work its own way; there is nothing to do now but fold the letter as I am doing, and write upon it, ‘To the king’s attorney,’ and that’s all settled.” And Danglars wrote the address as he spoke.

“Yes, and that’s all settled!” exclaimed Caderousse, who, by a last effort of intellect, had followed the reading of the letter, and instinctively comprehended all the misery which such a denunciation must entail. “Yes, and that’s all settled; only it will be an infamous shame;” and he stretched out his hand to reach the letter.

“Yes,” said Danglars, taking it from beyond his reach; “and as what I say and do is merely in jest, and I, amongst the first and foremost, should be sorry if anything happened to Dantès—the worthy Dantès—look here!” And taking the letter, he squeezed it up in his hands and threw it into a corner of the arbor.

“All right!” said Caderousse. “Dantès is my friend, and I won’t have him ill-used.”

“And who thinks of using him ill? Certainly neither I nor Fernand,” said Danglars, rising and looking at the young man, who still remained seated, but whose eye was fixed on the denunciatory sheet of paper flung into the corner.

“In this case,” replied Caderousse, “let’s have some more wine. I wish to drink to the health of Edmond and the lovely Mercédès.”

“You have had too much already, drunkard,” said Danglars; “and if you continue, you will be compelled to sleep here, because unable to stand on your legs.”

“I?” said Caderousse, rising with all the offended dignity of a drunken man, “I can’t keep on my legs? Why, I’ll wager I can go up into the belfry of the Accoules, and without staggering, too!”

“Done!” said Danglars, “I’ll take your bet; but tomorrow—today it is time to return. Give me your arm, and let us go.”

“Very well, let us go,” said Caderousse; “but I don’t want your arm at all. Come, Fernand, won’t you return to Marseilles with us?”

“No,” said Fernand; “I shall return to the Catalans.”

“You’re wrong. Come with us to Marseilles—come along.”

“I will not.”

“What do you mean? you will not? Well, just as you like, my prince; there’s liberty for all the world. Come along, Danglars, and let the young gentleman return to the Catalans if he chooses.”

Danglars took advantage of Caderousse’s temper at the moment, to take him off towards Marseilles by the Porte Saint-Victor, staggering as he went.

When they had advanced about twenty yards, Danglars looked back and saw Fernand stoop, pick up the crumpled paper, and putting it into his pocket then rush out of the arbor towards Pillon.

“Well,” said Caderousse, “why, what a lie he told! He said he was going to the Catalans, and he is going to the city. Hallo, Fernand! You are coming, my boy!”

“Oh, you don’t see straight,” said Danglars; “he’s gone right by the road to the Vieilles Infirmeries.”

“Well,” said Caderousse, “I should have sworn that he turned to the right—how treacherous wine is!”

“Come, come,” said Danglars to himself, “now the thing is at work and it will effect its purpose unassisted.”

Chapter 5. The Marriage Feast

The morning’s sun rose clear and resplendent, touching the foamy waves into a network of ruby-tinted light.

The feast had been made ready on the second floor at La Réserve, with whose arbor the reader is already familiar. The apartment destined for the purpose was spacious and lighted by a number of windows, over each of which was written in golden letters for some inexplicable reason the name of one of the principal cities of France; beneath these windows a wooden balcony extended the entire length of the house. And although the entertainment was fixed for twelve o’clock, an hour previous to that time the balcony was filled with impatient and expectant guests, consisting of the favored part of the crew of the _Pharaon_, and other personal friends of the bridegroom, the whole of whom had arrayed themselves in their choicest costumes, in order to do greater honor to the occasion.

Various rumors were afloat to the effect that the owners of the _Pharaon_ had promised to attend the nuptial feast; but all seemed unanimous in doubting that an act of such rare and exceeding condescension could possibly be intended.

Danglars, however, who now made his appearance, accompanied by Caderousse, effectually confirmed the report, stating that he had recently conversed with M. Morrel, who had himself assured him of his intention to dine at La Réserve.

In fact, a moment later M. Morrel appeared and was saluted with an enthusiastic burst of applause from the crew of the _Pharaon_, who hailed the visit of the shipowner as a sure indication that the man whose wedding feast he thus delighted to honor would ere long be first in command of the ship; and as Dantès was universally beloved on board his vessel, the sailors put no restraint on their tumultuous joy at finding that the opinion and choice of their superiors so exactly coincided with their own.

With the entrance of M. Morrel, Danglars and Caderousse were despatched in search of the bridegroom to convey to him the intelligence of the arrival of the important personage whose coming had created such a lively sensation, and to beseech him to make haste.

Danglars and Caderousse set off upon their errand at full speed; but ere they had gone many steps they perceived a group advancing towards them, composed of the betrothed pair, a party of young girls in attendance on the bride, by whose side walked Dantès’ father; the whole brought up by Fernand, whose lips wore their usual sinister smile.

Neither Mercédès nor Edmond observed the strange expression of his countenance; they were so happy that they were conscious only of the sunshine and the presence of each other.

Having acquitted themselves of their errand, and exchanged a hearty shake of the hand with Edmond, Danglars and Caderousse took their places beside Fernand and old Dantès,—the latter of whom attracted universal notice.

The old man was attired in a suit of glistening watered silk, trimmed with steel buttons, beautifully cut and polished. His thin but wiry legs were arrayed in a pair of richly embroidered clocked stockings, evidently of English manufacture, while from his three-cornered hat depended a long streaming knot of white and blue ribbons. Thus he came along, supporting himself on a curiously carved stick, his aged countenance lit up with happiness, looking for all the world like one of the aged dandies of 1796, parading the newly opened gardens of the Luxembourg and Tuileries.

Beside him glided Caderousse, whose desire to partake of the good things provided for the wedding party had induced him to become reconciled to the Dantès, father and son, although there still lingered in his mind a faint and unperfect recollection of the events of the preceding night; just as the brain retains on waking in the morning the dim and misty outline of a dream.

0065m

As Danglars approached the disappointed lover, he cast on him a look of deep meaning, while Fernand, as he slowly paced behind the happy pair, who seemed, in their own unmixed content, to have entirely forgotten that such a being as himself existed, was pale and abstracted; occasionally, however, a deep flush would overspread his countenance, and a nervous contraction distort his features, while, with an agitated and restless gaze, he would glance in the direction of Marseilles, like one who either anticipated or foresaw some great and important event.

Dantès himself was simply, but becomingly, clad in the dress peculiar to the merchant service—a costume somewhat between a military and a civil garb; and with his fine countenance, radiant with joy and happiness, a more perfect specimen of manly beauty could scarcely be imagined.

Lovely as the Greek girls of Cyprus or Chios, Mercédès boasted the same bright flashing eyes of jet, and ripe, round, coral lips. She moved with the light, free step of an Arlesienne or an Andalusian. One more practiced in the arts of great cities would have hid her blushes beneath a veil, or, at least, have cast down her thickly fringed lashes, so as to have concealed the liquid lustre of her animated eyes; but, on the contrary, the delighted girl looked around her with a smile that seemed to say: “If you are my friends, rejoice with me, for I am very happy.”

As soon as the bridal party came in sight of La Réserve, M. Morrel descended and came forth to meet it, followed by the soldiers and sailors there assembled, to whom he had repeated the promise already given, that Dantès should be the successor to the late Captain Leclere. Edmond, at the approach of his patron, respectfully placed the arm of his affianced bride within that of M. Morrel, who, forthwith conducting her up the flight of wooden steps leading to the chamber in which the feast was prepared, was gayly followed by the guests, beneath whose heavy tread the slight structure creaked and groaned for the space of several minutes.

“Father,” said Mercédès, stopping when she had reached the centre of the table, “sit, I pray you, on my right hand; on my left I will place him who has ever been as a brother to me,” pointing with a soft and gentle smile to Fernand; but her words and look seemed to inflict the direst torture on him, for his lips became ghastly pale, and even beneath the dark hue of his complexion the blood might be seen retreating as though some sudden pang drove it back to the heart.

During this time, Dantès, at the opposite side of the table, had been occupied in similarly placing his most honored guests. M. Morrel was seated at his right hand, Danglars at his left; while, at a sign from Edmond, the rest of the company ranged themselves as they found it most agreeable.

Then they began to pass around the dusky, piquant, Arlesian sausages, and lobsters in their dazzling red cuirasses, prawns of large size and brilliant color, the echinus with its prickly outside and dainty morsel within, the clovis, esteemed by the epicures of the South as more than rivalling the exquisite flavor of the oyster, North. All the delicacies, in fact, that are cast up by the wash of waters on the sandy beach, and styled by the grateful fishermen “fruits of the sea.”

“A pretty silence truly!” said the old father of the bridegroom, as he carried to his lips a glass of wine of the hue and brightness of the topaz, and which had just been placed before Mercédès herself. “Now, would anybody think that this room contained a happy, merry party, who desire nothing better than to laugh and dance the hours away?”

“Ah,” sighed Caderousse, “a man cannot always feel happy because he is about to be married.”

“The truth is,” replied Dantès, “that I am too happy for noisy mirth; if that is what you meant by your observation, my worthy friend, you are right; joy takes a strange effect at times, it seems to oppress us almost the same as sorrow.”

Danglars looked towards Fernand, whose excitable nature received and betrayed each fresh impression.

“Why, what ails you?” asked he of Edmond. “Do you fear any approaching evil? I should say that you were the happiest man alive at this instant.”

“And that is the very thing that alarms me,” returned Dantès. “Man does not appear to me to be intended to enjoy felicity so unmixed; happiness is like the enchanted palaces we read of in our childhood, where fierce, fiery dragons defend the entrance and approach; and monsters of all shapes and kinds, requiring to be overcome ere victory is ours. I own that I am lost in wonder to find myself promoted to an honor of which I feel myself unworthy—that of being the husband of Mercédès.”

“Nay, nay!” cried Caderousse, smiling, “you have not attained that honor yet. Mercédès is not yet your wife. Just assume the tone and manner of a husband, and see how she will remind you that your hour is not yet come!”

The bride blushed, while Fernand, restless and uneasy, seemed to start at every fresh sound, and from time to time wiped away the large drops of perspiration that gathered on his brow.

“Well, never mind that, neighbor Caderousse; it is not worthwhile to contradict me for such a trifle as that. ’Tis true that Mercédès is not actually my wife; but,” added he, drawing out his watch, “in an hour and a half she will be.”

A general exclamation of surprise ran round the table, with the exception of the elder Dantès, whose laugh displayed the still perfect beauty of his large white teeth. Mercédès looked pleased and gratified, while Fernand grasped the handle of his knife with a convulsive clutch.

“In an hour?” inquired Danglars, turning pale. “How is that, my friend?”

“Why, thus it is,” replied Dantès. “Thanks to the influence of M. Morrel, to whom, next to my father, I owe every blessing I enjoy, every difficulty has been removed. We have purchased permission to waive the usual delay; and at half-past two o’clock the Mayor of Marseilles will be waiting for us at the city hall. Now, as a quarter-past one has already struck, I do not consider I have asserted too much in saying, that, in another hour and thirty minutes Mercédès will have become Madame Dantès.”

0069m

Fernand closed his eyes, a burning sensation passed across his brow, and he was compelled to support himself by the table to prevent his falling from his chair; but in spite of all his efforts, he could not refrain from uttering a deep groan, which, however, was lost amid the noisy felicitations of the company.

“Upon my word,” cried the old man, “you make short work of this kind of affair. Arrived here only yesterday morning, and married today at three o’clock! Commend me to a sailor for going the quick way to work!”

“But,” asked Danglars, in a timid tone, “how did you manage about the other formalities—the contract—the settlement?”

“The contract,” answered Dantès, laughingly, “it didn’t take long to fix that. Mercédès has no fortune; I have none to settle on her. So, you see, our papers were quickly written out, and certainly do not come very expensive.” This joke elicited a fresh burst of applause.

“So that what we presumed to be merely the betrothal feast turns out to be the actual wedding dinner!” said Danglars.

“No, no,” answered Dantès; “don’t imagine I am going to put you off in that shabby manner. Tomorrow morning I start for Paris; four days to go, and the same to return, with one day to discharge the commission entrusted to me, is all the time I shall be absent. I shall be back here by the first of March, and on the second I give my real marriage feast.”

This prospect of fresh festivity redoubled the hilarity of the guests to such a degree, that the elder Dantès, who, at the commencement of the repast, had commented upon the silence that prevailed, now found it difficult, amid the general din of voices, to obtain a moment’s tranquillity in which to drink to the health and prosperity of the bride and bridegroom.

Dantès, perceiving the affectionate eagerness of his father, responded by a look of grateful pleasure; while Mercédès glanced at the clock and made an expressive gesture to Edmond.

Around the table reigned that noisy hilarity which usually prevails at such a time among people sufficiently free from the demands of social position not to feel the trammels of etiquette. Such as at the commencement of the repast had not been able to seat themselves according to their inclination rose unceremoniously, and sought out more agreeable companions. Everybody talked at once, without waiting for a reply and each one seemed to be contented with expressing his or her own thoughts.

Fernand’s paleness appeared to have communicated itself to Danglars. As for Fernand himself, he seemed to be enduring the tortures of the damned; unable to rest, he was among the first to quit the table, and, as though seeking to avoid the hilarious mirth that rose in such deafening sounds, he continued, in utter silence, to pace the farther end of the salon.

Caderousse approached him just as Danglars, whom Fernand seemed most anxious to avoid, had joined him in a corner of the room.

“Upon my word,” said Caderousse, from whose mind the friendly treatment of Dantès, united with the effect of the excellent wine he had partaken of, had effaced every feeling of envy or jealousy at Dantès’ good fortune,—“upon my word, Dantès is a downright good fellow, and when I see him sitting there beside his pretty wife that is so soon to be. I cannot help thinking it would have been a great pity to have served him that trick you were planning yesterday.”

“Oh, there was no harm meant,” answered Danglars; “at first I certainly did feel somewhat uneasy as to what Fernand might be tempted to do; but when I saw how completely he had mastered his feelings, even so far as to become one of his rival’s attendants,

I knew there was no further cause for apprehension.” Caderousse looked full at Fernand—he was ghastly pale.

“Certainly,” continued Danglars, “the sacrifice was no trifling one, when the beauty of the bride is concerned. Upon my soul, that future captain of mine is a lucky dog! Gad! I only wish he would let me take his place.”

“Shall we not set forth?” asked the sweet, silvery voice of Mercédès; “two o’clock has just struck, and you know we are expected in a quarter of an hour.”

0071m

“To be sure!—to be sure!” cried Dantès, eagerly quitting the table; “let us go directly!”

His words were re-echoed by the whole party, with vociferous cheers.

At this moment Danglars, who had been incessantly observing every change in Fernand’s look and manner, saw him stagger and fall back, with an almost convulsive spasm, against a seat placed near one of the open windows. At the same instant his ear caught a sort of indistinct sound on the stairs, followed by the measured tread of soldiery, with the clanking of swords and military accoutrements; then came a hum and buzz as of many voices, so as to deaden even the noisy mirth of the bridal party, among whom a vague feeling of curiosity and apprehension quelled every disposition to talk, and almost instantaneously the most deathlike stillness prevailed.

The sounds drew nearer. Three blows were struck upon the panel of the door. The company looked at each other in consternation.

“I demand admittance,” said a loud voice outside the room, “in the name of the law!” As no attempt was made to prevent it, the door was opened, and a magistrate, wearing his official scarf, presented himself, followed by four soldiers and a corporal. Uneasiness now yielded to the most extreme dread on the part of those present.

“May I venture to inquire the reason of this unexpected visit?” said M. Morrel, addressing the magistrate, whom he evidently knew; “there is doubtless some mistake easily explained.”

“If it be so,” replied the magistrate, “rely upon every reparation being made; meanwhile, I am the bearer of an order of arrest, and although I most reluctantly perform the task assigned me, it must, nevertheless, be fulfilled. Who among the persons here assembled answers to the name of Edmond Dantès?”

Every eye was turned towards the young man who, spite of the agitation he could not but feel, advanced with dignity, and said, in a firm voice:

“I am he; what is your pleasure with me?”

“Edmond Dantès,” replied the magistrate, “I arrest you in the name of the law!”

“Me!” repeated Edmond, slightly changing color, “and wherefore, I pray?”

“I cannot inform you, but you will be duly acquainted with the reasons that have rendered such a step necessary at the preliminary examination.”

M. Morrel felt that further resistance or remonstrance was useless. He saw before him an officer delegated to enforce the law, and perfectly well knew that it would be as unavailing to seek pity from a magistrate decked with his official scarf, as to address a petition to some cold marble effigy. Old Dantès, however, sprang forward. There are situations which the heart of a father or a mother cannot be made to understand. He prayed and supplicated in terms so moving, that even the officer was touched, and, although firm in his duty, he kindly said, “My worthy friend, let me beg of you to calm your apprehensions. Your son has probably neglected some prescribed form or attention in registering his cargo, and it is more than probable he will be set at liberty directly he has given the information required, whether touching the health of his crew, or the value of his freight.”

“What is the meaning of all this?” inquired Caderousse, frowningly, of Danglars, who had assumed an air of utter surprise.

0073m

“How can I tell you?” replied he; “I am, like yourself, utterly bewildered at all that is going on, and cannot in the least make out what it is about.” Caderousse then looked around for Fernand, but he had disappeared.

The scene of the previous night now came back to his mind with startling clearness. The painful catastrophe he had just witnessed appeared effectually to have rent away the veil which the intoxication of the evening before had raised between himself and his memory.

“So, so,” said he, in a hoarse and choking voice, to Danglars, “this, then, I suppose, is a part of the trick you were concerting yesterday? All I can say is, that if it be so, ’tis an ill turn, and well deserves to bring double evil on those who have projected it.”

“Nonsense,” returned Danglars, “I tell you again I have nothing whatever to do with it; besides, you know very well that I tore the paper to pieces.”

“No, you did not!” answered Caderousse, “you merely threw it by—I saw it lying in a corner.”

“Hold your tongue, you fool!—what should you know about it?—why, you were drunk!”

“Where is Fernand?” inquired Caderousse.

“How do I know?” replied Danglars; “gone, as every prudent man ought to be, to look after his own affairs, most likely. Never mind where he is, let you and I go and see what is to be done for our poor friends.”

During this conversation, Dantès, after having exchanged a cheerful shake of the hand with all his sympathizing friends, had surrendered himself to the officer sent to arrest him, merely saying, “Make yourselves quite easy, my good fellows, there is some little mistake to clear up, that’s all, depend upon it; and very likely I may not have to go so far as the prison to effect that.”

0075m

“Oh, to be sure!” responded Danglars, who had now approached the group, “nothing more than a mistake, I feel quite certain.”

Dantès descended the staircase, preceded by the magistrate, and followed by the soldiers. A carriage awaited him at the door; he got in, followed by two soldiers and the magistrate, and the vehicle drove off towards Marseilles.

“Adieu, adieu, dearest Edmond!” cried Mercédès, stretching out her arms to him from the balcony.

The prisoner heard the cry, which sounded like the sob of a broken heart, and leaning from the coach he called out, “Good-bye, Mercédès—we shall soon meet again!” Then the vehicle disappeared round one of the turnings of Fort Saint Nicholas.

“Wait for me here, all of you!” cried M. Morrel; “I will take the first conveyance I find, and hurry to Marseilles, whence I will bring you word how all is going on.”

“That’s right!” exclaimed a multitude of voices, “go, and return as quickly as you can!”

This second departure was followed by a long and fearful state of terrified silence on the part of those who were left behind. The old father and Mercédès remained for some time apart, each absorbed in grief; but at length the two poor victims of the same blow raised their eyes, and with a simultaneous burst of feeling rushed into each other’s arms.

Meanwhile Fernand made his appearance, poured out for himself a glass of water with a trembling hand; then hastily swallowing it, went to sit down at the first vacant place, and this was, by mere chance, placed next to the seat on which poor Mercédès had fallen half fainting, when released from the warm and affectionate embrace of old Dantès. Instinctively Fernand drew back his chair.

“He is the cause of all this misery—I am quite sure of it,” whispered Caderousse, who had never taken his eyes off Fernand, to Danglars.

“I don’t think so,” answered the other; “he’s too stupid to imagine such a scheme. I only hope the mischief will fall upon the head of whoever wrought it.”

“You don’t mention those who aided and abetted the deed,” said Caderousse.

“Surely,” answered Danglars, “one cannot be held responsible for every chance arrow shot into the air.”

“You can, indeed, when the arrow lights point downward on somebody’s head.”

Meantime the subject of the arrest was being canvassed in every different form.

“What think you, Danglars,” said one of the party, turning towards him, “of this event?”

“Why,” replied he, “I think it just possible Dantès may have been detected with some trifling article on board ship considered here as contraband.”

“But how could he have done so without your knowledge, Danglars, since you are the ship’s supercargo?”

“Why, as for that, I could only know what I was told respecting the merchandise with which the vessel was laden. I know she was loaded with cotton, and that she took in her freight at Alexandria from Pastret’s warehouse, and at Smyrna from Pascal’s; that is all I was obliged to know, and I beg I may not be asked for any further particulars.”

“Now I recollect,” said the afflicted old father; “my poor boy told me yesterday he had got a small case of coffee, and another of tobacco for me!”

“There, you see,” exclaimed Danglars. “Now the mischief is out; depend upon it the custom-house people went rummaging about the ship in our absence, and discovered poor Dantès’ hidden treasures.”

Mercédès, however, paid no heed to this explanation of her lover’s arrest. Her grief, which she had hitherto tried to restrain, now burst out in a violent fit of hysterical sobbing.

“Come, come,” said the old man, “be comforted, my poor child; there is still hope!”

“Hope!” repeated Danglars.

“Hope!” faintly murmured Fernand, but the word seemed to die away on his pale agitated lips, and a convulsive spasm passed over his countenance.

“Good news! good news!” shouted forth one of the party stationed in the balcony on the lookout. “Here comes M. Morrel back. No doubt, now, we shall hear that our friend is released!”

Mercédès and the old man rushed to meet the shipowner and greeted him at the door. He was very pale.

“What news?” exclaimed a general burst of voices.

“Alas, my friends,” replied M. Morrel, with a mournful shake of his head, “the thing has assumed a more serious aspect than I expected.”

“Oh, indeed—indeed, sir, he is innocent!” sobbed forth Mercédès.

“That I believe!” answered M. Morrel; “but still he is charged——”

“With what?” inquired the elder Dantès.

“With being an agent of the Bonapartist faction!” Many of our readers may be able to recollect how formidable such an accusation became in the period at which our story is dated.

A despairing cry escaped the pale lips of Mercédès; the old man sank into a chair.

“Ah, Danglars!” whispered Caderousse, “you have deceived me—the trick you spoke of last night has been played; but I cannot suffer a poor old man or an innocent girl to die of grief through your fault. I am determined to tell them all about it.”

“Be silent, you simpleton!” cried Danglars, grasping him by the arm, “or I will not answer even for your own safety. Who can tell whether Dantès be innocent or guilty? The vessel did touch at Elba, where he quitted it, and passed a whole day in the island. Now, should any letters or other documents of a compromising character be found upon him, will it not be taken for granted that all who uphold him are his accomplices?”

With the rapid instinct of selfishness, Caderousse readily perceived the solidity of this mode of reasoning; he gazed, doubtfully, wistfully, on Danglars, and then caution supplanted generosity.

“Suppose we wait a while, and see what comes of it,” said he, casting a bewildered look on his companion.

“To be sure!” answered Danglars. “Let us wait, by all means. If he be innocent, of course he will be set at liberty; if guilty, why, it is no use involving ourselves in a conspiracy.”

“Let us go, then. I cannot stay here any longer.”

“With all my heart!” replied Danglars, pleased to find the other so tractable. “Let us take ourselves out of the way, and leave things for the present to take their course.”

After their departure, Fernand, who had now again become the friend and protector of Mercédès, led the girl to her home, while some friends of Dantès conducted his father, nearly lifeless, to the Allées de Meilhan.

The rumor of Edmond’s arrest as a Bonapartist agent was not slow in circulating throughout the city.

“Could you ever have credited such a thing, my dear Danglars?” asked M. Morrel, as, on his return to the port for the purpose of gleaning fresh tidings of Dantès, from M. de Villefort, the assistant procureur, he overtook his supercargo and Caderousse. “Could you have believed such a thing possible?”

“Why, you know I told you,” replied Danglars, “that I considered the circumstance of his having anchored at the Island of Elba as a very suspicious circumstance.”

“And did you mention these suspicions to any person beside myself?”

0079m

“Certainly not!” returned Danglars. Then added in a low whisper, “You understand that, on account of your uncle, M. Policar Morrel, who served under the _other_ government, and who does not altogether conceal what he thinks on the subject, you are strongly suspected of regretting the abdication of Napoleon. I should have feared to injure both Edmond and yourself, had I divulged my own apprehensions to a soul. I am too well aware that though a subordinate, like myself, is bound to acquaint the shipowner with everything that occurs, there are many things he ought most carefully to conceal from all else.”

“’Tis well, Danglars—’tis well!” replied M. Morrel. “You are a worthy fellow; and I had already thought of your interests in the event of poor Edmond having become captain of the _Pharaon_.”

“Is it possible you were so kind?”

“Yes, indeed; I had previously inquired of Dantès what was his opinion of you, and if he should have any reluctance to continue you in your post, for somehow I have perceived a sort of coolness between you.”

“And what was his reply?”

“That he certainly did think he had given you offence in an affair which he merely referred to without entering into particulars, but that whoever possessed the good opinion and confidence of the ship’s owners would have his preference also.”

“The hypocrite!” murmured Danglars.

“Poor Dantès!” said Caderousse. “No one can deny his being a noble-hearted young fellow.”

“But meanwhile,” continued M. Morrel, “here is the _Pharaon_ without a captain.”

“Oh,” replied Danglars, “since we cannot leave this port for the next three months, let us hope that ere the expiration of that period Dantès will be set at liberty.”

“No doubt; but in the meantime?”

“I am entirely at your service, M. Morrel,” answered Danglars. “You know that I am as capable of managing a ship as the most experienced captain in the service; and it will be so far advantageous to you to accept my services, that upon Edmond’s release from prison no further change will be requisite on board the _Pharaon_ than for Dantès and myself each to resume our respective posts.”

“Thanks, Danglars—that will smooth over all difficulties. I fully authorize you at once to assume the command of the _Pharaon_, and look carefully to the unloading of her freight. Private misfortunes must never be allowed to interfere with business.”

“Be easy on that score, M. Morrel; but do you think we shall be permitted to see our poor Edmond?”

“I will let you know that directly I have seen M. de Villefort, whom I shall endeavor to interest in Edmond’s favor. I am aware he is a furious royalist; but, in spite of that, and of his being king’s attorney, he is a man like ourselves, and I fancy not a bad sort of one.”

“Perhaps not,” replied Danglars; “but I hear that he is ambitious, and that’s rather against him.”

“Well, well,” returned M. Morrel, “we shall see. But now hasten on board, I will join you there ere long.”

So saying, the worthy shipowner quitted the two allies, and proceeded in the direction of the Palais de Justice.

0081m

“You see,” said Danglars, addressing Caderousse, “the turn things have taken. Do you still feel any desire to stand up in his defence?”

“Not the slightest, but yet it seems to me a shocking thing that a mere joke should lead to such consequences.”

“But who perpetrated that joke, let me ask? neither you nor myself, but Fernand; you knew very well that I threw the paper into a corner of the room—indeed, I fancied I had destroyed it.”

“Oh, no,” replied Caderousse, “that I can answer for, you did not. I only wish I could see it now as plainly as I saw it lying all crushed and crumpled in a corner of the arbor.”

“Well, then, if you did, depend upon it, Fernand picked it up, and either copied it or caused it to be copied; perhaps, even, he did not take the trouble of recopying it. And now I think of it, by Heavens, he may have sent the letter itself! Fortunately, for me, the handwriting was disguised.”

“Then you were aware of Dantès being engaged in a conspiracy?”

“Not I. As I before said, I thought the whole thing was a joke, nothing more. It seems, however, that I have unconsciously stumbled upon the truth.”

“Still,” argued Caderousse, “I would give a great deal if nothing of the kind had happened; or, at least, that I had had no hand in it. You will see, Danglars, that it will turn out an unlucky job for both of us.”

“Nonsense! If any harm come of it, it should fall on the guilty person; and that, you know, is Fernand. How can we be implicated in any way? All we have got to do is, to keep our own counsel, and remain perfectly quiet, not breathing a word to any living soul; and you will see that the storm will pass away without in the least affecting us.”

“Amen!” responded Caderousse, waving his hand in token of adieu to Danglars, and bending his steps towards the Allées de Meilhan, moving his head to and fro, and muttering as he went, after the manner of one whose mind was overcharged with one absorbing idea.

“So far, then,” said Danglars, mentally, “all has gone as I would have it. I am, temporarily, commander of the _Pharaon_, with the certainty of being permanently so, if that fool of a Caderousse can be persuaded to hold his tongue. My only fear is the chance of Dantès being released. But, there, he is in the hands of Justice; and,” added he with a smile, “she will take her own.” So saying, he leaped into a boat, desiring to be rowed on board the _Pharaon_, where M. Morrel had agreed to meet him.

Chapter 6. The Deputy Procureur du Roi

In one of the aristocratic mansions built by Puget in the Rue du Grand Cours opposite the Medusa fountain, a second marriage feast was being celebrated, almost at the same hour with the nuptial repast given by Dantès. In this case, however, although the occasion of the entertainment was similar, the company was strikingly dissimilar. Instead of a rude mixture of sailors, soldiers, and those belonging to the humblest grade of life, the present assembly was composed of the very flower of Marseilles society,—magistrates who had resigned their office during the usurper’s reign; officers who had deserted from the imperial army

and joined forces with Condé; and younger members of families, brought up to hate and execrate the man whom five years of exile would convert into a martyr, and fifteen of restoration elevate to the rank of a god.

The guests were still at table, and the heated and energetic conversation that prevailed betrayed the violent and vindictive passions that then agitated each dweller of the South, where unhappily, for five centuries religious strife had long given increased bitterness to the violence of party feeling.

The emperor, now king of the petty Island of Elba, after having held sovereign sway over one-half of the world, counting as his subjects a small population of five or six thousand souls,—after having been accustomed to hear the "_Vive Napoléons_" of a hundred and twenty millions of human beings, uttered in ten different languages,—was looked upon here as a ruined man, separated forever from any fresh connection with France or claim to her throne.

The magistrates freely discussed their political views; the military part of the company talked unreservedly of Moscow and Leipsic, while the women commented on the divorce of Josephine. It was not over the downfall of the man, but over the defeat of the Napoleonic idea, that they rejoiced, and in this they foresaw for themselves the bright and cheering prospect of a revivified political existence.

An old man, decorated with the cross of Saint Louis, now rose and proposed the health of King Louis XVIII. It was the Marquis de Saint-Méran. This toast, recalling at once the patient exile of Hartwell and the peace-loving King of France, excited universal enthusiasm; glasses were elevated in the air _à l'Anglaise_, and the ladies, snatching their bouquets from their fair bosoms, strewed the table with their floral treasures. In a word, an almost poetical fervor prevailed.

"Ah," said the Marquise de Saint-Méran, a woman with a stern, forbidding eye, though still noble and distinguished in appearance, despite her fifty years—"ah, these revolutionists, who have driven us from those very possessions they afterwards purchased for a mere trifle during the Reign of Terror, would be compelled to own, were they here, that all true devotion was on our side, since we were content to follow the fortunes of a falling monarch, while they, on the contrary, made their fortune by worshipping the rising sun; yes, yes, they could not help admitting that the king, for whom we sacrificed rank, wealth, and station was truly our 'Louis the well-beloved,' while their wretched usurper has been, and ever will be, to them their evil genius, their 'Napoleon the accursed.' Am I not right, Villefort?"

"I beg your pardon, madame. I really must pray you to excuse me, but—in truth—I was not attending to the conversation."

"Marquise, marquise!" interposed the old nobleman who had proposed the toast, "let the young people alone; let me tell you, on one's wedding day there are more agreeable subjects of conversation than dry politics."

"Never mind, dearest mother," said a young and lovely girl, with a profusion of light brown hair, and eyes that seemed to float in liquid crystal, "'tis all my fault for seizing upon M. de Villefort, so as to prevent his listening to what you said. But there—now take him—he is your own for as long as you like. M. Villefort, I beg to remind you my mother speaks to you."

"If the marquise will deign to repeat the words I but imperfectly caught, I shall be delighted to answer," said M. de Villefort.

"Never mind, Renée," replied the marquise, with a look of tenderness that seemed out of keeping with her harsh dry features; but, however all other feelings may be withered in a woman's nature, there is always one bright smiling spot in the desert of her heart, and that is the shrine of maternal love. "I forgive you. What I was saying, Villefort, was, that the Bonapartists had not our sincerity, enthusiasm, or devotion."

"They had, however, what supplied the place of those fine qualities," replied the young man, "and that was fanaticism. Napoleon is the Mahomet of the West, and is worshipped by his commonplace but ambitious followers, not only as a leader and lawgiver, but also as the personification of equality."

"He!" cried the marquise: "Napoleon the type of equality! For mercy's sake, then, what would you call Robespierre? Come, come, do not strip the latter of his just rights to bestow them on the Corsican, who, to my mind, has usurped quite enough."

0085m

"Nay, madame; I would place each of these heroes on his right pedestal—that of Robespierre on his scaffold in the Place Louis Quinze; that of Napoleon on the column of the Place Vendôme. The only difference consists in the opposite character of the

equality advocated by these two men; one is the equality that elevates, the other is the equality that degrades; one brings a king within reach of the guillotine, the other elevates the people to a level with the throne. Observe," said Villefort, smiling, "I do not mean to deny that both these men were revolutionary scoundrels, and that the 9th Thermidor and the 4th of April, in the year 1814, were lucky days for France, worthy of being gratefully remembered by every friend to monarchy and civil order; and that explains how it comes to pass that, fallen, as I trust he is forever, Napoleon has still retained a train of parasitical satellites. Still, marquise, it has been so with other usurpers—Cromwell, for instance, who was not half so bad as Napoleon, had his partisans and advocates."

"Do you know, Villefort, that you are talking in a most dreadfully revolutionary strain? But I excuse it, it is impossible to expect the son of a Girondin to be free from a small spice of the old leaven." A deep crimson suffused the countenance of Villefort.

"'Tis true, madame," answered he, "that my father was a Girondin, but he was not among the number of those who voted for the king's death; he was an equal sufferer with yourself during the Reign of Terror, and had well-nigh lost his head on the same scaffold on which your father perished."

"True," replied the marquise, without wincing in the slightest degree at the tragic remembrance thus called up; "but bear in mind, if you please, that our respective parents underwent persecution and proscription from diametrically opposite principles; in proof of which I may remark, that while my family remained among the staunchest adherents of the exiled princes, your father lost no time in joining the new government; and that while the Citizen Noirtier was a Girondin, the Count Noirtier became a senator."

"Dear mother," interposed Renée, "you know very well it was agreed that all these disagreeable reminiscences should forever be laid aside."

"Suffer me, also, madame," replied Villefort, "to add my earnest request to Mademoiselle de Saint-Méran's, that you will kindly allow the veil of oblivion to cover and conceal the past. What avails recrimination over matters wholly past recall? For my own part, I have laid aside even the name of my father, and altogether disown his political principles. He was—nay, probably may still be—a Bonapartist, and is called Noirtier; I, on the contrary, am a staunch royalist, and style myself de Villefort. Let what may remain of revolutionary sap exhaust itself and die away with the old trunk, and condescend only to regard the young shoot which has started up at a distance from the parent tree, without having the power, any more than the wish, to separate entirely from the stock from which it sprung."

"Bravo, Villefort!" cried the marquis; "excellently well said! Come, now, I have hopes of obtaining what I have been for years endeavoring to persuade the marquise to promise; namely, a perfect amnesty and forgetfulness of the past."

"With all my heart," replied the marquise; "let the past be forever forgotten. I promise you it affords _me_ as little pleasure to revive it as it does you. All I ask is, that Villefort will be firm and inflexible for the future in his political principles. Remember, also, Villefort, that we have pledged ourselves to his majesty for your fealty and strict loyalty, and that at our recommendation the king consented to forget the past, as I do" (and here she extended to him her hand)—"as I now do at your entreaty. But bear in mind, that should there fall in your way anyone guilty of conspiring against the government, you will be so much the more bound to visit the offence with rigorous punishment, as it is known you belong to a suspected family."

"Alas, madame," returned Villefort, "my profession, as well as the times in which we live, compels me to be severe. I have already successfully conducted several public prosecutions, and brought the offenders to merited punishment. But we have not done with the thing yet."

0087m

"Do you, indeed, think so?" inquired the marquise.

"I am, at least, fearful of it. Napoleon, in the Island of Elba, is too near France, and his proximity keeps up the hopes of his partisans. Marseilles is filled with half-pay officers, who are daily, under one frivolous pretext or other, getting up quarrels with the royalists; from hence arise continual and fatal duels among the higher classes of persons, and assassinations in the lower."

"You have heard, perhaps," said the Comte de Salvieux, one of M. de Saint-Méran's oldest friends, and chamberlain to the Comte d'Artois, "that the Holy Alliance purpose removing him from thence?"

"Yes; they were talking about it when we left Paris," said M. de Saint-Méran; "and where is it decided to transfer him?"

“To Saint Helena.”

“For heaven’s sake, where is that?” asked the marquise.

“An island situated on the other side of the equator, at least two thousand leagues from here,” replied the count.

“So much the better. As Villefort observes, it is a great act of folly to have left such a man between Corsica, where he was born, and Naples, of which his brother-in-law is king, and face to face with Italy, the sovereignty of which he coveted for his son.”

“Unfortunately,” said Villefort, “there are the treaties of 1814, and we cannot molest Napoleon without breaking those compacts.”

“Oh, well, we shall find some way out of it,” responded M. de Salvieux. “There wasn’t any trouble over treaties when it was a question of shooting the poor Duc d’Enghien.”

“Well,” said the marquise, “it seems probable that, by the aid of the Holy Alliance, we shall be rid of Napoleon; and we must trust to the vigilance of M. de Villefort to purify Marseilles of his partisans. The king is either a king or no king; if he be acknowledged as sovereign of France, he should be upheld in peace and tranquillity; and this can best be effected by employing the most inflexible agents to put down every attempt at conspiracy—’tis the best and surest means of preventing mischief.”

“Unfortunately, madame,” answered Villefort, “the strong arm of the law is not called upon to interfere until the evil has taken place.”

“Then all he has got to do is to endeavor to repair it.”

“Nay, madame, the law is frequently powerless to effect this; all it can do is to avenge the wrong done.”

“Oh, M. de Villefort,” cried a beautiful young creature, daughter to the Comte de Salvieux, and the cherished friend of Mademoiselle de Saint-Méran, “do try and get up some famous trial while we are at Marseilles. I never was in a law-court; I am told it is so very amusing!”

“Amusing, certainly,” replied the young man, “inasmuch as, instead of shedding tears as at the fictitious tale of woe produced at a theatre, you behold in a law-court a case of real and genuine distress—a drama of life. The prisoner whom you there see pale, agitated, and alarmed, instead of—as is the case when a curtain falls on a tragedy—going home to sup peacefully with his family, and then retiring to rest, that he may recommence his mimic woes on the morrow,—is removed from your sight merely to be reconducted to his prison and delivered up to the executioner. I leave you to judge how far your nerves are calculated to bear you through such a scene. Of this, however, be assured, that should any favorable opportunity present itself, I will not fail to offer you the choice of being present.”

“For shame, M. de Villefort!” said Renée, becoming quite pale; “don’t you see how you are frightening us?—and yet you laugh.”

“What would you have? ’Tis like a duel. I have already recorded sentence of death, five or six times, against the movers of political conspiracies, and who can say how many daggers may be ready sharpened, and only waiting a favorable opportunity to be buried in my heart?”

“Gracious heavens, M. de Villefort,” said Renée, becoming more and more terrified; “you surely are not in earnest.”

“Indeed I am,” replied the young magistrate with a smile; “and in the interesting trial that young lady is anxious to witness, the case would only be still more aggravated. Suppose, for instance, the prisoner, as is more than probable, to have served under Napoleon—well, can you expect for an instant, that one accustomed, at the word of his commander, to rush fearlessly on the very bayonets of his foe, will scruple more to drive a stiletto into the heart of one he knows to be his personal enemy, than to slaughter his fellow-creatures, merely because bidden to do so by one he is bound to obey? Besides, one requires the excitement of being hateful in the eyes of the accused, in order to lash one’s self into a state of sufficient vehemence and power. I would not choose to see the man against whom I pleaded smile, as though in mockery of my words. No; my pride is to see the accused pale, agitated, and as though beaten out of all composure by the fire of my eloquence.” Renée uttered a smothered exclamation.

“Bravo!” cried one of the guests; “that is what I call talking to some purpose.”

“Just the person we require at a time like the present,” said a second.

“What a splendid business that last case of yours was, my dear Villefort!” remarked a third; “I mean the trial of the man for murdering his father. Upon my word, you killed him ere the executioner had laid his hand upon him.”

“Oh, as for parricides, and such dreadful people as that,” interposed Renée, “it matters very little what is done to them; but as regards poor unfortunate creatures whose only crime consists in having mixed themselves up in political intrigues——”

“Why, that is the very worst offence they could possibly commit; for, don’t you see, Renée, the king is the father of his people, and he who shall plot or contrive aught against the life and safety of the parent of thirty-two millions of souls, is a parricide upon a fearfully great scale?”

“I don’t know anything about that,” replied Renée; “but, M. de Villefort, you have promised me—have you not?—always to show mercy to those I plead for.”

“Make yourself quite easy on that point,” answered Villefort, with one of his sweetest smiles; “you and I will always consult upon our verdicts.”

“My love,” said the marquise, “attend to your doves, your lap-dogs, and embroidery, but do not meddle with what you do not understand. Nowadays the military profession is in abeyance and the magisterial robe is the badge of honor. There is a wise Latin proverb that is very much in point.”

“_Cedant arma togæ_,” said Villefort with a bow.

“I cannot speak Latin,” responded the marquise.

“Well,” said Renée, “I cannot help regretting you had not chosen some other profession than your own—a physician, for instance. Do you know I always felt a shudder at the idea of even a _destroying_ angel?”

“Dear, good Renée,” whispered Villefort, as he gazed with unutterable tenderness on the lovely speaker.

“Let us hope, my child,” cried the marquis, “that M. de Villefort may prove the moral and political physician of this province; if so, he will have achieved a noble work.”

“And one which will go far to efface the recollection of his father’s conduct,” added the incorrigible marquise.

“Madame,” replied Villefort, with a mournful smile, “I have already had the honor to observe that my father has—at least, I hope so—abjured his past errors, and that he is, at the present moment, a firm and zealous friend to religion and order—a better royalist, possibly, than his son; for he has to atone for past dereliction, while I have no other impulse than warm, decided preference and conviction.” Having made this well-turned speech, Villefort looked carefully around to mark the effect of his oratory, much as he would have done had he been addressing the bench in open court.

“Do you know, my dear Villefort,” cried the Comte de Salvieux, “that is exactly what I myself said the other day at the Tuileries, when questioned by his majesty’s principal chamberlain touching the singularity of an alliance between the son of a Girondin and the daughter of an officer of the Duc de Condé; and I assure you he seemed fully to comprehend that this mode of reconciling political differences was based upon sound and excellent principles. Then the king, who, without our suspecting it, had overheard our conversation, interrupted us by saying, ‘Villefort’—observe that the king did not pronounce the word Noirtier, but, on the contrary, placed considerable emphasis on that of Villefort—‘Villefort,’ said his majesty, ‘is a young man of great judgment and discretion, who will be sure to make a figure in his profession; I like him much, and it gave me great pleasure to hear that he was about to become the son-in-law of the Marquis and Marquise de Saint-Méran. I should myself have recommended the match, had not the noble marquis anticipated my wishes by requesting my consent to it.’”

“Is it possible the king could have condescended so far as to express himself so favorably of me?” asked the enraptured Villefort.

“I give you his very words; and if the marquis chooses to be candid, he will confess that they perfectly agree with what his majesty said to him, when he went six months ago to consult him upon the subject of your espousing his daughter.”

0091m

“That is true,” answered the marquis.

“How much do I owe this gracious prince! What is there I would not do to evince my earnest gratitude!”

“That is right,” cried the marquise. “I love to see you thus. Now, then, were a conspirator to fall into your hands, he would be most welcome.”

“For my part, dear mother,” interposed Renée, “I trust your wishes will not prosper, and that Providence will only permit petty offenders, poor debtors, and miserable cheats to fall into M. de Villefort’s hands,—then I shall be contented.”

“Just the same as though you prayed that a physician might only be called upon to prescribe for headaches, measles, and the stings of wasps, or any other slight affection of the epidermis. If you wish to see me the king’s attorney, you must desire for me some of those violent and dangerous diseases from the cure of which so much honor redounds to the physician.”

At this moment, and as though the utterance of Villefort’s wish had sufficed to effect its accomplishment, a servant entered the room, and whispered a few words in his ear. Villefort immediately rose from table and quitted the room upon the plea of urgent business; he soon, however, returned, his whole face beaming with delight. Renée regarded him with fond affection; and certainly his handsome features, lit up as they then were with more than usual fire and animation, seemed formed to excite the innocent admiration with which she gazed on her graceful and intelligent lover.

“You were wishing just now,” said Villefort, addressing her, “that I were a doctor instead of a lawyer. Well, I at least resemble the disciples of Esculapius in one thing [people spoke in this style in 1815], that of not being able to call a day my own, not even that of my betrothal.”

“And wherefore were you called away just now?” asked Mademoiselle de Saint-Méran, with an air of deep interest.

“For a very serious matter, which bids fair to make work for the executioner.”

“How dreadful!” exclaimed Renée, turning pale.

“Is it possible?” burst simultaneously from all who were near enough to the magistrate to hear his words.

“Why, if my information prove correct, a sort of Bonapartist conspiracy has just been discovered.”

“Can I believe my ears?” cried the marquise.

“I will read you the letter containing the accusation, at least,” said Villefort:

“‘The king’s attorney is informed by a friend to the throne and the religious institutions of his country, that one named Edmond Dantès, mate of the ship _Pharaon_, this day arrived from Smyrna, after having touched at Naples and Porto-Ferrajo, has been the bearer of a letter from Murat to the usurper, and again taken charge of another letter from the usurper to the Bonapartist club in Paris. Ample corroboration of this statement may be obtained by arresting the above-mentioned Edmond Dantès, who either carries the letter for Paris about with him, or has it at his father’s abode. Should it not be found in the possession of father or son, then it will assuredly be discovered in the cabin belonging to the said Dantès on board the _Pharaon_.’”

“But,” said Renée, “this letter, which, after all, is but an anonymous scrawl, is not even addressed to you, but to the king’s attorney.”

0093m

“True; but that gentleman being absent, his secretary, by his orders, opened his letters; thinking this one of importance, he sent for me, but not finding me, took upon himself to give the necessary orders for arresting the accused party.”

“Then the guilty person is absolutely in custody?” said the marquise.

“Nay, dear mother, say the accused person. You know we cannot yet pronounce him guilty.”

“He is in safe custody,” answered Villefort; “and rely upon it, if the letter is found, he will not be likely to be trusted abroad again, unless he goes forth under the especial protection of the headsman.”

“And where is the unfortunate being?” asked Renée.

“He is at my house.”

“Come, come, my friend,” interrupted the marquise, “do not neglect your duty to linger with us. You are the king’s servant, and must go wherever that service calls you.”

“Oh, Villefort!” cried Renée, clasping her hands, and looking towards her lover with piteous earnestness, “be merciful on this the day of our betrothal.”

The young man passed round to the side of the table where the fair pleader sat, and leaning over her chair said tenderly:

“To give you pleasure, my sweet Renée, I promise to show all the lenity in my power; but if the charges brought against this Bonapartist hero prove correct, why, then, you really must give me leave to order his head to be cut off.”

Renée shuddered at the word _cut_, for the growth in question had a head.

“Never mind that foolish girl, Villefort,” said the marquise. “She will soon get over these things.” So saying, Madame de Saint-Méran extended her dry bony hand to Villefort, who, while imprinting a son-in-law’s respectful salute on it, looked at Renée, as much as to say, “I must try and fancy ’tis your dear hand I kiss, as it should have been.”

“These are mournful auspices to accompany a betrothal,” sighed poor Renée.

“Upon my word, child!” exclaimed the angry marquise, “your folly exceeds all bounds. I should be glad to know what connection there can possibly be between your sickly sentimentality and the affairs of the state!”

“Oh, mother!” murmured Renée.

“Nay, madame, I pray you pardon this little traitor. I promise you that to make up for her want of loyalty, I will be most inflexibly severe;” then casting an expressive glance at his betrothed, which seemed to say, “Fear not, for your dear sake my justice shall be tempered with mercy,” and receiving a sweet and approving smile in return, Villefort departed with paradise in his heart.

Chapter 7. The Examination

No sooner had Villefort left the salon, than he assumed the grave air of a man who holds the balance of life and death in his hands. Now, in spite of the nobility of his countenance, the command of which, like a finished actor, he had carefully studied before the glass, it was by no means easy for him to assume an air of judicial severity. Except the recollection of the line of politics his father had adopted, and which might interfere, unless he acted with the greatest prudence, with his own career, Gérard de Villefort was as happy as a man could be. Already rich, he held a high official situation, though only twenty-seven. He was about to marry a young and charming woman, whom he loved, not passionately, but reasonably, as became a deputy attorney of the king; and besides her personal attractions, which were very great, Mademoiselle de Saint-Méran’s family possessed considerable political influence, which they would, of course, exert in his favor. The dowry of his wife amounted to fifty thousand crowns, and he had, besides, the prospect of seeing her fortune increased to half a million at her father’s death. These considerations naturally gave Villefort a feeling of such complete felicity that his mind was fairly dazzled in its contemplation.

At the door he met the commissary of police, who was waiting for him. The sight of this officer recalled Villefort from the third heaven to earth; he composed his face, as we have before described, and said, “I have read the letter, sir, and you have acted rightly in arresting this man; now inform me what you have discovered concerning him and the conspiracy.”

“We know nothing as yet of the conspiracy, monsieur; all the papers found have been sealed up and placed on your desk. The prisoner himself is named Edmond Dantès, mate on board the three-master the _Pharaon_, trading in cotton with Alexandria and Smyrna, and belonging to Morrel & Son, of Marseilles.”

“Before he entered the merchant service, had he ever served in the marines?”

“Oh, no, monsieur, he is very young.”

“How old?”

“Nineteen or twenty at the most.”

At this moment, and as Villefort had arrived at the corner of the Rue des Conseils, a man, who seemed to have been waiting for him, approached; it was M. Morrel.

“Ah, M. de Villefort,” cried he, “I am delighted to see you. Some of your people have committed the strangest mistake—they have just arrested Edmond Dantès, mate of my vessel.”

“I know it, monsieur,” replied Villefort, “and I am now going to examine him.”

“Oh,” said Morrel, carried away by his friendship, “you do not know him, and I do. He is the most estimable, the most trustworthy creature in the world, and I will venture to say, there is not a better seaman in all the merchant service. Oh, M. de Villefort, I beseech your indulgence for him.”

Villefort, as we have seen, belonged to the aristocratic party at Marseilles, Morrel to the plebeian; the first was a royalist, the other suspected of Bonapartism. Villefort looked disdainfully at Morrel, and replied coldly:

“You are aware, monsieur, that a man may be estimable and trustworthy in private life, and the best seaman in the merchant service, and yet be, politically speaking, a great criminal. Is it not true?”

The magistrate laid emphasis on these words, as if he wished to apply them to the owner himself, while his eyes seemed to plunge into the heart of one who, interceding for another, had himself need of indulgence. Morrel reddened, for his own conscience was not quite clear on politics; besides, what Dantès had told him of his interview with the grand-marshal, and what the emperor had said to him, embarrassed him. He replied, however, in a tone of deep interest:

“I entreat you, M. de Villefort, be, as you always are, kind and equitable, and give him back to us soon.” This _give us_ sounded revolutionary in the deputy’s ears.

“Ah, ah,” murmured he, “is Dantès then a member of some Carbonari society, that his protector thus employs the collective form? He was, if I recollect, arrested in a tavern, in company with a great many others.” Then he added, “Monsieur, you may rest assured I shall perform my duty impartially, and that if he be innocent you shall not have appealed to me in vain; should he, however, be guilty, in this present epoch, impunity would furnish a dangerous example, and I must do my duty.”

0097m

As he had now arrived at the door of his own house, which adjoined the Palais de Justice, he entered, after having, coldly saluted the shipowner, who stood, as if petrified, on the spot where Villefort had left him. The antechamber was full of police agents and gendarmes, in the midst of whom, carefully watched, but calm and smiling, stood the prisoner. Villefort traversed the antechamber, cast a side glance at Dantès, and taking a packet which a gendarme offered him, disappeared, saying, “Bring in the prisoner.”

Rapid as had been Villefort’s glance, it had served to give him an idea of the man he was about to interrogate. He had recognized intelligence in the high forehead, courage in the dark eye and bent brow, and frankness in the thick lips that showed a set of pearly teeth. Villefort’s first impression was favorable; but he had been so often warned to mistrust first impulses, that he applied the maxim to the impression, forgetting the difference between the two words. He stifled, therefore, the feelings of compassion that were rising, composed his features, and sat down, grim and sombre, at his desk. An instant after Dantès entered. He was pale, but calm and collected, and saluting his judge with easy politeness, looked round for a seat, as if he had been in M. Morrel’s salon. It was then that he encountered for the first time Villefort’s look,—that look peculiar to the magistrate, who, while seeming to read the thoughts of others, betrays nothing of his own.

“Who and what are you?” demanded Villefort, turning over a pile of papers, containing information relative to the prisoner, that a police agent had given to him on his entry, and that, already, in an hour’s time, had swelled to voluminous proportions, thanks to the corrupt espionage of which “the accused” is always made the victim.

“My name is Edmond Dantès,” replied the young man calmly; “I am mate of the _Pharaon_, belonging to Messrs. Morrel & Son.”

“Your age?” continued Villefort.

“Nineteen,” returned Dantès.

“What were you doing at the moment you were arrested?”

“I was at the festival of my marriage, monsieur,” said the young man, his voice slightly tremulous, so great was the contrast between that happy moment and the painful ceremony he was now undergoing; so great was the contrast between the sombre

aspect of M. de Villefort and the radiant face of Mercédès.

“You were at the festival of your marriage?” said the deputy, shuddering in spite of himself.

“Yes, monsieur; I am on the point of marrying a young girl I have been attached to for three years.” Villefort, impassive as he was, was struck with this coincidence; and the tremulous voice of Dantès, surprised in the midst of his happiness, struck a sympathetic chord in his own bosom—he also was on the point of being married, and he was summoned from his own happiness to destroy that of another. “This philosophic reflection,” thought he, “will make a great sensation at M. de Saint-Méran’s;” and he arranged mentally, while Dantès awaited further questions, the antithesis by which orators often create a reputation for eloquence. When this speech was arranged, Villefort turned to Dantès.

0099m

“Go on, sir,” said he.

“What would you have me say?”

“Give all the information in your power.”

“Tell me on which point you desire information, and I will tell all I know; only,” added he, with a smile, “I warn you I know very little.”

“Have you served under the usurper?”

“I was about to be mustered into the Royal Marines when he fell.”

“It is reported your political opinions are extreme,” said Villefort, who had never heard anything of the kind, but was not sorry to make this inquiry, as if it were an accusation.

“My political opinions!” replied Dantès. “Alas, sir, I never had any opinions. I am hardly nineteen; I know nothing; I have no part to play. If I obtain the situation I desire, I shall owe it to M. Morrel. Thus all my opinions—I will not say public, but private—are confined to these three sentiments,—I love my father, I respect M. Morrel, and I adore Mercédès. This, sir, is all I can tell you, and you see how uninteresting it is.” As Dantès spoke, Villefort gazed at his ingenuous and open countenance, and recollected the words of Renée, who, without knowing who the culprit was, had besought his indulgence for him. With the deputy’s knowledge of crime and criminals, every word the young man uttered convinced him more and more of his innocence. This lad, for he was scarcely a man,—simple, natural, eloquent with that eloquence of the heart never found when sought for; full of affection for everybody, because he was happy, and because happiness renders even the wicked good—extended his affection even to his judge, spite of Villefort’s severe look and stern accent. Dantès seemed full of kindness.

“Pardieu!” said Villefort, “he is a noble fellow. I hope I shall gain Renée’s favor easily by obeying the first command she ever imposed on me. I shall have at least a pressure of the hand in public, and a sweet kiss in private.” Full of this idea, Villefort’s face became so joyous, that when he turned to Dantès, the latter, who had watched the change on his physiognomy, was smiling also.

“Sir,” said Villefort, “have you any enemies, at least, that you know.”

“I have enemies?” replied Dantès; “my position is not sufficiently elevated for that. As for my disposition, that is, perhaps, somewhat too hasty; but I have striven to repress it. I have had ten or twelve sailors under me, and if you question them, they will tell you that they love and respect me, not as a father, for I am too young, but as an elder brother.”

“But you may have excited jealousy. You are about to become captain at nineteen—an elevated post; you are about to marry a pretty girl, who loves you; and these two pieces of good fortune may have excited the envy of someone.”

“You are right; you know men better than I do, and what you say may possibly be the case, I confess; but if such persons are among my acquaintances I prefer not to know it, because then I should be forced to hate them.”

“You are wrong; you should always strive to see clearly around you. You seem a worthy young man; I will depart from the strict line of my duty to aid you in discovering the author of this accusation. Here is the paper; do you know the writing?” As he spoke, Villefort drew the letter from his pocket, and presented it to Dantès. Dantès read it. A cloud passed over his brow as he said:

“No, monsieur, I do not know the writing, and yet it is tolerably plain. Whoever did it writes well. I am very fortunate,” added he, looking gratefully at Villefort, “to be examined by such a man as you; for this envious person is a real enemy.” And by the rapid glance that the young man’s eyes shot forth, Villefort saw how much energy lay hid beneath this mildness.

“Now,” said the deputy, “answer me frankly, not as a prisoner to a judge, but as one man to another who takes an interest in him, what truth is there in the accusation contained in this anonymous letter?” And Villefort threw disdainfully on his desk the letter Dantès had just given back to him.

“None at all. I will tell you the real facts. I swear by my honor as a sailor, by my love for Mercédès, by the life of my father——”

“Speak, monsieur,” said Villefort. Then, internally, “If Renée could see me, I hope she would be satisfied, and would no longer call me a decapitator.”

“Well, when we quitted Naples, Captain Leclere was attacked with a brain fever. As we had no doctor on board, and he was so anxious to arrive at Elba, that he would not touch at any other port, his disorder rose to such a height, that at the end of the third day, feeling he was dying, he called me to him. ‘My dear Dantès,’ said he, ‘swear to perform what I am going to tell you, for it is a matter of the deepest importance.’

“‘I swear, captain,’ replied I.

“‘Well, as after my death the command devolves on you as mate, assume the command, and bear up for the Island of Elba, disembark at Porto-Ferrajo, ask for the grand-marshal, give him this letter—perhaps they will give you another letter, and charge you with a commission. You will accomplish what I was to have done, and derive all the honor and profit from it.’

“‘I will do it, captain; but perhaps I shall not be admitted to the grand-marshal’s presence as easily as you expect?’

“‘Here is a ring that will obtain audience of him, and remove every difficulty,’ said the captain. At these words he gave me a ring. It was time—two hours after he was delirious; the next day he died.”

“And what did you do then?”

“What I ought to have done, and what everyone would have done in my place. Everywhere the last requests of a dying man are sacred; but with a sailor the last requests of his superior are commands. I sailed for the Island of Elba, where I arrived the next day; I ordered everybody to remain on board, and went on shore alone. As I had expected, I found some difficulty in obtaining access to the grand-marshal; but I sent the ring I had received from the captain to him, and was instantly admitted. He questioned me concerning Captain Leclere’s death; and, as the latter had told me, gave me a letter to carry on to a person in Paris. I undertook it because it was what my captain had bade me do. I landed here, regulated the affairs of the vessel, and hastened to visit my affianced bride, whom I found more lovely than ever. Thanks to M. Morrel, all the forms were got over; in a word I was, as I told you, at my marriage feast; and I should have been married in an hour, and tomorrow I intended to start for Paris, had I not been arrested on this charge which you as well as I now see to be unjust.”

“Ah,” said Villefort, “this seems to me the truth. If you have been culpable, it was imprudence, and this imprudence was in obedience to the orders of your captain. Give up this letter you have brought from Elba, and pass your word you will appear should you be required, and go and rejoin your friends.

“I am free, then, sir?” cried Dantès joyfully.

“Yes; but first give me this letter.”

“You have it already, for it was taken from me with some others which I see in that packet.”

“Stop a moment,” said the deputy, as Dantès took his hat and gloves. “To whom is it addressed?”

“To Monsieur Noirtier, Rue Coq-Héron, Paris.” Had a thunderbolt fallen into the room, Villefort could not have been more stupefied. He sank into his seat, and hastily turning over the packet, drew forth the fatal letter, at which he glanced with an expression of terror.

“M. Noirtier, Rue Coq-Héron, No. 13,” murmured he, growing still paler.

“Yes,” said Dantès; “do you know him?”

“No,” replied Villefort; “a faithful servant of the king does not know conspirators.”

0103m

“It is a conspiracy, then?” asked Dantès, who after believing himself free, now began to feel a tenfold alarm. “I have, however, already told you, sir, I was entirely ignorant of the contents of the letter.”

“Yes; but you knew the name of the person to whom it was addressed,” said Villefort.

“I was forced to read the address to know to whom to give it.”

“Have you shown this letter to anyone?” asked Villefort, becoming still more pale.

“To no one, on my honor.”

“Everybody is ignorant that you are the bearer of a letter from the Island of Elba, and addressed to M. Noirtier?”

“Everybody, except the person who gave it to me.”

“And that was too much, far too much,” murmured Villefort. Villefort’s brow darkened more and more, his white lips and clenched teeth filled Dantès with apprehension. After reading the letter, Villefort covered his face with his hands.

“Oh,” said Dantès timidly, “what is the matter?” Villefort made no answer, but raised his head at the expiration of a few seconds, and again perused the letter.

“And you say that you are ignorant of the contents of this letter?”

“I give you my word of honor, sir,” said Dantès; “but what is the matter? You are ill—shall I ring for assistance?—shall I call?”

“No,” said Villefort, rising hastily; “stay where you are. It is for me to give orders here, and not you.”

“Monsieur,” replied Dantès proudly, “it was only to summon assistance for you.”

“I want none; it was a temporary indisposition. Attend to yourself; answer me.” Dantès waited, expecting a question, but in vain. Villefort fell back on his chair, passed his hand over his brow, moist with perspiration, and, for the third time, read the letter.

“Oh, if he knows the contents of this!” murmured he, “and that Noirtier is the father of Villefort, I am lost!” And he fixed his eyes upon Edmond as if he would have penetrated his thoughts.

“Oh, it is impossible to doubt it,” cried he, suddenly.

“In heaven’s name!” cried the unhappy young man, “if you doubt me, question me; I will answer you.” Villefort made a violent effort, and in a tone he strove to render firm:

“Sir,” said he, “I am no longer able, as I had hoped, to restore you immediately to liberty; before doing so, I must consult the trial justice; what my own feeling is you already know.”

“Oh, monsieur,” cried Dantès, “you have been rather a friend than a judge.”

0105m

“Well, I must detain you some time longer, but I will strive to make it as short as possible. The principal charge against you is this letter, and you see——” Villefort approached the fire, cast it in, and waited until it was entirely consumed.

“You see, I destroy it?”

“Oh,” exclaimed Dantès, “you are goodness itself.”

“Listen,” continued Villefort; “you can now have confidence in me after what I have done.”

“Oh, command, and I will obey.”

“Listen; this is not a command, but advice I give you.”

“Speak, and I will follow your advice.”

“I shall detain you until this evening in the Palais de Justice. Should anyone else interrogate you, say to him what you have said to me, but do not breathe a word of this letter.”

“I promise.” It was Villefort who seemed to entreat, and the prisoner who reassured him.

“You see,” continued he, glancing toward the grate, where fragments of burnt paper fluttered in the flames, “the letter is destroyed; you and I alone know of its existence; should you, therefore, be questioned, deny all knowledge of it—deny it boldly, and you are saved.”

“Be satisfied; I will deny it.”

“It was the only letter you had?”

“It was.”

“Swear it.”

“I swear it.”

Villefort rang. A police agent entered. Villefort whispered some words in his ear, to which the officer replied by a motion of his head.

“Follow him,” said Villefort to Dantès. Dantès saluted Villefort and retired. Hardly had the door closed when Villefort threw himself half-fainting into a chair.

“Alas, alas,” murmured he, “if the procureur himself had been at Marseilles I should have been ruined. This accursed letter would have destroyed all my hopes. Oh, my father, must your past career always interfere with my successes?” Suddenly a light passed over his face, a smile played round his set mouth, and his haggard eyes were fixed in thought.

“This will do,” said he, “and from this letter, which might have ruined me, I will make my fortune. Now to the work I have in hand.” And after having assured himself that the prisoner was gone, the deputy procureur hastened to the house of his betrothed.

0107m

Chapter 8. The Château d’If

The commissary of police, as he traversed the antechamber, made a sign to two gendarmes, who placed themselves one on Dantès’ right and the other on his left. A door that communicated with the Palais de Justice was opened, and they went through a long range of gloomy corridors, whose appearance might have made even the boldest shudder. The Palais de Justice communicated with the prison,—a sombre edifice, that from its grated windows looks on the clock-tower of the Accoules. After numberless windings, Dantès saw a door with an iron wicket. The commissary took up an iron mallet and knocked thrice, every blow seeming to Dantès as if struck on his heart. The door opened, the two gendarmes gently pushed him forward, and the door closed with a loud sound behind him. The air he inhaled was no longer pure, but thick and mephitic,—he was in prison.

He was conducted to a tolerably neat chamber, but grated and barred, and its appearance, therefore, did not greatly alarm him; besides, the words of Villefort, who seemed to interest himself so much, resounded still in his ears like a promise of freedom. It was four o’clock when Dantès was placed in this chamber. It was, as we have said, the 1st of March, and the prisoner was soon buried in darkness. The obscurity augmented the acuteness of his hearing; at the slightest sound he rose and hastened to the door, convinced they were about to liberate him, but the sound died away, and Dantès sank again into his seat. At last, about ten o’clock, and just as Dantès began to despair, steps were heard in the corridor, a key turned in the lock, the bolts creaked, the massy oaken door flew open, and a flood of light from two torches pervaded the apartment.

By the torchlight Dantès saw the glittering sabres and carbines of four gendarmes. He had advanced at first, but stopped at the sight of this display of force.

“Are you come to fetch me?” asked he.

“Yes,” replied a gendarme.

“By the orders of the deputy procureur?”

“I believe so.” The conviction that they came from M. de Villefort relieved all Dantès’ apprehensions; he advanced calmly, and placed himself in the centre of the escort. A carriage waited at the door, the coachman was on the box, and a police officer sat beside him.

“Is this carriage for me?” said Dantès.

“It is for you,” replied a gendarme.

Dantès was about to speak; but feeling himself urged forward, and having neither the power nor the intention to resist, he mounted the steps, and was in an instant seated inside between two gendarmes; the two others took their places opposite, and the carriage rolled heavily over the stones.

The prisoner glanced at the windows—they were grated; he had changed his prison for another that was conveying him he knew not whither. Through the grating, however, Dantès saw they were passing through the Rue Caisserie, and by the Rue Saint-Laurent and the Rue Taramis, to the quay. Soon he saw the lights of La Consigne.

The carriage stopped, the officer descended, approached the guardhouse, a dozen soldiers came out and formed themselves in order; Dantès saw the reflection of their muskets by the light of the lamps on the quay.

“Can all this force be summoned on my account?” thought he.

The officer opened the door, which was locked, and, without speaking a word, answered Dantès’ question; for he saw between the ranks of the soldiers a passage formed from the carriage to the port. The two gendarmes who were opposite to him descended first, then he was ordered to alight and the gendarmes on each side of him followed his example. They advanced towards a boat, which a custom-house officer held by a chain, near the quay.

The soldiers looked at Dantès with an air of stupid curiosity. In an instant he was placed in the stern-sheets of the boat, between the gendarmes, while the officer stationed himself at the bow; a shove sent the boat adrift, and four sturdy oarsmen impelled it rapidly towards the Pilon. At a shout from the boat, the chain that closes the mouth of the port was lowered and in a second they were, as Dantès knew, in the Frioul and outside the inner harbor.

The prisoner’s first feeling was of joy at again breathing the pure air—for air is freedom; but he soon sighed, for he passed before La Réserve, where he had that morning been so happy, and now through the open windows came the laughter and revelry of a ball. Dantès folded his hands, raised his eyes to heaven, and prayed fervently.

0111m

The boat continued her voyage. They had passed the Tête de Mort, were now off the Anse du Pharo, and about to double the battery. This manœuvre was incomprehensible to Dantès.

“Whither are you taking me?” asked he.

“You will soon know.”

“But still——”

“We are forbidden to give you any explanation.” Dantès, trained in discipline, knew that nothing would be more absurd than to question subordinates, who were forbidden to reply; and so he remained silent.

The most vague and wild thoughts passed through his mind. The boat they were in could not make a long voyage; there was no vessel at anchor outside the harbor; he thought, perhaps, they were going to leave him on some distant point. He was not bound, nor had they made any attempt to handcuff him; this seemed a good augury. Besides, had not the deputy, who had been so kind to him, told him that provided he did not pronounce the dreaded name of Noirtier, he had nothing to apprehend? Had not Villefort in his presence destroyed the fatal letter, the only proof against him?

He waited silently, striving to pierce through the darkness.

They had left the Ile Ratonneau, where the lighthouse stood, on the right, and were now opposite the Point des Catalans. It seemed to the prisoner that he could distinguish a feminine form on the beach, for it was there Mercédès dwelt. How was it that a presentiment did not warn Mercédès that her lover was within three hundred yards of her?

One light alone was visible; and Dantès saw that it came from Mercédès' chamber. Mercédès was the only one awake in the whole settlement. A loud cry could be heard by her. But pride restrained him and he did not utter it. What would his guards think if they heard him shout like a madman?

He remained silent, his eyes fixed upon the light; the boat went on, but the prisoner thought only of Mercédès. An intervening elevation of land hid the light. Dantès turned and perceived that they had got out to sea. While he had been absorbed in thought, they had shipped their oars and hoisted sail; the boat was now moving with the wind.

In spite of his repugnance to address the guards, Dantès turned to the nearest gendarme, and taking his hand,

"Comrade," said he, "I adjure you, as a Christian and a soldier, to tell me where we are going. I am Captain Dantès, a loyal Frenchman, thought accused of treason; tell me where you are conducting me, and I promise you on my honor I will submit to my fate."

The gendarme looked irresolutely at his companion, who returned for answer a sign that said, "I see no great harm in telling him now," and the gendarme replied:

"You are a native of Marseilles, and a sailor, and yet you do not know where you are going?"

"On my honor, I have no idea."

"Have you no idea whatever?"

"None at all."

"That is impossible."

"I swear to you it is true. Tell me, I entreat."

"But my orders."

"Your orders do not forbid your telling me what I must know in ten minutes, in half an hour, or an hour. You see I cannot escape, even if I intended."

"Unless you are blind, or have never been outside the harbor, you must know."

"I do not."

"Look round you then." Dantès rose and looked forward, when he saw rise within a hundred yards of him the black and frowning rock on which stands the Château d'If. This gloomy fortress, which has for more than three hundred years furnished food for so many wild legends, seemed to Dantès like a scaffold to a malefactor.

"The Château d'If?" cried he, "what are we going there for?"

The gendarme smiled.

"I am not going there to be imprisoned," said Dantès; "it is only used for political prisoners. I have committed no crime. Are there any magistrates or judges at the Château d'If?"

"There are only," said the gendarme, "a governor, a garrison, turnkeys, and good thick walls. Come, come, do not look so astonished, or you will make me think you are laughing at me in return for my good nature."

Dantès pressed the gendarme's hand as though he would crush it.

"You think, then," said he, "that I am taken to the Château d'If to be imprisoned there?"

"It is probable; but there is no occasion to squeeze so hard."

“Without any inquiry, without any formality?”

“All the formalities have been gone through; the inquiry is already made.”

“And so, in spite of M. de Villefort’s promises?”

“I do not know what M. de Villefort promised you,” said the gendarme, “but I know we are taking you to the Château d’If. But what are you doing? Help, comrades, help!”

By a rapid movement, which the gendarme’s practiced eye had perceived, Dantès sprang forward to precipitate himself into the sea; but four vigorous arms seized him as his feet quitted the bottom of the boat. He fell back cursing with rage.

“Good!” said the gendarme, placing his knee on his chest; “this is the way you keep your word as a sailor! Believe soft-spoken gentlemen again! Hark ye, my friend, I have disobeyed my first order, but I will not disobey the second; and if you move, I will blow your brains out.” And he levelled his carbine at Dantès, who felt the muzzle against his temple.

For a moment the idea of struggling crossed his mind, and of so ending the unexpected evil that had overtaken him. But he bethought him of M. de Villefort’s promise; and, besides, death in a boat from the hand of a gendarme seemed too terrible. He remained motionless, but gnashing his teeth and wringing his hands with fury.

At this moment the boat came to a landing with a violent shock. One of the sailors leaped on shore, a cord creaked as it ran through a pulley, and Dantès guessed they were at the end of the voyage, and that they were mooring the boat.

His guards, taking him by the arms and coat-collar, forced him to rise, and dragged him towards the steps that lead to the gate of the fortress, while the police officer carrying a musket with fixed bayonet followed behind.

Dantès made no resistance; he was like a man in a dream; he saw soldiers drawn up on the embankment; he knew vaguely that he was ascending a flight of steps; he was conscious that he passed through a door, and that the door closed behind him; but all this indistinctly as through a mist. He did not even see the ocean, that terrible barrier against freedom, which the prisoners look upon with utter despair.

They halted for a minute, during which he strove to collect his thoughts. He looked around; he was in a court surrounded by high walls; he heard the measured tread of sentinels, and as they passed before the light he saw the barrels of their muskets shine.

They waited upwards of ten minutes. Certain Dantès could not escape, the gendarmes released him. They seemed awaiting orders. The orders came.

“Where is the prisoner?” said a voice.

“Here,” replied the gendarmes.

“Let him follow me; I will take him to his cell.”

“Go!” said the gendarmes, thrusting Dantès forward.

The prisoner followed his guide, who led him into a room almost under ground, whose bare and reeking walls seemed as though impregnated with tears; a lamp placed on a stool illumined the apartment faintly, and showed Dantès the features of his conductor, an under-jailer, ill-clothed, and of sullen appearance.

0113m

“Here is your chamber for tonight,” said he. “It is late, and the governor is asleep. Tomorrow, perhaps, he may change you. In the meantime there is bread, water, and fresh straw; and that is all a prisoner can wish for. Goodnight.” And before Dantès could open his mouth—before he had noticed where the jailer placed his bread or the water—before he had glanced towards the corner where the straw was, the jailer disappeared, taking with him the lamp and closing the door, leaving stamped upon the prisoner’s mind the dim reflection of the dripping walls of his dungeon.

Dantès was alone in darkness and in silence—cold as the shadows that he felt breathe on his burning forehead. With the first dawn of day the jailer returned, with orders to leave Dantès where he was. He found the prisoner in the same position, as if fixed there, his eyes swollen with weeping. He had passed the night standing, and without sleep. The jailer advanced; Dantès appeared not to

perceive him. He touched him on the shoulder. Edmond started.

“Have you not slept?” said the jailer.

“I do not know,” replied Dantès. The jailer stared.

“Are you hungry?” continued he.

“I do not know.”

“Do you wish for anything?”

“I wish to see the governor.”

The jailer shrugged his shoulders and left the chamber.

Dantès followed him with his eyes, and stretched forth his hands towards the open door; but the door closed. All his emotion then burst forth; he cast himself on the ground, weeping bitterly, and asking himself what crime he had committed that he was thus punished.

The day passed thus; he scarcely tasted food, but walked round and round the cell like a wild beast in its cage. One thought in particular tormented him: namely, that during his journey hither he had sat so still, whereas he might, a dozen times, have plunged into the sea, and, thanks to his powers of swimming, for which he was famous, have gained the shore, concealed himself until the arrival of a Genoese or Spanish vessel, escaped to Spain or Italy, where Mercédès and his father could have joined him. He had no fears as to how he should live—good seamen are welcome everywhere. He spoke Italian like a Tuscan, and Spanish like a Castilian; he would have been free, and happy with Mercédès and his father, whereas he was now confined in the Château d’If, that impregnable fortress, ignorant of the future destiny of his father and Mercédès; and all this because he had trusted to Villefort’s promise. The thought was maddening, and Dantès threw himself furiously down on his straw. The next morning at the same hour, the jailer came again.

“Well,” said the jailer, “are you more reasonable today?” Dantès made no reply.

“Come, cheer up; is there anything that I can do for you?”

“I wish to see the governor.”

“I have already told you it was impossible.”

“Why so?”

“Because it is against prison rules, and prisoners must not even ask for it.”

“What is allowed, then?”

“Better fare, if you pay for it, books, and leave to walk about.”

“I do not want books, I am satisfied with my food, and do not care to walk about; but I wish to see the governor.”

“If you worry me by repeating the same thing, I will not bring you any more to eat.”

“Well, then,” said Edmond, “if you do not, I shall die of hunger—that is all.”

The jailer saw by his tone he would be happy to die; and as every prisoner is worth ten sous a day to his jailer, he replied in a more subdued tone.

“What you ask is impossible; but if you are very well behaved you will be allowed to walk about, and some day you will meet the governor, and if he chooses to reply, that is his affair.”

“But,” asked Dantès, “how long shall I have to wait?”

“Ah, a month—six months—a year.”

“It is too long a time. I wish to see him at once.”

“Ah,” said the jailer, “do not always brood over what is impossible, or you will be mad in a fortnight.”

“You think so?”

“Yes; we have an instance here; it was by always offering a million of francs to the governor for his liberty that an abbé became mad, who was in this chamber before you.”

0119m

“How long has he left it?”

“Two years.”

“Was he liberated, then?”

“No; he was put in a dungeon.”

“Listen!” said Dantès. “I am not an abbé, I am not mad; perhaps I shall be, but at present, unfortunately, I am not. I will make you another offer.”

“What is that?”

“I do not offer you a million, because I have it not; but I will give you a hundred crowns if, the first time you go to Marseilles, you will seek out a young girl named Mercédès, at the Catalans, and give her two lines from me.”

0120m

“If I took them, and were detected, I should lose my place, which is worth two thousand francs a year; so that I should be a great fool to run such a risk for three hundred.”

“Well,” said Dantès, “mark this; if you refuse at least to tell Mercédès I am here, I will some day hide myself behind the door, and when you enter I will dash out your brains with this stool.”

“Threats!” cried the jailer, retreating and putting himself on the defensive; “you are certainly going mad. The abbé began like you, and in three days you will be like him, mad enough to tie up; but, fortunately, there are dungeons here.”

Dantès whirled the stool round his head.

“All right, all right,” said the jailer; “all right, since you will have it so. I will send word to the governor.”

“Very well,” returned Dantès, dropping the stool and sitting on it as if he were in reality mad. The jailer went out, and returned in an instant with a corporal and four soldiers.

“By the governor’s orders,” said he, “conduct the prisoner to the tier beneath.”

“To the dungeon, then,” said the corporal.

“Yes; we must put the madman with the madmen.” The soldiers seized Dantès, who followed passively.

He descended fifteen steps, and the door of a dungeon was opened, and he was thrust in. The door closed, and Dantès advanced with outstretched hands until he touched the wall; he then sat down in the corner until his eyes became accustomed to the darkness. The jailer was right; Dantès wanted but little of being utterly mad.

Chapter 9. The Evening of the Betrothal

Villefort had, as we have said, hastened back to Madame de Saint-Méran’s in the Place du Grand Cours, and on entering the house found that the guests whom he had left at table were taking coffee in the salon. Renée was, with all the rest of the company, anxiously awaiting him, and his entrance was followed by a general exclamation.

“Well, Decapitator, Guardian of the State, Royalist, Brutus, what is the matter?” said one. “Speak out.”

“Are we threatened with a fresh Reign of Terror?” asked another.

“Has the Corsican ogre broken loose?” cried a third.

“Marquise,” said Villefort, approaching his future mother-in-law, “I request your pardon for thus leaving you. Will the marquis honor me by a few moments’ private conversation?”

“Ah, it is really a serious matter, then?” asked the marquis, remarking the cloud on Villefort’s brow.

“So serious that I must take leave of you for a few days; so,” added he, turning to Renée, “judge for yourself if it be not important.”

“You are going to leave us?” cried Renée, unable to hide her emotion at this unexpected announcement.

“Alas,” returned Villefort, “I must!”

“Where, then, are you going?” asked the marquise.

“That, madame, is an official secret; but if you have any commissions for Paris, a friend of mine is going there tonight, and will with pleasure undertake them.” The guests looked at each other.

“You wish to speak to me alone?” said the marquis.

“Yes, let us go to the library, please.” The marquis took his arm, and they left the salon.

“Well,” asked he, as soon as they were by themselves, “tell me what it is?”

“An affair of the greatest importance, that demands my immediate presence in Paris. Now, excuse the indiscretion, marquis, but have you any landed property?”

“All my fortune is in the funds; seven or eight hundred thousand francs.”

“Then sell out—sell out, marquis, or you will lose it all.”

0123m

“But how can I sell out here?”

“You have a broker, have you not?”

“Yes.”

“Then give me a letter to him, and tell him to sell out without an instant’s delay, perhaps even now I shall arrive too late.”

“The deuce you say!” replied the marquis, “let us lose no time, then!”

And, sitting down, he wrote a letter to his broker, ordering him to sell out at the market price.

“Now, then,” said Villefort, placing the letter in his pocketbook, “I must have another!”

“To whom?”

“To the king.”

“To the king?”

“Yes.”

“I dare not write to his majesty.”

“I do not ask you to write to his majesty, but ask M. de Salvieux to do so. I want a letter that will enable me to reach the king’s presence without all the formalities of demanding an audience; that would occasion a loss of precious time.”

“But address yourself to the keeper of the seals; he has the right of entry at the Tuileries, and can procure you audience at any hour of the day or night.”

“Doubtless; but there is no occasion to divide the honors of my discovery with him. The keeper would leave me in the background, and take all the glory to himself. I tell you, marquis, my fortune is made if I only reach the Tuileries the first, for the king will not forget the service I do him.”

“In that case go and get ready. I will call Salvieux and make him write the letter.”

“Be as quick as possible, I must be on the road in a quarter of an hour.”

“Tell your coachman to stop at the door.”

“You will present my excuses to the marquise and Mademoiselle Renée, whom I leave on such a day with great regret.”

“You will find them both here, and can make your farewells in person.”

“A thousand thanks—and now for the letter.”

The marquis rang, a servant entered.

“Say to the Comte de Salvieux that I would like to see him.”

“Now, then, go,” said the marquis.

“I shall be gone only a few moments.”

Villefort hastily quitted the apartment, but reflecting that the sight of the deputy procureur running through the streets would be enough to throw the whole city into confusion, he resumed his ordinary pace. At his door he perceived a figure in the shadow that seemed to wait for him. It was Mercédès, who, hearing no news of her lover, had come unobserved to inquire after him.

As Villefort drew near, she advanced and stood before him. Dantès had spoken of Mercédès, and Villefort instantly recognized her. Her beauty and high bearing surprised him, and when she inquired what had become of her lover, it seemed to him that she was the judge, and he the accused.

“The young man you speak of,” said Villefort abruptly, “is a great criminal, and I can do nothing for him, mademoiselle.” Mercédès burst into tears, and, as Villefort strove to pass her, again addressed him.

“But, at least, tell me where he is, that I may know whether he is alive or dead,” said she.

0125m

“I do not know; he is no longer in my hands,” replied Villefort.

And desirous of putting an end to the interview, he pushed by her, and closed the door, as if to exclude the pain he felt. But remorse is not thus banished; like Virgil’s wounded hero, he carried the arrow in his wound, and, arrived at the salon, Villefort uttered a sigh that was almost a sob, and sank into a chair.

Then the first pangs of an unending torture seized upon his heart. The man he sacrificed to his ambition, that innocent victim immolated on the altar of his father’s faults, appeared to him pale and threatening, leading his affianced bride by the hand, and bringing with him remorse, not such as the ancients figured, furious and terrible, but that slow and consuming agony whose pangs are intensified from hour to hour up to the very moment of death. Then he had a moment’s hesitation. He had frequently called for capital punishment on criminals, and owing to his irresistible eloquence they had been condemned, and yet the slightest shadow of remorse had never clouded Villefort’s brow, because they were guilty; at least, he believed so; but here was an innocent man whose happiness he had destroyed. In this case he was not the judge, but the executioner.

As he thus reflected, he felt the sensation we have described, and which had hitherto been unknown to him, arise in his bosom, and fill him with vague apprehensions. It is thus that a wounded man trembles instinctively at the approach of the finger to his wound until it be healed, but Villefort’s was one of those that never close, or if they do, only close to reopen more agonizing than ever. If at this moment the sweet voice of Renée had sounded in his ears pleading for mercy, or the fair Mercédès had entered and said, “In the name of God, I conjure you to restore me my affianced husband,” his cold and trembling hands would have signed his release; but no voice broke the stillness of the chamber, and the door was opened only by Villefort’s valet, who came to tell him that the travelling carriage was in readiness.

Villefort rose, or rather sprang, from his chair, hastily opened one of the drawers of his desk, emptied all the gold it contained into his pocket, stood motionless an instant, his hand pressed to his head, muttered a few inarticulate sounds, and then, perceiving that his servant had placed his cloak on his shoulders, he sprang into the carriage, ordering the postilions to drive to M. de Saint-Méran's. The hapless Dantès was doomed.

As the marquis had promised, Villefort found the marquise and Renée in waiting. He started when he saw Renée, for he fancied she was again about to plead for Dantès. Alas, her emotions were wholly personal: she was thinking only of Villefort's departure.

She loved Villefort, and he left her at the moment he was about to become her husband. Villefort knew not when he should return, and Renée, far from pleading for Dantès, hated the man whose crime separated her from her lover.

0127m

Meanwhile what of Mercédès? She had met Fernand at the corner of the Rue de la Loge; she had returned to the Catalans, and had despairingly cast herself on her couch. Fernand, kneeling by her side, took her hand, and covered it with kisses that Mercédès did not even feel. She passed the night thus. The lamp went out for want of oil, but she paid no heed to the darkness, and dawn came, but she knew not that it was day. Grief had made her blind to all but one object—that was Edmond.

"Ah, you are there," said she, at length, turning towards Fernand.

"I have not quitted you since yesterday," returned Fernand sorrowfully.

M. Morrel had not readily given up the fight. He had learned that Dantès had been taken to prison, and he had gone to all his friends, and the influential persons of the city; but the report was already in circulation that Dantès was arrested as a Bonapartist agent; and as the most sanguine looked upon any attempt of Napoleon to remount the throne as impossible, he met with nothing but refusal, and had returned home in despair, declaring that the matter was serious and that nothing more could be done.

Caderousse was equally restless and uneasy, but instead of seeking, like M. Morrel, to aid Dantès, he had shut himself up with two bottles of black currant brandy, in the hope of drowning reflection. But he did not succeed, and became too intoxicated to fetch any more drink, and yet not so intoxicated as to forget what had happened. With his elbows on the table he sat between the two empty bottles, while spectres danced in the light of the unsnuffed candle—spectres such as Hoffmann strews over his punch-drenched pages, like black, fantastic dust.

Danglars alone was content and joyous—he had got rid of an enemy and made his own situation on the _Pharaon_ secure. Danglars was one of those men born with a pen behind the ear, and an inkstand in place of a heart. Everything with him was multiplication or subtraction. The life of a man was to him of far less value than a numeral, especially when, by taking it away, he could increase the sum total of his own desires. He went to bed at his usual hour, and slept in peace.

Villefort, after having received M. de Salvieux's letter, embraced Renée, kissed the marquise's hand, and shaken that of the marquis, started for Paris along the Aix road.

Old Dantès was dying with anxiety to know what had become of Edmond. But we know very well what had become of Edmond.

Chapter 10. The King's Closet at the Tuileries

We will leave Villefort on the road to Paris, travelling—thanks to trebled fees—with all speed, and passing through two or three apartments, enter at the Tuileries the little room with the arched window, so well known as having been the favorite closet of Napoleon and Louis XVIII., and now of Louis Philippe.

There, seated before a walnut table he had brought with him from Hartwell, and to which, from one of those fancies not uncommon to great people, he was particularly attached, the king, Louis XVIII., was carelessly listening to a man of fifty or fifty-two years of age, with gray hair, aristocratic bearing, and exceedingly gentlemanly attire, and meanwhile making a marginal note in a volume of Gryphius's rather inaccurate, but much sought-after, edition of Horace—a work which was much indebted to the sagacious observations of the philosophical monarch.

"You say, sir——" said the king.

“That I am exceedingly disquieted, sire.”

“Really, have you had a vision of the seven fat kine and the seven lean kine?”

“No, sire, for that would only betoken for us seven years of plenty and seven years of scarcity; and with a king as full of foresight as your majesty, scarcity is not a thing to be feared.”

“Then of what other scourge are you afraid, my dear Blacas?”

“Sire, I have every reason to believe that a storm is brewing in the south.”

“Well, my dear duke,” replied Louis XVIII., “I think you are wrongly informed, and know positively that, on the contrary, it is very fine weather in that direction.” Man of ability as he was, Louis XVIII. liked a pleasant jest.

“Sire,” continued M. de Blacas, “if it only be to reassure a faithful servant, will your majesty send into Languedoc, Provence, and Dauphiné, trusty men, who will bring you back a faithful report as to the feeling in these three provinces?”

“_Canimus surdis_,” replied the king, continuing the annotations in his Horace.

“Sire,” replied the courtier, laughing, in order that he might seem to comprehend the quotation, “your majesty may be perfectly right in relying on the good feeling of France, but I fear I am not altogether wrong in dreading some desperate attempt.”

“By whom?”

“By Bonaparte, or, at least, by his adherents.”

“My dear Blacas,” said the king, “you with your alarms prevent me from working.”

“And you, sire, prevent me from sleeping with your security.”

“Wait, my dear sir, wait a moment; for I have such a delightful note on the _Pastor quum traheret_—wait, and I will listen to you afterwards.”

There was a brief pause, during which Louis XVIII. wrote, in a hand as small as possible, another note on the margin of his Horace, and then looking at the duke with the air of a man who thinks he has an idea of his own, while he is only commenting upon the idea of another, said:

“Go on, my dear duke, go on—I listen.”

“Sire,” said Blacas, who had for a moment the hope of sacrificing Villefort to his own profit, “I am compelled to tell you that these are not mere rumors destitute of foundation which thus disquiet me; but a serious-minded man, deserving all my confidence, and charged by me to watch over the south” (the duke hesitated as he pronounced these words), “has arrived by post to tell me that a great peril threatens the king, and so I hastened to you, sire.”

“_Mala ducis avi domum_,” continued Louis XVIII., still annotating.

“Does your majesty wish me to drop the subject?”

“By no means, my dear duke; but just stretch out your hand.”

“Which?”

“Whichever you please—there to the left.”

“Here, sire?”

“I tell you to the left, and you are looking to the right; I mean on my left—yes, there. You will find yesterday’s report of the minister of police. But here is M. Dandré himself;” and M. Dandré, announced by the chamberlain-in-waiting, entered.

“Come in,” said Louis XVIII., with repressed smile, “come in, Baron, and tell the duke all you know—the latest news of M. de Bonaparte; do not conceal anything, however serious,—let us see, the Island of Elba is a volcano, and we may expect to have issuing thence flaming and bristling war—_bella, horrida bella_.”

M. Dandré leaned very respectfully on the back of a chair with his two hands, and said:

“Has your majesty perused yesterday’s report?”

“Yes, yes; but tell the duke himself, who cannot find anything, what the report contains—give him the particulars of what the usurper is doing in his islet.”

“Monsieur,” said the baron to the duke, “all the servants of his majesty must approve of the latest intelligence which we have from the Island of Elba. Bonaparte——”

M. Dandré looked at Louis XVIII., who, employed in writing a note, did not even raise his head. “Bonaparte,” continued the baron, “is mortally wearied, and passes whole days in watching his miners at work at Porto-Longone.”

“And scratches himself for amusement,” added the king.

“Scratches himself?” inquired the duke, “what does your majesty mean?”

“Yes, indeed, my dear duke. Did you forget that this great man, this hero, this demigod, is attacked with a malady of the skin which worries him to death, _prurigo_?”

“And, moreover, my dear duke,” continued the minister of police, “we are almost assured that, in a very short time, the usurper will be insane.”

“Insane?”

“Raving mad; his head becomes weaker. Sometimes he weeps bitterly, sometimes laughs boisterously, at other time he passes hours on the seashore, flinging stones in the water and when the flint makes ‘duck-and-drake’ five or six times, he appears as delighted as if he had gained another Marengo or Austerlitz. Now, you must agree that these are indubitable symptoms of insanity.”

“Or of wisdom, my dear baron—or of wisdom,” said Louis XVIII., laughing; “the greatest captains of antiquity amused themselves by casting pebbles into the ocean—see Plutarch’s life of Scipio Africanus.”

M. de Blacas pondered deeply between the confident monarch and the truthful minister. Villefort, who did not choose to reveal the whole secret, lest another should reap all the benefit of the disclosure, had yet communicated enough to cause him the greatest uneasiness.

“Well, well, Dandré,” said Louis XVIII., “Blacas is not yet convinced; let us proceed, therefore, to the usurper’s conversion.” The minister of police bowed.

“The usurper’s conversion!” murmured the duke, looking at the king and Dandré, who spoke alternately, like Virgil’s shepherds. “The usurper converted!”

“Decidedly, my dear duke.”

“In what way converted?”

“To good principles. Tell him all about it, baron.”

“Why, this is the way of it,” said the minister, with the gravest air in the world: “Napoleon lately had a review, and as two or three of his old veterans expressed a desire to return to France, he gave them their dismissal, and exhorted them to ‘serve the good king.’ These were his own words, of that I am certain.”

“Well, Blacas, what think you of this?” inquired the king triumphantly, and pausing for a moment from the voluminous scholiast before him.

“I say, sire, that the minister of police is greatly deceived or I am; and as it is impossible it can be the minister of police as he has the guardianship of the safety and honor of your majesty, it is probable that I am in error. However, sire, if I might advise, your majesty will interrogate the person of whom I spoke to you, and I will urge your majesty to do him this honor.”

“Most willingly, duke; under your auspices I will receive any person you please, but you must not expect me to be too confiding. Baron, have you any report more recent than this, dated the 20th February, and this is the 3rd of March?”

“No, sire, but I am hourly expecting one; it may have arrived since I left my office.”

“Go thither, and if there be none—well, well,” continued Louis XVIII., “make one; that is the usual way, is it not?” and the king laughed facetiously.

“Oh, sire,” replied the minister, “we have no occasion to invent any; every day our desks are loaded with most circumstantial denunciations, coming from hosts of people who hope for some return for services which they seek to render, but cannot; they trust to fortune, and rely upon some unexpected event in some way to justify their predictions.”

“Well, sir, go,” said Louis XVIII., “and remember that I am waiting for you.”

“I will but go and return, sire; I shall be back in ten minutes.”

“And I, sire,” said M. de Blacas, “will go and find my messenger.”

“Wait, sir, wait,” said Louis XVIII. “Really, M. de Blacas, I must change your armorial bearings; I will give you an eagle with outstretched wings, holding in its claws a prey which tries in vain to escape, and bearing this device—_Tenax_.”

0133m

“Sire, I listen,” said De Blacas, biting his nails with impatience.

“I wish to consult you on this passage, ‘_Molli fugiens anhelitu_,’ you know it refers to a stag flying from a wolf. Are you not a sportsman and a great wolf-hunter? Well, then, what do you think of the _molli anhelitu_?”

“Admirable, sire; but my messenger is like the stag you refer to, for he has posted two hundred and twenty leagues in scarcely three days.”

“Which is undergoing great fatigue and anxiety, my dear duke, when we have a telegraph which transmits messages in three or four hours, and that without getting in the least out of breath.”

“Ah, sire, you recompense but badly this poor young man, who has come so far, and with so much ardor, to give your majesty useful information. If only for the sake of M. de Salvieux, who recommends him to me, I entreat your majesty to receive him graciously.”

“M. de Salvieux, my brother’s chamberlain?”

“Yes, sire.”

“He is at Marseilles.”

“And writes me thence.”

“Does he speak to you of this conspiracy?”

“No; but strongly recommends M. de Villefort, and begs me to present him to your majesty.”

“M. de Villefort!” cried the king, “is the messenger’s name M. de Villefort?”

“Yes, sire.”

“And he comes from Marseilles?”

“In person.”

“Why did you not mention his name at once?” replied the king, betraying some uneasiness.

“Sire, I thought his name was unknown to your majesty.”

“No, no, Blacas; he is a man of strong and elevated understanding, ambitious, too, and, _pardieu!_ you know his father’s name!”

“His father?”

“Yes, Noirtier.”

“Noirtier the Girondin?—Noirtier the senator?”

“He himself.”

“And your majesty has employed the son of such a man?”

“Blacas, my friend, you have but limited comprehension. I told you Villefort was ambitious, and to attain this ambition Villefort would sacrifice everything, even his father.”

“Then, sire, may I present him?”

“This instant, duke! Where is he?”

“Waiting below, in my carriage.”

“Seek him at once.”

“I hasten to do so.”

The duke left the royal presence with the speed of a young man; his really sincere royalism made him youthful again. Louis XVIII. remained alone, and turning his eyes on his half-opened Horace, muttered:

“_Justum et tenacem propositi virum_.”

M. de Blacas returned as speedily as he had departed, but in the antechamber he was forced to appeal to the king’s authority. Villefort’s dusty garb, his costume, which was not of courtly cut, excited the susceptibility of M. de Brezé, who was all astonishment at finding that this young man had the audacity to enter before the king in such attire. The duke, however, overcame all difficulties with a word—his majesty’s order; and, in spite of the protestations which the master of ceremonies made for the honor of his office and principles, Villefort was introduced.

The king was seated in the same place where the duke had left him. On opening the door, Villefort found himself facing him, and the young magistrate’s first impulse was to pause.

“Come in, M. de Villefort,” said the king, “come in.”

Villefort bowed, and advancing a few steps, waited until the king should interrogate him.

“M. de Villefort,” said Louis XVIII., “the Duc de Blacas assures me you have some interesting information to communicate.”

“Sire, the duke is right, and I believe your majesty will think it equally important.”

0137m

“In the first place, and before everything else, sir, is the news as bad in your opinion as I am asked to believe?”

“Sire, I believe it to be most urgent, but I hope, by the speed I have used, that it is not irreparable.”

“Speak as fully as you please, sir,” said the king, who began to give way to the emotion which had showed itself in Blacas’s face and affected Villefort’s voice. “Speak, sir, and pray begin at the beginning; I like order in everything.”

“Sire,” said Villefort, “I will render a faithful report to your majesty, but I must entreat your forgiveness if my anxiety leads to some obscurity in my language.” A glance at the king after this discreet and subtle exordium, assured Villefort of the benignity of his august auditor, and he went on:

“Sire, I have come as rapidly to Paris as possible, to inform your majesty that I have discovered, in the exercise of my duties, not a commonplace and insignificant plot, such as is every day got up in the lower ranks of the people and in the army, but an actual conspiracy—a storm which menaces no less than your majesty’s throne. Sire, the usurper is arming three ships, he meditates some project, which, however mad, is yet, perhaps, terrible. At this moment he will have left Elba, to go whither I know not, but assuredly to attempt a landing either at Naples, or on the coast of Tuscany, or perhaps on the shores of France. Your majesty is

well aware that the sovereign of the Island of Elba has maintained his relations with Italy and France?”

“I am, sir,” said the king, much agitated; “and recently we have had information that the Bonapartist clubs have had meetings in the Rue Saint-Jacques. But proceed, I beg of you. How did you obtain these details?”

“Sire, they are the results of an examination which I have made of a man of Marseilles, whom I have watched for some time, and arrested on the day of my departure. This person, a sailor, of turbulent character, and whom I suspected of Bonapartism, has been secretly to the Island of Elba. There he saw the grand-marshal, who charged him with an oral message to a Bonapartist in Paris, whose name I could not extract from him; but this mission was to prepare men’s minds for a return (it is the man who says this, sire)—a return which will soon occur.”

“And where is this man?”

“In prison, sire.”

“And the matter seems serious to you?”

“So serious, sire, that when the circumstance surprised me in the midst of a family festival, on the very day of my betrothal, I left my bride and friends, postponing everything, that I might hasten to lay at your majesty’s feet the fears which impressed me, and the assurance of my devotion.”

“True,” said Louis XVIII., “was there not a marriage engagement between you and Mademoiselle de Saint-Méran?”

“Daughter of one of your majesty’s most faithful servants.”

“Yes, yes; but let us talk of this plot, M. de Villefort.”

“Sire, I fear it is more than a plot; I fear it is a conspiracy.”

“A conspiracy in these times,” said Louis XVIII., smiling, “is a thing very easy to meditate, but more difficult to conduct to an end, inasmuch as, re-established so recently on the throne of our ancestors, we have our eyes open at once upon the past, the present, and the future. For the last ten months my ministers have redoubled their vigilance, in order to watch the shore of the Mediterranean. If Bonaparte landed at Naples, the whole coalition would be on foot before he could even reach Piombino; if he land in Tuscany, he will be in an unfriendly territory; if he land in France, it must be with a handful of men, and the result of that is easily foretold, execrated as he is by the population. Take courage, sir; but at the same time rely on our royal gratitude.”

“Ah, here is M. Dandré!” cried de Blacas. At this instant the minister of police appeared at the door, pale, trembling, and as if ready to faint. Villefort was about to retire, but M. de Blacas, taking his hand, restrained him.

Chapter 11. The Corsican Ogre

At the sight of this agitation Louis XVIII. pushed from him violently the table at which he was sitting.

“What ails you, baron?” he exclaimed. “You appear quite aghast. Has your uneasiness anything to do with what M. de Blacas has told me, and M. de Villefort has just confirmed?” M. de Blacas moved suddenly towards the baron, but the fright of the courtier pleaded for the forbearance of the statesman; and besides, as matters were, it was much more to his advantage that the prefect of police should triumph over him than that he should humiliate the prefect.

“Sire,——” stammered the baron.

“Well, what is it?” asked Louis XVIII. The minister of police, giving way to an impulse of despair, was about to throw himself at the feet of Louis XVIII., who retreated a step and frowned.

“Will you speak?” he said.

“Oh, sire, what a dreadful misfortune! I am, indeed, to be pitied. I can never forgive myself!”

“Monsieur,” said Louis XVIII., “I command you to speak.”

“Well, sire, the usurper left Elba on the 26th February, and landed on the 1st of March.”

“And where? In Italy?” asked the king eagerly.

“In France, sire,—at a small port, near Antibes, in the Gulf of Juan.”

“The usurper landed in France, near Antibes, in the Gulf of Juan, two hundred and fifty leagues from Paris, on the 1st of March, and you only acquired this information today, the 3rd of March! Well, sir, what you tell me is impossible. You must have received a false report, or you have gone mad.”

“Alas, sire, it is but too true!” Louis made a gesture of indescribable anger and alarm, and then drew himself up as if this sudden blow had struck him at the same moment in heart and countenance.

“In France!” he cried, “the usurper in France! Then they did not watch over this man. Who knows? they were, perhaps, in league with him.”

“Oh, sire,” exclaimed the Duc de Blacas, “M. Dandré is not a man to be accused of treason! Sire, we have all been blind, and the minister of police has shared the general blindness, that is all.”

“But——” said Villefort, and then suddenly checking himself, he was silent; then he continued, “Your pardon, sire,” he said, bowing, “my zeal carried me away. Will your majesty deign to excuse me?”

“Speak, sir, speak boldly,” replied Louis. “You alone forewarned us of the evil; now try and aid us with the remedy.”

“Sire,” said Villefort, “the usurper is detested in the south; and it seems to me that if he ventured into the south, it would be easy to raise Languedoc and Provence against him.”

“Yes, assuredly,” replied the minister; “but he is advancing by Gap and Sisteron.”

“Advancing—he is advancing!” said Louis XVIII. “Is he then advancing on Paris?” The minister of police maintained a silence which was equivalent to a complete avowal.

“And Dauphiné, sir?” inquired the king, of Villefort. “Do you think it possible to rouse that as well as Provence?”

“Sire, I am sorry to tell your majesty a cruel fact; but the feeling in Dauphiné is quite the reverse of that in Provence or Languedoc. The mountaineers are Bonapartists, sire.”

“Then,” murmured Louis, “he was well informed. And how many men had he with him?”

“I do not know, sire,” answered the minister of police.

“What, you do not know! Have you neglected to obtain information on that point? Of course it is of no consequence,” he added, with a withering smile.

“Sire, it was impossible to learn; the despatch simply stated the fact of the landing and the route taken by the usurper.”

“And how did this despatch reach you?” inquired the king. The minister bowed his head, and while a deep color overspread his cheeks, he stammered out:

“By the telegraph, sire.” Louis XVIII. advanced a step, and folded his arms over his chest as Napoleon would have done.

0141m

“So then,” he exclaimed, turning pale with anger, “seven conjoined and allied armies overthrew that man. A miracle of heaven replaced me on the throne of my fathers after five-and-twenty years of exile. I have, during those five-and-twenty years, spared no pains to understand the people of France and the interests which were confided to me; and now, when I see the fruition of my wishes almost within reach, the power I hold in my hands bursts and shatters me to atoms!”

“Sire, it is fatality!” murmured the minister, feeling that the pressure of circumstances, however light a thing to destiny, was too much for any human strength to endure.

“What our enemies say of us is then true. We have learnt nothing, forgotten nothing! If I were betrayed as he was, I would console myself; but to be in the midst of persons elevated by myself to places of honor, who ought to watch over me more carefully than

over themselves,—for my fortune is theirs—before me they were nothing—after me they will be nothing, and perish miserably from incapacity—ineptitude! Oh, yes, sir, you are right—it is fatality!"

The minister quailed before this outburst of sarcasm. M. de Blacas wiped the moisture from his brow. Villefort smiled within himself, for he felt his increased importance.

"To fall," continued King Louis, who at the first glance had sounded the abyss on which the monarchy hung suspended,—"to fall, and learn of that fall by telegraph! Oh, I would rather mount the scaffold of my brother, Louis XVI., than thus descend the staircase at the Tuileries driven away by ridicule. Ridicule, sir—why, you know not its power in France, and yet you ought to know it!"

"Sire, sire," murmured the minister, "for pity's——"

"Approach, M. de Villefort," resumed the king, addressing the young man, who, motionless and breathless, was listening to a conversation on which depended the destiny of a kingdom. "Approach, and tell monsieur that it is possible to know beforehand all that he has not known."

"Sire, it was really impossible to learn secrets which that man concealed from all the world."

"Really impossible! Yes—that is a great word, sir. Unfortunately, there are great words, as there are great men; I have measured them. Really impossible for a minister who has an office, agents, spies, and fifteen hundred thousand francs for secret service money, to know what is going on at sixty leagues from the coast of France! Well, then, see, here is a gentleman who had none of these resources at his disposal—a gentleman, only a simple magistrate, who learned more than you with all your police, and who would have saved my crown, if, like you, he had the power of directing a telegraph." The look of the minister of police was turned with concentrated spite on Villefort, who bent his head in modest triumph.

"I do not mean that for you, Blacas," continued Louis XVIII.; "for if you have discovered nothing, at least you have had the good sense to persevere in your suspicions. Any other than yourself would have considered the disclosure of M. de Villefort insignificant, or else dictated by venal ambition." These words were an allusion to the sentiments which the minister of police had uttered with so much confidence an hour before.

Villefort understood the king's intent. Any other person would, perhaps, have been overcome by such an intoxicating draught of praise; but he feared to make for himself a mortal enemy of the police minister, although he saw that Dandré was irrevocably lost. In fact, the minister, who, in the plenitude of his power, had been unable to unearth Napoleon's secret, might in despair at his own downfall interrogate Dantès and so lay bare the motives of Villefort's plot. Realizing this, Villefort came to the rescue of the crest-fallen minister, instead of aiding to crush him.

"Sire," said Villefort, "the suddenness of this event must prove to your majesty that the issue is in the hands of Providence; what your majesty is pleased to attribute to me as profound perspicacity is simply owing to chance, and I have profited by that chance, like a good and devoted servant—that's all. Do not attribute to me more than I deserve, sire, that your majesty may never have occasion to recall the first opinion you have been pleased to form of me." The minister of police thanked the young man by an eloquent look, and Villefort understood that he had succeeded in his design; that is to say, that without forfeiting the gratitude of the king, he had made a friend of one on whom, in case of necessity, he might rely.

"'Tis well," resumed the king. "And now, gentlemen," he continued, turning towards M. de Blacas and the minister of police, "I have no further occasion for you, and you may retire; what now remains to do is in the department of the minister of war."

"Fortunately, sire," said M. de Blacas, "we can rely on the army; your majesty knows how every report confirms their loyalty and attachment."

"Do not mention reports, duke, to me, for I know now what confidence to place in them. Yet, speaking of reports, baron, what have you learned with regard to the affair in the Rue Saint-Jacques?"

"The affair in the Rue Saint-Jacques!" exclaimed Villefort, unable to repress an exclamation. Then, suddenly pausing, he added, "Your pardon, sire, but my devotion to your majesty has made me forget, not the respect I have, for that is too deeply engraved in my heart, but the rules of etiquette."

"Go on, go on, sir," replied the king; "you have today earned the right to make inquiries here."

“Sire,” interposed the minister of police, “I came a moment ago to give your majesty fresh information which I had obtained on this head, when your majesty’s attention was attracted by the terrible event that has occurred in the gulf, and now these facts will cease to interest your majesty.”

“On the contrary, sir,—on the contrary,” said Louis XVIII., “this affair seems to me to have a decided connection with that which occupies our attention, and the death of General Quesnel will, perhaps, put us on the direct track of a great internal conspiracy.” At the name of General Quesnel, Villefort trembled.

“Everything points to the conclusion, sire,” said the minister of police, “that death was not the result of suicide, as we first believed, but of assassination. General Quesnel, it appears, had just left a Bonapartist club when he disappeared. An unknown person had been with him that morning, and made an appointment with him in the Rue Saint-Jacques; unfortunately, the general’s valet, who was dressing his hair at the moment when the stranger entered, heard the street mentioned, but did not catch the number.” As the police minister related this to the king, Villefort, who looked as if his very life hung on the speaker’s lips, turned alternately red and pale. The king looked towards him.

“Do you not think with me, M. de Villefort, that General Quesnel, whom they believed attached to the usurper, but who was really entirely devoted to me, has perished the victim of a Bonapartist ambush?”

“It is probable, sire,” replied Villefort. “But is this all that is known?”

“They are on the track of the man who appointed the meeting with him.”

“On his track?” said Villefort.

“Yes, the servant has given his description. He is a man of from fifty to fifty-two years of age, dark, with black eyes covered with shaggy eyebrows, and a thick moustache. He was dressed in a blue frock-coat, buttoned up to the chin, and wore at his button-hole the rosette of an officer of the Legion of Honor. Yesterday a person exactly corresponding with this description was followed, but he was lost sight of at the corner of the Rue de la Jussienne and the Rue Coq-Héron.” Villefort leaned on the back of an armchair, for as the minister of police went on speaking he felt his legs bend under him; but when he learned that the unknown had escaped the vigilance of the agent who followed him, he breathed again.

“Continue to seek for this man, sir,” said the king to the minister of police; “for if, as I am all but convinced, General Quesnel, who would have been so useful to us at this moment, has been murdered, his assassins, Bonapartists or not, shall be cruelly punished.” It required all Villefort’s coolness not to betray the terror with which this declaration of the king inspired him.

“How strange,” continued the king, with some asperity; “the police think that they have disposed of the whole matter when they say, ‘A murder has been committed,’ and especially so when they can add, ‘And we are on the track of the guilty persons.’”

“Sire, your majesty will, I trust, be amply satisfied on this point at least.”

“We shall see. I will no longer detain you, M. de Villefort, for you must be fatigued after so long a journey; go and rest. Of course you stopped at your father’s?” A feeling of faintness came over Villefort.

0145m

“No, sire,” he replied, “I alighted at the Hotel de Madrid, in the Rue de Tournon.”

“But you have seen him?”

“Sire, I went straight to the Duc de Blacas.”

“But you will see him, then?”

“I think not, sire.”

“Ah, I forgot,” said Louis, smiling in a manner which proved that all these questions were not made without a motive; “I forgot you and M. Noirtier are not on the best terms possible, and that is another sacrifice made to the royal cause, and for which you should be recompensed.”

“Sire, the kindness your majesty deigns to evince towards me is a recompense which so far surpasses my utmost ambition that I have nothing more to ask for.”

“Never mind, sir, we will not forget you; make your mind easy. In the meanwhile” (the king here detached the cross of the Legion of Honor which he usually wore over his blue coat, near the cross of St. Louis, above the order of Notre-Dame-du-Mont-Carmel and St. Lazare, and gave it to Villefort)—“in the meanwhile take this cross.”

“Sire,” said Villefort, “your majesty mistakes; this is an officer’s cross.”

“_Ma foi!_” said Louis XVIII., “take it, such as it is, for I have not the time to procure you another. Blacas, let it be your care to see that the brevet is made out and sent to M. de Villefort.” Villefort’s eyes were filled with tears of joy and pride; he took the cross and kissed it.

“And now,” he said, “may I inquire what are the orders with which your majesty deigns to honor me?”

“Take what rest you require, and remember that if you are not able to serve me here in Paris, you may be of the greatest service to me at Marseilles.”

“Sire,” replied Villefort, bowing, “in an hour I shall have quitted Paris.”

“Go, sir,” said the king; “and should I forget you (kings’ memories are short), do not be afraid to bring yourself to my recollection. Baron, send for the minister of war. Blacas, remain.”

“Ah, sir,” said the minister of police to Villefort, as they left the Tuileries, “you entered by luck’s door—your fortune is made.”

“Will it be long first?” muttered Villefort, saluting the minister, whose career was ended, and looking about him for a hackney-coach. One passed at the moment, which he hailed; he gave his address to the driver, and springing in, threw himself on the seat, and gave loose to dreams of ambition.

Ten minutes afterwards Villefort reached his hotel, ordered horses to be ready in two hours, and asked to have his breakfast brought to him. He was about to begin his repast when the sound of the bell rang sharp and loud. The valet opened the door, and Villefort heard someone speak his name.

0147m

“Who could know that I was here already?” said the young man. The valet entered.

“Well,” said Villefort, “what is it?—Who rang?—Who asked for me?”

“A stranger who will not send in his name.”

“A stranger who will not send in his name! What can he want with me?”

“He wishes to speak to you.”

“To me?”

“Yes.”

“Did he mention my name?”

“Yes.”

“What sort of person is he?”

“Why, sir, a man of about fifty.”

“Short or tall?”

“About your own height, sir.”

“Dark or fair?”

“Dark,—very dark; with black eyes, black hair, black eyebrows.”

“And how dressed?” asked Villefort quickly.

“In a blue frock-coat, buttoned up close, decorated with the Legion of Honor.”

“It is he!” said Villefort, turning pale.

0148m

“Eh, _pardieu!_” said the individual whose description we have twice given, entering the door, “what a great deal of ceremony! Is it the custom in Marseilles for sons to keep their fathers waiting in their anterooms?”

“Father!” cried Villefort, “then I was not deceived; I felt sure it must be you.”

“Well, then, if you felt so sure,” replied the new-comer, putting his cane in a corner and his hat on a chair, “allow me to say, my dear Gérard, that it was not very filial of you to keep me waiting at the door.”

“Leave us, Germain,” said Villefort. The servant quitted the apartment with evident signs of astonishment.

Chapter 12. Father and Son

M. Noirtier—for it was, indeed, he who entered—looked after the servant until the door was closed, and then, fearing, no doubt, that he might be overheard in the antechamber, he opened the door again, nor was the precaution useless, as appeared from the rapid retreat of Germain, who proved that he was not exempt from the sin which ruined our first parents. M. Noirtier then took the trouble to close and bolt the antechamber door, then that of the bedchamber, and then extended his hand to Villefort, who had followed all his motions with surprise which he could not conceal.

“Well, now, my dear Gérard,” said he to the young man, with a very significant look, “do you know, you seem as if you were not very glad to see me?”

“My dear father,” said Villefort, “I am, on the contrary, delighted; but I so little expected your visit, that it has somewhat overcome me.”

“But, my dear fellow,” replied M. Noirtier, seating himself, “I might say the same thing to you, when you announce to me your wedding for the 28th of February, and on the 3rd of March you turn up here in Paris.”

“And if I have come, my dear father,” said Gérard, drawing closer to M. Noirtier, “do not complain, for it is for you that I came, and my journey will be your salvation.”

“Ah, indeed!” said M. Noirtier, stretching himself out at his ease in the chair. “Really, pray tell me all about it, for it must be interesting.”

“Father, you have heard speak of a certain Bonapartist club in the Rue Saint-Jacques?”

“No. 53; yes, I am vice-president.”

“Father, your coolness makes me shudder.”

“Why, my dear boy, when a man has been proscribed by the mountaineers, has escaped from Paris in a hay-cart, been hunted over the plains of Bordeaux by Robespierre’s bloodhounds, he becomes accustomed to most things. But go on, what about the club in the Rue Saint-Jacques?”

“Why, they induced General Quesnel to go there, and General Quesnel, who quitted his own house at nine o’clock in the evening, was found the next day in the Seine.”

0151m

“And who told you this fine story?”

“The king himself.”

“Well, then, in return for your story,” continued Noirtier, “I will tell you another.”

“My dear father, I think I already know what you are about to tell me.”

“Ah, you have heard of the landing of the emperor?”

“Not so loud, father, I entreat of you—for your own sake as well as mine. Yes, I heard this news, and knew it even before you could; for three days ago I posted from Marseilles to Paris with all possible speed, half-desperate at the enforced delay.”

“Three days ago? You are crazy. Why, three days ago the emperor had not landed.”

“No matter, I was aware of his intention.”

“How did you know about it?”

“By a letter addressed to you from the Island of Elba.”

“To me?”

“To you; and which I discovered in the pocket-book of the messenger. Had that letter fallen into the hands of another, you, my dear father, would probably ere this have been shot.” Villefort’s father laughed.

“Come, come,” said he, “will the Restoration adopt imperial methods so promptly? Shot, my dear boy? What an idea! Where is the letter you speak of? I know you too well to suppose you would allow such a thing to pass you.”

“I burnt it, for fear that even a fragment should remain; for that letter must have led to your condemnation.”

“And the destruction of your future prospects,” replied Noirtier; “yes, I can easily comprehend that. But I have nothing to fear while I have you to protect me.”

“I do better than that, sir—I save you.”

“You do? Why, really, the thing becomes more and more dramatic—explain yourself.”

“I must refer again to the club in the Rue Saint-Jacques.”

“It appears that this club is rather a bore to the police. Why didn’t they search more vigilantly? they would have found——”

“They have not found; but they are on the track.”

“Yes, that the usual phrase; I am quite familiar with it. When the police is at fault, it declares that it is on the track; and the government patiently awaits the day when it comes to say, with a sneaking air, that the track is lost.”

“Yes, but they have found a corpse; the general has been killed, and in all countries they call that a murder.”

“A murder do you call it? why, there is nothing to prove that the general was murdered. People are found every day in the Seine, having thrown themselves in, or having been drowned from not knowing how to swim.”

“Father, you know very well that the general was not a man to drown himself in despair, and people do not bathe in the Seine in the month of January. No, no, do not be deceived; this was murder in every sense of the word.”

“And who thus designated it?”

“The king himself.”

“The king! I thought he was philosopher enough to allow that there was no murder in politics. In politics, my dear fellow, you know, as well as I do, there are no men, but ideas—no feelings, but interests; in politics we do not kill a man, we only remove an obstacle, that is all. Would you like to know how matters have progressed? Well, I will tell you. It was thought reliance might be placed in General Quesnel; he was recommended to us from the Island of Elba; one of us went to him, and invited him to the Rue Saint-Jacques, where he would find some friends. He came there, and the plan was unfolded to him for leaving Elba, the projected landing, etc. When he had heard and comprehended all to the fullest extent, he replied that he was a royalist. Then all looked at

each other,—he was made to take an oath, and did so, but with such an ill grace that it was really tempting Providence to swear thus, and yet, in spite of that, the general was allowed to depart free—perfectly free. Yet he did not return home. What could that mean? why, my dear fellow, that on leaving us he lost his way, that's all. A murder? really, Villefort, you surprise me. You, a deputy procureur, to found an accusation on such bad premises! Did I ever say to you, when you were fulfilling your character as a royalist, and cut off the head of one of my party, 'My son, you have committed a murder?' No, I said, 'Very well, sir, you have gained the victory; tomorrow, perchance, it will be our turn.'"

"But, father, take care; when our turn comes, our revenge will be sweeping."

"I do not understand you."

"You rely on the usurper's return?"

"We do."

"You are mistaken; he will not advance two leagues into the interior of France without being followed, tracked, and caught like a wild beast."

"My dear fellow, the emperor is at this moment on the way to Grenoble; on the 10th or 12th he will be at Lyons, and on the 20th or 25th at Paris."

"The people will rise."

"Yes, to go and meet him."

"He has but a handful of men with him, and armies will be despatched against him."

"Yes, to escort him into the capital. Really, my dear Gérard, you are but a child; you think yourself well informed because the telegraph has told you, three days after the landing, 'The usurper has landed at Cannes with several men. He is pursued.' But where is he? what is he doing? You do not know at all, and in this way they will chase him to Paris, without drawing a trigger."

"Grenoble and Lyons are faithful cities, and will oppose to him an impassable barrier."

"Grenoble will open her gates to him with enthusiasm—all Lyons will hasten to welcome him. Believe me, we are as well informed as you, and our police are as good as your own. Would you like a proof of it? well, you wished to conceal your journey from me, and yet I knew of your arrival half an hour after you had passed the barrier. You gave your direction to no one but your postilion, yet I have your address, and in proof I am here the very instant you are going to sit at table. Ring, then, if you please, for a second knife, fork, and plate, and we will dine together."

"Indeed!" replied Villefort, looking at his father with astonishment, "you really do seem very well informed."

"Eh? the thing is simple enough. You who are in power have only the means that money produces—we who are in expectation, have those which devotion prompts."

"Devotion!" said Villefort, with a sneer.

"Yes, devotion; for that is, I believe, the phrase for hopeful ambition."

And Villefort's father extended his hand to the bell-rope, to summon the servant whom his son had not called. Villefort caught his arm.

"Wait, my dear father," said the young man, "one word more."

"Say on."

"However stupid the royalist police may be, they do know one terrible thing."

"What is that?"

"The description of the man who, on the morning of the day when General Quesnel disappeared, presented himself at his house."

"Oh, the admirable police have found that out, have they? And what may be that description?"

“Dark complexion; hair, eyebrows, and whiskers black; blue frock-coat, buttoned up to the chin; rosette of an officer of the Legion of Honor in his button-hole; a hat with wide brim, and a cane.”

“Ah, ha, that’s it, is it?” said Noirtier; “and why, then, have they not laid hands on him?”

“Because yesterday, or the day before, they lost sight of him at the corner of the Rue Coq-Héron.”

“Didn’t I say that your police were good for nothing?”

“Yes; but they may catch him yet.”

“True,” said Noirtier, looking carelessly around him, “true, if this person were not on his guard, as he is;” and he added with a smile, “He will consequently make a few changes in his personal appearance.” At these words he rose, and put off his frock-coat and cravat, went towards a table on which lay his son’s toilet articles, lathered his face, took a razor, and, with a firm hand, cut off the compromising whiskers. Villefort watched him with alarm not devoid of admiration.

His whiskers cut off, Noirtier gave another turn to his hair; took, instead of his black cravat, a colored neckerchief which lay at the top of an open portmanteau; put on, in lieu of his blue and high-buttoned frock-coat, a coat of Villefort’s of dark brown, and cut away in front; tried on before the glass a narrow-brimmed hat of his son’s, which appeared to fit him perfectly, and, leaving his cane in the corner where he had deposited it, he took up a small bamboo switch, cut the air with it once or twice, and walked about with that easy swagger which was one of his principal characteristics.

“Well,” he said, turning towards his wondering son, when this disguise was completed, “well, do you think your police will recognize me now.”

“No, father,” stammered Villefort; “at least, I hope not.”

“And now, my dear boy,” continued Noirtier, “I rely on your prudence to remove all the things which I leave in your care.”

“Oh, rely on me,” said Villefort.

“Yes, yes; and now I believe you are right, and that you have really saved my life; be assured I will return the favor hereafter.”

Villefort shook his head.

“You are not convinced yet?”

“I hope at least, that you may be mistaken.”

“Shall you see the king again?”

“Perhaps.”

“Would you pass in his eyes for a prophet?”

“Prophets of evil are not in favor at the court, father.”

“True, but some day they do them justice; and supposing a second restoration, you would then pass for a great man.”

“Well, what should I say to the king?”

“Say this to him: ‘Sire, you are deceived as to the feeling in France, as to the opinions of the towns, and the prejudices of the army; he whom in Paris you call the Corsican ogre, who at Nevers is styled the usurper, is already saluted as Bonaparte at Lyons, and emperor at Grenoble. You think he is tracked, pursued, captured; he is advancing as rapidly as his own eagles. The soldiers you believe to be dying with hunger, worn out with fatigue, ready to desert, gather like atoms of snow about the rolling ball as it hastens onward. Sire, go, leave France to its real master, to him who acquired it, not by purchase, but by right of conquest; go, sire, not that you incur any risk, for your adversary is powerful enough to show you mercy, but because it would be humiliating for a grandson of Saint Louis to owe his life to the man of Arcola, Marengo, Austerlitz.’ Tell him this, Gérard; or, rather, tell him nothing. Keep your journey a secret; do not boast of what you have come to Paris to do, or have done; return with all speed; enter Marseilles at night, and your house by the back-door, and there remain, quiet, submissive, secret, and, above all, inoffensive; for this time, I swear to you, we shall act like powerful men who know their enemies. Go, my son—go, my dear Gérard, and by your obedience to my

paternal orders, or, if you prefer it, friendly counsels, we will keep you in your place. This will be," added Noirtier, with a smile, "one means by which you may a second time save me, if the political balance should some day take another turn, and cast you aloft while hurling me down. Adieu, my dear Gérard, and at your next journey alight at my door."

Noirtier left the room when he had finished, with the same calmness that had characterized him during the whole of this remarkable and trying conversation. Villefort, pale and agitated, ran to the window, put aside the curtain, and saw him pass, cool and collected, by two or three ill-looking men at the corner of the street, who were there, perhaps, to arrest a man with black whiskers, and a blue frock-coat, and hat with broad brim.

Villefort stood watching, breathless, until his father had disappeared at the Rue Bussy. Then he turned to the various articles he had left behind him, put the black cravat and blue frock-coat at the bottom of the portmanteau, threw the hat into a dark closet, broke the cane into small bits and flung it in the fire, put on his travelling-cap, and calling his valet, checked with a look the thousand questions he was ready to ask, paid his bill, sprang into his carriage, which was ready, learned at Lyons that Bonaparte had entered Grenoble, and in the midst of the tumult which prevailed along the road, at length reached Marseilles, a prey to all the hopes and fears which enter into the heart of man with ambition and its first successes.

Chapter 13. The Hundred Days

M. Noirtier was a true prophet, and things progressed rapidly, as he had predicted. Everyone knows the history of the famous return from Elba, a return which was unprecedented in the past, and will probably remain without a counterpart in the future.

Louis XVIII. made but a faint attempt to parry this unexpected blow; the monarchy he had scarcely reconstructed tottered on its precarious foundation, and at a sign from the emperor the incongruous structure of ancient prejudices and new ideas fell to the ground. Villefort, therefore, gained nothing save the king's gratitude (which was rather likely to injure him at the present time) and the cross of the Legion of Honor, which he had the prudence not to wear, although M. de Blacas had duly forwarded the brevet.

Napoleon would, doubtless, have deprived Villefort of his office had it not been for Noirtier, who was all powerful at court, and thus the Girondin of '93 and the Senator of 1806 protected him who so lately had been his protector. All Villefort's influence barely enabled him to stifle the secret Dantès had so nearly divulged. The king's procureur alone was deprived of his office, being suspected of royalism.

However, scarcely was the imperial power established—that is, scarcely had the emperor re-entered the Tuileries and begun to issue orders from the closet into which we have introduced our readers,—he found on the table there Louis XVIII.'s half-filled snuff-box,—scarcely had this occurred when Marseilles began, in spite of the authorities, to rekindle the flames of civil war, always smouldering in the south, and it required but little to excite the populace to acts of far greater violence than the shouts and insults with which they assailed the royalists whenever they ventured abroad.

0159m

Owing to this change, the worthy shipowner became at that moment—we will not say all powerful, because Morrel was a prudent and rather a timid man, so much so, that many of the most zealous partisans of Bonaparte accused him of "moderation"—but sufficiently influential to make a demand in favor of Dantès.

Villefort retained his place, but his marriage was put off until a more favorable opportunity. If the emperor remained on the throne, Gérard required a different alliance to aid his career; if Louis XVIII. returned, the influence of M. de Saint-Méran, like his own, could be vastly increased, and the marriage be still more suitable. The deputy procureur was, therefore, the first magistrate of Marseilles, when one morning his door opened, and M. Morrel was announced.

Anyone else would have hastened to receive him; but Villefort was a man of ability, and he knew this would be a sign of weakness. He made Morrel wait in the antechamber, although he had no one with him, for the simple reason that the king's procureur always makes everyone wait, and after passing a quarter of an hour in reading the papers, he ordered M. Morrel to be admitted.

Morrel expected Villefort would be dejected; he found him as he had found him six weeks before, calm, firm, and full of that glacial politeness, that most insurmountable barrier which separates the well-bred from the vulgar man.

He had entered Villefort's office expecting that the magistrate would tremble at the sight of him; on the contrary, he felt a cold shudder all over him when he saw Villefort sitting there with his elbow on his desk, and his head leaning on his hand. He stopped at the door; Villefort gazed at him as if he had some difficulty in recognizing him; then, after a brief interval, during which the honest shipowner turned his hat in his hands,

"M. Morrel, I believe?" said Villefort.

"Yes, sir."

"Come nearer," said the magistrate, with a patronizing wave of the hand, "and tell me to what circumstance I owe the honor of this visit."

"Do you not guess, monsieur?" asked Morrel.

"Not in the least; but if I can serve you in any way I shall be delighted."

"Everything depends on you."

"Explain yourself, pray."

"Monsieur," said Morrel, recovering his assurance as he proceeded, "do you recollect that a few days before the landing of his majesty the emperor, I came to intercede for a young man, the mate of my ship, who was accused of being concerned in correspondence with the Island of Elba? What was the other day a crime is today a title to favor. You then served Louis XVIII., and you did not show any favor—it was your duty; today you serve Napoleon, and you ought to protect him—it is equally your duty; I come, therefore, to ask what has become of him?"

0161m

Villefort by a strong effort sought to control himself. "What is his name?" said he. "Tell me his name."

"Edmond Dantès."

Villefort would probably have rather stood opposite the muzzle of a pistol at five-and-twenty paces than have heard this name spoken; but he did not blanch.

"Dantès," repeated he, "Edmond Dantès."

"Yes, monsieur." Villefort opened a large register, then went to a table, from the table turned to his registers, and then, turning to Morrel,

"Are you quite sure you are not mistaken, monsieur?" said he, in the most natural tone in the world.

Had Morrel been a more quick-sighted man, or better versed in these matters, he would have been surprised at the king's procureur answering him on such a subject, instead of referring him to the governors of the prison or the prefect of the department. But Morrel, disappointed in his expectations of exciting fear, was conscious only of the other's condescension. Villefort had calculated rightly.

"No," said Morrel; "I am not mistaken. I have known him for ten years, the last four of which he was in my service. Do not you recollect, I came about six weeks ago to plead for clemency, as I come today to plead for justice. You received me very coldly. Oh, the royalists were very severe with the Bonapartists in those days."

"Monsieur," returned Villefort, "I was then a royalist, because I believed the Bourbons not only the heirs to the throne, but the chosen of the nation. The miraculous return of Napoleon has conquered me, the legitimate monarch is he who is loved by his people."

"That's right!" cried Morrel. "I like to hear you speak thus, and I augur well for Edmond from it."

"Wait a moment," said Villefort, turning over the leaves of a register; "I have it—a sailor, who was about to marry a young Catalan girl. I recollect now; it was a very serious charge."

“How so?”

“You know that when he left here he was taken to the Palais de Justice.”

“Well?”

“I made my report to the authorities at Paris, and a week after he was carried off.”

“Carried off!” said Morrel. “What can they have done with him?”

“Oh, he has been taken to Fenestrelles, to Pignerol, or to the Sainte-Marguérite islands. Some fine morning he will return to take command of your vessel.”

“Come when he will, it shall be kept for him. But how is it he is not already returned? It seems to me the first care of government should be to set at liberty those who have suffered for their adherence to it.”

“Do not be too hasty, M. Morrel,” replied Villefort. “The order of imprisonment came from high authority, and the order for his liberation must proceed from the same source; and, as Napoleon has scarcely been reinstated a fortnight, the letters have not yet been forwarded.”

“But,” said Morrel, “is there no way of expediting all these formalities—of releasing him from arrest?”

“There has been no arrest.”

“How?”

“It is sometimes essential to government to cause a man’s disappearance without leaving any traces, so that no written forms or documents may defeat their wishes.”

“It might be so under the Bourbons, but at present——”

“It has always been so, my dear Morrel, since the reign of Louis XIV. The emperor is more strict in prison discipline than even Louis himself, and the number of prisoners whose names are not on the register is incalculable.” Had Morrel even any suspicions, so much kindness would have dispelled them.

“Well, M. de Villefort, how would you advise me to act?” asked he.

“Petition the minister.”

“Oh, I know what that is; the minister receives two hundred petitions every day, and does not read three.”

“That is true; but he will read a petition countersigned and presented by me.”

“And will you undertake to deliver it?”

“With the greatest pleasure. Dantès was then guilty, and now he is innocent, and it is as much my duty to free him as it was to condemn him.” Villefort thus forestalled any danger of an inquiry, which, however improbable it might be, if it did take place would leave him defenceless.

“But how shall I address the minister?”

“Sit down there,” said Villefort, giving up his place to Morrel, “and write what I dictate.”

“Will you be so good?”

“Certainly. But lose no time; we have lost too much already.”

“That is true. Only think what the poor fellow may even now be suffering.”

Villefort shuddered at the suggestion; but he had gone too far to draw back. Dantès must be crushed to gratify Villefort’s ambition.

Villefort dictated a petition, in which, from an excellent intention, no doubt, Dantès’ patriotic services were exaggerated, and he was made out one of the most active agents of Napoleon’s return. It was evident that at the sight of this document the minister would

instantly release him. The petition finished, Villefort read it aloud.

“That will do,” said he; “leave the rest to me.”

“Will the petition go soon?”

“Today.”

“Countersigned by you?”

“The best thing I can do will be to certify the truth of the contents of your petition.” And, sitting down, Villefort wrote the certificate at the bottom.

“What more is to be done?”

“I will do whatever is necessary.” This assurance delighted Morrel, who took leave of Villefort, and hastened to announce to old Dantès that he would soon see his son.

As for Villefort, instead of sending to Paris, he carefully preserved the petition that so fearfully compromised Dantès, in the hopes of an event that seemed not unlikely,—that is, a second restoration. Dantès remained a prisoner, and heard not the noise of the fall of Louis XVIII.’s throne, or the still more tragic destruction of the empire.

Twice during the Hundred Days had Morrel renewed his demand, and twice had Villefort soothed him with promises. At last there was Waterloo, and Morrel came no more; he had done all that was in his power, and any fresh attempt would only compromise himself uselessly.

Louis XVIII. remounted the throne; Villefort, to whom Marseilles had become filled with remorseful memories, sought and obtained the situation of king’s procureur at Toulouse, and a fortnight afterwards he married Mademoiselle de Saint-Méran, whose father now stood higher at court than ever.

And so Dantès, after the Hundred Days and after Waterloo, remained in his dungeon, forgotten of earth and heaven.

Danglars comprehended the full extent of the wretched fate that overwhelmed Dantès; and, when Napoleon returned to France, he, after the manner of mediocre minds, termed the coincidence, _a decree of Providence_. But when Napoleon returned to Paris, Danglars’ heart failed him, and he lived in constant fear of Dantès’ return on a mission of vengeance. He therefore informed M. Morrel of his wish to quit the sea, and obtained a recommendation from him to a Spanish merchant, into whose service he entered at the end of March, that is, ten or twelve days after Napoleon’s return. He then left for Madrid, and was no more heard of.

Fernand understood nothing except that Dantès was absent. What had become of him he cared not to inquire. Only, during the respite the absence of his rival afforded him, he reflected, partly on the means of deceiving Mercédès as to the cause of his absence, partly on plans of emigration and abduction, as from time to time he sat sad and motionless on the summit of Cape Pharo, at the spot from whence Marseilles and the Catalans are visible, watching for the apparition of a young and handsome man, who was for him also the messenger of vengeance. Fernand’s mind was made up; he would shoot Dantès, and then kill himself. But Fernand was mistaken; a man of his disposition never kills himself, for he constantly hopes.

During this time the empire made its last conscription, and every man in France capable of bearing arms rushed to obey the summons of the emperor. Fernand departed with the rest, bearing with him the terrible thought that while he was away, his rival would perhaps return and marry Mercédès. Had Fernand really meant to kill himself, he would have done so when he parted from Mercédès. His devotion, and the compassion he showed for her misfortunes, produced the effect they always produce on noble minds—Mercédès had always had a sincere regard for Fernand, and this was now strengthened by gratitude.

“My brother,” said she, as she placed his knapsack on his shoulders, “be careful of yourself, for if you are killed, I shall be alone in the world.” These words carried a ray of hope into Fernand’s heart. Should Dantès not return, Mercédès might one day be his.

0165m

Mercédès was left alone face to face with the vast plain that had never seemed so barren, and the sea that had never seemed so vast. Bathed in tears she wandered about the Catalan village. Sometimes she stood mute and motionless as a statue, looking towards Marseilles, at other times gazing on the sea, and debating as to whether it were not better to cast herself into the abyss of

the ocean, and thus end her woes. It was not want of courage that prevented her putting this resolution into execution; but her religious feelings came to her aid and saved her.

Caderousse was, like Fernand, enrolled in the army, but, being married and eight years older, he was merely sent to the frontier. Old Dantès, who was only sustained by hope, lost all hope at Napoleon's downfall. Five months after he had been separated from his son, and almost at the hour of his arrest, he breathed his last in Mercédès' arms. M. Morrel paid the expenses of his funeral, and a few small debts the poor old man had contracted.

There was more than benevolence in this action; there was courage; the south was aflame, and to assist, even on his death-bed, the father of so dangerous a Bonapartist as Dantès, was stigmatized as a crime.

Chapter 14. The Two Prisoners

A year after Louis XVIII.'s restoration, a visit was made by the inspector-general of prisons. Dantès in his cell heard the noise of preparation,—sounds that at the depth where he lay would have been inaudible to any but the ear of a prisoner, who could hear the splash of the drop of water that every hour fell from the roof of his dungeon. He guessed something uncommon was passing among the living; but he had so long ceased to have any intercourse with the world, that he looked upon himself as dead.

The inspector visited, one after another, the cells and dungeons of several of the prisoners, whose good behavior or stupidity recommended them to the clemency of the government. He inquired how they were fed, and if they had any request to make. The universal response was, that the fare was detestable, and that they wanted to be set free.

The inspector asked if they had anything else to ask for. They shook their heads. What could they desire beyond their liberty? The inspector turned smilingly to the governor.

"I do not know what reason government can assign for these useless visits; when you see one prisoner, you see all,—always the same thing,—ill fed and innocent. Are there any others?"

"Yes; the dangerous and mad prisoners are in the dungeons."

"Let us visit them," said the inspector with an air of fatigue. "We must play the farce to the end. Let us see the dungeons."

"Let us first send for two soldiers," said the governor. "The prisoners sometimes, through mere uneasiness of life, and in order to be sentenced to death, commit acts of useless violence, and you might fall a victim."

"Take all needful precautions," replied the inspector.

Two soldiers were accordingly sent for, and the inspector descended a stairway, so foul, so humid, so dark, as to be loathsome to sight, smell, and respiration.

"Oh," cried the inspector, "who can live here?"

"A most dangerous conspirator, a man we are ordered to keep the most strict watch over, as he is daring and resolute."

"He is alone?"

"Certainly."

"How long has he been there?"

"Nearly a year."

"Was he placed here when he first arrived?"

"No; not until he attempted to kill the turnkey, who took his food to him."

"To kill the turnkey?"

"Yes, the very one who is lighting us. Is it not true, Antoine?" asked the governor.

"True enough; he wanted to kill me!" returned the turnkey.

“He must be mad,” said the inspector.

“He is worse than that,—he is a devil!” returned the turnkey.

“Shall I complain of him?” demanded the inspector.

“Oh, no; it is useless. Besides, he is almost mad now, and in another year he will be quite so.”

“So much the better for him,—he will suffer less,” said the inspector. He was, as this remark shows, a man full of philanthropy, and in every way fit for his office.

“You are right, sir,” replied the governor; “and this remark proves that you have deeply considered the subject. Now we have in a dungeon about twenty feet distant, and to which you descend by another stair, an old abbé, formerly leader of a party in Italy, who has been here since 1811, and in 1813 he went mad, and the change is astonishing. He used to weep, he now laughs; he grew thin, he now grows fat. You had better see him, for his madness is amusing.”

“I will see them both,” returned the inspector; “I must conscientiously perform my duty.”

This was the inspector’s first visit; he wished to display his authority.

“Let us visit this one first,” added he.

“By all means,” replied the governor, and he signed to the turnkey to open the door. At the sound of the key turning in the lock, and the creaking of the hinges, Dantès, who was crouched in a corner of the dungeon, whence he could see the ray of light that came through a narrow iron grating above, raised his head. Seeing a stranger, escorted by two turnkeys holding torches and accompanied by two soldiers, and to whom the governor spoke bareheaded, Dantès, who guessed the truth, and that the moment to address himself to the superior authorities was come, sprang forward with clasped hands.

The soldiers interposed their bayonets, for they thought that he was about to attack the inspector, and the latter recoiled two or three steps. Dantès saw that he was looked upon as dangerous. Then, infusing all the humility he possessed into his eyes and voice, he addressed the inspector, and sought to inspire him with pity.

The inspector listened attentively; then, turning to the governor, observed, “He will become religious—he is already more gentle; he is afraid, and retreated before the bayonets—madmen are not afraid of anything; I made some curious observations on this at Charenton.” Then, turning to the prisoner, “What is it you want?” said he.

“I want to know what crime I have committed—to be tried; and if I am guilty, to be shot; if innocent, to be set at liberty.”

“Are you well fed?” said the inspector.

“I believe so; I don’t know; it’s of no consequence. What matters really, not only to me, but to officers of justice and the king, is that an innocent man should languish in prison, the victim of an infamous denunciation, to die here cursing his executioners.”

“You are very humble today,” remarked the governor; “you are not so always; the other day, for instance, when you tried to kill the turnkey.”

“It is true, sir, and I beg his pardon, for he has always been very good to me, but I was mad.”

“And you are not so any longer?”

“No; captivity has subdued me—I have been here so long.”

“So long?—when were you arrested, then?” asked the inspector.

“The 28th of February, 1815, at half-past two in the afternoon.”

“Today is the 30th of July, 1816,—why, it is but seventeen months.”

“Only seventeen months,” replied Dantès. “Oh, you do not know what is seventeen months in prison!—seventeen ages rather, especially to a man who, like me, had arrived at the summit of his ambition—to a man, who, like me, was on the point of marrying a woman he adored, who saw an honorable career opened before him, and who loses all in an instant—who sees his prospects

destroyed, and is ignorant of the fate of his affianced wife, and whether his aged father be still living! Seventeen months' captivity to a sailor accustomed to the boundless ocean, is a worse punishment than human crime ever merited. Have pity on me, then, and ask for me, not intelligence, but a trial; not pardon, but a verdict—a trial, sir, I ask only for a trial; that, surely, cannot be denied to one who is accused!"

"We shall see," said the inspector; then, turning to the governor, "On my word, the poor devil touches me. You must show me the proofs against him."

"Certainly; but you will find terrible charges."

"Monsieur," continued Dantès, "I know it is not in your power to release me; but you can plead for me—you can have me tried—and that is all I ask. Let me know my crime, and the reason why I was condemned. Uncertainty is worse than all."

"Go on with the lights," said the inspector.

"Monsieur," cried Dantès, "I can tell by your voice you are touched with pity; tell me at least to hope."

"I cannot tell you that," replied the inspector; "I can only promise to examine into your case."

"Oh, I am free—then I am saved!"

"Who arrested you?"

"M. Villefort. See him, and hear what he says."

"M. Villefort is no longer at Marseilles; he is now at Toulouse."

"I am no longer surprised at my detention," murmured Dantès, "since my only protector is removed."

"Had M. de Villefort any cause of personal dislike to you?"

"None; on the contrary, he was very kind to me."

"I can, then, rely on the notes he has left concerning you?"

"Entirely."

"That is well; wait patiently, then."

Dantès fell on his knees, and prayed earnestly. The door closed; but this time a fresh inmate was left with Dantès—Hope.

0173m

"Will you see the register at once," asked the governor, "or proceed to the other cell?"

"Let us visit them all," said the inspector. "If I once went up those stairs. I should never have the courage to come down again."

"Ah, this one is not like the other, and his madness is less affecting than this one's display of reason."

"What is his folly?"

"He fancies he possesses an immense treasure. The first year he offered government a million of francs for his release; the second, two; the third, three; and so on progressively. He is now in his fifth year of captivity; he will ask to speak to you in private, and offer you five millions."

"How curious!—what is his name?"

"The Abbé Faria."

"No. 27," said the inspector.

"It is here; unlock the door, Antoine."

The turnkey obeyed, and the inspector gazed curiously into the chamber of the _mad abbé_, as the prisoner was usually called.

In the centre of the cell, in a circle traced with a fragment of plaster detached from the wall, sat a man whose tattered garments scarcely covered him. He was drawing in this circle geometrical lines, and seemed as much absorbed in his problem as Archimedes was when the soldier of Marcellus slew him. He did not move at the sound of the door, and continued his calculations until the flash of the torches lighted up with an unwonted glare the sombre walls of his cell; then, raising his head, he perceived with astonishment the number of persons present. He hastily seized the coverlet of his bed, and wrapped it round him.

“What is it you want?” said the inspector.

“I, monsieur,” replied the abbé with an air of surprise,—“I want nothing.”

“You do not understand,” continued the inspector; “I am sent here by government to visit the prison, and hear the requests of the prisoners.”

“Oh, that is different,” cried the abbé; “and we shall understand each other, I hope.”

“There, now,” whispered the governor, “it is just as I told you.”

“Monsieur,” continued the prisoner, “I am the Abbé Faria, born at Rome. I was for twenty years Cardinal Spada’s secretary; I was arrested, why, I know not, toward the beginning of the year 1811; since then I have demanded my liberty from the Italian and French government.”

“Why from the French government?”

“Because I was arrested at Piombino, and I presume that, like Milan and Florence, Piombino has become the capital of some French department.”

“Ah,” said the inspector, “you have not the latest news from Italy?”

“My information dates from the day on which I was arrested,” returned the Abbé Faria; “and as the emperor had created the kingdom of Rome for his infant son, I presume that he has realized the dream of Machiavelli and Cæsar Borgia, which was to make Italy a united kingdom.”

“Monsieur,” returned the inspector, “Providence has changed this gigantic plan you advocate so warmly.”

“It is the only means of rendering Italy strong, happy, and independent.”

“Very possibly; only I am not come to discuss politics, but to inquire if you have anything to ask or to complain of.”

“The food is the same as in other prisons,—that is, very bad; the lodging is very unhealthful, but, on the whole, passable for a dungeon; but it is not that which I wish to speak of, but a secret I have to reveal of the greatest importance.”

“We are coming to the point,” whispered the governor.

“It is for that reason I am delighted to see you,” continued the abbé, “although you have disturbed me in a most important calculation, which, if it succeeded, would possibly change Newton’s system. Could you allow me a few words in private.”

“What did I tell you?” said the governor.

“You knew him,” returned the inspector with a smile.

“What you ask is impossible, monsieur,” continued he, addressing Faria.

0175m

“But,” said the abbé, “I would speak to you of a large sum, amounting to five millions.”

“The very sum you named,” whispered the inspector in his turn.

“However,” continued Faria, seeing that the inspector was about to depart, “it is not absolutely necessary for us to be alone; the governor can be present.”

“Unfortunately,” said the governor, “I know beforehand what you are about to say; it concerns your treasures, does it not?” Faria fixed his eyes on him with an expression that would have convinced anyone else of his sanity.

“Of course,” said he; “of what else should I speak?”

“Mr. Inspector,” continued the governor, “I can tell you the story as well as he, for it has been dinned in my ears for the last four or five years.”

“That proves,” returned the abbé, “that you are like those of Holy Writ, who having eyes see not, and having ears hear not.”

“My dear sir, the government is rich and does not want your treasures,” replied the inspector; “keep them until you are liberated.” The abbé’s eyes glistened; he seized the inspector’s hand.

“But what if I am not liberated,” cried he, “and am detained here until my death? this treasure will be lost. Had not government better profit by it? I will offer six millions, and I will content myself with the rest, if they will only give me my liberty.”

“On my word,” said the inspector in a low tone, “had I not been told beforehand that this man was mad, I should believe what he says.”

“I am not mad,” replied Faria, with that acuteness of hearing peculiar to prisoners. “The treasure I speak of really exists, and I offer to sign an agreement with you, in which I promise to lead you to the spot where you shall dig; and if I deceive you, bring me here again,—I ask no more.”

The governor laughed. “Is the spot far from here?”

“A hundred leagues.”

“It is not ill-planned,” said the governor. “If all the prisoners took it into their heads to travel a hundred leagues, and their guardians consented to accompany them, they would have a capital chance of escaping.”

“The scheme is well known,” said the inspector; “and the abbé’s plan has not even the merit of originality.”

Then turning to Faria, “I inquired if you are well fed?” said he.

“Swear to me,” replied Faria, “to free me if what I tell you prove true, and I will stay here while you go to the spot.”

“Are you well fed?” repeated the inspector.

“Monsieur, you run no risk, for, as I told you, I will stay here; so there is no chance of my escaping.”

“You do not reply to my question,” replied the inspector impatiently.

“Nor you to mine,” cried the abbé. “You will not accept my gold; I will keep it for myself. You refuse me my liberty; God will give it me.” And the abbé, casting away his coverlet, resumed his place, and continued his calculations.

0177m

“What is he doing there?” said the inspector.

“Counting his treasures,” replied the governor.

Faria replied to this sarcasm with a glance of profound contempt. They went out. The turnkey closed the door behind them.

“He was wealthy once, perhaps?” said the inspector.

“Or dreamed he was, and awoke mad.”

“After all,” said the inspector, “if he had been rich, he would not have been here.”

So the matter ended for the Abbé Faria. He remained in his cell, and this visit only increased the belief in his insanity.

Caligula or Nero, those treasure-seekers, those desirers of the impossible, would have accorded to the poor wretch, in exchange for his wealth, the liberty he so earnestly prayed for. But the kings of modern times, restrained by the limits of mere probability, have

neither courage nor desire. They fear the ear that hears their orders, and the eye that scrutinizes their actions. Formerly they believed themselves sprung from Jupiter, and shielded by their birth; but nowadays they are not inviolable.

It has always been against the policy of despotic governments to suffer the victims of their persecutions to reappear. As the Inquisition rarely allowed its victims to be seen with their limbs distorted and their flesh lacerated by torture, so madness is always concealed in its cell, from whence, should it depart, it is conveyed to some gloomy hospital, where the doctor has no thought for man or mind in the mutilated being the jailer delivers to him. The very madness of the Abbé Faria, gone mad in prison, condemned him to perpetual captivity.

The inspector kept his word with Dantès; he examined the register, and found the following note concerning him:

Edmond Dantès:

Violent Bonapartist; took an active part in the return from Elba.

The greatest watchfulness and care to be exercised.

This note was in a different hand from the rest, which showed that it had been added since his confinement. The inspector could not contend against this accusation; he simply wrote, _Nothing to be done._

This visit had infused new vigor into Dantès; he had, till then, forgotten the date; but now, with a fragment of plaster, he wrote the date, 30th July, 1816, and made a mark every day, in order not to lose his reckoning again. Days and weeks passed away, then months—Dantès still waited; he at first expected to be freed in a fortnight. This fortnight expired, he decided that the inspector would do nothing until his return to Paris, and that he would not reach there until his circuit was finished, he therefore fixed three months; three months passed away, then six more. Finally ten months and a half had gone by and no favorable change had taken place, and Dantès began to fancy the inspector's visit but a dream, an illusion of the brain.

At the expiration of a year the governor was transferred; he had obtained charge of the fortress at Ham. He took with him several of his subordinates, and amongst them Dantès' jailer. A new governor arrived; it would have been too tedious to acquire the names of the prisoners; he learned their numbers instead. This horrible place contained fifty cells; their inhabitants were designated by the numbers of their cell, and the unhappy young man was no longer called Edmond Dantès—he was now number 34.

Chapter 15. Number 34 and Number 27

Dantès passed through all the stages of torture natural to prisoners in suspense. He was sustained at first by that pride of conscious innocence which is the sequence to hope; then he began to doubt his own innocence, which justified in some measure the governor's belief in his mental alienation; and then, relaxing his sentiment of pride, he addressed his supplications, not to God, but to man. God is always the last resource. Unfortunates, who ought to begin with God, do not have any hope in him till they have exhausted all other means of deliverance.

Dantès asked to be removed from his present dungeon into another, even if it were darker and deeper, for a change, however disadvantageous, was still a change, and would afford him some amusement. He entreated to be allowed to walk about, to have fresh air, books, and writing materials. His requests were not granted, but he went on asking all the same. He accustomed himself to speaking to the new jailer, although the latter was, if possible, more taciturn than the old one; but still, to speak to a man, even though mute, was something. Dantès spoke for the sake of hearing his own voice; he had tried to speak when alone, but the sound of his voice terrified him.

Often, before his captivity, Dantès' mind had revolted at the idea of assemblages of prisoners, made up of thieves, vagabonds, and murderers. He now wished to be amongst them, in order to see some other face besides that of his jailer; he sighed for the galleys, with the infamous costume, the chain, and the brand on the shoulder. The galley-slaves breathed the fresh air of heaven, and saw each other. They were very happy.

He besought the jailer one day to let him have a companion, were it even the mad abbé. The jailer, though rough and hardened by the constant sight of so much suffering, was yet a man. At the bottom of his heart he had often had a feeling of pity for this unhappy young man who suffered so; and he laid the request of number 34 before the governor; but the latter sapiently imagined that Dantès wished to conspire or attempt an escape, and refused his request. Dantès had exhausted all human resources, and he then turned to God.

All the pious ideas that had been so long forgotten, returned; he recollected the prayers his mother had taught him, and discovered a new meaning in every word; for in prosperity prayers seem but a mere medley of words, until misfortune comes and the unhappy sufferer first understands the meaning of the sublime language in which he invokes the pity of heaven! He prayed, and prayed aloud, no longer terrified at the sound of his own voice, for he fell into a sort of ecstasy. He laid every action of his life before the Almighty, proposed tasks to accomplish, and at the end of every prayer introduced the entreaty oftener addressed to man than to God: “Forgive us our trespasses as we forgive them that trespass against us.” Yet in spite of his earnest prayers, Dantès remained a prisoner.

Then gloom settled heavily upon him. Dantès was a man of great simplicity of thought, and without education; he could not, therefore, in the solitude of his dungeon, traverse in mental vision the history of the ages, bring to life the nations that had perished, and rebuild the ancient cities so vast and stupendous in the light of the imagination, and that pass before the eye glowing with celestial colors in Martin’s Babylonian pictures. He could not do this, he whose past life was so short, whose present so melancholy, and his future so doubtful. Nineteen years of light to reflect upon in eternal darkness! No distraction could come to his aid; his energetic spirit, that would have exalted in thus revisiting the past, was imprisoned like an eagle in a cage. He clung to one idea—that of his happiness, destroyed, without apparent cause, by an unheard-of fatality; he considered and reconsidered this idea, devoured it (so to speak), as the implacable Ugolino devours the skull of Archbishop Roger in the Inferno of Dante.

Rage supplanted religious fervor. Dantès uttered blasphemies that made his jailer recoil with horror, dashed himself furiously against the walls of his prison, wreaked his anger upon everything, and chiefly upon himself, so that the least thing,—a grain of sand, a straw, or a breath of air that annoyed him, led to paroxysms of fury. Then the letter that Villefort had showed to him recurred to his mind, and every line gleamed forth in fiery letters on the wall like the _mene, mene, tekel upharsin_ of Belshazzar. He told himself that it was the enmity of man, and not the vengeance of Heaven, that had thus plunged him into the deepest misery. He consigned his unknown persecutors to the most horrible tortures he could imagine, and found them all insufficient, because after torture came death, and after death, if not repose, at least the boon of unconsciousness.

By dint of constantly dwelling on the idea that tranquillity was death, and if punishment were the end in view other tortures than death must be invented, he began to reflect on suicide. Unhappy he, who, on the brink of misfortune, broods over ideas like these!

Before him is a dead sea that stretches in azure calm before the eye; but he who unwarily ventures within its embrace finds himself struggling with a monster that would drag him down to perdition. Once thus ensnared, unless the protecting hand of God snatch him thence, all is over, and his struggles but tend to hasten his destruction. This state of mental anguish is, however, less terrible than the sufferings that precede or the punishment that possibly will follow. There is a sort of consolation at the contemplation of the yawning abyss, at the bottom of which lie darkness and obscurity.

Edmond found some solace in these ideas. All his sorrows, all his sufferings, with their train of gloomy spectres, fled from his cell when the angel of death seemed about to enter. Dantès reviewed his past life with composure, and, looking forward with terror to his future existence, chose that middle line that seemed to afford him a refuge.

“Sometimes,” said he, “in my voyages, when I was a man and commanded other men, I have seen the heavens overcast, the sea rage and foam, the storm arise, and, like a monstrous bird, beating the two horizons with its wings. Then I felt that my vessel was a vain refuge, that trembled and shook before the tempest. Soon the fury of the waves and the sight of the sharp rocks announced the approach of death, and death then terrified me, and I used all my skill and intelligence as a man and a sailor to struggle against the wrath of God. But I did so because I was happy, because I had not courted death, because to be cast upon a bed of rocks and seaweed seemed terrible, because I was unwilling that I, a creature made for the service of God, should serve for food to the gulls and ravens. But now it is different; I have lost all that bound me to life, death smiles and invites me to repose; I die after my own manner, I die exhausted and broken-spirited, as I fall asleep when I have paced three thousand times round my cell,—that is thirty thousand steps, or about ten leagues.”

No sooner had this idea taken possession of him than he became more composed, arranged his couch to the best of his power, ate little and slept less, and found existence almost supportable, because he felt that he could throw it off at pleasure, like a worn-out garment. Two methods of self-destruction were at his disposal. He could hang himself with his handkerchief to the window bars, or refuse food and die of starvation. But the first was repugnant to him. Dantès had always entertained the greatest horror of pirates, who are hung up to the yard-arm; he would not die by what seemed an infamous death. He resolved to adopt the second, and began that day to carry out his resolve.

0185m

Nearly four years had passed away; at the end of the second he had ceased to mark the lapse of time. Dantès said, “I wish to die,” and had chosen the manner of his death, and fearful of changing his mind, he had taken an oath to die. “When my morning and evening meals are brought,” thought he, “I will cast them out of the window, and they will think that I have eaten them.”

He kept his word; twice a day he cast out, through the barred aperture, the provisions his jailer brought him—at first gayly, then with deliberation, and at last with regret. Nothing but the recollection of his oath gave him strength to proceed. Hunger made viands once repugnant, now acceptable; he held the plate in his hand for an hour at a time, and gazed thoughtfully at the morsel of bad meat, of tainted fish, of black and mouldy bread. It was the last yearning for life contending with the resolution of despair; then his dungeon seemed less sombre, his prospects less desperate. He was still young—he was only four or five-and-twenty—he had nearly fifty years to live. What unforseen events might not open his prison door, and restore him to liberty? Then he raised to his lips the repast that, like a voluntary Tantalus, he refused himself; but he thought of his oath, and he would not break it. He persisted until, at last, he had not sufficient strength to rise and cast his supper out of the loophole. The next morning he could not see or hear; the jailer feared he was dangerously ill. Edmond hoped he was dying.

Thus the day passed away. Edmond felt a sort of stupor creeping over him which brought with it a feeling almost of content; the gnawing pain at his stomach had ceased; his thirst had abated; when he closed his eyes he saw myriads of lights dancing before them like the will-o’-the-wisps that play about the marshes. It was the twilight of that mysterious country called Death!

Suddenly, about nine o’clock in the evening, Edmond heard a hollow sound in the wall against which he was lying.

So many loathsome animals inhabited the prison, that their noise did not, in general, awake him; but whether abstinence had quickened his faculties, or whether the noise was really louder than usual, Edmond raised his head and listened. It was a continual scratching, as if made by a huge claw, a powerful tooth, or some iron instrument attacking the stones.

Although weakened, the young man’s brain instantly responded to the idea that haunts all prisoners—liberty! It seemed to him that heaven had at length taken pity on him, and had sent this noise to warn him on the very brink of the abyss. Perhaps one of those beloved ones he had so often thought of was thinking of him, and striving to diminish the distance that separated them.

No, no, doubtless he was deceived, and it was but one of those dreams that forerun death!

Edmond still heard the sound. It lasted nearly three hours; he then heard a noise of something falling, and all was silent.

Some hours afterwards it began again, nearer and more distinct. Edmond was intensely interested. Suddenly the jailer entered.

For a week since he had resolved to die, and during the four days that he had been carrying out his purpose, Edmond had not spoken to the attendant, had not answered him when he inquired what was the matter with him, and turned his face to the wall when he looked too curiously at him; but now the jailer might hear the noise and put an end to it, and so destroy a ray of something like hope that soothed his last moments.

The jailer brought him his breakfast. Dantès raised himself up and began to talk about everything; about the bad quality of the food, about the coldness of his dungeon, grumbling and complaining, in order to have an excuse for speaking louder, and wearying the patience of his jailer, who out of kindness of heart had brought broth and white bread for his prisoner.

Fortunately, he fancied that Dantès was delirious; and placing the food on the rickety table, he withdrew. Edmond listened, and the sound became more and more distinct.

“There can be no doubt about it,” thought he; “it is some prisoner who is striving to obtain his freedom. Oh, if I were only there to help him!”

Suddenly another idea took possession of his mind, so used to misfortune, that it was scarcely capable of hope—the idea that the noise was made by workmen the governor had ordered to repair the neighboring dungeon.

It was easy to ascertain this; but how could he risk the question? It was easy to call his jailer’s attention to the noise, and watch his countenance as he listened; but might he not by this means destroy hopes far more important than the short-lived satisfaction of his own curiosity? Unfortunately, Edmond’s brain was still so feeble that he could not bend his thoughts to anything in particular. He saw but one means of restoring lucidity and clearness to his judgment. He turned his eyes towards the soup which the jailer had

brought, rose, staggered towards it, raised the vessel to his lips, and drank off the contents with a feeling of indescribable pleasure.

He had the resolution to stop with this. He had often heard that shipwrecked persons had died through having eagerly devoured too much food. Edmond replaced on the table the bread he was about to devour, and returned to his couch—he did not wish to die. He soon felt that his ideas became again collected—he could think, and strengthen his thoughts by reasoning. Then he said to himself:

“I must put this to the test, but without compromising anybody. If it is a workman, I need but knock against the wall, and he will cease to work, in order to find out who is knocking, and why he does so; but as his occupation is sanctioned by the governor, he will soon resume it. If, on the contrary, it is a prisoner, the noise I make will alarm him, he will cease, and not begin again until he thinks everyone is asleep.”

Edmond rose again, but this time his legs did not tremble, and his sight was clear; he went to a corner of his dungeon, detached a stone, and with it knocked against the wall where the sound came. He struck thrice.

At the first blow the sound ceased, as if by magic.

Edmond listened intently; an hour passed, two hours passed, and no sound was heard from the wall—all was silent there.

Full of hope, Edmond swallowed a few mouthfuls of bread and water, and, thanks to the vigor of his constitution, found himself well-nigh recovered.

The day passed away in utter silence—night came without recurrence of the noise.

“It is a prisoner,” said Edmond joyfully. His brain was on fire, and life and energy returned.

The night passed in perfect silence. Edmond did not close his eyes.

In the morning the jailer brought him fresh provisions—he had already devoured those of the previous day; he ate these listening anxiously for the sound, walking round and round his cell, shaking the iron bars of the loophole, restoring vigor and agility to his limbs by exercise, and so preparing himself for his future destiny. At intervals he listened to learn if the noise had not begun again, and grew impatient at the prudence of the prisoner, who did not guess he had been disturbed by a captive as anxious for liberty as himself.

Three days passed—seventy-two long tedious hours which he counted off by minutes!

At length one evening, as the jailer was visiting him for the last time that night, Dantès, with his ear for the hundredth time at the wall, fancied he heard an almost imperceptible movement among the stones. He moved away, walked up and down his cell to collect his thoughts, and then went back and listened.

The matter was no longer doubtful. Something was at work on the other side of the wall; the prisoner had discovered the danger, and had substituted a lever for a chisel.

Encouraged by this discovery, Edmond determined to assist the indefatigable laborer. He began by moving his bed, and looked around for anything with which he could pierce the wall, penetrate the moist cement, and displace a stone.

He saw nothing, he had no knife or sharp instrument, the window grating was of iron, but he had too often assured himself of its solidity. All his furniture consisted of a bed, a chair, a table, a pail, and a jug. The bed had iron clamps, but they were screwed to the wood, and it would have required a screw-driver to take them off. The table and chair had nothing, the pail had once possessed a handle, but that had been removed.

0189m

Dantès had but one resource, which was to break the jug, and with one of the sharp fragments attack the wall. He let the jug fall on the floor, and it broke in pieces.

Dantès concealed two or three of the sharpest fragments in his bed, leaving the rest on the floor. The breaking of his jug was too natural an accident to excite suspicion. Edmond had all the night to work in, but in the darkness he could not do much, and he soon felt that he was working against something very hard; he pushed back his bed, and waited for day.

All night he heard the subterranean workman, who continued to mine his way. Day came, the jailer entered. Dantès told him that the jug had fallen from his hands while he was drinking, and the jailer went grumblingly to fetch another, without giving himself the trouble to remove the fragments of the broken one. He returned speedily, advised the prisoner to be more careful, and departed.

Dantès heard joyfully the key grate in the lock; he listened until the sound of steps died away, and then, hastily displacing his bed, saw by the faint light that penetrated into his cell, that he had labored uselessly the previous evening in attacking the stone instead of removing the plaster that surrounded it.

The damp had rendered it friable, and Dantès was able to break it off—in small morsels, it is true, but at the end of half an hour he had scraped off a handful; a mathematician might have calculated that in two years, supposing that the rock was not encountered, a passage twenty feet long and two feet broad, might be formed.

The prisoner reproached himself with not having thus employed the hours he had passed in vain hopes, prayer, and despondency. During the six years that he had been imprisoned, what might he not have accomplished?

This idea imparted new energy, and in three days he had succeeded, with the utmost precaution, in removing the cement, and exposing the stone-work. The wall was built of rough stones, among which, to give strength to the structure, blocks of hewn stone were at intervals imbedded. It was one of these he had uncovered, and which he must remove from its socket.

Dantès strove to do this with his nails, but they were too weak. The fragments of the jug broke, and after an hour of useless toil, Dantès paused with anguish on his brow.

Was he to be thus stopped at the beginning, and was he to wait inactive until his fellow workman had completed his task? Suddenly an idea occurred to him—he smiled, and the perspiration dried on his forehead.

The jailer always brought Dantès' soup in an iron saucepan; this saucepan contained soup for both prisoners, for Dantès had noticed that it was either quite full, or half empty, according as the turnkey gave it to him or to his companion first.

The handle of this saucepan was of iron; Dantès would have given ten years of his life in exchange for it.

0191m

The jailer was accustomed to pour the contents of the saucepan into Dantès' plate, and Dantès, after eating his soup with a wooden spoon, washed the plate, which thus served for every day. Now when evening came Dantès put his plate on the ground near the door; the jailer, as he entered, stepped on it and broke it.

This time he could not blame Dantès. He was wrong to leave it there, but the jailer was wrong not to have looked before him. The jailer, therefore, only grumbled. Then he looked about for something to pour the soup into; Dantès' entire dinner service consisted of one plate—there was no alternative.

"Leave the saucepan," said Dantès; "you can take it away when you bring me my breakfast."

This advice was to the jailer's taste, as it spared him the necessity of making another trip. He left the saucepan.

Dantès was beside himself with joy. He rapidly devoured his food, and after waiting an hour, lest the jailer should change his mind and return, he removed his bed, took the handle of the saucepan, inserted the point between the hewn stone and rough stones of the wall, and employed it as a lever. A slight oscillation showed Dantès that all went well. At the end of an hour the stone was extricated from the wall, leaving a cavity a foot and a half in diameter.

Dantès carefully collected the plaster, carried it into the corner of his cell, and covered it with earth. Then, wishing to make the best use of his time while he had the means of labor, he continued to work without ceasing. At the dawn of day he replaced the stone, pushed his bed against the wall, and lay down. The breakfast consisted of a piece of bread; the jailer entered and placed the bread on the table.

"Well, don't you intend to bring me another plate?" said Dantès.

"No," replied the turnkey; "you destroy everything. First you break your jug, then you make me break your plate; if all the prisoners followed your example, the government would be ruined. I shall leave you the saucepan, and pour your soup into that. So for the future I hope you will not be so destructive."

Dantès raised his eyes to heaven and clasped his hands beneath the coverlet. He felt more gratitude for the possession of this piece of iron than he had ever felt for anything. He had noticed, however, that the prisoner on the other side had ceased to labor; no matter, this was a greater reason for proceeding—if his neighbor would not come to him, he would go to his neighbor. All day he toiled on untiringly, and by the evening he had succeeded in extracting ten handfuls of plaster and fragments of stone. When the hour for his jailer's visit arrived, Dantès straightened the handle of the saucepan as well as he could, and placed it in its accustomed place. The turnkey poured his ration of soup into it, together with the fish—for thrice a week the prisoners were deprived of meat. This would have been a method of reckoning time, had not Dantès long ceased to do so. Having poured out the soup, the turnkey retired.

Dantès wished to ascertain whether his neighbor had really ceased to work. He listened—all was silent, as it had been for the last three days. Dantès sighed; it was evident that his neighbor distrusted him. However, he toiled on all the night without being discouraged; but after two or three hours he encountered an obstacle. The iron made no impression, but met with a smooth surface; Dantès touched it, and found that it was a beam. This beam crossed, or rather blocked up, the hole Dantès had made; it was necessary, therefore, to dig above or under it. The unhappy young man had not thought of this.

"Oh, my God, my God!" murmured he, "I have so earnestly prayed to you, that I hoped my prayers had been heard. After having deprived me of my liberty, after having deprived me of death, after having recalled me to existence, my God, have pity on me, and do not let me die in despair!"

0193m

"Who talks of God and despair at the same time?" said a voice that seemed to come from beneath the earth, and, deadened by the distance, sounded hollow and sepulchral in the young man's ears. Edmond's hair stood on end, and he rose to his knees.

"Ah," said he, "I hear a human voice." Edmond had not heard anyone speak save his jailer for four or five years; and a jailer is no man to a prisoner—he is a living door, a barrier of flesh and blood adding strength to restraints of oak and iron.

"In the name of Heaven," cried Dantès, "speak again, though the sound of your voice terrifies me. Who are you?"

"Who are you?" said the voice.

"An unhappy prisoner," replied Dantès, who made no hesitation in answering.

"Of what country?"

"A Frenchman."

"Your name?"

"Edmond Dantès."

"Your profession?"

"A sailor."

"How long have you been here?"

"Since the 28th of February, 1815."

"Your crime?"

"I am innocent."

"But of what are you accused?"

"Of having conspired to aid the emperor's return."

"What! For the emperor's return?—the emperor is no longer on the throne, then?"

"He abdicated at Fontainebleau in 1814, and was sent to the Island of Elba. But how long have you been here that you are ignorant of all this?"

“Since 1811.”

Dantès shuddered; this man had been four years longer than himself in prison.

“Do not dig any more,” said the voice; “only tell me how high up is your excavation?”

“On a level with the floor.”

“How is it concealed?”

“Behind my bed.”

“Has your bed been moved since you have been a prisoner?”

“No.”

“What does your chamber open on?”

“A corridor.”

“And the corridor?”

“On a court.”

“Alas!” murmured the voice.

“Oh, what is the matter?” cried Dantès.

“I have made a mistake owing to an error in my plans. I took the wrong angle, and have come out fifteen feet from where I intended. I took the wall you are mining for the outer wall of the fortress.”

“But then you would be close to the sea?”

“That is what I hoped.”

“And supposing you had succeeded?”

“I should have thrown myself into the sea, gained one of the islands near here—the Isle de Daume or the Isle de Tiboulen—and then I should have been safe.”

“Could you have swum so far?”

“Heaven would have given me strength; but now all is lost.”

“All?”

“Yes; stop up your excavation carefully, do not work any more, and wait until you hear from me.”

“Tell me, at least, who you are?”

“I am—I am No. 27.”

“You mistrust me, then,” said Dantès. Edmond fancied he heard a bitter laugh resounding from the depths.

“Oh, I am a Christian,” cried Dantès, guessing instinctively that this man meant to abandon him. “I swear to you by him who died for us that naught shall induce me to breathe one syllable to my jailers; but I conjure you do not abandon me. If you do, I swear to you, for I have got to the end of my strength, that I will dash my brains out against the wall, and you will have my death to reproach yourself with.”

“How old are you? Your voice is that of a young man.”

“I do not know my age, for I have not counted the years I have been here. All I do know is, that I was just nineteen when I was arrested, the 28th of February, 1815.”

“Not quite twenty-six!” murmured the voice; “at that age he cannot be a traitor.”

“Oh, no, no,” cried Dantès. “I swear to you again, rather than betray you, I would allow myself to be hacked in pieces!”

“You have done well to speak to me, and ask for my assistance, for I was about to form another plan, and leave you; but your age reassures me. I will not forget you. Wait.”

“How long?”

“I must calculate our chances; I will give you the signal.”

“But you will not leave me; you will come to me, or you will let me come to you. We will escape, and if we cannot escape we will talk; you of those whom you love, and I of those whom I love. You must love somebody?”

“No, I am alone in the world.”

“Then you will love me. If you are young, I will be your comrade; if you are old, I will be your son. I have a father who is seventy if he yet lives; I only love him and a young girl called Mercédès. My father has not yet forgotten me, I am sure, but God alone knows if she loves me still; I shall love you as I loved my father.”

“It is well,” returned the voice; “tomorrow.”

These few words were uttered with an accent that left no doubt of his sincerity; Dantès rose, dispersed the fragments with the same precaution as before, and pushed his bed back against the wall. He then gave himself up to his happiness. He would no longer be alone. He was, perhaps, about to regain his liberty; at the worst, he would have a companion, and captivity that is shared is but half captivity. Plaints made in common are almost prayers, and prayers where two or three are gathered together invoke the mercy of heaven.

All day Dantès walked up and down his cell. He sat down occasionally on his bed, pressing his hand on his heart. At the slightest noise he bounded towards the door. Once or twice the thought crossed his mind that he might be separated from this unknown, whom he loved already; and then his mind was made up—when the jailer moved his bed and stooped to examine the opening, he would kill him with his water jug. He would be condemned to die, but he was about to die of grief and despair when this miraculous noise recalled him to life.

The jailer came in the evening. Dantès was on his bed. It seemed to him that thus he better guarded the unfinished opening. Doubtless there was a strange expression in his eyes, for the jailer said, “Come, are you going mad again?”

Dantès did not answer; he feared that the emotion of his voice would betray him. The jailer went away shaking his head. Night came; Dantès hoped that his neighbor would profit by the silence to address him, but he was mistaken. The next morning, however, just as he removed his bed from the wall, he heard three knocks; he threw himself on his knees.

“Is it you?” said he; “I am here.”

“Is your jailer gone?”

“Yes,” said Dantès; “he will not return until the evening; so that we have twelve hours before us.”

“I can work, then?” said the voice.

“Oh, yes, yes; this instant, I entreat you.”

In a moment that part of the floor on which Dantès was resting his two hands, as he knelt with his head in the opening, suddenly gave way; he drew back smartly, while a mass of stones and earth disappeared in a hole that opened beneath the aperture he himself had formed. Then from the bottom of this passage, the depth of which it was impossible to measure, he saw appear, first the head, then the shoulders, and lastly the body of a man, who sprang lightly into his cell.

0197m

Chapter 16. A Learned Italian

Seizing in his arms the friend so long and ardently desired, Dantès almost carried him towards the window, in order to obtain a better view of his features by the aid of the imperfect light that struggled through the grating.

He was a man of small stature, with hair blanched rather by suffering and sorrow than by age. He had a deep-set, penetrating eye, almost buried beneath the thick gray eyebrow, and a long (and still black) beard reaching down to his breast. His thin face, deeply furrowed by care, and the bold outline of his strongly marked features, betokened a man more accustomed to exercise his mental faculties than his physical strength. Large drops of perspiration were now standing on his brow, while the garments that hung about him were so ragged that one could only guess at the pattern upon which they had originally been fashioned.

The stranger might have numbered sixty or sixty-five years; but a certain briskness and appearance of vigor in his movements made it probable that he was aged more from captivity than the course of time. He received the enthusiastic greeting of his young acquaintance with evident pleasure, as though his chilled affections were rekindled and invigorated by his contact with one so warm and ardent. He thanked him with grateful cordiality for his kindly welcome, although he must at that moment have been suffering bitterly to find another dungeon where he had fondly reckoned on discovering a means of regaining his liberty.

“Let us first see,” said he, “whether it is possible to remove the traces of my entrance here—our future tranquillity depends upon our jailers being entirely ignorant of it.”

Advancing to the opening, he stooped and raised the stone easily in spite of its weight; then, fitting it into its place, he said:

“You removed this stone very carelessly; but I suppose you had no tools to aid you.”

“Why,” exclaimed Dantès, with astonishment, “do you possess any?”

“I made myself some; and with the exception of a file, I have all that are necessary,—a chisel, pincers, and lever.”

0201m

“Oh, how I should like to see these products of your industry and patience.”

“Well, in the first place, here is my chisel.”

So saying, he displayed a sharp strong blade, with a handle made of beechwood.

“And with what did you contrive to make that?” inquired Dantès.

“With one of the clamps of my bedstead; and this very tool has sufficed me to hollow out the road by which I came hither, a distance of about fifty feet.”

“Fifty feet!” responded Dantès, almost terrified.

“Do not speak so loud, young man—don’t speak so loud. It frequently occurs in a state prison like this, that persons are stationed outside the doors of the cells purposely to overhear the conversation of the prisoners.”

“But they believe I am shut up alone here.”

“That makes no difference.”

“And you say that you dug your way a distance of fifty feet to get here?”

“I do; that is about the distance that separates your chamber from mine; only, unfortunately, I did not curve aright; for want of the necessary geometrical instruments to calculate my scale of proportion, instead of taking an ellipsis of forty feet, I made it fifty. I expected, as I told you, to reach the outer wall, pierce through it, and throw myself into the sea; I have, however, kept along the corridor on which your chamber opens, instead of going beneath it. My labor is all in vain, for I find that the corridor looks into a courtyard filled with soldiers.”

“That’s true,” said Dantès; “but the corridor you speak of only bounds _one_ side of my cell; there are three others—do you know anything of their situation?”

“This one is built against the solid rock, and it would take ten experienced miners, duly furnished with the requisite tools, as many years to perforate it. This adjoins the lower part of the governor’s apartments, and were we to work our way through, we should only get into some lock-up cellars, where we must necessarily be recaptured. The fourth and last side of your cell faces on—faces on—stop a minute, now where does it face?”

The wall of which he spoke was the one in which was fixed the loophole by which light was admitted to the chamber. This loophole, which gradually diminished in size as it approached the outside, to an opening through which a child could not have passed, was, for better security, furnished with three iron bars, so as to quiet all apprehensions even in the mind of the most suspicious jailer as to the possibility of a prisoner’s escape. As the stranger asked the question, he dragged the table beneath the window.

“Climb up,” said he to Dantès.

The young man obeyed, mounted on the table, and, divining the wishes of his companion, placed his back securely against the wall and held out both hands. The stranger, whom as yet Dantès knew only by the number of his cell, sprang up with an agility by no means to be expected in a person of his years, and, light and steady on his feet as a cat or a lizard, climbed from the table to the outstretched hands of Dantès, and from them to his shoulders; then, bending double, for the ceiling of the dungeon prevented him from holding himself erect, he managed to slip his head between the upper bars of the window, so as to be able to command a perfect view from top to bottom.

An instant afterwards he hastily drew back his head, saying, “I thought so!” and sliding from the shoulders of Dantès as dextrously as he had ascended, he nimbly leaped from the table to the ground.

“What was it that you thought?” asked the young man anxiously, in his turn descending from the table.

The elder prisoner pondered the matter. “Yes,” said he at length, “it is so. This side of your chamber looks out upon a kind of open gallery, where patrols are continually passing, and sentries keep watch day and night.”

“Are you quite sure of that?”

“Certain. I saw the soldier’s shape and the top of his musket; that made me draw in my head so quickly, for I was fearful he might also see me.”

“Well?” inquired Dantès.

“You perceive then the utter impossibility of escaping through your dungeon?”

“Then——” pursued the young man eagerly.

“Then,” answered the elder prisoner, “the will of God be done!” And as the old man slowly pronounced those words, an air of profound resignation spread itself over his careworn countenance. Dantès gazed on the man who could thus philosophically resign hopes so long and ardently nourished with an astonishment mingled with admiration.

“Tell me, I entreat of you, who and what you are?” said he at length. “Never have I met with so remarkable a person as yourself.”

“Willingly,” answered the stranger; “if, indeed, you feel any curiosity respecting one, now, alas, powerless to aid you in any way.”

“Say not so; you can console and support me by the strength of your own powerful mind. Pray let me know who you really are?”

The stranger smiled a melancholy smile. “Then listen,” said he. “I am the Abbé Faria, and have been imprisoned as you know in this Château d’If since the year 1811; previously to which I had been confined for three years in the fortress of Fenestrelle. In the year 1811 I was transferred to Piedmont in France. It was at this period I learned that the destiny which seemed subservient to every wish formed by Napoleon, had bestowed on him a son, named king of Rome even in his cradle. I was very far then from expecting the change you have just informed me of; namely, that four years afterwards, this colossus of power would be overthrown. Then who reigns in France at this moment—Napoleon II.?”

“No, Louis XVIII.”

“The brother of Louis XVI.! How inscrutable are the ways of Providence—for what great and mysterious purpose has it pleased Heaven to abase the man once so elevated, and raise up him who was so abased?”

Dantès' whole attention was riveted on a man who could thus forget his own misfortunes while occupying himself with the destinies of others.

"Yes, yes," continued he, "'Twill be the same as it was in England. After Charles I., Cromwell; after Cromwell, Charles II., and then James II., and then some son-in-law or relation, some Prince of Orange, a stadtholder who becomes a king. Then new concessions to the people, then a constitution, then liberty. Ah, my friend!" said the abbé, turning towards Dantès, and surveying him with the kindling gaze of a prophet, "you are young, you will see all this come to pass."

"Probably, if ever I get out of prison!"

"True," replied Faria, "we are prisoners; but I forget this sometimes, and there are even moments when my mental vision transports me beyond these walls, and I fancy myself at liberty."

"But wherefore are you here?"

"Because in 1807 I dreamed of the very plan Napoleon tried to realize in 1811; because, like Machiavelli, I desired to alter the political face of Italy, and instead of allowing it to be split up into a quantity of petty principalities, each held by some weak or tyrannical ruler, I sought to form one large, compact, and powerful empire; and, lastly, because I fancied I had found my Cæsar Borgia in a crowned simpleton, who feigned to enter into my views only to betray me. It was the plan of Alexander VI. and Clement VII., but it will never succeed now, for they attempted it fruitlessly, and Napoleon was unable to complete his work. Italy seems fated to misfortune." And the old man bowed his head.

Dantès could not understand a man risking his life for such matters. Napoleon certainly he knew something of, inasmuch as he had seen and spoken with him; but of Clement VII. and Alexander VI. he knew nothing.

"Are you not," he asked, "the priest who here in the Château d'If is generally thought to be—ill?"

"Mad, you mean, don't you?"

"I did not like to say so," answered Dantès, smiling.

"Well, then," resumed Faria with a bitter smile, "let me answer your question in full, by acknowledging that I am the poor mad prisoner of the Château d'If, for many years permitted to amuse the different visitors with what is said to be my insanity; and, in all probability, I should be promoted to the honor of making sport for the children, if such innocent beings could be found in an abode devoted like this to suffering and despair."

Dantès remained for a short time mute and motionless; at length he said:

"Then you abandon all hope of escape?"

"I perceive its utter impossibility; and I consider it impious to attempt that which the Almighty evidently does not approve."

"Nay, be not discouraged. Would it not be expecting too much to hope to succeed at your first attempt? Why not try to find an opening in another direction from that which has so unfortunately failed?"

"Alas, it shows how little notion you can have of all it has cost me to effect a purpose so unexpectedly frustrated, that you talk of beginning over again. In the first place, I was four years making the tools I possess, and have been two years scraping and digging out earth, hard as granite itself; then what toil and fatigue has it not been to remove huge stones I should once have deemed impossible to loosen. Whole days have I passed in these Titanic efforts, considering my labor well repaid if, by night-time I had contrived to carry away a square inch of this hard-bound cement, changed by ages into a substance unyielding as the stones themselves; then to conceal the mass of earth and rubbish I dug up, I was compelled to break through a staircase, and throw the fruits of my labor into the hollow part of it; but the well is now so completely choked up, that I scarcely think it would be possible to add another handful of dust without leading to discovery. Consider also that I fully believed I had accomplished the end and aim of my undertaking, for which I had so exactly husbanded my strength as to make it just hold out to the termination of my enterprise; and now, at the moment when I reckoned upon success, my hopes are forever dashed from me. No, I repeat again, that nothing shall induce me to renew attempts evidently at variance with the Almighty's pleasure."

Dantès held down his head, that the other might not see how joy at the thought of having a companion outweighed the sympathy he felt for the failure of the abbé's plans.

The abbé sank upon Edmond's bed, while Edmond himself remained standing. Escape had never once occurred to him. There are, indeed, some things which appear so impossible that the mind does not dwell on them for an instant. To undermine the ground for fifty feet—to devote three years to a labor which, if successful, would conduct you to a precipice overhanging the sea—to plunge into the waves from the height of fifty, sixty, perhaps a hundred feet, at the risk of being dashed to pieces against the rocks, should you have been fortunate enough to have escaped the fire of the sentinels; and even, supposing all these perils past, then to have to swim for your life a distance of at least three miles ere you could reach the shore—were difficulties so startling and formidable that Dantès had never even dreamed of such a scheme, resigning himself rather to death.

But the sight of an old man clinging to life with so desperate a courage, gave a fresh turn to his ideas, and inspired him with new courage. Another, older and less strong than he, had attempted what he had not had sufficient resolution to undertake, and had failed only because of an error in calculation. This same person, with almost incredible patience and perseverance, had contrived to provide himself with tools requisite for so unparalleled an attempt. Another had done all this; why, then, was it impossible to Dantès? Faria had dug his way through fifty feet, Dantès would dig a hundred; Faria, at the age of fifty, had devoted three years to the task; he, who was but half as old, would sacrifice six; Faria, a priest and savant, had not shrunk from the idea of risking his life by trying to swim a distance of three miles to one of the islands—Daume, Rattonneau, or Lemaire; should a hardy sailor, an experienced diver, like himself, shrink from a similar task; should he, who had so often for mere amusement's sake plunged to the bottom of the sea to fetch up the bright coral branch, hesitate to entertain the same project? He could do it in an hour, and how many times had he, for pure pastime, continued in the water for more than twice as long! At once Dantès resolved to follow the brave example of his energetic companion, and to remember that what has once been done may be done again.

After continuing some time in profound meditation, the young man suddenly exclaimed, "I have found what you were in search of!"

Faria started: "Have you, indeed?" cried he, raising his head with quick anxiety; "pray, let me know what it is you have discovered?"

"The corridor through which you have bored your way from the cell you occupy here, extends in the same direction as the outer gallery, does it not?"

0207m

"It does."

"And is not above fifteen feet from it?"

"About that."

"Well, then, I will tell you what we must do. We must pierce through the corridor by forming a side opening about the middle, as it were the top part of a cross. This time you will lay your plans more accurately; we shall get out into the gallery you have described; kill the sentinel who guards it, and make our escape. All we require to insure success is courage, and that you possess, and strength, which I am not deficient in; as for patience, you have abundantly proved yours—you shall now see me prove mine."

"One instant, my dear friend," replied the abbé; "it is clear you do not understand the nature of the courage with which I am endowed, and what use I intend making of my strength. As for patience, I consider that I have abundantly exercised that in beginning every morning the task of the night before, and every night renewing the task of the day. But then, young man (and I pray of you to give me your full attention), then I thought I could not be doing anything displeasing to the Almighty in trying to set an innocent being at liberty—one who had committed no offence, and merited not condemnation."

"And have your notions changed?" asked Dantès with much surprise; "do you think yourself more guilty in making the attempt since you have encountered me?"

"No; neither do I wish to incur guilt. Hitherto I have fancied myself merely waging war against circumstances, not men. I have thought it no sin to bore through a wall, or destroy a staircase; but I cannot so easily persuade myself to pierce a heart or take away a life."

A slight movement of surprise escaped Dantès.

"Is it possible," said he, "that where your liberty is at stake you can allow any such scruple to deter you from obtaining it?"

“Tell me,” replied Faria, “what has hindered you from knocking down your jailer with a piece of wood torn from your bedstead, dressing yourself in his clothes, and endeavoring to escape?”

“Simply the fact that the idea never occurred to me,” answered Dantès.

“Because,” said the old man, “the natural repugnance to the commission of such a crime prevented you from thinking of it; and so it ever is because in simple and allowable things our natural instincts keep us from deviating from the strict line of duty. The tiger, whose nature teaches him to delight in shedding blood, needs but the sense of smell to show him when his prey is within his reach, and by following this instinct he is enabled to measure the leap necessary to permit him to spring on his victim; but man, on the contrary, loathes the idea of blood—it is not alone that the laws of social life inspire him with a shrinking dread of taking life; his natural construction and physiological formation——”

Dantès was confused and silent at this explanation of the thoughts which had unconsciously been working in his mind, or rather soul; for there are two distinct sorts of ideas, those that proceed from the head and those that emanate from the heart.

0209m

“Since my imprisonment,” said Faria, “I have thought over all the most celebrated cases of escape on record. They have rarely been successful. Those that have been crowned with full success have been long meditated upon, and carefully arranged; such, for instance, as the escape of the Duc de Beaufort from the Château de Vincennes, that of the Abbé Dubuquoi from For l’Evêque; of Latude from the Bastille. Then there are those for which chance sometimes affords opportunity, and those are the best of all. Let us, therefore, wait patiently for some favorable moment, and when it presents itself, profit by it.”

“Ah,” said Dantès, “you might well endure the tedious delay; you were constantly employed in the task you set yourself, and when weary with toil, you had your hopes to refresh and encourage you.”

“I assure you,” replied the old man, “I did not turn to that source for recreation or support.”

“What did you do then?”

“I wrote or studied.”

“Were you then permitted the use of pens, ink, and paper?”

“Oh, no,” answered the abbé; “I had none but what I made for myself.”

“You made paper, pens and ink?”

“Yes.”

Dantès gazed with admiration, but he had some difficulty in believing. Faria saw this.

“When you pay me a visit in my cell, my young friend,” said he, “I will show you an entire work, the fruits of the thoughts and reflections of my whole life; many of them meditated over in the shades of the Colosseum at Rome, at the foot of St. Mark’s column at Venice, and on the borders of the Arno at Florence, little imagining at the time that they would be arranged in order within the walls of the Château d’If. The work I speak of is called _A Treatise on the Possibility of a General Monarchy in Italy_, and will make one large quarto volume.”

“And on what have you written all this?”

“On two of my shirts. I invented a preparation that makes linen as smooth and as easy to write on as parchment.”

“You are, then, a chemist?”

“Somewhat; I know Lavoisier, and was the intimate friend of Cabanis.”

“But for such a work you must have needed books—had you any?”

“I had nearly five thousand volumes in my library at Rome; but after reading them over many times, I found out that with one hundred and fifty well-chosen books a man possesses, if not a complete summary of all human knowledge, at least all that a man

need really know. I devoted three years of my life to reading and studying these one hundred and fifty volumes, till I knew them nearly by heart; so that since I have been in prison, a very slight effort of memory has enabled me to recall their contents as readily as though the pages were open before me. I could recite you the whole of Thucydides, Xenophon, Plutarch, Titus Livius, Tacitus, Strada, Jornandes, Dante, Montaigne, Shakespeare, Spinoza, Machiavelli, and Bossuet. I name only the most important."

"You are, doubtless, acquainted with a variety of languages, so as to have been able to read all these?"

"Yes, I speak five of the modern tongues—that is to say, German, French, Italian, English, and Spanish; by the aid of ancient Greek I learned modern Greek—I don't speak it so well as I could wish, but I am still trying to improve myself."

"Improve yourself!" repeated Dantès; "why, how can you manage to do so?"

"Why, I made a vocabulary of the words I knew; turned, returned, and arranged them, so as to enable me to express my thoughts through their medium. I know nearly one thousand words, which is all that is absolutely necessary, although I believe there are nearly one hundred thousand in the dictionaries. I cannot hope to be very fluent, but I certainly should have no difficulty in explaining my wants and wishes; and that would be quite as much as I should ever require."

Stronger grew the wonder of Dantès, who almost fancied he had to do with one gifted with supernatural powers; still hoping to find some imperfection which might bring him down to a level with human beings, he added, "Then if you were not furnished with pens, how did you manage to write the work you speak of?"

"I made myself some excellent ones, which would be universally preferred to all others if once known. You are aware what huge whitings are served to us on _maigre_ days. Well, I selected the cartilages of the heads of these fishes, and you can scarcely imagine the delight with which I welcomed the arrival of each Wednesday, Friday, and Saturday, as affording me the means of increasing my stock of pens; for I will freely confess that my historical labors have been my greatest solace and relief. While retracing the past, I forget the present; and traversing at will the path of history I cease to remember that I am myself a prisoner."

"But the ink," said Dantès; "of what did you make your ink?"

"There was formerly a fireplace in my dungeon," replied Faria, "but it was closed up long ere I became an occupant of this prison. Still, it must have been many years in use, for it was thickly covered with a coating of soot; this soot I dissolved in a portion of the wine brought to me every Sunday, and I assure you a better ink cannot be desired. For very important notes, for which closer attention is required, I pricked one of my fingers, and wrote with my own blood."

"And when," asked Dantès, "may I see all this?"

"Whenever you please," replied the abbé.

"Oh, then let it be directly!" exclaimed the young man.

"Follow me, then," said the abbé, as he re-entered the subterranean passage, in which he soon disappeared, followed by Dantès.

Chapter 17. The Abbé's Chamber

After having passed with tolerable ease through the subterranean passage, which, however, did not admit of their holding themselves erect, the two friends reached the further end of the corridor, into which the abbé's cell opened; from that point the passage became much narrower, and barely permitted one to creep through on hands and knees. The floor of the abbé's cell was paved, and it had been by raising one of the stones in the most obscure corner that Faria had been able to commence the laborious task of which Dantès had witnessed the completion.

As he entered the chamber of his friend, Dantès cast around one eager and searching glance in quest of the expected marvels, but nothing more than common met his view.

"It is well," said the abbé; "we have some hours before us—it is now just a quarter past twelve o'clock." Instinctively Dantès turned round to observe by what watch or clock the abbé had been able so accurately to specify the hour.

"Look at this ray of light which enters by my window," said the abbé, "and then observe the lines traced on the wall. Well, by means of these lines, which are in accordance with the double motion of the earth, and the ellipse it describes round the sun, I am enabled to ascertain the precise hour with more minuteness than if I possessed a watch; for that might be broken or deranged in its

movements, while the sun and earth never vary in their appointed paths."

This last explanation was wholly lost upon Dantès, who had always imagined, from seeing the sun rise from behind the mountains and set in the Mediterranean, that it moved, and not the earth. A double movement of the globe he inhabited, and of which he could feel nothing, appeared to him perfectly impossible. Each word that fell from his companion's lips seemed fraught with the mysteries of science, as worthy of digging out as the gold and diamonds in the mines of Guzerat and Golconda, which he could just recollect having visited during a voyage made in his earliest youth.

"Come," said he to the abbé, "I am anxious to see your treasures."

The abbé smiled, and, proceeding to the disused fireplace, raised, by the help of his chisel, a long stone, which had doubtless been the hearth, beneath which was a cavity of considerable depth, serving as a safe depository of the articles mentioned to Dantès.

0213m

"What do you wish to see first?" asked the abbé.

"Oh, your great work on the monarchy of Italy!"

Faria then drew forth from his hiding-place three or four rolls of linen, laid one over the other, like folds of papyrus. These rolls consisted of slips of cloth about four inches wide and eighteen long; they were all carefully numbered and closely covered with writing, so legible that Dantès could easily read it, as well as make out the sense—it being in Italian, a language he, as a Provençal, perfectly understood.

"There," said he, "there is the work complete. I wrote the word _finis_ at the end of the sixty-eighth strip about a week ago. I have torn up two of my shirts, and as many handkerchiefs as I was master of, to complete the precious pages. Should I ever get out of prison and find in all Italy a printer courageous enough to publish what I have composed, my literary reputation is forever secured."

"I see," answered Dantès. "Now let me behold the curious pens with which you have written your work."

"Look!" said Faria, showing to the young man a slender stick about six inches long, and much resembling the size of the handle of a fine painting-brush, to the end of which was tied, by a piece of thread, one of those cartilages of which the abbé had before spoken to Dantès; it was pointed, and divided at the nib like an ordinary pen. Dantès examined it with intense admiration, then looked around to see the instrument with which it had been shaped so correctly into form.

"Ah, yes," said Faria; "the penknife. That's my masterpiece. I made it, as well as this larger knife, out of an old iron candlestick." The penknife was sharp and keen as a razor; as for the other knife, it would serve a double purpose, and with it one could cut and thrust.

Dantès examined the various articles shown to him with the same attention that he had bestowed on the curiosities and strange tools exhibited in the shops at Marseilles as the works of the savages in the South Seas from whence they had been brought by the different trading vessels.

"As for the ink," said Faria, "I told you how I managed to obtain that—and I only just make it from time to time, as I require it."

"One thing still puzzles me," observed Dantès, "and that is how you managed to do all this by daylight?"

"I worked at night also," replied Faria.

"Night!—why, for Heaven's sake, are your eyes like cats', that you can see to work in the dark?"

"Indeed they are not; but God has supplied man with the intelligence that enables him to overcome the limitations of natural conditions. I furnished myself with a light."

"You did? Pray tell me how."

"I separated the fat from the meat served to me, melted it, and so made oil—here is my lamp." So saying, the abbé exhibited a sort of torch very similar to those used in public illuminations.

"But how do you procure a light?"

“Oh, here are two flints and a piece of burnt linen.”

“And matches?”

“I pretended that I had a disorder of the skin, and asked for a little sulphur, which was readily supplied.”

Dantès laid the different things he had been looking at on the table, and stood with his head drooping on his breast, as though overwhelmed by the perseverance and strength of Faria’s mind.

0215m

“You have not seen all yet,” continued Faria, “for I did not think it wise to trust all my treasures in the same hiding-place. Let us shut this one up.” They put the stone back in its place; the abbé sprinkled a little dust over it to conceal the traces of its having been removed, rubbed his foot well on it to make it assume the same appearance as the other, and then, going towards his bed, he removed it from the spot it stood in. Behind the head of the bed, and concealed by a stone fitting in so closely as to defy all suspicion, was a hollow space, and in this space a ladder of cords between twenty-five and thirty feet in length. Dantès closely and eagerly examined it; he found it firm, solid, and compact enough to bear any weight.

“Who supplied you with the materials for making this wonderful work?”

“I tore up several of my shirts, and ripped out the seams in the sheets of my bed, during my three years’ imprisonment at Fenestrelle; and when I was removed to the Château d’If, I managed to bring the ravellings with me, so that I have been able to finish my work here.”

“And was it not discovered that your sheets were unhemmed?”

“Oh, no, for when I had taken out the thread I required, I hemmed the edges over again.”

“With what?”

“With this needle,” said the abbé, as, opening his ragged vestments, he showed Dantès a long, sharp fish-bone, with a small perforated eye for the thread, a small portion of which still remained in it.

“I once thought,” continued Faria, “of removing these iron bars, and letting myself down from the window, which, as you see, is somewhat wider than yours, although I should have enlarged it still more preparatory to my flight; however, I discovered that I should merely have dropped into a sort of inner court, and I therefore renounced the project altogether as too full of risk and danger. Nevertheless, I carefully preserved my ladder against one of those unforeseen opportunities of which I spoke just now, and which sudden chance frequently brings about.”

While affecting to be deeply engaged in examining the ladder, the mind of Dantès was, in fact, busily occupied by the idea that a person so intelligent, ingenious, and clear-sighted as the abbé might probably be able to solve the dark mystery of his own misfortunes, where he himself could see nothing.

“What are you thinking of?” asked the abbé smilingly, imputing the deep abstraction in which his visitor was plunged to the excess of his awe and wonder.

“I was reflecting, in the first place,” replied Dantès, “upon the enormous degree of intelligence and ability you must have employed to reach the high perfection to which you have attained. What would you not have accomplished if you had been free?”

“Possibly nothing at all; the overflow of my brain would probably, in a state of freedom, have evaporated in a thousand follies; misfortune is needed to bring to light the treasures of the human intellect. Compression is needed to explode gunpowder. Captivity has brought my mental faculties to a focus; and you are well aware that from the collision of clouds electricity is produced—from electricity, lightning, from lightning, illumination.”

“No,” replied Dantès. “I know nothing. Some of your words are to me quite empty of meaning. You must be blessed indeed to possess the knowledge you have.”

The abbé smiled. “Well,” said he, “but you had another subject for your thoughts; did you not say so just now?”

“I did!”

“You have told me as yet but one of them—let me hear the other.”

“It was this,—that while you had related to me all the particulars of your past life, you were perfectly unacquainted with mine.”

“Your life, my young friend, has not been of sufficient length to admit of your having passed through any very important events.”

“It has been long enough to inflict on me a great and undeserved misfortune. I would fain fix the source of it on man that I may no longer vent reproaches upon Heaven.”

“Then you profess ignorance of the crime with which you are charged?”

“I do, indeed; and this I swear by the two beings most dear to me upon earth,—my father and Mercédès.”

“Come,” said the abbé, closing his hiding-place, and pushing the bed back to its original situation, “let me hear your story.”

Dantès obeyed, and commenced what he called his history, but which consisted only of the account of a voyage to India, and two or three voyages to the Levant, until he arrived at the recital of his last cruise, with the death of Captain Leclere, and the receipt of a packet to be delivered by himself to the grand marshal; his interview with that personage, and his receiving, in place of the packet brought, a letter addressed to a Monsieur Noirtier—his arrival at Marseilles, and interview with his father—his affection for Mercédès, and their nuptial feast—his arrest and subsequent examination, his temporary detention at the Palais de Justice, and his final imprisonment in the Château d’If. From this point everything was a blank to Dantès—he knew nothing more, not even the length of time he had been imprisoned. His recital finished, the abbé reflected long and earnestly.

“There is,” said he, at the end of his meditations, “a clever maxim, which bears upon what I was saying to you some little while ago, and that is, that unless wicked ideas take root in a naturally depraved mind, human nature, in a right and wholesome state, revolts at crime. Still, from an artificial civilization have originated wants, vices, and false tastes, which occasionally become so powerful as to stifle within us all good feelings, and ultimately to lead us into guilt and wickedness. From this view of things, then, comes the axiom that if you visit to discover the author of any bad action, seek first to discover the person to whom the perpetration of that bad action could be in any way advantageous. Now, to apply it in your case,—to whom could your disappearance have been serviceable?”

“To no one, by Heaven! I was a very insignificant person.”

“Do not speak thus, for your reply evinces neither logic nor philosophy; everything is relative, my dear young friend, from the king who stands in the way of his successor, to the employee who keeps his rival out of a place. Now, in the event of the king’s death, his successor inherits a crown,—when the employee dies, the supernumerary steps into his shoes, and receives his salary of twelve thousand livres. Well, these twelve thousand livres are his civil list, and are as essential to him as the twelve millions of a king. Everyone, from the highest to the lowest degree, has his place on the social ladder, and is beset by stormy passions and conflicting interests, as in Descartes’ theory of pressure and impulsion. But these forces increase as we go higher, so that we have a spiral which in defiance of reason rests upon the apex and not on the base. Now let us return to your particular world. You say you were on the point of being made captain of the _Pharaon_?”

“Yes.”

“And about to become the husband of a young and lovely girl?”

“Yes.”

“Now, could anyone have had any interest in preventing the accomplishment of these two things? But let us first settle the question as to its being the interest of anyone to hinder you from being captain of the _Pharaon_. What say you?”

“I cannot believe such was the case. I was generally liked on board, and had the sailors possessed the right of selecting a captain themselves, I feel convinced their choice would have fallen on me. There was only one person among the crew who had any feeling of ill-will towards me. I had quarelled with him some time previously, and had even challenged him to fight me; but he refused.”

“Now we are getting on. And what was this man’s name?”

“Danglars.”

“What rank did he hold on board?”

“He was supercargo.”

“And had you been captain, should you have retained him in his employment?”

“Not if the choice had remained with me, for I had frequently observed inaccuracies in his accounts.”

“Good again! Now then, tell me, was any person present during your last conversation with Captain Leclere?”

“No; we were quite alone.”

“Could your conversation have been overheard by anyone?”

“It might, for the cabin door was open—and—stay; now I recollect,—Danglars himself passed by just as Captain Leclere was giving me the packet for the grand marshal.”

“That’s better,” cried the abbé; “now we are on the right scent. Did you take anybody with you when you put into the port of Elba?”

“Nobody.”

“Somebody there received your packet, and gave you a letter in place of it, I think?”

“Yes; the grand marshal did.”

“And what did you do with that letter?”

“Put it into my portfolio.”

“You had your portfolio with you, then? Now, how could a sailor find room in his pocket for a portfolio large enough to contain an official letter?”

“You are right; it was left on board.”

“Then it was not till your return to the ship that you put the letter in the portfolio?”

“No.”

“And what did you do with this same letter while returning from Porto-Ferrajo to the vessel?”

“I carried it in my hand.”

“So that when you went on board the _Pharaon_, everybody could see that you held a letter in your hand?”

“Yes.”

“Danglars, as well as the rest?”

“Danglars, as well as others.”

“Now, listen to me, and try to recall every circumstance attending your arrest. Do you recollect the words in which the information against you was formulated?”

“Oh yes, I read it over three times, and the words sank deeply into my memory.”

“Repeat it to me.”

Dantès paused a moment, then said, “This is it, word for word: ‘The king’s attorney is informed by a friend to the throne and religion, that one Edmond Dantès, mate on board the _Pharaon_, this day arrived from Smyrna, after having touched at Naples and Porto-Ferrajo, has been intrusted by Murat with a packet for the usurper; again, by the usurper, with a letter for the Bonapartist Club in Paris. This proof of his guilt may be procured by his immediate arrest, as the letter will be found either about his person, at his father’s residence, or in his cabin on board the _Pharaon_.’”

The abbé shrugged his shoulders. “The thing is clear as day,” said he; “and you must have had a very confiding nature, as well as a good heart, not to have suspected the origin of the whole affair.”

“Do you really think so? Ah, that would indeed be infamous.”

“How did Danglars usually write?”

“In a handsome, running hand.”

“And how was the anonymous letter written?”

“Backhanded.”

Again the abbé smiled. “Disguised.”

“It was very boldly written, if disguised.”

“Stop a bit,” said the abbé, taking up what he called his pen, and, after dipping it into the ink, he wrote on a piece of prepared linen, with his left hand, the first two or three words of the accusation. Dantès drew back, and gazed on the abbé with a sensation almost amounting to terror.

“How very astonishing!” cried he at length. “Why your writing exactly resembles that of the accusation.”

“Simply because that accusation had been written with the left hand; and I have noticed that——”

“What?”

“That while the writing of different persons done with the right hand varies, that performed with the left hand is invariably uniform.”

“You have evidently seen and observed everything.”

“Let us proceed.”

“Oh, yes, yes!”

“Now as regards the second question.”

“I am listening.”

“Was there any person whose interest it was to prevent your marriage with Mercédès?”

“Yes; a young man who loved her.”

“And his name was——”

“Fernand.”

“That is a Spanish name, I think?”

“He was a Catalan.”

“You imagine him capable of writing the letter?”

“Oh, no; he would more likely have got rid of me by sticking a knife into me.”

“That is in strict accordance with the Spanish character; an assassination they will unhesitatingly commit, but an act of cowardice, never.”

“Besides,” said Dantès, “the various circumstances mentioned in the letter were wholly unknown to him.”

“You had never spoken of them yourself to anyone?”

“To no one.”

“Not even to your mistress?”

“No, not even to my betrothed.”

“Then it is Danglars.”

“I feel quite sure of it now.”

“Wait a little. Pray, was Danglars acquainted with Fernand?”

“No—yes, he was. Now I recollect——”

“What?”

“To have seen them both sitting at table together under an arbor at Père Pamphile’s the evening before the day fixed for my wedding. They were in earnest conversation. Danglars was joking in a friendly way, but Fernand looked pale and agitated.”

“Were they alone?”

“There was a third person with them whom I knew perfectly well, and who had, in all probability made their acquaintance; he was a tailor named Caderousse, but he was very drunk. Stay!—stay!—How strange that it should not have occurred to me before! Now I remember quite well, that on the table round which they were sitting were pens, ink, and paper. Oh, the heartless, treacherous scoundrels!” exclaimed Dantès, pressing his hand to his throbbing brows.

“Is there anything else I can assist you in discovering, besides the villany of your friends?” inquired the abbé with a laugh.

“Yes, yes,” replied Dantès eagerly; “I would beg of you, who see so completely to the depths of things, and to whom the greatest mystery seems but an easy riddle, to explain to me how it was that I underwent no second examination, was never brought to trial, and, above all, was condemned without ever having had sentence passed on me?”

“That is altogether a different and more serious matter,” responded the abbé. “The ways of justice are frequently too dark and mysterious to be easily penetrated. All we have hitherto done in the matter has been child’s play. If you wish me to enter upon the more difficult part of the business, you must assist me by the most minute information on every point.”

“Pray ask me whatever questions you please; for, in good truth, you see more clearly into my life than I do myself.”

“In the first place, then, who examined you,—the king’s attorney, his deputy, or a magistrate?”

“The deputy.”

“Was he young or old?”

“About six or seven-and-twenty years of age, I should say.”

“So,” answered the abbé. “Old enough to be ambitious, but too young to be corrupt. And how did he treat you?”

“With more of mildness than severity.”

“Did you tell him your whole story?”

“I did.”

“And did his conduct change at all in the course of your examination?”

“He did appear much disturbed when he read the letter that had brought me into this scrape. He seemed quite overcome by my misfortune.”

“By your misfortune?”

“Yes.”

“Then you feel quite sure that it was your misfortune he deplored?”

“He gave me one great proof of his sympathy, at any rate.”

“And that?”

“He burnt the sole evidence that could at all have criminated me.”

“What? the accusation?”

“No; the letter.”

“Are you sure?”

“I saw it done.”

“That alters the case. This man might, after all, be a greater scoundrel than you have thought possible.”

“Upon my word,” said Dantès, “you make me shudder. Is the world filled with tigers and crocodiles?”

“Yes; and remember that two-legged tigers and crocodiles are more dangerous than the others.”

“Never mind; let us go on.”

“With all my heart! You tell me he burned the letter?”

“He did; saying at the same time, ‘You see I thus destroy the only proof existing against you.’”

“This action is somewhat too sublime to be natural.”

“You think so?”

“I am sure of it. To whom was this letter addressed?”

“To M. Noirtier, Rue Coq-Héron, No. 13, Paris.”

“Now can you conceive of any interest that your heroic deputy could possibly have had in the destruction of that letter?”

“Why, it is not altogether impossible he might have had, for he made me promise several times never to speak of that letter to anyone, assuring me he so advised me for my own interest; and, more than this, he insisted on my taking a solemn oath never to utter the name mentioned in the address.”

“Noirtier!” repeated the abbé; “Noirtier!—I knew a person of that name at the court of the Queen of Etruria,—a Noirtier, who had been a Girondin during the Revolution! What was your deputy called?”

“De Villefort!” The abbé burst into a fit of laughter, while Dantès gazed on him in utter astonishment.

“What ails you?” said he at length.

“Do you see that ray of sunlight?”

“I do.”

“Well, the whole thing is more clear to me than that sunbeam is to you. Poor fellow! poor young man! And you tell me this magistrate expressed great sympathy and commiseration for you?”

“He did.”

“And the worthy man destroyed your compromising letter?”

“Yes.”

“And then made you swear never to utter the name of Noirtier?”

“Yes.”

“Why, you poor short-sighted simpleton, can you not guess who this Noirtier was, whose very name he was so careful to keep concealed? This Noirtier was his father!”

Had a thunderbolt fallen at the feet of Dantès, or hell opened its yawning gulf before him, he could not have been more completely transfixed with horror than he was at the sound of these unexpected words. Starting up, he clasped his hands around his head as though to prevent his very brain from bursting, and exclaimed, “His father! his father!”

“Yes, his father,” replied the abbé; “his right name was Noirtier de Villefort.”

At this instant a bright light shot through the mind of Dantès, and cleared up all that had been dark and obscure before. The change that had come over Villefort during the examination, the destruction of the letter, the exacted promise, the almost supplicating tones of the magistrate, who seemed rather to implore mercy than to pronounce punishment,—all returned with a stunning force to his memory. He cried out, and staggered against the wall like a drunken man, then he hurried to the opening that led from the abbé’s cell to his own, and said, “I must be alone, to think over all this.”

When he regained his dungeon, he threw himself on his bed, where the turnkey found him in the evening visit, sitting with fixed gaze and contracted features, dumb and motionless as a statue. During these hours of profound meditation, which to him had seemed only minutes, he had formed a fearful resolution, and bound himself to its fulfilment by a solemn oath.

Dantès was at length roused from his reverie by the voice of Faria, who, having also been visited by his jailer, had come to invite his fellow-sufferer to share his supper. The reputation of being out of his mind, though harmlessly and even amusingly so, had procured for the abbé unusual privileges. He was supplied with bread of a finer, whiter quality than the usual prison fare, and even regaled each Sunday with a small quantity of wine. Now this was a Sunday, and the abbé had come to ask his young companion to share the luxuries with him.

Dantès followed him; his features were no longer contracted, and now wore their usual expression, but there was that in his whole appearance that bespoke one who had come to a fixed and desperate resolve. Faria bent on him his penetrating eye.

“I regret now,” said he, “having helped you in your late inquiries, or having given you the information I did.”

“Why so?” inquired Dantès.

“Because it has instilled a new passion in your heart—that of vengeance.”

Dantès smiled. “Let us talk of something else,” said he.

Again the abbé looked at him, then mournfully shook his head; but in accordance with Dantès’ request, he began to speak of other matters. The elder prisoner was one of those persons whose conversation, like that of all who have experienced many trials, contained many useful and important hints as well as sound information; but it was never egotistical, for the unfortunate man never alluded to his own sorrows. Dantès listened with admiring attention to all he said; some of his remarks corresponded with what he already knew, or applied to the sort of knowledge his nautical life had enabled him to acquire. A part of the good abbé’s words, however, were wholly incomprehensible to him; but, like the aurora which guides the navigator in northern latitudes, opened new vistas to the inquiring mind of the listener, and gave fantastic glimpses of new horizons, enabling him justly to estimate the delight an intellectual mind would have in following one so richly gifted as Faria along the heights of truth, where he was so much at home.

“You must teach me a small part of what you know,” said Dantès, “if only to prevent your growing weary of me. I can well believe that so learned a person as yourself would prefer absolute solitude to being tormented with the company of one as ignorant and uninformed as myself. If you will only agree to my request, I promise you never to mention another word about escaping.”

The abbé smiled.

“Alas, my boy,” said he, “human knowledge is confined within very narrow limits; and when I have taught you mathematics, physics, history, and the three or four modern languages with which I am acquainted, you will know as much as I do myself. Now, it will scarcely require two years for me to communicate to you the stock of learning I possess.”

“Two years!” exclaimed Dantès; “do you really believe I can acquire all these things in so short a time?”

“Not their application, certainly, but their principles you may; to learn is not to know; there are the learners and the learned. Memory makes the one, philosophy the other.”

“But cannot one learn philosophy?”

“Philosophy cannot be taught; it is the application of the sciences to truth; it is like the golden cloud in which the Messiah went up into heaven.”

“Well, then,” said Dantès, “What shall you teach me first? I am in a hurry to begin. I want to learn.”

“Everything,” said the abbé. And that very evening the prisoners sketched a plan of education, to be entered upon the following day. Dantès possessed a prodigious memory, combined with an astonishing quickness and readiness of conception; the mathematical turn of his mind rendered him apt at all kinds of calculation, while his naturally poetical feelings threw a light and pleasing veil over the dry reality of arithmetical computation, or the rigid severity of geometry. He already knew Italian, and had also picked up a little of the Romaic dialect during voyages to the East; and by the aid of these two languages he easily comprehended the construction of all the others, so that at the end of six months he began to speak Spanish, English, and German.

In strict accordance with the promise made to the abbé, Dantès spoke no more of escape. Perhaps the delight his studies afforded him left no room for such thoughts; perhaps the recollection that he had pledged his word (on which his sense of honor was keen) kept him from referring in any way to the possibilities of flight. Days, even months, passed by unheeded in one rapid and instructive course. At the end of a year Dantès was a new man. Dantès observed, however, that Faria, in spite of the relief his society afforded, daily grew sadder; one thought seemed incessantly to harass and distract his mind. Sometimes he would fall into long reveries, sigh heavily and involuntarily, then suddenly rise, and, with folded arms, begin pacing the confined space of his dungeon. One day he stopped all at once, and exclaimed:

“Ah, if there were no sentinel!”

“There shall not be one a minute longer than you please,” said Dantès, who had followed the working of his thoughts as accurately as though his brain were enclosed in crystal so clear as to display its minutest operations.

“I have already told you,” answered the abbé, “that I loathe the idea of shedding blood.”

“And yet the murder, if you choose to call it so, would be simply a measure of self-preservation.”

“No matter! I could never agree to it.”

“Still, you have thought of it?”

“Incessantly, alas!” cried the abbé.

“And you have discovered a means of regaining our freedom, have you not?” asked Dantès eagerly.

“I have; if it were only possible to place a deaf and blind sentinel in the gallery beyond us.”

“He shall be both blind and deaf,” replied the young man, with an air of determination that made his companion shudder.

“No, no,” cried the abbé; “impossible!”

Dantès endeavored to renew the subject; the abbé shook his head in token of disapproval, and refused to make any further response. Three months passed away.

“Are you strong?” the abbé asked one day of Dantès. The young man, in reply, took up the chisel, bent it into the form of a horseshoe, and then as readily straightened it.

“And will you engage not to do any harm to the sentry, except as a last resort?”

“I promise on my honor.”

“Then,” said the abbé, “we may hope to put our design into execution.”

“And how long shall we be in accomplishing the necessary work?”

“At least a year.”

“And shall we begin at once?”

“At once.”

“We have lost a year to no purpose!” cried Dantès.

“Do you consider the last twelve months to have been wasted?” asked the abbé.

“Forgive me!” cried Edmond, blushing deeply.

“Tut, tut!” answered the abbé, “man is but man after all, and you are about the best specimen of the genus I have ever known. Come, let me show you my plan.”

The abbé then showed Dantès the sketch he had made for their escape. It consisted of a plan of his own cell and that of Dantès, with the passage which united them. In this passage he proposed to drive a level as they do in mines; this level would bring the two prisoners immediately beneath the gallery where the sentry kept watch; once there, a large excavation would be made, and one of the flag-stones with which the gallery was paved be so completely loosened that at the desired moment it would give way beneath the feet of the soldier, who, stunned by his fall, would be immediately bound and gagged by Dantès before he had power to offer any resistance. The prisoners were then to make their way through one of the gallery windows, and to let themselves down from the outer walls by means of the abbé’s ladder of cords.

Dantès’ eyes sparkled with joy, and he rubbed his hands with delight at the idea of a plan so simple, yet apparently so certain to succeed. That very day the miners began their labors, with a vigor and alacrity proportionate to their long rest from fatigue and their hopes of ultimate success. Nothing interrupted the progress of the work except the necessity that each was under of returning to his cell in anticipation of the turnkey’s visits. They had learned to distinguish the almost imperceptible sound of his footsteps as he descended towards their dungeons, and happily, never failed of being prepared for his coming. The fresh earth excavated during their present work, and which would have entirely blocked up the old passage, was thrown, by degrees and with the utmost precaution, out of the window in either Faria’s or Dantès’ cell, the rubbish being first pulverized so finely that the night wind carried it far away without permitting the smallest trace to remain.

More than a year had been consumed in this undertaking, the only tools for which had been a chisel, a knife, and a wooden lever; Faria still continuing to instruct Dantès by conversing with him, sometimes in one language, sometimes in another; at others, relating to him the history of nations and great men who from time to time have risen to fame and trodden the path of glory. The abbé was a man of the world, and had, moreover, mixed in the first society of the day; he wore an air of melancholy dignity which Dantès, thanks to the imitative powers bestowed on him by nature, easily acquired, as well as that outward polish and politeness he had before been wanting in, and which is seldom possessed except by those who have been placed in constant intercourse with persons of high birth and breeding.

At the end of fifteen months the level was finished, and the excavation completed beneath the gallery, and the two workmen could distinctly hear the measured tread of the sentinel as he paced to and fro over their heads. Compelled, as they were, to await a night sufficiently dark to favor their flight, they were obliged to defer their final attempt till that auspicious moment should arrive; their greatest dread now was lest the stone through which the sentry was doomed to fall should give way before its right time, and this they had in some measure provided against by propping it up with a small beam which they had discovered in the walls through which they had worked their way. Dantès was occupied in arranging this piece of wood when he heard Faria, who had remained in Edmond’s cell for the purpose of cutting a peg to secure their rope-ladder, call to him in a tone indicative of great suffering. Dantès hastened to his dungeon, where he found him standing in the middle of the room, pale as death, his forehead streaming with perspiration, and his hands clenched tightly together.

“Gracious heavens!” exclaimed Dantès, “what is the matter? what has happened?”

“Quick! quick!” returned the abbé, “listen to what I have to say.”

Dantès looked in fear and wonder at the livid countenance of Faria, whose eyes, already dull and sunken, were surrounded by purple circles, while his lips were white as those of a corpse, and his very hair seemed to stand on end.

“Tell me, I beseech you, what ails you?” cried Dantès, letting his chisel fall to the floor.

“Alas,” faltered out the abbé, “all is over with me. I am seized with a terrible, perhaps mortal illness; I can feel that the paroxysm is fast approaching. I had a similar attack the year previous to my imprisonment. This malady admits but of one remedy; I will tell you what that is. Go into my cell as quickly as you can; draw out one of the feet that support the bed; you will find it has been hollowed out for the purpose of containing a small phial you will see there half-filled with a red-looking fluid. Bring it to me—or rather—no,

no!—I may be found here, therefore help me back to my room while I have the strength to drag myself along. Who knows what may happen, or how long the attack may last?”

In spite of the magnitude of the misfortune which thus suddenly frustrated his hopes, Dantès did not lose his presence of mind, but descended into the passage, dragging his unfortunate companion with him; then, half-carrying, half-supporting him, he managed to reach the abbé’s chamber, when he immediately laid the sufferer on his bed.

“Thanks,” said the poor abbé, shivering as though his veins were filled with ice. “I am about to be seized with a fit of catalepsy; when it comes to its height I shall probably lie still and motionless as though dead, uttering neither sigh nor groan. On the other hand, the symptoms may be much more violent, and cause me to fall into fearful convulsions, foam at the mouth, and cry out loudly. Take care my cries are not heard, for if they are it is more than probable I should be removed to another part of the prison, and we be separated forever. When I become quite motionless, cold, and rigid as a corpse, then, and not before,—be careful about this,—force open my teeth with the knife, pour from eight to ten drops of the liquor contained in the phial down my throat, and I may perhaps revive.”

“Perhaps!” exclaimed Dantès in grief-stricken tones.

“Help! help!” cried the abbé, “I—I—die—I——”

0229m

So sudden and violent was the fit that the unfortunate prisoner was unable to complete the sentence; a violent convulsion shook his whole frame, his eyes started from their sockets, his mouth was drawn on one side, his cheeks became purple, he struggled, foamed, dashed himself about, and uttered the most dreadful cries, which, however, Dantès prevented from being heard by covering his head with the blanket. The fit lasted two hours; then, more helpless than an infant, and colder and paler than marble, more crushed and broken than a reed trampled under foot, he fell back, doubled up in one last convulsion, and became as rigid as a corpse.

Edmond waited till life seemed extinct in the body of his friend, then, taking up the knife, he with difficulty forced open the closely fixed jaws, carefully administered the appointed number of drops, and anxiously awaited the result. An hour passed away and the old man gave no sign of returning animation. Dantès began to fear he had delayed too long ere he administered the remedy, and, thrusting his hands into his hair, continued gazing on the lifeless features of his friend. At length a slight color tinged the livid cheeks, consciousness returned to the dull, open eyeballs, a faint sigh issued from the lips, and the sufferer made a feeble effort to move.

“He is saved! he is saved!” cried Dantès in a paroxysm of delight.

The sick man was not yet able to speak, but he pointed with evident anxiety towards the door. Dantès listened, and plainly distinguished the approaching steps of the jailer. It was therefore near seven o’clock; but Edmond’s anxiety had put all thoughts of time out of his head.

The young man sprang to the entrance, darted through it, carefully drawing the stone over the opening, and hurried to his cell. He had scarcely done so before the door opened, and the jailer saw the prisoner seated as usual on the side of his bed. Almost before the key had turned in the lock, and before the departing steps of the jailer had died away in the long corridor he had to traverse, Dantès, whose restless anxiety concerning his friend left him no desire to touch the food brought him, hurried back to the abbé’s chamber, and raising the stone by pressing his head against it, was soon beside the sick man’s couch. Faria had now fully regained his consciousness, but he still lay helpless and exhausted on his miserable bed.

“I did not expect to see you again,” said he feebly, to Dantès.

“And why not?” asked the young man. “Did you fancy yourself dying?”

“No, I had no such idea; but, knowing that all was ready for flight, I thought you might have made your escape.”

The deep glow of indignation suffused the cheeks of Dantès.

“Without you? Did you really think me capable of that?”

“At least,” said the abbé, “I now see how wrong such an opinion would have been. Alas, alas! I am fearfully exhausted and debilitated by this attack.”

“Be of good cheer,” replied Dantès; “your strength will return.” And as he spoke he seated himself near the bed beside Faria, and took his hands. The abbé shook his head.

“The last attack I had,” said he, “lasted but half an hour, and after it I was hungry, and got up without help; now I can move neither my right arm nor leg, and my head seems uncomfortable, which shows that there has been a suffusion of blood on the brain. The third attack will either carry me off, or leave me paralyzed for life.”

“No, no,” cried Dantès; “you are mistaken—you will not die! And your third attack (if, indeed, you should have another) will find you at liberty. We shall save you another time, as we have done this, only with a better chance of success, because we shall be able to command every requisite assistance.”

“My good Edmond,” answered the abbé, “be not deceived. The attack which has just passed away, condemns me forever to the walls of a prison. None can fly from a dungeon who cannot walk.”

“Well, we will wait,—a week, a month, two months, if need be,—and meanwhile your strength will return. Everything is in readiness for our flight, and we can select any time we choose. As soon as you feel able to swim we will go.”

“I shall never swim again,” replied Faria. “This arm is paralyzed; not for a time, but forever. Lift it, and judge if I am mistaken.”

The young man raised the arm, which fell back by its own weight, perfectly inanimate and helpless. A sigh escaped him.

“You are convinced now, Edmond, are you not?” asked the abbé. “Depend upon it, I know what I say. Since the first attack I experienced of this malady, I have continually reflected on it. Indeed, I expected it, for it is a family inheritance; both my father and grandfather died of it in a third attack. The physician who prepared for me the remedy I have twice successfully taken, was no other than the celebrated Cabanis, and he predicted a similar end for me.”

0233m

“The physician may be mistaken!” exclaimed Dantès. “And as for your poor arm, what difference will that make? I can take you on my shoulders, and swim for both of us.”

“My son,” said the abbé, “you, who are a sailor and a swimmer, must know as well as I do that a man so loaded would sink before he had done fifty strokes. Cease, then, to allow yourself to be duped by vain hopes, that even your own excellent heart refuses to believe in. Here I shall remain till the hour of my deliverance arrives, and that, in all human probability, will be the hour of my death. As for you, who are young and active, delay not on my account, but fly—go—I give you back your promise.”

“It is well,” said Dantès. “Then I shall also remain.” Then, rising and extending his hand with an air of solemnity over the old man’s head, he slowly added, “By the blood of Christ I swear never to leave you while you live.”

Faria gazed fondly on his noble-minded, single-hearted, high-principled young friend, and read in his countenance ample confirmation of the sincerity of his devotion and the loyalty of his purpose.

“Thanks,” murmured the invalid, extending one hand. “I accept. You may one of these days reap the reward of your disinterested devotion. But as I cannot, and you will not, quit this place, it becomes necessary to fill up the excavation beneath the soldier’s gallery; he might, by chance, hear the hollow sound of his footsteps, and call the attention of his officer to the circumstance. That would bring about a discovery which would inevitably lead to our being separated. Go, then, and set about this work, in which, unhappily, I can offer you no assistance; keep at it all night, if necessary, and do not return here tomorrow till after the jailer has visited me. I shall have something of the greatest importance to communicate to you.”

Dantès took the hand of the abbé in his, and affectionately pressed it. Faria smiled encouragingly on him, and the young man retired to his task, in the spirit of obedience and respect which he had sworn to show towards his aged friend.

Chapter 18. The Treasure

When Dantès returned next morning to the chamber of his companion in captivity, he found Faria seated and looking composed. In the ray of light which entered by the narrow window of his cell, he held open in his left hand, of which alone, it will be recollected, he retained the use, a sheet of paper, which, from being constantly rolled into a small compass, had the form of a cylinder, and was not easily kept open. He did not speak, but showed the paper to Dantès.

“What is that?” he inquired.

“Look at it,” said the abbé with a smile.

“I have looked at it with all possible attention,” said Dantès, “and I only see a half-burnt paper, on which are traces of Gothic characters inscribed with a peculiar kind of ink.”

“This paper, my friend,” said Faria, “I may now avow to you, since I have the proof of your fidelity—this paper is my treasure, of which, from this day forth, one-half belongs to you.”

The sweat started forth on Dantès’ brow. Until this day and for how long a time!—he had refrained from talking of the treasure, which had brought upon the abbé the accusation of madness. With his instinctive delicacy Edmond had preferred avoiding any touch on this painful chord, and Faria had been equally silent. He had taken the silence of the old man for a return to reason; and now these few words uttered by Faria, after so painful a crisis, seemed to indicate a serious relapse into mental alienation.

“Your treasure?” stammered Dantès. Faria smiled.

“Yes,” said he. “You have, indeed, a noble nature, Edmond, and I see by your paleness and agitation what is passing in your heart at this moment. No, be assured, I am not mad. This treasure exists, Dantès, and if I have not been allowed to possess it, you will. Yes—you. No one would listen or believe me, because everyone thought me mad; but you, who must know that I am not, listen to me, and believe me so afterwards if you will.”

“Alas,” murmured Edmond to himself, “this is a terrible relapse! There was only this blow wanting.” Then he said aloud, “My dear friend, your attack has, perhaps, fatigued you; had you not better repose awhile? Tomorrow, if you will, I will hear your narrative; but today I wish to nurse you carefully. Besides,” he said, “a treasure is not a thing we need hurry about.”

“On the contrary, it is a matter of the utmost importance, Edmond!” replied the old man. “Who knows if tomorrow, or the next day after, the third attack may not come on? and then must not all be over? Yes, indeed, I have often thought with a bitter joy that these riches, which would make the wealth of a dozen families, will be forever lost to those men who persecute me. This idea was one of vengeance to me, and I tasted it slowly in the night of my dungeon and the despair of my captivity. But now I have forgiven the world for the love of you; now that I see you, young and with a promising future,—now that I think of all that may result to you in the good fortune of such a disclosure, I shudder at any delay, and tremble lest I should not assure to one as worthy as yourself the possession of so vast an amount of hidden wealth.”

Edmond turned away his head with a sigh.

“You persist in your incredulity, Edmond,” continued Faria. “My words have not convinced you. I see you require proofs. Well, then, read this paper, which I have never shown to anyone.”

“Tomorrow, my dear friend,” said Edmond, desirous of not yielding to the old man’s madness. “I thought it was understood that we should not talk of that until tomorrow.”

“Then we will not talk of it until tomorrow; but read this paper today.”

“I will not irritate him,” thought Edmond, and taking the paper, of which half was wanting,—having been burnt, no doubt, by some accident,—he read:

“this treasure, which may amount to two...

of Roman crowns in the most distant a...

of the second opening wh...

declare to belong to him alo...

heir.

“25th April, 149’”

“Well!” said Faria, when the young man had finished reading it.

“Why,” replied Dantès, “I see nothing but broken lines and unconnected words, which are rendered illegible by fire.”

“Yes, to you, my friend, who read them for the first time; but not for me, who have grown pale over them by many nights’ study, and have reconstructed every phrase, completed every thought.”

“And do you believe you have discovered the hidden meaning?”

“I am sure I have, and you shall judge for yourself; but first listen to the history of this paper.”

“Silence!” exclaimed Dantès. “Steps approach—I go—adieu!”

And Dantès, happy to escape the history and explanation which would be sure to confirm his belief in his friend’s mental instability, glided like a snake along the narrow passage; while Faria, restored by his alarm to a certain amount of activity, pushed the stone into place with his foot, and covered it with a mat in order the more effectually to avoid discovery.

It was the governor, who, hearing of Faria’s illness from the jailer, had come in person to see him.

Faria sat up to receive him, avoiding all gestures in order that he might conceal from the governor the paralysis that had already half stricken him with death. His fear was lest the governor, touched with pity, might order him to be removed to better quarters, and thus separate him from his young companion. But fortunately this was not the case, and the governor left him, convinced that the poor madman, for whom in his heart he felt a kind of affection, was only troubled with a slight indisposition.

During this time, Edmond, seated on his bed with his head in his hands, tried to collect his scattered thoughts. Faria, since their first acquaintance, had been on all points so rational and logical, so wonderfully sagacious, in fact, that he could not understand how so much wisdom on all points could be allied with madness. Was Faria deceived as to his treasure, or was all the world deceived as to Faria?

Dantès remained in his cell all day, not daring to return to his friend, thinking thus to defer the moment when he should be convinced, once for all, that the abbé was mad—such a conviction would be so terrible!

But, towards the evening after the hour for the customary visit had gone by, Faria, not seeing the young man appear, tried to move and get over the distance which separated them. Edmond shuddered when he heard the painful efforts which the old man made to drag himself along; his leg was inert, and he could no longer make use of one arm. Edmond was obliged to assist him, for otherwise he would not have been able to enter by the small aperture which led to Dantès’ chamber.

“Here I am, pursuing you remorselessly,” he said with a benignant smile. “You thought to escape my munificence, but it is in vain. Listen to me.”

Edmond saw there was no escape, and placing the old man on his bed, he seated himself on the stool beside him.

“You know,” said the abbé, “that I was the secretary and intimate friend of Cardinal Spada, the last of the princes of that name. I owe to this worthy lord all the happiness I ever knew. He was not rich, although the wealth of his family had passed into a proverb, and I heard the phrase very often, ‘As rich as a Spada.’ But he, like public rumor, lived on this reputation for wealth; his palace was my paradise. I was tutor to his nephews, who are dead; and when he was alone in the world, I tried by absolute devotion to his will, to make up to him all he had done for me during ten years of unremitting kindness. The cardinal’s house had no secrets for me. I had often seen my noble patron annotating ancient volumes, and eagerly searching amongst dusty family manuscripts. One day when I was reproaching him for his unavailing searches, and deploring the prostration of mind that followed them, he looked at me, and, smiling bitterly, opened a volume relating to the History of the City of Rome. There, in the twentieth chapter of the Life of Pope Alexander VI., were the following lines, which I can never forget:—

“‘The great wars of Romagna had ended; Cæsar Borgia, who had completed his conquest, had need of money to purchase all Italy. The pope had also need of money to bring matters to an end with Louis XII. King of France, who was formidable still in spite of his recent reverses; and it was necessary, therefore, to have recourse to some profitable scheme, which was a matter of great difficulty

in the impoverished condition of exhausted Italy. His holiness had an idea. He determined to make two cardinals.'

"By choosing two of the greatest personages of Rome, especially rich men—_this_ was the return the Holy Father looked for. In the first place, he could sell the great appointments and splendid offices which the cardinals already held; and then he had the two hats to sell besides. There was a third point in view, which will appear hereafter.

"The pope and Cæsar Borgia first found the two future cardinals; they were Giovanni Rospigliosi, who held four of the highest dignities of the Holy See, and Cæsar Spada, one of the noblest and richest of the Roman nobility; both felt the high honor of such a favor from the pope. They were ambitious, and Cæsar Borgia soon found purchasers for their appointments. The result was, that Rospigliosi and Spada paid for being cardinals, and eight other persons paid for the offices the cardinals held before their elevation, and thus eight hundred thousand crowns entered into the coffers of the speculators.

0239m

"It is time now to proceed to the last part of the speculation. The pope heaped attentions upon Rospigliosi and Spada, conferred upon them the insignia of the cardinalate, and induced them to arrange their affairs and take up their residence at Rome. Then the pope and Cæsar Borgia invited the two cardinals to dinner. This was a matter of dispute between the Holy Father and his son. Cæsar thought they could make use of one of the means which he always had ready for his friends, that is to say, in the first place, the famous key which was given to certain persons with the request that they go and open a designated cupboard. This key was furnished with a small iron point,—a negligence on the part of the locksmith. When this was pressed to effect the opening of the cupboard, of which the lock was difficult, the person was pricked by this small point, and died next day. Then there was the ring with the lion's head, which Cæsar wore when he wanted to greet his friends with a clasp of the hand. The lion bit the hand thus favored, and at the end of twenty-four hours, the bite was mortal.

"Cæsar proposed to his father, that they should either ask the cardinals to open the cupboard, or shake hands with them; but Alexander VI. replied: 'Now as to the worthy cardinals, Spada and Rospigliosi, let us ask both of them to dinner, something tells me that we shall get that money back. Besides, you forget, Cæsar, an indigestion declares itself immediately, while a prick or a bite occasions a delay of a day or two.' Cæsar gave way before such cogent reasoning, and the cardinals were consequently invited to dinner.

"The table was laid in a vineyard belonging to the pope, near San Pierdarena, a charming retreat which the cardinals knew very well by report. Rospigliosi, quite set up with his new dignities, went with a good appetite and his most ingratiating manner. Spada, a prudent man, and greatly attached to his only nephew, a young captain of the highest promise, took paper and pen, and made his will. He then sent word to his nephew to wait for him near the vineyard; but it appeared the servant did not find him.

"Spada knew what these invitations meant; since Christianity, so eminently civilizing, had made progress in Rome, it was no longer a centurion who came from the tyrant with a message, 'Cæsar wills that you die.' but it was a legate _à latere_, who came with a smile on his lips to say from the pope, 'His holiness requests you to dine with him.'

"Spada set out about two o'clock to San Pierdarena. The pope awaited him. The first sight that attracted the eyes of Spada was that of his nephew, in full costume, and Cæsar Borgia paying him most marked attentions. Spada turned pale, as Cæsar looked at him with an ironical air, which proved that he had anticipated all, and that the snare was well spread.

"They began dinner and Spada was only able to inquire of his nephew if he had received his message. The nephew replied no; perfectly comprehending the meaning of the question. It was too late, for he had already drunk a glass of excellent wine, placed for him expressly by the pope's butler. Spada at the same moment saw another bottle approach him, which he was pressed to taste. An hour afterwards a physician declared they were both poisoned through eating mushrooms. Spada died on the threshold of the vineyard; the nephew expired at his own door, making signs which his wife could not comprehend.

"Then Cæsar and the pope hastened to lay hands on the heritage, under pretense of seeking for the papers of the dead man. But the inheritance consisted in this only, a scrap of paper on which Spada had written:—'I bequeath to my beloved nephew my coffers, my books, and, amongst others, my breviary with the gold corners, which I beg he will preserve in remembrance of his affectionate uncle.'

"The heirs sought everywhere, admired the breviary, laid hands on the furniture, and were greatly astonished that Spada, the rich man, was really the most miserable of uncles—no treasures—unless they were those of science, contained in the library and

laboratories. That was all. Cæsar and his father searched, examined, scrutinized, but found nothing, or at least very little; not exceeding a few thousand crowns in plate, and about the same in ready money; but the nephew had time to say to his wife before he expired: ‘Look well among my uncle’s papers; there is a will.’

“They sought even more thoroughly than the august heirs had done, but it was fruitless. There were two palaces and a vineyard behind the Palatine Hill; but in these days landed property had not much value, and the two palaces and the vineyard remained to the family since they were beneath the rapacity of the pope and his son. Months and years rolled on. Alexander VI. died, poisoned,—you know by what mistake. Cæsar, poisoned at the same time, escaped by shedding his skin like a snake; but the new skin was spotted by the poison till it looked like a tiger’s. Then, compelled to quit Rome, he went and got himself obscurely killed in a night skirmish, scarcely noticed in history.

“After the pope’s death and his son’s exile, it was supposed that the Spada family would resume the splendid position they had held before the cardinal’s time; but this was not the case. The Spadas remained in doubtful ease, a mystery hung over this dark affair, and the public rumor was, that Cæsar, a better politician than his father, had carried off from the pope the fortune of the two cardinals. I say the two, because Cardinal Rospigliosi, who had not taken any precaution, was completely despoiled.

“Up to this point,” said Faria, interrupting the thread of his narrative, “this seems to you very meaningless, no doubt, eh?”

“Oh, my friend,” cried Dantès, “on the contrary, it seems as if I were reading a most interesting narrative; go on, I beg of you.”

“I will. The family began to get accustomed to their obscurity. Years rolled on, and amongst the descendants some were soldiers, others diplomatists; some churchmen, some bankers; some grew rich, and some were ruined. I come now to the last of the family, whose secretary I was—the Count of Spada. I had often heard him complain of the disproportion of his rank with his fortune; and I advised him to invest all he had in an annuity. He did so, and thus doubled his income. The celebrated breviary remained in the family, and was in the count’s possession. It had been handed down from father to son; for the singular clause of the only will that had been found, had caused it to be regarded as a genuine relic, preserved in the family with superstitious veneration. It was an illuminated book, with beautiful Gothic characters, and so weighty with gold, that a servant always carried it before the cardinal on days of great solemnity.

“At the sight of papers of all sorts,—titles, contracts, parchments, which were kept in the archives of the family, all descending from the poisoned cardinal, I in my turn examined the immense bundles of documents, like twenty servitors, stewards, secretaries before me; but in spite of the most exhaustive researches, I found—nothing. Yet I had read, I had even written a precise history of the Borgia family, for the sole purpose of assuring myself whether any increase of fortune had occurred to them on the death of the Cardinal Cæsar Spada; but could only trace the acquisition of the property of the Cardinal Rospigliosi, his companion in misfortune.

“I was then almost assured that the inheritance had neither profited the Borgias nor the family, but had remained unpossessed like the treasures of the Arabian Nights, which slept in the bosom of the earth under the eyes of the genie. I searched, ransacked, counted, calculated a thousand and a thousand times the income and expenditure of the family for three hundred years. It was useless. I remained in my ignorance, and the Count of Spada in his poverty.

“My patron died. He had reserved from his annuity his family papers, his library, composed of five thousand volumes, and his famous breviary. All these he bequeathed to me, with a thousand Roman crowns, which he had in ready money, on condition that I would have anniversary masses said for the repose of his soul, and that I would draw up a genealogical tree and history of his house. All this I did scrupulously. Be easy, my dear Edmond, we are near the conclusion.

“In 1807, a month before I was arrested, and a fortnight after the death of the Count of Spada, on the 25th of December (you will see presently how the date became fixed in my memory), I was reading, for the thousandth time, the papers I was arranging, for the palace was sold to a stranger, and I was going to leave Rome and settle at Florence, intending to take with me twelve thousand francs I possessed, my library, and the famous breviary, when, tired with my constant labor at the same thing, and overcome by a heavy dinner I had eaten, my head dropped on my hands, and I fell asleep about three o’clock in the afternoon.

0243m

“I awoke as the clock was striking six. I raised my head; I was in utter darkness. I rang for a light, but, as no one came, I determined to find one for myself. It was indeed but anticipating the simple manners which I should soon be under the necessity of adopting. I took a wax-candle in one hand, and with the other groped about for a piece of paper (my match-box being empty), with which I

proposed to get a light from the small flame still playing on the embers. Fearing, however, to make use of any valuable piece of paper, I hesitated for a moment, then recollected that I had seen in the famous breviary, which was on the table beside me, an old paper quite yellow with age, and which had served as a marker for centuries, kept there by the request of the heirs. I felt for it, found it, twisted it up together, and putting it into the expiring flame, set light to it.

“But beneath my fingers, as if by magic, in proportion as the fire ascended, I saw yellowish characters appear on the paper. I grasped it in my hand, put out the flame as quickly as I could, lighted my taper in the fire itself, and opened the crumpled paper with inexpressible emotion, recognizing, when I had done so, that these characters had been traced in mysterious and sympathetic ink, only appearing when exposed to the fire; nearly one-third of the paper had been consumed by the flame. It was that paper you read this morning; read it again, Dantès, and then I will complete for you the incomplete words and unconnected sense.”

Faria, with an air of triumph, offered the paper to Dantès, who this time read the following words, traced with an ink of a reddish color resembling rust:

“This 25th day of April, 1498, be...

Alexander VI., and fearing that not...

he may desire to become my heir, and re...

and Bentivoglio, who were poisoned,...

my sole heir, that I have bu...

and has visited with me, that is, in...

Island of Monte Cristo, all I poss...

jewels, diamonds, gems; that I alone...

may amount to nearly two mil...

will find on raising the twentieth ro...

creek to the east in a right line. Two open...

in these caves; the treasure is in the furthest a...

which treasure I bequeath and leave en...

as my sole heir.

“25th April, 1498.

“Cæs...

“And now,” said the abbé, “read this other paper;” and he presented to Dantès a second leaf with fragments of lines written on it, which Edmond read as follows:

“...ing invited to dine by his Holiness

...content with making me pay for my hat,

...serves for me the fate of Cardinals Caprara

...I declare to my nephew, Guido Spada

...ried in a place he knows

...the caves of the small

...essed of ingots, gold, money,

...know of the existence of this treasure, which

...lions of Roman crowns, and which he

...ck from the small

...ings have been made

...ngle in the second;

...tire to him

...ar † Spada."

Faria followed him with an excited look.

"And now," he said, when he saw that Dantès had read the last line, "put the two fragments together, and judge for yourself." Dantès obeyed, and the conjointed pieces gave the following:

0245m

"This 25th day of April, 1498, be...ing invited to dine by his Holiness Alexander VI., and fearing that not...content with making me pay for my hat, he may desire to become my heir, and re...serves for me the fate of Cardinals Caprara and Bentivoglio, who were poisoned,...I declare to my nephew, Guido Spada, my sole heir, that I have bu...ried in a place he knows and has visited with me, that is, in...the caves of the small Island of Monte Cristo, all I poss...essed of ingots, gold, money, jewels, diamonds, gems; that I alone...know of the existence of this treasure, which may amount to nearly two mil...lions of Roman crowns, and which he will find on raising the twentieth ro...ck from the small creek to the east in a right line. Two open...ings have been made in these caves; the treasure is in the furthest a...ngle in the second; which treasure I bequeath and leave en...tire to him as my sole heir. "25th April, 1498. "Cæs...ar † Spada."

"Well, do you comprehend now?" inquired Faria.

"It is the declaration of Cardinal Spada, and the will so long sought for," replied Edmond, still incredulous.

"Yes; a thousand times, yes!"

"And who completed it as it now is?"

"I did. Aided by the remaining fragment, I guessed the rest; measuring the length of the lines by those of the paper, and divining the hidden meaning by means of what was in part revealed, as we are guided in a cavern by the small ray of light above us."

"And what did you do when you arrived at this conclusion?"

"I resolved to set out, and did set out at that very instant, carrying with me the beginning of my great work, the unity of the Italian kingdom; but for some time the imperial police (who at this period, quite contrary to what Napoleon desired so soon as he had a son born to him, wished for a partition of provinces) had their eyes on me; and my hasty departure, the cause of which they were unable to guess, having aroused their suspicions, I was arrested at the very moment I was leaving Piombino.

"Now," continued Faria, addressing Dantès with an almost paternal expression, "now, my dear fellow, you know as much as I do myself. If we ever escape together, half this treasure is yours; if I die here, and you escape alone, the whole belongs to you."

"But," inquired Dantès hesitating, "has this treasure no more legitimate possessor in the world than ourselves?"

"No, no, be easy on that score; the family is extinct. The last Count of Spada, moreover, made me his heir, bequeathing to me this symbolic breviary, he bequeathed to me all it contained; no, no, make your mind satisfied on that point. If we lay hands on this fortune, we may enjoy it without remorse."

"And you say this treasure amounts to——"

"Two millions of Roman crowns; nearly thirteen millions of our money."2

“Impossible!” said Dantès, staggered at the enormous amount.

“Impossible? and why?” asked the old man. “The Spada family was one of the oldest and most powerful families of the fifteenth century; and in those times, when other opportunities for investment were wanting, such accumulations of gold and jewels were by no means rare; there are at this day Roman families perishing of hunger, though possessed of nearly a million in diamonds and jewels, handed down by entail, and which they cannot touch.”

Edmond thought he was in a dream—he wavered between incredulity and joy.

“I have only kept this secret so long from you,” continued Faria, “that I might test your character, and then surprise you. Had we escaped before my attack of catalepsy, I should have conducted you to Monte Cristo; now,” he added, with a sigh, “it is you who will conduct me thither. Well, Dantès, you do not thank me?”

“This treasure belongs to you, my dear friend,” replied Dantès, “and to you only. I have no right to it. I am no relation of yours.”

“You are my son, Dantès,” exclaimed the old man. “You are the child of my captivity. My profession condemns me to celibacy. God has sent you to me to console, at one and the same time, the man who could not be a father, and the prisoner who could not get free.”

And Faria extended the arm of which alone the use remained to him to the young man, who threw himself upon his neck and wept.

Chapter 19. The Third Attack

Now that this treasure, which had so long been the object of the abbé’s meditations, could insure the future happiness of him whom Faria really loved as a son, it had doubled its value in his eyes, and every day he expatiated on the amount, explaining to Dantès all the good which, with thirteen or fourteen millions of francs, a man could do in these days to his friends; and then Dantès’ countenance became gloomy, for the oath of vengeance he had taken recurred to his memory, and he reflected how much ill, in these times, a man with thirteen or fourteen millions could do to his enemies.

The abbé did not know the Island of Monte Cristo; but Dantès knew it, and had often passed it, situated twenty-five miles from Pianosa, between Corsica and the Island of Elba, and had once touched there. This island was, always had been, and still is, completely deserted. It is a rock of almost conical form, which looks as though it had been thrust up by volcanic force from the depth to the surface of the ocean. Dantès drew a plan of the island for Faria, and Faria gave Dantès advice as to the means he should employ to recover the treasure. But Dantès was far from being as enthusiastic and confident as the old man. It was past a question now that Faria was not a lunatic, and the way in which he had achieved the discovery, which had given rise to the suspicion of his madness, increased Edmond’s admiration of him; but at the same time Dantès could not believe that the deposit, supposing it had ever existed, still existed; and though he considered the treasure as by no means chimerical, he yet believed it was no longer there.

However, as if fate resolved on depriving the prisoners of their last chance, and making them understand that they were condemned to perpetual imprisonment, a new misfortune befell them; the gallery on the sea side, which had long been in ruins, was rebuilt. They had repaired it completely, and stopped up with vast masses of stone the hole Dantès had partly filled in. But for this precaution, which, it will be remembered, the abbé had made to Edmond, the misfortune would have been still greater, for their attempt to escape would have been detected, and they would undoubtedly have been separated. Thus a new, a stronger, and more inexorable barrier was interposed to cut off the realization of their hopes.

“You see,” said the young man, with an air of sorrowful resignation, to Faria, “that God deems it right to take from me any claim to merit for what you call my devotion to you. I have promised to remain forever with you, and now I could not break my promise if I would. The treasure will be no more mine than yours, and neither of us will quit this prison. But my real treasure is not that, my dear friend, which awaits me beneath the sombre rocks of Monte Cristo, it is your presence, our living together five or six hours a day, in spite of our jailers; it is the rays of intelligence you have elicited from my brain, the languages you have implanted in my memory, and which have taken root there with all their philological ramifications. These different sciences that you have made so easy to me by the depth of the knowledge you possess of them, and the clearness of the principles to which you have reduced them—this is my treasure, my beloved friend, and with this you have made me rich and happy. Believe me, and take comfort, this is better for me than tons of gold and cases of diamonds, even were they not as problematical as the clouds we see in the morning floating over the sea, which we take for _terra firma_, and which evaporate and vanish as we draw near to them. To have you as long as possible

near me, to hear your eloquent speech,—which embellishes my mind, strengthens my soul, and makes my whole frame capable of great and terrible things, if I should ever be free,—so fills my whole existence, that the despair to which I was just on the point of yielding when I knew you, has no longer any hold over me; and this—this is my fortune—not chimerical, but actual. I owe you my real good, my present happiness; and all the sovereigns of the earth, even Cæsar Borgia himself, could not deprive me of this."

Thus, if not actually happy, yet the days these two unfortunates passed together went quickly. Faria, who for so long a time had kept silence as to the treasure, now perpetually talked of it. As he had prophesied would be the case, he remained paralyzed in the right arm and the left leg, and had given up all hope of ever enjoying it himself. But he was continually thinking over some means of escape for his young companion, and anticipating the pleasure he would enjoy. For fear the letter might be some day lost or stolen, he compelled Dantès to learn it by heart; and Dantès knew it from the first to the last word. Then he destroyed the second portion, assured that if the first were seized, no one would be able to discover its real meaning. Whole hours sometimes passed while Faria was giving instructions to Dantès,—instructions which were to serve him when he was at liberty. Then, once free, from the day and hour and moment when he was so, he could have but one only thought, which was, to gain Monte Cristo by some means, and remain there alone under some pretext which would arouse no suspicions; and once there, to endeavor to find the wonderful caverns, and search in the appointed spot,—the appointed spot, be it remembered, being the farthest angle in the second opening.

In the meanwhile the hours passed, if not rapidly, at least tolerably. Faria, as we have said, without having recovered the use of his hand and foot, had regained all the clearness of his understanding, and had gradually, besides the moral instructions we have detailed, taught his youthful companion the patient and sublime duty of a prisoner, who learns to make something from nothing. They were thus perpetually employed,—Faria, that he might not see himself grow old; Dantès, for fear of recalling the almost extinct past which now only floated in his memory like a distant light wandering in the night. So life went on for them as it does for those who are not victims of misfortune and whose activities glide along mechanically and tranquilly beneath the eye of Providence.

But beneath this superficial calm there were in the heart of the young man, and perhaps in that of the old man, many repressed desires, many stifled sighs, which found vent when Faria was left alone, and when Edmond returned to his cell.

One night Edmond awoke suddenly, believing that he heard someone calling him. He opened his eyes upon utter darkness. His name, or rather a plaintive voice which essayed to pronounce his name, reached him. He sat up in bed and a cold sweat broke out upon his brow. Undoubtedly the call came from Faria's dungeon.

"Alas," murmured Edmond; "can it be?"

He moved his bed, drew up the stone, rushed into the passage, and reached the opposite extremity; the secret entrance was open. By the light of the wretched and wavering lamp, of which we have spoken, Dantès saw the old man, pale, but yet erect, clinging to the bedstead. His features were writhing with those horrible symptoms which he already knew, and which had so seriously alarmed him when he saw them for the first time.

"Alas, my dear friend," said Faria in a resigned tone, "you understand, do you not, and I need not attempt to explain to you?"

Edmond uttered a cry of agony, and, quite out of his senses, rushed towards the door, exclaiming, "Help, help!"

Faria had just sufficient strength to restrain him.

"Silence," he said, "or you are lost. We must now only think of you, my dear friend, and so act as to render your captivity supportable or your flight possible. It would require years to do again what I have done here, and the results would be instantly destroyed if our jailers knew we had communicated with each other. Besides, be assured, my dear Edmond, the dungeon I am about to leave will not long remain empty; some other unfortunate being will soon take my place, and to him you will appear like an angel of salvation. Perhaps he will be young, strong, and enduring, like yourself, and will aid you in your escape, while I have been but a hindrance. You will no longer have half a dead body tied to you as a drag to all your movements. At length Providence has done something for you; he restores to you more than he takes away, and it was time I should die."

Edmond could only clasp his hands and exclaim, "Oh, my friend, my friend, speak not thus!" and then resuming all his presence of mind, which had for a moment staggered under this blow, and his strength, which had failed at the words of the old man, he said, "Oh, I have saved you once, and I will save you a second time!" And raising the foot of the bed, he drew out the phial, still a third filled with the red liquor.

“See,” he exclaimed, “there remains still some of the magic draught. Quick, quick! tell me what I must do this time; are there any fresh instructions? Speak, my friend; I listen.”

“There is not a hope,” replied Faria, shaking his head, “but no matter; God wills it that man whom he has created, and in whose heart he has so profoundly rooted the love of life, should do all in his power to preserve that existence, which, however painful it may be, is yet always so dear.”

“Oh, yes, yes!” exclaimed Dantès; “and I tell you that I will save you yet.”

“Well, then, try. The cold gains upon me. I feel the blood flowing towards my brain. These horrible chills, which make my teeth chatter and seem to dislocate my bones, begin to pervade my whole frame; in five minutes the malady will reach its height, and in a quarter of an hour there will be nothing left of me but a corpse.”

“Oh!” exclaimed Dantès, his heart wrung with anguish.

“Do as you did before, only do not wait so long, all the springs of life are now exhausted in me, and death,” he continued, looking at his paralyzed arm and leg, “has but half its work to do. If, after having made me swallow twelve drops instead of ten, you see that I do not recover, then pour the rest down my throat. Now lift me on my bed, for I can no longer support myself.”

Edmond took the old man in his arms, and laid him on the bed.

“And now, my dear friend,” said Faria, “sole consolation of my wretched existence,—you whom Heaven gave me somewhat late, but still gave me, a priceless gift, and for which I am most grateful,—at the moment of separating from you forever, I wish you all the happiness and all the prosperity you so well deserve. My son, I bless thee!”

The young man cast himself on his knees, leaning his head against the old man’s bed.

“Listen, now, to what I say in this my dying moment. The treasure of the Spadas exists. God grants me the boon of vision unrestricted by time or space. I see it in the depths of the inner cavern. My eyes pierce the inmost recesses of the earth, and are dazzled at the sight of so much riches. If you do escape, remember that the poor abbé, whom all the world called mad, was not so. Hasten to Monte Cristo—avail yourself of the fortune—for you have indeed suffered long enough.”

A violent convulsion attacked the old man. Dantès raised his head and saw Faria’s eyes injected with blood. It seemed as if a flow of blood had ascended from the chest to the head.

“Adieu, adieu!” murmured the old man, clasping Edmond’s hand convulsively—“adieu!”

“Oh, no,—no, not yet,” he cried; “do not forsake me! Oh, succor him! Help—help—help!”

“Hush! hush!” murmured the dying man, “that they may not separate us if you save me!”

“You are right. Oh, yes, yes; be assured I shall save you! Besides, although you suffer much, you do not seem to be in such agony as you were before.”

“Do not mistake! I suffer less because there is in me less strength to endure. At your age we have faith in life; it is the privilege of youth to believe and hope, but old men see death more clearly. Oh, ’tis here—’tis here—’tis over—my sight is gone—my senses fail! Your hand, Dantès! Adieu! adieu!”

And raising himself by a final effort, in which he summoned all his faculties, he said,—“Monte Cristo, forget not Monte Cristo!” And he fell back on the bed.

The crisis was terrible, and a rigid form with twisted limbs, swollen eyelids, and lips flecked with bloody foam, lay on the bed of torture, in place of the intellectual being who so lately rested there.

Dantès took the lamp, placed it on a projecting stone above the bed, whence its tremulous light fell with strange and fantastic ray on the distorted countenance and motionless, stiffened body. With steady gaze he awaited confidently the moment for administering the restorative.

When he believed that the right moment had arrived, he took the knife, pried open the teeth, which offered less resistance than before, counted one after the other twelve drops, and watched; the phial contained, perhaps, twice as much more. He waited ten

minutes, a quarter of an hour, half an hour,—no change took place. Trembling, his hair erect, his brow bathed with perspiration, he counted the seconds by the beating of his heart. Then he thought it was time to make the last trial, and he put the phial to the purple lips of Faria, and without having occasion to force open his jaws, which had remained extended, he poured the whole of the liquid down his throat.

0255m

The draught produced a galvanic effect, a violent trembling pervaded the old man's limbs, his eyes opened until it was fearful to gaze upon them, he heaved a sigh which resembled a shriek, and then his convulsed body returned gradually to its former immobility, the eyes remaining open.

Half an hour, an hour, an hour and a half elapsed, and during this period of anguish, Edmond leaned over his friend, his hand applied to his heart, and felt the body gradually grow cold, and the heart's pulsation become more and more deep and dull, until at length it stopped; the last movement of the heart ceased, the face became livid, the eyes remained open, but the eyeballs were glazed.

It was six o'clock in the morning, the dawn was just breaking, and its feeble ray came into the dungeon, and paled the ineffectual light of the lamp. Strange shadows passed over the countenance of the dead man, and at times gave it the appearance of life. While the struggle between day and night lasted, Dantès still doubted; but as soon as the daylight gained the pre-eminence, he saw that he was alone with a corpse. Then an invincible and extreme terror seized upon him, and he dared not again press the hand that hung out of bed, he dared no longer to gaze on those fixed and vacant eyes, which he tried many times to close, but in vain—they opened again as soon as shut. He extinguished the lamp, carefully concealed it, and then went away, closing as well as he could the entrance to the secret passage by the large stone as he descended.

It was time, for the jailer was coming. On this occasion he began his rounds at Dantès' cell, and on leaving him he went on to Faria's dungeon, taking thither breakfast and some linen. Nothing betokened that the man knew anything of what had occurred. He went on his way.

Dantès was then seized with an indescribable desire to know what was going on in the dungeon of his unfortunate friend. He therefore returned by the subterraneous gallery, and arrived in time to hear the exclamations of the turnkey, who called out for help. Other turnkeys came, and then was heard the regular tramp of soldiers. Last of all came the governor.

Edmond heard the creaking of the bed as they moved the corpse, heard the voice of the governor, who asked them to throw water on the dead man's face; and seeing that, in spite of this application, the prisoner did not recover, they sent for the doctor. The governor then went out, and words of pity fell on Dantès' listening ears, mingled with brutal laughter.

"Well, well," said one, "the madman has gone to look after his treasure. Good journey to him!"

"With all his millions, he will not have enough to pay for his shroud!" said another.

"Oh," added a third voice, "the shrouds of the Château d'If are not dear!"

0257m

"Perhaps," said one of the previous speakers, "as he was a churchman, they may go to some expense in his behalf."

"They may give him the honors of the sack."

Edmond did not lose a word, but comprehended very little of what was said. The voices soon ceased, and it seemed to him as if everyone had left the cell. Still he dared not to enter, as they might have left some turnkey to watch the dead. He remained, therefore, mute and motionless, hardly venturing to breathe. At the end of an hour, he heard a faint noise, which increased. It was the governor who returned, followed by the doctor and other attendants. There was a moment's silence,—it was evident that the doctor was examining the dead body. The inquiries soon commenced.

The doctor analyzed the symptoms of the malady to which the prisoner had succumbed, and declared that he was dead. Questions and answers followed in a nonchalant manner that made Dantès indignant, for he felt that all the world should have for the poor abbé a love and respect equal to his own.

“I am very sorry for what you tell me,” said the governor, replying to the assurance of the doctor, “that the old man is really dead; for he was a quiet, inoffensive prisoner, happy in his folly, and required no watching.”

“Ah,” added the turnkey, “there was no occasion for watching him; he would have stayed here fifty years, I’ll answer for it, without any attempt to escape.”

“Still,” said the governor, “I believe it will be requisite, notwithstanding your certainty, and not that I doubt your science, but in discharge of my official duty, that we should be perfectly assured that the prisoner is dead.”

There was a moment of complete silence, during which Dantès, still listening, knew that the doctor was examining the corpse a second time.

“You may make your mind easy,” said the doctor; “he is dead. I will answer for that.”

“You know, sir,” said the governor, persisting, “that we are not content in such cases as this with such a simple examination. In spite of all appearances, be so kind, therefore, as to finish your duty by fulfilling the formalities described by law.”

“Let the irons be heated,” said the doctor; “but really it is a useless precaution.”

This order to heat the irons made Dantès shudder. He heard hasty steps, the creaking of a door, people going and coming, and some minutes afterwards a turnkey entered, saying:

“Here is the brazier, lighted.”

There was a moment’s silence, and then was heard the crackling of burning flesh, of which the peculiar and nauseous smell penetrated even behind the wall where Dantès was listening in horror. The perspiration poured forth upon the young man’s brow, and he felt as if he should faint.

“You see, sir, he is really dead,” said the doctor; “this burn in the heel is decisive. The poor fool is cured of his folly, and delivered from his captivity.”

“Wasn’t his name Faria?” inquired one of the officers who accompanied the governor.

0259m

“Yes, sir; and, as he said, it was an ancient name. He was, too, very learned, and rational enough on all points which did not relate to his treasure; but on that, indeed, he was intractable.”

“It is the sort of malady which we call monomania,” said the doctor.

“You had never anything to complain of?” said the governor to the jailer who had charge of the abbé.

“Never, sir,” replied the jailer, “never; on the contrary, he sometimes amused me very much by telling me stories. One day, too, when my wife was ill, he gave me a prescription which cured her.”

“Ah, ah!” said the doctor, “I did not know that I had a rival; but I hope, governor, that you will show him all proper respect in consequence.”

“Yes, yes, make your mind easy, he shall be decently interred in the newest sack we can find. Will that satisfy you?”

“Must this last formality take place in your presence, sir?” inquired a turnkey.

“Certainly. But make haste—I cannot stay here all day.” Other footsteps, going and coming, were now heard, and a moment afterwards the noise of rustling canvas reached Dantès’ ears, the bed creaked, and the heavy footfall of a man who lifts a weight sounded on the floor; then the bed again creaked under the weight deposited upon it.

“This evening,” said the governor.

“Will there be any mass?” asked one of the attendants.

“That is impossible,” replied the governor. “The chaplain of the château came to me yesterday to beg for leave of absence, in order to take a trip to Hyères for a week. I told him I would attend to the prisoners in his absence. If the poor abbé had not been in such a hurry, he might have had his requiem.”

“Pooh, pooh;” said the doctor, with the impiety usual in persons of his profession; “he is a churchman. God will respect his profession, and not give the devil the wicked delight of sending him a priest.” A shout of laughter followed this brutal jest. Meanwhile the operation of putting the body in the sack was going on.

“This evening,” said the governor, when the task was ended.

“At what hour?” inquired a turnkey.

“Why, about ten or eleven o’clock.”

“Shall we watch by the corpse?”

“Of what use would it be? Shut the dungeon as if he were alive—that is all.”

Then the steps retreated, and the voices died away in the distance; the noise of the door, with its creaking hinges and bolts ceased, and a silence more sombre than that of solitude ensued,—the silence of death, which was all-pervasive, and struck its icy chill to the very soul of Dantès.

Then he raised the flag-stone cautiously with his head, and looked carefully around the chamber. It was empty, and Dantès emerged from the tunnel.

Chapter 20. The Cemetery of the Château d’If

On the bed, at full length, and faintly illuminated by the pale light that came from the window, lay a sack of canvas, and under its rude folds was stretched a long and stiffened form; it was Faria’s last winding-sheet,—a winding-sheet which, as the turnkey said, cost so little. Everything was in readiness. A barrier had been placed between Dantès and his old friend. No longer could Edmond look into those wide-open eyes which had seemed to be penetrating the mysteries of death; no longer could he clasp the hand which had done so much to make his existence blessed. Faria, the beneficent and cheerful companion, with whom he was accustomed to live so intimately, no longer breathed. He seated himself on the edge of that terrible bed, and fell into melancholy and gloomy reverie.

Alone! he was alone again! again condemned to silence—again face to face with nothingness! Alone!—never again to see the face, never again to hear the voice of the only human being who united him to earth! Was not Faria’s fate the better, after all—to solve the problem of life at its source, even at the risk of horrible suffering?

The idea of suicide, which his friend had driven away and kept away by his cheerful presence, now hovered like a phantom over the abbé’s dead body.

“If I could die,” he said, “I should go where he goes, and should assuredly find him again. But how to die? It is very easy,” he went on with a smile; “I will remain here, rush on the first person that opens the door, strangle him, and then they will guillotine me.”

But excessive grief is like a storm at sea, where the frail bark is tossed from the depths to the top of the wave. Dantès recoiled from the idea of so infamous a death, and passed suddenly from despair to an ardent desire for life and liberty.

“Die? oh, no,” he exclaimed—“not die now, after having lived and suffered so long and so much! Die? yes, had I died years ago; but now to die would be, indeed, to give way to the sarcasm of destiny. No, I want to live; I shall struggle to the very last; I will yet win back the happiness of which I have been deprived. Before I die I must not forget that I have my executioners to punish, and perhaps, too, who knows, some friends to reward. Yet they will forget me here, and I shall die in my dungeon like Faria.”

As he said this, he became silent and gazed straight before him like one overwhelmed with a strange and amazing thought. Suddenly he arose, lifted his hand to his brow as if his brain were giddy, paced twice or thrice round the dungeon, and then paused abruptly by the bed.

“Just God!” he muttered, “whence comes this thought? Is it from thee? Since none but the dead pass freely from this dungeon, let me take the place of the dead!”

Without giving himself time to reconsider his decision, and, indeed, that he might not allow his thoughts to be distracted from his desperate resolution, he bent over the appalling shroud, opened it with the knife which Faria had made, drew the corpse from the sack, and bore it along the tunnel to his own chamber, laid it on his couch, tied around its head the rag he wore at night around his own, covered it with his counterpane, once again kissed the ice-cold brow, and tried vainly to close the resisting eyes, which glared horribly, turned the head towards the wall, so that the jailer might, when he brought the evening meal, believe that he was asleep, as was his frequent custom; entered the tunnel again, drew the bed against the wall, returned to the other cell, took from the hiding-place the needle and thread, flung off his rags, that they might feel only naked flesh beneath the coarse canvas, and getting inside the sack, placed himself in the posture in which the dead body had been laid, and sewed up the mouth of the sack from the inside.

He would have been discovered by the beating of his heart, if by any mischance the jailers had entered at that moment. Dantès might have waited until the evening visit was over, but he was afraid that the governor would change his mind, and order the dead body to be removed earlier. In that case his last hope would have been destroyed.

Now his plans were fully made, and this is what he intended to do. If while he was being carried out the grave-diggers should discover that they were bearing a live instead of a dead body, Dantès did not intend to give them time to recognize him, but with a sudden cut of the knife, he meant to open the sack from top to bottom, and, profiting by their alarm, escape; if they tried to catch him, he would use his knife to better purpose.

0263m

If they took him to the cemetery and laid him in a grave, he would allow himself to be covered with earth, and then, as it was night, the grave-diggers could scarcely have turned their backs before he would have worked his way through the yielding soil and escaped. He hoped that the weight of earth would not be so great that he could not overcome it. If he was detected in this and the earth proved too heavy, he would be stifled, and then—so much the better, all would be over.

Dantès had not eaten since the preceding evening, but he had not thought of hunger, nor did he think of it now. His situation was too precarious to allow him even time to reflect on any thought but one.

The first risk that Dantès ran was, that the jailer, when he brought him his supper at seven o’clock, might perceive the change that had been made; fortunately, twenty times at least, from misanthropy or fatigue, Dantès had received his jailer in bed, and then the man placed his bread and soup on the table, and went away without saying a word. This time the jailer might not be as silent as usual, but speak to Dantès, and seeing that he received no reply, go to the bed, and thus discover all.

When seven o’clock came, Dantès’ agony really began. His hand placed upon his heart was unable to redress its throbbings, while, with the other he wiped the perspiration from his temples. From time to time chills ran through his whole body, and clutched his heart in a grasp of ice. Then he thought he was going to die. Yet the hours passed on without any unusual disturbance, and Dantès knew that he had escaped the first peril. It was a good augury.

At length, about the hour the governor had appointed, footsteps were heard on the stairs. Edmond felt that the moment had arrived, summoned up all his courage, held his breath, and would have been happy if at the same time he could have repressed the throbbing of his veins. The footsteps—they were double—paused at the door—and Dantès guessed that the two grave-diggers had come to seek him—this idea was soon converted into certainty, when he heard the noise they made in putting down the hand-bier.

The door opened, and a dim light reached Dantès’ eyes through the coarse sack that covered him; he saw two shadows approach his bed, a third remaining at the door with a torch in its hand. The two men, approaching the ends of the bed, took the sack by its extremities.

“He’s heavy, though, for an old and thin man,” said one, as he raised the head.

“They say every year adds half a pound to the weight of the bones,” said another, lifting the feet.

“Have you tied the knot?” inquired the first speaker.

“What would be the use of carrying so much more weight?” was the reply, “I can do that when we get there.”

“Yes, you’re right,” replied the companion.

“What’s the knot for?” thought Dantès.

They deposited the supposed corpse on the bier. Edmond stiffened himself in order to play the part of a dead man, and then the party, lighted by the man with the torch, who went first, ascended the stairs. Suddenly he felt the fresh and sharp night air, and Dantès knew that the mistral was blowing. It was a sensation in which pleasure and pain were strangely mingled.

The bearers went on for twenty paces, then stopped, putting the bier down on the ground. One of them went away, and Dantès heard his shoes striking on the pavement.

“Where am I?” he asked himself.

“Really, he is by no means a light load!” said the other bearer, sitting on the edge of the hand-barrow.

Dantès’ first impulse was to escape, but fortunately he did not attempt it.

“Give us a light,” said the other bearer, “or I shall never find what I am looking for.”

The man with the torch complied, although not asked in the most polite terms.

“What can he be looking for?” thought Edmond. “The spade, perhaps.”

An exclamation of satisfaction indicated that the grave-digger had found the object of his search. “Here it is at last,” he said, “not without some trouble, though.”

“Yes,” was the answer, “but it has lost nothing by waiting.”

As he said this, the man came towards Edmond, who heard a heavy metallic substance laid down beside him, and at the same moment a cord was fastened round his feet with sudden and painful violence.

“Well, have you tied the knot?” inquired the grave-digger, who was looking on.

“Yes, and pretty tight too, I can tell you,” was the answer.

“Move on, then.” And the bier was lifted once more, and they proceeded.

They advanced fifty paces farther, and then stopped to open a door, then went forward again. The noise of the waves dashing against the rocks on which the château is built, reached Dantès’ ear distinctly as they went forward.

“Bad weather!” observed one of the bearers; “not a pleasant night for a dip in the sea.”

“Why, yes, the abbé runs a chance of being wet,” said the other; and then there was a burst of brutal laughter.

Dantès did not comprehend the jest, but his hair stood erect on his head.

“Well, here we are at last,” said one of them.

“A little farther—a little farther,” said the other. “You know very well that the last was stopped on his way, dashed on the rocks, and the governor told us next day that we were careless fellows.”

They ascended five or six more steps, and then Dantès felt that they took him, one by the head and the other by the heels, and swung him to and fro.

“One!” said the grave-diggers, “two! three!”

And at the same instant Dantès felt himself flung into the air like a wounded bird, falling, falling, with a rapidity that made his blood curdle. Although drawn downwards by the heavy weight which hastened his rapid descent, it seemed to him as if the fall lasted for a century. At last, with a horrible splash, he darted like an arrow into the ice-cold water, and as he did so he uttered a shrill cry, stifled in a moment by his immersion beneath the waves.

Dantès had been flung into the sea, and was dragged into its depths by a thirty-six-pound shot tied to his feet.

The sea is the cemetery of the Château d’If.

0267m

Chapter 21. The Island of Tiboulen

Dantès, although stunned and almost suffocated, had sufficient presence of mind to hold his breath, and as his right hand (prepared as he was for every chance) held his knife open, he rapidly ripped up the sack, extricated his arm, and then his body; but in spite of all his efforts to free himself from the shot, he felt it dragging him down still lower. He then bent his body, and by a desperate effort severed the cord that bound his legs, at the moment when it seemed as if he were actually strangled. With a mighty leap he rose to the surface of the sea, while the shot dragged down to the depths the sack that had so nearly become his shroud.

Dantès waited only to get breath, and then dived, in order to avoid being seen. When he arose a second time, he was fifty paces from where he had first sunk. He saw overhead a black and tempestuous sky, across which the wind was driving clouds that occasionally suffered a twinkling star to appear; before him was the vast expanse of waters, sombre and terrible, whose waves foamed and roared as if before the approach of a storm. Behind him, blacker than the sea, blacker than the sky, rose phantom-like the vast stone structure, whose projecting crags seemed like arms extended to seize their prey, and on the highest rock was a torch lighting two figures.

He fancied that these two forms were looking at the sea; doubtless these strange grave-diggers had heard his cry. Dantès dived again, and remained a long time beneath the water. This was an easy feat to him, for he usually attracted a crowd of spectators in the bay before the lighthouse at Marseilles when he swam there, and was unanimously declared to be the best swimmer in the port. When he came up again the light had disappeared.

He must now get his bearings. Ratonneau and Pomègue are the nearest islands of all those that surround the Château d'If, but Ratonneau and Pomègue are inhabited, as is also the islet of Daume. Tiboulen and Lemaire were therefore the safest for Dantès' venture. The islands of Tiboulen and Lemaire are a league from the Château d'If; Dantès, nevertheless, determined to make for them. But how could he find his way in the darkness of the night?

At this moment he saw the light of Planier, gleaming in front of him like a star. By leaving this light on the right, he kept the Island of Tiboulen a little on the left; by turning to the left, therefore, he would find it. But, as we have said, it was at least a league from the Château d'If to this island. Often in prison Faria had said to him, when he saw him idle and inactive:

"Dantès, you must not give way to this listlessness; you will be drowned if you seek to escape, and your strength has not been properly exercised and prepared for exertion."

These words rang in Dantès' ears, even beneath the waves; he hastened to cleave his way through them to see if he had not lost his strength. He found with pleasure that his captivity had taken away nothing of his power, and that he was still master of that element on whose bosom he had so often sported as a boy.

Fear, that relentless pursuer, clogged Dantès' efforts. He listened for any sound that might be audible, and every time that he rose to the top of a wave he scanned the horizon, and strove to penetrate the darkness. He fancied that every wave behind him was a pursuing boat, and he redoubled his exertions, increasing rapidly his distance from the château, but exhausting his strength. He swam on still, and already the terrible château had disappeared in the darkness. He could not see it, but he _felt_ its presence.

An hour passed, during which Dantès, excited by the feeling of freedom, continued to cleave the waves.

"Let us see," said he, "I have swum above an hour, but as the wind is against me, that has retarded my speed; however, if I am not mistaken, I must be close to Tiboulen. But what if I were mistaken?"

A shudder passed over him. He sought to tread water, in order to rest himself; but the sea was too violent, and he felt that he could not make use of this means of recuperation.

"Well," said he, "I will swim on until I am worn out, or the cramp seizes me, and then I shall sink;" and he struck out with the energy of despair.

Suddenly the sky seemed to him to become still darker and more dense, and heavy clouds seemed to sweep down towards him; at the same time he felt a sharp pain in his knee. He fancied for a moment that he had been shot, and listened for the report; but he

heard nothing. Then he put out his hand, and encountered an obstacle and with another stroke knew that he had gained the shore.

Before him rose a grotesque mass of rocks, that resembled nothing so much as a vast fire petrified at the moment of its most fervent combustion. It was the Island of Tiboulen. Dantès rose, advanced a few steps, and, with a fervent prayer of gratitude, stretched himself on the granite, which seemed to him softer than down. Then, in spite of the wind and rain, he fell into the deep, sweet sleep of utter exhaustion. At the expiration of an hour Edmond was awakened by the roar of thunder. The tempest was let loose and beating the atmosphere with its mighty wings; from time to time a flash of lightning stretched across the heavens like a fiery serpent, lighting up the clouds that rolled on in vast chaotic waves.

Dantès had not been deceived—he had reached the first of the two islands, which was, in fact, Tiboulen. He knew that it was barren and without shelter; but when the sea became more calm, he resolved to plunge into its waves again, and swim to Lemaire, equally arid, but larger, and consequently better adapted for concealment.

An overhanging rock offered him a temporary shelter, and scarcely had he availed himself of it when the tempest burst forth in all its fury. Edmond felt the trembling of the rock beneath which he lay; the waves, dashing themselves against it, wetted him with their spray. He was safely sheltered, and yet he felt dizzy in the midst of the warring of the elements and the dazzling brightness of the lightning. It seemed to him that the island trembled to its base, and that it would, like a vessel at anchor, break moorings, and bear him off into the centre of the storm.

He then recollected that he had not eaten or drunk for four-and-twenty hours. He extended his hands, and drank greedily of the rainwater that had lodged in a hollow of the rock.

As he rose, a flash of lightning, that seemed to rive the remotest heights of heaven, illumined the darkness. By its light, between the Island of Lemaire and Cape Croiselle, a quarter of a league distant, Dantès saw a fishing-boat driven rapidly like a spectre before the power of winds and waves. A second after, he saw it again, approaching with frightful rapidity. Dantès cried at the top of his voice to warn them of their danger, but they saw it themselves. Another flash showed him four men clinging to the shattered mast and the rigging, while a fifth clung to the broken rudder. The men he beheld saw him undoubtedly, for their cries were carried to his ears by the wind. Above the splintered mast a sail rent to tatters was waving; suddenly the ropes that still held it gave way, and it disappeared in the darkness of the night like a vast sea-bird.

At the same moment a violent crash was heard, and cries of distress. Dantès from his rocky perch saw the shattered vessel, and among the fragments the floating forms of the hapless sailors. Then all was dark again.

Dantès ran down the rocks at the risk of being himself dashed to pieces; he listened, he groped about, but he heard and saw nothing—the cries had ceased, and the tempest continued to rage. By degrees the wind abated, vast gray clouds rolled towards the west, and the blue firmament appeared studded with bright stars. Soon a red streak became visible in the horizon, the waves whitened, a light played over them, and gilded their foaming crests with gold. It was day.

Dantès stood mute and motionless before this majestic spectacle, as if he now beheld it for the first time; and indeed since his captivity in the Château d'If he had forgotten that such scenes were ever to be witnessed. He turned towards the fortress, and looked at both sea and land. The gloomy building rose from the bosom of the ocean with imposing majesty and seemed to dominate the scene. It was about five o'clock. The sea continued to get calmer.

"In two or three hours," thought Dantès, "the turnkey will enter my chamber, find the body of my poor friend, recognize it, seek for me in vain, and give the alarm. Then the tunnel will be discovered; the men who cast me into the sea and who must have heard the cry I uttered, will be questioned. Then boats filled with armed soldiers will pursue the wretched fugitive. The cannon will warn everyone to refuse shelter to a man wandering about naked and famished. The police of Marseilles will be on the alert by land, whilst the governor pursues me by sea. I am cold, I am hungry. I have lost even the knife that saved me. Oh, my God, I have suffered enough surely! Have pity on me, and do for me what I am unable to do for myself."

As Dantès (his eyes turned in the direction of the Château d'If) uttered this prayer, he saw off the farther point of the Island of Pomègue a small vessel with lateen sail skimming the sea like a gull in search of prey; and with his sailor's eye he knew it to be a Genoese tartan. She was coming out of Marseilles harbor, and was standing out to sea rapidly, her sharp prow cleaving through the waves.

“Oh,” cried Edmond, “to think that in half an hour I could join her, did I not fear being questioned, detected, and conveyed back to Marseilles! What can I do? What story can I invent? under pretext of trading along the coast, these men, who are in reality smugglers, will prefer selling me to doing a good action. I must wait. But I cannot—I am starving. In a few hours my strength will be utterly exhausted; besides, perhaps I have not been missed at the fortress. I can pass as one of the sailors wrecked last night. My story will be accepted, for there is no one left to contradict me.”

As he spoke, Dantès looked toward the spot where the fishing-vessel had been wrecked, and started. The red cap of one of the sailors hung to a point of the rock and some timbers that had formed part of the vessel’s keel, floated at the foot of the crag. In an instant Dantès’ plan was formed. He swam to the cap, placed it on his head, seized one of the timbers, and struck out so as to cut across the course the vessel was taking.

“I am saved!” murmured he. And this conviction restored his strength.

He soon saw that the vessel, with the wind dead ahead, was tacking between the Château d’If and the tower of Planier. For an instant he feared lest, instead of keeping in shore, she should stand out to sea; but he soon saw that she would pass, like most vessels bound for Italy, between the islands of Jaros and Calaseraigne.

However, the vessel and the swimmer insensibly neared one another, and in one of its tacks the tartan bore down within a quarter of a mile of him. He rose on the waves, making signs of distress; but no one on board saw him, and the vessel stood on another tack. Dantès would have shouted, but he knew that the wind would drown his voice.

It was then he rejoiced at his precaution in taking the timber, for without it he would have been unable, perhaps, to reach the vessel—certainly to return to shore, should he be unsuccessful in attracting attention.

Dantès, though almost sure as to what course the vessel would take, had yet watched it anxiously until it tacked and stood towards him. Then he advanced; but before they could meet, the vessel again changed her course. By a violent effort he rose half out of the water, waving his cap, and uttering a loud shout peculiar to sailors. This time he was both seen and heard, and the tartan instantly steered towards him. At the same time, he saw they were about to lower the boat.

An instant after, the boat, rowed by two men, advanced rapidly towards him. Dantès let go of the timber, which he now thought to be useless, and swam vigorously to meet them. But he had reckoned too much upon his strength, and then he realized how serviceable the timber had been to him. His arms became stiff, his legs lost their flexibility, and he was almost breathless.

He shouted again. The two sailors redoubled their efforts, and one of them cried in Italian, “Courage!”

The word reached his ear as a wave which he no longer had the strength to surmount passed over his head. He rose again to the surface, struggled with the last desperate effort of a drowning man, uttered a third cry, and felt himself sinking, as if the fatal cannon shot were again tied to his feet. The water passed over his head, and the sky turned gray. A convulsive movement again brought him to the surface. He felt himself seized by the hair, then he saw and heard nothing. He had fainted.

When he opened his eyes Dantès found himself on the deck of the tartan. His first care was to see what course they were taking. They were rapidly leaving the Château d’If behind. Dantès was so exhausted that the exclamation of joy he uttered was mistaken for a sigh.

As we have said, he was lying on the deck. A sailor was rubbing his limbs with a woollen cloth; another, whom he recognized as the one who had cried out “Courage!” held a gourd full of rum to his mouth; while the third, an old sailor, at once the pilot and captain, looked on with that egotistical pity men feel for a misfortune that they have escaped yesterday, and which may overtake them tomorrow.

A few drops of the rum restored suspended animation, while the friction of his limbs restored their elasticity.

“Who are you?” said the pilot in bad French.

“I am,” replied Dantès, in bad Italian, “a Maltese sailor. We were coming from Syracuse laden with grain. The storm of last night overtook us at Cape Morgiou, and we were wrecked on these rocks.”

“Where do you come from?”

“From these rocks that I had the good luck to cling to while our captain and the rest of the crew were all lost. I saw your vessel, and fearful of being left to perish on the desolate island, I swam off on a piece of wreckage to try and intercept your course. You have saved my life, and I thank you,” continued Dantès. “I was lost when one of your sailors caught hold of my hair.”

“It was I,” said a sailor of a frank and manly appearance; “and it was time, for you were sinking.”

“Yes,” returned Dantès, holding out his hand, “I thank you again.”

“I almost hesitated, though,” replied the sailor; “you looked more like a brigand than an honest man, with your beard six inches, and your hair a foot long.”

Dantès recollected that his hair and beard had not been cut all the time he was at the Château d’If.

“Yes,” said he, “I made a vow, to our Lady of the Grotto not to cut my hair or beard for ten years if I were saved in a moment of danger; but today the vow expires.”

“Now what are we to do with you?” said the captain.

“Alas, anything you please. My captain is dead; I have barely escaped; but I am a good sailor. Leave me at the first port you make; I shall be sure to find employment.”

“Do you know the Mediterranean?”

“I have sailed over it since my childhood.”

“You know the best harbors?”

“There are few ports that I could not enter or leave with a bandage over my eyes.”

“I say, captain,” said the sailor who had cried “Courage!” to Dantès, “if what he says is true, what hinders his staying with us?”

“If he says true,” said the captain doubtingly. “But in his present condition he will promise anything, and take his chance of keeping it afterwards.”

“I will do more than I promise,” said Dantès.

“We shall see,” returned the other, smiling.

“Where are you going?” asked Dantès.

“To Leghorn.”

“Then why, instead of tacking so frequently, do you not sail nearer the wind?”

“Because we should run straight on to the Island of Rion.”

“You shall pass it by twenty fathoms.”

“Take the helm, and let us see what you know.”

The young man took the helm, felt to see if the vessel answered the rudder promptly and seeing that, without being a first-rate sailor, she yet was tolerably obedient.

“To the sheets,” said he. The four seamen, who composed the crew, obeyed, while the pilot looked on. “Haul taut.”

They obeyed.

“Belay.” This order was also executed; and the vessel passed, as Dantès had predicted, twenty fathoms to windward.

“Bravo!” said the captain.

“Bravo!” repeated the sailors. And they all looked with astonishment at this man whose eye now disclosed an intelligence and his body a vigor they had not thought him capable of showing.

“You see,” said Dantès, quitting the helm, “I shall be of some use to you, at least during the voyage. If you do not want me at Leghorn, you can leave me there, and I will pay you out of the first wages I get, for my food and the clothes you lend me.”

“Ah,” said the captain, “we can agree very well, if you are reasonable.”

“Give me what you give the others, and it will be all right,” returned Dantès.

“That’s not fair,” said the seaman who had saved Dantès; “for you know more than we do.”

“What is that to you, Jacopo?” returned the Captain. “Everyone is free to ask what he pleases.”

“That’s true,” replied Jacopo; “I only make a remark.”

“Well, you would do much better to find him a jacket and a pair of trousers, if you have them.”

“No,” said Jacopo; “but I have a shirt and a pair of trousers.”

“That is all I want,” interrupted Dantès. Jacopo dived into the hold and soon returned with what Edmond wanted.

“Now, then, do you wish for anything else?” said the patron.

“A piece of bread and another glass of the capital rum I tasted, for I have not eaten or drunk for a long time.” He had not tasted food for forty hours. A piece of bread was brought, and Jacopo offered him the gourd.

“Larboard your helm,” cried the captain to the steersman. Dantès glanced that way as he lifted the gourd to his mouth; then paused with hand in mid-air.

“Hollo! what’s the matter at the Château d’If?” said the captain.

A small white cloud, which had attracted Dantès’ attention, crowned the summit of the bastion of the Château d’If. At the same moment the faint report of a gun was heard. The sailors looked at one another.

“What is this?” asked the captain.

“A prisoner has escaped from the Château d’If, and they are firing the alarm gun,” replied Dantès. The captain glanced at him, but he had lifted the rum to his lips and was drinking it with so much composure, that suspicions, if the captain had any, died away.

0277m

“Pretty strong rum!” said Dantès, wiping his brow with his sleeve.

“At any rate,” murmured he, “if it be, so much the better, for I have made a rare acquisition.”

0279m

Under pretence of being fatigued, Dantès asked to take the helm; the steersman, glad to be relieved, looked at the captain, and the latter by a sign indicated that he might abandon it to his new comrade. Dantès could thus keep his eyes on Marseilles.

“What is the day of the month?” asked he of Jacopo, who sat down beside him.

“The 28th of February.”

“In what year?”

“In what year—you ask me in what year?”

“Yes,” replied the young man, “I ask you in what year!”

“You have forgotten then?”

“I got such a fright last night,” replied Dantès, smiling, “that I have almost lost my memory. I ask you what year is it?”

“The year 1829,” returned Jacopo.

It was fourteen years, day for day, since Dantès' arrest. He was nineteen when he entered the Château d'If; he was thirty-three when he escaped. A sorrowful smile passed over his face; he asked himself what had become of Mercédès, who must believe him dead. Then his eyes lighted up with hatred as he thought of the three men who had caused him so long and wretched a captivity. He renewed against Danglars, Fernand, and Villefort the oath of implacable vengeance he had made in his dungeon.

This oath was no longer a vain menace; for the fastest sailor in the Mediterranean would have been unable to overtake the little tartan, that with every stitch of canvas set was flying before the wind to Leghorn.

Chapter 22. The Smugglers

Dantès had not been a day on board before he had a very clear idea of the men with whom his lot had been cast. Without having been in the school of the Abbé Faria, the worthy master of _La Jeune Amélie_ (the name of the Genoese tartan) knew a smattering of all the tongues spoken on the shores of that large lake called the Mediterranean, from the Arabic to the Provençal, and this, while it spared him interpreters, persons always troublesome and frequently indiscreet, gave him great facilities of communication, either with the vessels he met at sea, with the small boats sailing along the coast, or with the people without name, country, or occupation, who are always seen on the quays of seaports, and who live by hidden and mysterious means which we must suppose to be a direct gift of Providence, as they have no visible means of support. It is fair to assume that Dantès was on board a smuggler.

At first the captain had received Dantès on board with a certain degree of distrust. He was very well known to the customs officers of the coast; and as there was between these worthies and himself a perpetual battle of wits, he had at first thought that Dantès might be an emissary of these industrious guardians of rights and duties, who perhaps employed this ingenious means of learning some of the secrets of his trade. But the skilful manner in which Dantès had handled the lugger had entirely reassured him; and then, when he saw the light plume of smoke floating above the bastion of the Château d'If, and heard the distant report, he was instantly struck with the idea that he had on board his vessel one whose coming and going, like that of kings, was accompanied with salutes of artillery. This made him less uneasy, it must be owned, than if the new-comer had proved to be a customs officer; but this supposition also disappeared like the first, when he beheld the perfect tranquillity of his recruit.

Edmond thus had the advantage of knowing what the owner was, without the owner knowing who he was; and however the old sailor and his crew tried to "pump" him, they extracted nothing more from him; he gave accurate descriptions of Naples and Malta, which he knew as well as Marseilles, and held stoutly to his first story. Thus the Genoese, subtle as he was, was duped by Edmond, in whose favor his mild demeanor, his nautical skill, and his admirable dissimulation, pleaded. Moreover, it is possible that the Genoese was one of those shrewd persons who know nothing but what they should know, and believe nothing but what they should believe.

In this state of mutual understanding, they reached Leghorn. Here Edmond was to undergo another trial; he was to find out whether he could recognize himself, as he had not seen his own face for fourteen years. He had preserved a tolerably good remembrance of what the youth had been, and was now to find out what the man had become. His comrades believed that his vow was fulfilled. As he had twenty times touched at Leghorn, he remembered a barber in St. Ferdinand Street; he went there to have his beard and hair cut. The barber gazed in amazement at this man with the long, thick and black hair and beard, which gave his head the appearance of one of Titian's portraits. At this period it was not the fashion to wear so large a beard and hair so long; now a barber would only be surprised if a man gifted with such advantages should consent voluntarily to deprive himself of them. The Leghorn barber said nothing and went to work.

When the operation was concluded, and Edmond felt that his chin was completely smooth, and his hair reduced to its usual length, he asked for a looking-glass. He was now, as we have said, three-and-thirty years of age, and his fourteen years' imprisonment had produced a great transformation in his appearance.

Dantès had entered the Château d'If with the round, open, smiling face of a young and happy man, with whom the early paths of life have been smooth, and who anticipates a future corresponding with his past. This was now all changed. The oval face was lengthened, his smiling mouth had assumed the firm and marked lines which betoken resolution; his eyebrows were arched beneath a brow furrowed with thought; his eyes were full of melancholy, and from their depths occasionally sparkled gloomy fires of misanthropy and hatred; his complexion, so long kept from the sun, had now that pale color which produces, when the features are encircled with black hair, the aristocratic beauty of the man of the north; the profound learning he had acquired had besides

diffused over his features a refined intellectual expression; and he had also acquired, being naturally of a goodly stature, that vigor which a frame possesses which has so long concentrated all its force within itself.

0283m

To the elegance of a nervous and slight form had succeeded the solidity of a rounded and muscular figure. As to his voice, prayers, sobs, and imprecations had changed it so that at times it was of a singularly penetrating sweetness, and at others rough and almost hoarse.

Moreover, from being so long in twilight or darkness, his eyes had acquired the faculty of distinguishing objects in the night, common to the hyena and the wolf. Edmond smiled when he beheld himself; it was impossible that his best friend—if, indeed, he had any friend left—could recognize him; he could not recognize himself.

The master of _La Jeune Amélie_, who was very desirous of retaining amongst his crew a man of Edmond's value, had offered to advance him funds out of his future profits, which Edmond had accepted. His next care on leaving the barber's who had achieved his first metamorphosis was to enter a shop and buy a complete sailor's suit—a garb, as we all know, very simple, and consisting of white trousers, a striped shirt, and a cap.

It was in this costume, and bringing back to Jacopo the shirt and trousers he had lent him, that Edmond reappeared before the captain of the lugger, who had made him tell his story over and over again before he could believe him, or recognize in the neat and trim sailor the man with thick and matted beard, hair tangled with seaweed, and body soaking in seabrine, whom he had picked up naked and nearly drowned. Attracted by his prepossessing appearance, he renewed his offers of an engagement to Dantès; but Dantès, who had his own projects, would not agree for a longer time than three months.

La Jeune Amélie had a very active crew, very obedient to their captain, who lost as little time as possible. He had scarcely been a week at Leghorn before the hold of his vessel was filled with printed muslins, contraband cottons, English powder, and tobacco on which the excise had forgotten to put its mark. The master was to get all this out of Leghorn free of duties, and land it on the shores of Corsica, where certain speculators undertook to forward the cargo to France.

They sailed; Edmond was again cleaving the azure sea which had been the first horizon of his youth, and which he had so often dreamed of in prison. He left Gorgone on his right and La Pianosa on his left, and went towards the country of Paoli and Napoleon.

The next morning going on deck, as he always did at an early hour, the patron found Dantès leaning against the bulwarks gazing with intense earnestness at a pile of granite rocks, which the rising sun tinged with rosy light. It was the Island of Monte Cristo.

La Jeune Amélie left it three-quarters of a league to the larboard and kept on for Corsica. Dantès thought, as they passed so closely to the island whose name was so interesting to him, that he had only to leap into the sea and in half an hour be at the promised land. But then what could he do without instruments to discover his treasure, without arms to defend himself? Besides, what would the sailors say? What would the patron think? He must wait.

Fortunately, Dantès had learned how to wait; he had waited fourteen years for his liberty, and now he was free he could wait at least six months or a year for wealth. Would he not have accepted liberty without riches if it had been offered to him? Besides, were not those riches chimerical?—offspring of the brain of the poor Abbé Faria, had they not died with him? It is true, the letter of the Cardinal Spada was singularly circumstantial, and Dantès repeated it to himself, from one end to the other, for he had not forgotten a word.

0285m

Evening came, and Edmond saw the island tinged with the shades of twilight, and then disappear in the darkness from all eyes but his own, for he, with vision accustomed to the gloom of a prison, continued to behold it last of all, for he remained alone upon deck. The next morn broke off the coast of Aleria; all day they coasted, and in the evening saw fires lighted on land; the position of these was no doubt a signal for landing, for a ship's lantern was hung up at the mast-head instead of the streamer, and they came to within a gunshot of the shore. Dantès noticed that the captain of _La Jeune Amélie_ had, as he neared the land, mounted two small culverins, which, without making much noise, can throw a four ounce ball a thousand paces or so.

But on this occasion the precaution was superfluous, and everything proceeded with the utmost smoothness and politeness. Four shallops came off with very little noise alongside the lugger, which, no doubt, in acknowledgement of the compliment, lowered her own shallop into the sea, and the five boats worked so well that by two o'clock in the morning all the cargo was out of _La Jeune Amélie_ and on _terra firma_. The same night, such a man of regularity was the patron of _La Jeune Amélie_, the profits were divided, and each man had a hundred Tuscan livres, or about eighty francs.

But the voyage was not ended. They turned the bowsprit towards Sardinia, where they intended to take in a cargo, which was to replace what had been discharged. The second operation was as successful as the first, _La Jeune Amélie_ was in luck. This new cargo was destined for the coast of the Duchy of Lucca, and consisted almost entirely of Havana cigars, sherry, and Malaga wines.

There they had a bit of a skirmish in getting rid of the duties; the excise was, in truth, the everlasting enemy of the patron of _La Jeune Amélie_. A customs officer was laid low, and two sailors wounded; Dantès was one of the latter, a ball having touched him in the left shoulder. Dantès was almost glad of this affray, and almost pleased at being wounded, for they were rude lessons which taught him with what eye he could view danger, and with what endurance he could bear suffering. He had contemplated danger with a smile, and when wounded had exclaimed with the great philosopher, "Pain, thou art not an evil."

He had, moreover, looked upon the customs officer wounded to death, and, whether from heat of blood produced by the encounter, or the chill of human sentiment, this sight had made but slight impression upon him. Dantès was on the way he desired to follow, and was moving towards the end he wished to achieve; his heart was in a fair way of petrifying in his bosom. Jacopo, seeing him fall, had believed him killed, and rushing towards him raised him up, and then attended to him with all the kindness of a devoted comrade.

This world was not then so good as Doctor Pangloss believed it, neither was it so wicked as Dantès thought it, since this man, who had nothing to expect from his comrade but the inheritance of his share of the prize-money, manifested so much sorrow when he saw him fall. Fortunately, as we have said, Edmond was only wounded, and with certain herbs gathered at certain seasons, and sold to the smugglers by the old Sardinian women, the wound soon closed. Edmond then resolved to try Jacopo, and offered him in return for his attention a share of his prize-money, but Jacopo refused it indignantly.

As a result of the sympathetic devotion which Jacopo had from the first bestowed on Edmond, the latter was moved to a certain degree of affection. But this sufficed for Jacopo, who instinctively felt that Edmond had a right to superiority of position—a superiority which Edmond had concealed from all others. And from this time the kindness which Edmond showed him was enough for the brave seaman.

Then in the long days on board ship, when the vessel, gliding on with security over the azure sea, required no care but the hand of the helmsman, thanks to the favorable winds that swelled her sails, Edmond, with a chart in his hand, became the instructor of Jacopo, as the poor Abbé Faria had been his tutor. He pointed out to him the bearings of the coast, explained to him the variations of the compass, and taught him to read in that vast book opened over our heads which they call heaven, and where God writes in azure with letters of diamonds.

And when Jacopo inquired of him, "What is the use of teaching all these things to a poor sailor like me?" Edmond replied, "Who knows? You may one day be the captain of a vessel. Your fellow-countryman, Bonaparte, became emperor." We had forgotten to say that Jacopo was a Corsican.

Two months and a half elapsed in these trips, and Edmond had become as skilful a coaster as he had been a hardy seaman; he had formed an acquaintance with all the smugglers on the coast, and learned all the Masonic signs by which these half pirates recognize each other. He had passed and re-passed his Island of Monte Cristo twenty times, but not once had he found an opportunity of landing there.

He then formed a resolution. As soon as his engagement with the patron of _La Jeune Amélie_ ended, he would hire a small vessel on his own account—for in his several voyages he had amassed a hundred piastres—and under some pretext land at the Island of Monte Cristo. Then he would be free to make his researches, not perhaps entirely at liberty, for he would be doubtless watched by those who accompanied him. But in this world we must risk something. Prison had made Edmond prudent, and he was desirous of running no risk whatever. But in vain did he rack his imagination; fertile as it was, he could not devise any plan for reaching the island without companionship.

Dantès was tossed about on these doubts and wishes, when the patron, who had great confidence in him, and was very desirous of retaining him in his service, took him by the arm one evening and led him to a tavern on the Via del' Oglio, where the leading smugglers of Leghorn used to congregate and discuss affairs connected with their trade. Already Dantès had visited this maritime Bourse two or three times, and seeing all these hardy free-traders, who supplied the whole coast for nearly two hundred leagues in extent, he had asked himself what power might not that man attain who should give the impulse of his will to all these contrary and diverging minds. This time it was a great matter that was under discussion, connected with a vessel laden with Turkey carpets, stuffs of the Levant, and cashmeres. It was necessary to find some neutral ground on which an exchange could be made, and then to try and land these goods on the coast of France. If the venture was successful the profit would be enormous, there would be a gain of fifty or sixty piastres each for the crew.

The patron of _La Jeune Amélie_ proposed as a place of landing the Island of Monte Cristo, which being completely deserted, and having neither soldiers nor revenue officers, seemed to have been placed in the midst of the ocean since the time of the heathen Olympus by Mercury, the god of merchants and robbers, classes of mankind which we in modern times have separated if not made distinct, but which antiquity appears to have included in the same category.

At the mention of Monte Cristo Dantès started with joy; he rose to conceal his emotion, and took a turn around the smoky tavern, where all the languages of the known world were jumbled in a _lingua franca_.

When he again joined the two persons who had been discussing the matter, it had been decided that they should touch at Monte Cristo and set out on the following night. Edmond, being consulted, was of opinion that the island afforded every possible security, and that great enterprises to be well done should be done quickly.

Nothing then was altered in the plan, and orders were given to get under weigh next night, and, wind and weather permitting, to make the neutral island by the following day.

Chapter 23. The Island of Monte Cristo

Thus, at length, by one of the unexpected strokes of fortune which sometimes befall those who have for a long time been the victims of an evil destiny, Dantès was about to secure the opportunity he wished for, by simple and natural means, and land on the island without incurring any suspicion. One night more and he would be on his way.

The night was one of feverish distraction, and in its progress visions, good and evil, passed through Dantès' mind. If he closed his eyes, he saw Cardinal Spada's letter written on the wall in characters of flame—if he slept for a moment the wildest dreams haunted his brain. He ascended into grottos paved with emeralds, with panels of rubies, and the roof glowing with diamond stalactites. Pearls fell drop by drop, as subterranean waters filter in their caves. Edmond, amazed, wonderstruck, filled his pockets with the radiant gems and then returned to daylight, when he discovered that his prizes had all changed into common pebbles. He then endeavored to re-enter the marvellous grottos, but they had suddenly receded, and now the path became a labyrinth, and then the entrance vanished, and in vain did he tax his memory for the magic and mysterious word which opened the splendid caverns of Ali Baba to the Arabian fisherman. All was useless, the treasure disappeared, and had again reverted to the genii from whom for a moment he had hoped to carry it off.

The day came at length, and was almost as feverish as the night had been, but it brought reason to the aid of imagination, and Dantès was then enabled to arrange a plan which had hitherto been vague and unsettled in his brain. Night came, and with it the preparation for departure, and these preparations served to conceal Dantès' agitation. He had by degrees assumed such authority over his companions that he was almost like a commander on board; and as his orders were always clear, distinct, and easy of execution, his comrades obeyed him with celerity and pleasure.

The old patron did not interfere, for he too had recognized the superiority of Dantès over the crew and himself. He saw in the young man his natural successor, and regretted that he had not a daughter, that he might have bound Edmond to him by a more secure alliance. At seven o'clock in the evening all was ready, and at ten minutes past seven they doubled the lighthouse just as the beacon was kindled. The sea was calm, and, with a fresh breeze from the south-east, they sailed beneath a bright blue sky, in which God also lighted up in turn his beacon lights, each of which is a world. Dantès told them that all hands might turn in, and he would take the helm. When the Maltese (for so they called Dantès) had said this, it was sufficient, and all went to their bunks

contentedly.

This frequently happened. Dantès, cast from solitude into the world, frequently experienced an imperious desire for solitude; and what solitude is more complete, or more poetical, than that of a ship floating in isolation on the sea during the obscurity of the night, in the silence of immensity, and under the eye of Heaven?

Now this solitude was peopled with his thoughts, the night lighted up by his illusions, and the silence animated by his anticipations. When the patron awoke, the vessel was hurrying on with every sail set, and every sail full with the breeze. They were making nearly ten knots an hour. The Island of Monte Cristo loomed large in the horizon. Edmond resigned the lugger to the master's care, and went and lay down in his hammock; but, in spite of a sleepless night, he could not close his eyes for a moment.

Two hours afterwards he came on deck, as the boat was about to double the Island of Elba. They were just abreast of Mareciana, and beyond the flat but verdant Island of La Pianosa. The peak of Monte Cristo reddened by the burning sun, was seen against the azure sky. Dantès ordered the helmsman to put down his helm, in order to leave La Pianosa to starboard, as he knew that he should shorten his course by two or three knots. About five o'clock in the evening the island was distinct, and everything on it was plainly perceptible, owing to that clearness of the atmosphere peculiar to the light which the rays of the sun cast at its setting.

Edmond gazed very earnestly at the mass of rocks which gave out all the variety of twilight colors, from the brightest pink to the deepest blue; and from time to time his cheeks flushed, his brow darkened, and a mist passed over his eyes. Never did a gamester, whose whole fortune is staked on one cast of the die, experience the anguish which Edmond felt in his paroxysms of hope.

Night came, and at ten o'clock they anchored. _La Jeune Amélie_ was first at the rendezvous. In spite of his usual command over himself, Dantès could not restrain his impetuosity. He was the first to jump on shore; and had he dared, he would, like Lucius Brutus, have "kissed his mother earth." It was dark, but at eleven o'clock the moon rose in the midst of the ocean, whose every wave she silvered, and then, "ascending high," played in floods of pale light on the rocky hills of this second Pelion.

The island was familiar to the crew of _La Jeune Amélie_,—it was one of her regular haunts. As to Dantès, he had passed it on his voyage to and from the Levant, but never touched at it. He questioned Jacopo.

"Where shall we pass the night?" he inquired.

"Why, on board the tartan," replied the sailor.

"Should we not do better in the grottos?"

"What grottos?"

"Why, the grottos—caves of the island."

"I do not know of any grottos," replied Jacopo.

The cold sweat sprang forth on Dantès' brow.

"What, are there no grottos at Monte Cristo?" he asked.

"None."

For a moment Dantès was speechless; then he remembered that these caves might have been filled up by some accident, or even stopped up, for the sake of greater security, by Cardinal Spada. The point was, then, to discover the hidden entrance. It was useless to search at night, and Dantès therefore delayed all investigation until the morning. Besides, a signal made half a league out at sea, and to which _La Jeune Amélie_ replied by a similar signal, indicated that the moment for business had come.

The boat that now arrived, assured by the answering signal that all was well, soon came in sight, white and silent as a phantom, and cast anchor within a cable's length of shore.

Then the landing began. Dantès reflected, as he worked, on the shout of joy which, with a single word, he could evoke from all these men, if he gave utterance to the one unchanging thought that pervaded his heart; but, far from disclosing this precious secret, he almost feared that he had already said too much, and by his restlessness and continual questions, his minute observations and evident preoccupation, aroused suspicions. Fortunately, as regarded this circumstance at least, his painful past gave to his countenance an indelible sadness, and the glimmerings of gayety seen beneath this cloud were indeed but transitory.

No one had the slightest suspicion; and when next day, taking a fowling-piece, powder, and shot, Dantès declared his intention to go and kill some of the wild goats that were seen springing from rock to rock, his wish was construed into a love of sport, or a desire for solitude. However, Jacopo insisted on following him, and Dantès did not oppose this, fearing if he did so that he might incur distrust. Scarcely, however, had they gone a quarter of a league when, having killed a kid, he begged Jacopo to take it to his comrades, and request them to cook it, and when ready to let him know by firing a gun. This and some dried fruits and a flask of Monte Pulciano, was the bill of fare.

Dantès went on, looking from time to time behind and around about him. Having reached the summit of a rock, he saw, a thousand feet beneath him, his companions, whom Jacopo had rejoined, and who were all busy preparing the repast which Edmond's skill as a marksman had augmented with a capital dish.

Edmond looked at them for a moment with the sad and gentle smile of a man superior to his fellows.

"In two hours' time," said he, "these persons will depart richer by fifty piastres each, to go and risk their lives again by endeavoring to gain fifty more; then they will return with a fortune of six hundred francs, and waste this treasure in some city with the pride of sultans and the insolence of nabobs. At this moment hope makes me despise their riches, which seem to me contemptible. Yet perchance tomorrow deception will so act on me, that I shall, on compulsion, consider such a contemptible possession as the utmost happiness. Oh, no!" exclaimed Edmond, "that will not be. The wise, unerring Faria could not be mistaken in this one thing. Besides, it were better to die than to continue to lead this low and wretched life."

Thus Dantès, who but three months before had no desire but liberty had now not liberty enough, and panted for wealth. The cause was not in Dantès, but in Providence, who, while limiting the power of man, has filled him with boundless desires.

Meanwhile, by a cleft between two walls of rock, following a path worn by a torrent, and which, in all human probability, human foot had never before trod, Dantès approached the spot where he supposed the grottos must have existed. Keeping along the shore, and examining the smallest object with serious attention, he thought he could trace, on certain rocks, marks made by the hand of man.

Time, which encrusts all physical substances with its mossy mantle, as it invests all things of the mind with forgetfulness, seemed to have respected these signs, which apparently had been made with some degree of regularity, and probably with a definite purpose. Occasionally the marks were hidden under tufts of myrtle, which spread into large bushes laden with blossoms, or beneath parasitical lichen. So Edmond had to separate the branches or brush away the moss to know where the guide-marks were. The sight of marks renewed Edmond's fondest hopes. Might it not have been the cardinal himself who had first traced them, in order that they might serve as a guide for his nephew in the event of a catastrophe, which he could not foresee would have been so complete. This solitary place was precisely suited to the requirements of a man desirous of burying treasure. Only, might not these betraying marks have attracted other eyes than those for whom they were made? and had the dark and wondrous island indeed faithfully guarded its precious secret?

0295m

It seemed, however, to Edmond, who was hidden from his comrades by the inequalities of the ground, that at sixty paces from the harbor the marks ceased; nor did they terminate at any grotto. A large round rock, placed solidly on its base, was the only spot to which they seemed to lead. Edmond concluded that perhaps instead of having reached the end of the route he had only explored its beginning, and he therefore turned round and retraced his steps.

Meanwhile his comrades had prepared the repast, had got some water from a spring, spread out the fruit and bread, and cooked the kid. Just at the moment when they were taking the dainty animal from the spit, they saw Edmond springing with the boldness of a chamois from rock to rock, and they fired the signal agreed upon. The sportsman instantly changed his direction, and ran quickly towards them. But even while they watched his daring progress, Edmond's foot slipped, and they saw him stagger on the edge of a rock and disappear. They all rushed towards him, for all loved Edmond in spite of his superiority; yet Jacopo reached him first.

He found Edmond lying prone, bleeding, and almost senseless. He had rolled down a declivity of twelve or fifteen feet. They poured a little rum down his throat, and this remedy which had before been so beneficial to him, produced the same effect as formerly. Edmond opened his eyes, complained of great pain in his knee, a feeling of heaviness in his head, and severe pains in his loins. They wished to carry him to the shore; but when they touched him, although under Jacopo's directions, he declared, with heavy

groans, that he could not bear to be moved.

It may be supposed that Dantès did not now think of his dinner, but he insisted that his comrades, who had not his reasons for fasting, should have their meal. As for himself, he declared that he had only need of a little rest, and that when they returned he should be easier. The sailors did not require much urging. They were hungry, and the smell of the roasted kid was very savory, and your tars are not very ceremonious. An hour afterwards they returned. All that Edmond had been able to do was to drag himself about a dozen paces forward to lean against a moss-grown rock.

But, instead of growing easier, Dantès' pains appeared to increase in violence. The old patron, who was obliged to sail in the morning in order to land his cargo on the frontiers of Piedmont and France, between Nice and Fréjus, urged Dantès to try and rise. Edmond made great exertions in order to comply; but at each effort he fell back, moaning and turning pale.

"He has broken his ribs," said the commander, in a low voice. "No matter; he is an excellent fellow, and we must not leave him. We will try and carry him on board the tartan."

Dantès declared, however, that he would rather die where he was than undergo the agony which the slightest movement cost him.

"Well," said the patron, "let what may happen, it shall never be said that we deserted a good comrade like you. We will not go till evening."

This very much astonished the sailors, although, not one opposed it. The patron was so strict that this was the first time they had ever seen him give up an enterprise, or even delay in its execution. Dantès would not allow that any such infraction of regular and proper rules should be made in his favor.

"No, no," he said to the patron, "I was awkward, and it is just that I pay the penalty of my clumsiness. Leave me a small supply of biscuit, a gun, powder, and balls, to kill the kids or defend myself at need, and a pickaxe, that I may build a shelter if you delay in coming back for me."

"But you'll die of hunger," said the patron.

"I would rather do so," was Edmond's reply, "than suffer the inexpressible agonies which the slightest movement causes me."

The patron turned towards his vessel, which was rolling on the swell in the little harbor, and, with sails partly set, would be ready for sea when her toilet should be completed.

"What are we to do, Maltese?" asked the captain. "We cannot leave you here so, and yet we cannot stay."

"Go, go!" exclaimed Dantès.

"We shall be absent at least a week," said the patron, "and then we must run out of our course to come here and take you up again."

"Why," said Dantès, "if in two or three days you hail any fishing-boat, desire them to come here to me. I will pay twenty-five piastres for my passage back to Leghorn. If you do not come across one, return for me." The patron shook his head.

"Listen, Captain Baldi; there's one way of settling this," said Jacopo. "Do you go, and I will stay and take care of the wounded man."

"And give up your share of the venture," said Edmond, "to remain with me?"

"Yes," said Jacopo, "and without any hesitation."

"You are a good fellow and a kind-hearted messmate," replied Edmond, "and heaven will recompense you for your generous intentions; but I do not wish anyone to stay with me. A day or two of rest will set me up, and I hope I shall find among the rocks certain herbs most excellent for bruises."

A peculiar smile passed over Dantès' lips; he squeezed Jacopo's hand warmly, but nothing could shake his determination to remain—and remain alone.

The smugglers left with Edmond what he had requested and set sail, but not without turning about several times, and each time making signs of a cordial farewell, to which Edmond replied with his hand only, as if he could not move the rest of his body.

Then, when they had disappeared, he said with a smile,—"'Tis strange that it should be among such men that we find proofs of friendship and devotion." Then he dragged himself cautiously to the top of a rock, from which he had a full view of the sea, and thence he saw the tartan complete her preparations for sailing, weigh anchor, and, balancing herself as gracefully as a water-fowl ere it takes to the wing, set sail.

At the end of an hour she was completely out of sight; at least, it was impossible for the wounded man to see her any longer from the spot where he was. Then Dantès rose more agile and light than the kid among the myrtles and shrubs of these wild rocks, took his gun in one hand, his pickaxe in the other, and hastened towards the rock on which the marks he had noted terminated.

"And now," he exclaimed, remembering the tale of the Arabian fisherman, which Faria had related to him, "now, Open Sesame!"

Chapter 24. The Secret Cave

The sun had nearly reached the meridian, and his scorching rays fell full on the rocks, which seemed themselves sensible of the heat. Thousands of grasshoppers, hidden in the bushes, chirped with a monotonous and dull note; the leaves of the myrtle and olive trees waved and rustled in the wind. At every step that Edmond took he disturbed the lizards glittering with the hues of the emerald; afar off he saw the wild goats bounding from crag to crag. In a word, the island was inhabited, yet Edmond felt himself alone, guided by the hand of God.

He felt an indescribable sensation somewhat akin to dread—that dread of the daylight which even in the desert makes us fear we are watched and observed. This feeling was so strong that at the moment when Edmond was about to begin his labor, he stopped, laid down his pickaxe, seized his gun, mounted to the summit of the highest rock, and from thence gazed round in every direction.

But it was not upon Corsica, the very houses of which he could distinguish; or on Sardinia; or on the Island of Elba, with its historical associations; or upon the almost imperceptible line that to the experienced eye of a sailor alone revealed the coast of Genoa the proud, and Leghorn the commercial, that he gazed. It was at the brigantine that had left in the morning, and the tartan that had just set sail, that Edmond fixed his eyes.

The first was just disappearing in the straits of Bonifacio; the other, following an opposite direction, was about to round the Island of Corsica.

This sight reassured him. He then looked at the objects near him. He saw that he was on the highest point of the island,—a statue on this vast pedestal of granite, nothing human appearing in sight, while the blue ocean beat against the base of the island, and covered it with a fringe of foam. Then he descended with cautious and slow step, for he dreaded lest an accident similar to that he had so adroitly feigned should happen in reality.

Dantès, as we have said, had traced the marks along the rocks, and he had noticed that they led to a small creek, which was hidden like the bath of some ancient nymph. This creek was sufficiently wide at its mouth, and deep in the centre, to admit of the entrance of a small vessel of the lugger class, which would be perfectly concealed from observation.

Then following the clew that, in the hands of the Abbé Faria, had been so skilfully used to guide him through the Dædalian labyrinth of probabilities, he thought that the Cardinal Spada, anxious not to be watched, had entered the creek, concealed his little barque, followed the line marked by the notches in the rock, and at the end of it had buried his treasure. It was this idea that had brought Dantès back to the circular rock. One thing only perplexed Edmond, and destroyed his theory. How could this rock, which weighed several tons, have been lifted to this spot, without the aid of many men?

Suddenly an idea flashed across his mind. Instead of raising it, thought he, they have lowered it. And he sprang from the rock in order to inspect the base on which it had formerly stood.

He soon perceived that a slope had been formed, and the rock had slid along this until it stopped at the spot it now occupied. A large stone had served as a wedge; flints and pebbles had been inserted around it, so as to conceal the orifice; this species of masonry had been covered with earth, and grass and weeds had grown there, moss had clung to the stones, myrtle-bushes had taken root, and the old rock seemed fixed to the earth.

Dantès dug away the earth carefully, and detected, or fancied he detected, the ingenious artifice. He attacked this wall, cemented by the hand of time, with his pickaxe. After ten minutes' labor the wall gave way, and a hole large enough to insert the arm was opened.

Dantès went and cut the strongest olive-tree he could find, stripped off its branches, inserted it in the hole, and used it as a lever. But the rock was too heavy, and too firmly wedged, to be moved by anyone man, were he Hercules himself. Dantès saw that he must attack the wedge. But how?

He cast his eyes around, and saw the horn full of powder which his friend Jacopo had left him. He smiled; the infernal invention would serve him for this purpose.

With the aid of his pickaxe, Dantès, after the manner of a labor-saving pioneer, dug a mine between the upper rock and the one that supported it, filled it with powder, then made a match by rolling his handkerchief in saltpetre. He lighted it and retired.

The explosion soon followed; the upper rock was lifted from its base by the terrific force of the powder; the lower one flew into pieces; thousands of insects escaped from the aperture Dantès had previously formed, and a huge snake, like the guardian demon of the treasure, rolled himself along in darkening coils, and disappeared.

Dantès approached the upper rock, which now, without any support, leaned towards the sea. The intrepid treasure-seeker walked round it, and, selecting the spot from whence it appeared most susceptible to attack, placed his lever in one of the crevices, and strained every nerve to move the mass.

The rock, already shaken by the explosion, tottered on its base. Dantès redoubled his efforts; he seemed like one of the ancient Titans, who uprooted the mountains to hurl against the father of the gods. The rock yielded, rolled over, bounded from point to point, and finally disappeared in the ocean.

On the spot it had occupied was a circular space, exposing an iron ring let into a square flag-stone.

Dantès uttered a cry of joy and surprise; never had a first attempt been crowned with more perfect success. He would fain have continued, but his knees trembled, and his heart beat so violently, and his sight became so dim, that he was forced to pause.

This feeling lasted but for a moment. Edmond inserted his lever in the ring and exerted all his strength; the flag-stone yielded, and disclosed steps that descended until they were lost in the obscurity of a subterraneous grotto.

Anyone else would have rushed on with a cry of joy. Dantès turned pale, hesitated, and reflected.

"Come," said he to himself, "be a man. I am accustomed to adversity. I must not be cast down by the discovery that I have been deceived. What, then, would be the use of all I have suffered? The heart breaks when, after having been elated by flattering hopes, it sees all its illusions destroyed. Faria has dreamed this; the Cardinal Spada buried no treasure here; perhaps he never came here, or if he did, Cæsar Borgia, the intrepid adventurer, the stealthy and indefatigable plunderer, has followed him, discovered his traces, pursued them as I have done, raised the stone, and descending before me, has left me nothing."

He remained motionless and pensive, his eyes fixed on the gloomy aperture that was open at his feet.

"Now that I expect nothing, now that I no longer entertain the slightest hopes, the end of this adventure becomes simply a matter of curiosity." And he remained again motionless and thoughtful.

"Yes, yes; this is an adventure worthy a place in the varied career of that royal bandit. This fabulous event formed but a link in a long chain of marvels. Yes, Borgia has been here, a torch in one hand, a sword in the other, and within twenty paces, at the foot of this rock, perhaps two guards kept watch on land and sea, while their master descended, as I am about to descend, dispelling the darkness before his awe-inspiring progress."

0303m

"But what was the fate of the guards who thus possessed his secret?" asked Dantès of himself.

"The fate," replied he, smiling, "of those who buried Alaric, and were interred with the corpse."

“Yet, had he come,” thought Dantès, “he would have found the treasure, and Borgia, he who compared Italy to an artichoke, which he could devour leaf by leaf, knew too well the value of time to waste it in replacing this rock. I will go down.”

Then he descended, a smile on his lips, and murmuring that last word of human philosophy, “Perhaps!”

But instead of the darkness, and the thick and mephitic atmosphere he had expected to find, Dantès saw a dim and bluish light, which, as well as the air, entered, not merely by the aperture he had just formed, but by the interstices and crevices of the rock which were visible from without, and through which he could distinguish the blue sky and the waving branches of the evergreen oaks, and the tendrils of the creepers that grew from the rocks.

After having stood a few minutes in the cavern, the atmosphere of which was rather warm than damp, Dantès’ eye, habituated as it was to darkness, could pierce even to the remotest angles of the cavern, which was of granite that sparkled like diamonds.

“Alas,” said Edmond, smiling, “these are the treasures the cardinal has left; and the good abbé, seeing in a dream these glittering walls, has indulged in fallacious hopes.”

But he called to mind the words of the will, which he knew by heart. “In the farthest angle of the second opening,” said the cardinal’s will. He had only found the first grotto; he had now to seek the second. Dantès continued his search. He reflected that this second grotto must penetrate deeper into the island; he examined the stones, and sounded one part of the wall where he fancied the opening existed, masked for precaution’s sake.

The pickaxe struck for a moment with a dull sound that drew out of Dantès’ forehead large drops of perspiration. At last it seemed to him that one part of the wall gave forth a more hollow and deeper echo; he eagerly advanced, and with the quickness of perception that no one but a prisoner possesses, saw that there, in all probability, the opening must be.

However, he, like Cæsar Borgia, knew the value of time; and, in order to avoid fruitless toil, he sounded all the other walls with his pickaxe, struck the earth with the butt of his gun, and finding nothing that appeared suspicious, returned to that part of the wall whence issued the consoling sound he had before heard.

He again struck it, and with greater force. Then a singular thing occurred. As he struck the wall, pieces of stucco similar to that used in the ground work of arabesques broke off, and fell to the ground in flakes, exposing a large white stone. The aperture of the rock had been closed with stones, then this stucco had been applied, and painted to imitate granite. Dantès struck with the sharp end of his pickaxe, which entered someway between the interstices.

It was there he must dig.

But by some strange play of emotion, in proportion as the proofs that Faria, had not been deceived became stronger, so did his heart give way, and a feeling of discouragement stole over him. This last proof, instead of giving him fresh strength, deprived him of it; the pickaxe descended, or rather fell; he placed it on the ground, passed his hand over his brow, and remounted the stairs, alleging to himself, as an excuse, a desire to be assured that no one was watching him, but in reality because he felt that he was about to faint.

The island was deserted, and the sun seemed to cover it with its fiery glance; afar off, a few small fishing boats studded the bosom of the blue ocean.

Dantès had tasted nothing, but he thought not of hunger at such a moment; he hastily swallowed a few drops of rum, and again entered the cavern.

The pickaxe that had seemed so heavy, was now like a feather in his grasp; he seized it, and attacked the wall. After several blows he perceived that the stones were not cemented, but had been merely placed one upon the other, and covered with stucco; he inserted the point of his pickaxe, and using the handle as a lever, with joy soon saw the stone turn as if on hinges, and fall at his feet.

He had nothing more to do now, but with the iron tooth of the pickaxe to draw the stones towards him one by one. The aperture was already sufficiently large for him to enter, but by waiting, he could still cling to hope, and retard the certainty of deception. At last, after renewed hesitation, Dantès entered the second grotto.

The second grotto was lower and more gloomy than the first; the air that could only enter by the newly formed opening had the mephitic smell Dantès was surprised not to find in the outer cavern. He waited in order to allow pure air to displace the foul atmosphere, and then went on.

At the left of the opening was a dark and deep angle. But to Dantès' eye there was no darkness. He glanced around this second grotto; it was, like the first, empty.

The treasure, if it existed, was buried in this corner. The time had at length arrived; two feet of earth removed, and Dantès' fate would be decided.

He advanced towards the angle, and summoning all his resolution, attacked the ground with the pickaxe. At the fifth or sixth blow the pickaxe struck against an iron substance. Never did funeral knell, never did alarm-bell, produce a greater effect on the hearer. Had Dantès found nothing he could not have become more ghastly pale.

He again struck his pickaxe into the earth, and encountered the same resistance, but not the same sound.

"It is a casket of wood bound with iron," thought he.

At this moment a shadow passed rapidly before the opening; Dantès seized his gun, sprang through the opening, and mounted the stair. A wild goat had passed before the mouth of the cave, and was feeding at a little distance. This would have been a favorable occasion to secure his dinner; but Dantès feared lest the report of his gun should attract attention.

He thought a moment, cut a branch of a resinous tree, lighted it at the fire at which the smugglers had prepared their breakfast, and descended with this torch.

He wished to see everything. He approached the hole he had dug, and now, with the aid of the torch, saw that his pickaxe had in reality struck against iron and wood. He planted his torch in the ground and resumed his labor.

In an instant a space three feet long by two feet broad was cleared, and Dantès could see an oaken coffer, bound with cut steel; in the middle of the lid he saw engraved on a silver plate, which was still untarnished, the arms of the Spada family—viz., a sword, _en pale_, on an oval shield, like all the Italian armorial bearings, and surmounted by a cardinal's hat.

Dantès easily recognized them, Faria had so often drawn them for him. There was no longer any doubt: the treasure was there—no one would have been at such pains to conceal an empty casket. In an instant he had cleared every obstacle away, and he saw successively the lock, placed between two padlocks, and the two handles at each end, all carved as things were carved at that epoch, when art rendered the commonest metals precious.

Dantès seized the handles, and strove to lift the coffer; it was impossible. He sought to open it; lock and padlock were fastened; these faithful guardians seemed unwilling to surrender their trust. Dantès inserted the sharp end of the pickaxe between the coffer and the lid, and pressing with all his force on the handle, burst open the fastenings. The hinges yielded in their turn and fell, still holding in their grasp fragments of the wood, and the chest was open.

0307m

Edmond was seized with vertigo; he cocked his gun and laid it beside him. He then closed his eyes as children do in order that they may see in the resplendent night of their own imagination more stars than are visible in the firmament; then he re-opened them, and stood motionless with amazement.

Three compartments divided the coffer. In the first, blazed piles of golden coin; in the second, were ranged bars of unpolished gold, which possessed nothing attractive save their value; in the third, Edmond grasped handfuls of diamonds, pearls, and rubies, which, as they fell on one another, sounded like hail against glass.

After having touched, felt, examined these treasures, Edmond rushed through the caverns like a man seized with frenzy; he leaped on a rock, from whence he could behold the sea. He was alone—alone with these countless, these unheard-of treasures! Was he awake, or was it but a dream? Was it a transient vision, or was he face to face with reality?

He would fain have gazed upon his gold, and yet he had not strength enough; for an instant he leaned his head in his hands as if to prevent his senses from leaving him, and then rushed madly about the rocks of Monte Cristo, terrifying the wild goats and scaring

the sea-fowls with his wild cries and gestures; then he returned, and, still unable to believe the evidence of his senses, rushed into the grotto, and found himself before this mine of gold and jewels.

This time he fell on his knees, and, clasping his hands convulsively, uttered a prayer intelligible to God alone. He soon became calmer and more happy, for only now did he begin to realize his felicity.

He then set himself to work to count his fortune. There were a thousand ingots of gold, each weighing from two to three pounds; then he piled up twenty-five thousand crowns, each worth about eighty francs of our money, and bearing the effigies of Alexander VI. and his predecessors; and he saw that the complement was not half empty. And he measured ten double handfuls of pearls, diamonds, and other gems, many of which, mounted by the most famous workmen, were valuable beyond their intrinsic worth.

Dantès saw the light gradually disappear, and fearing to be surprised in the cavern, left it, his gun in his hand. A piece of biscuit and a small quantity of rum formed his supper, and he snatched a few hours' sleep, lying over the mouth of the cave.

It was a night of joy and terror, such as this man of stupendous emotions had already experienced twice or thrice in his lifetime.

Chapter 25. The Unknown

Day, for which Dantès had so eagerly and impatiently waited with open eyes, again dawned. With the first light Dantès resumed his search. Again he climbed the rocky height he had ascended the previous evening, and strained his view to catch every peculiarity of the landscape; but it wore the same wild, barren aspect when seen by the rays of the morning sun which it had done when surveyed by the fading glimmer of eve.

Descending into the grotto, he lifted the stone, filled his pockets with gems, put the box together as well and securely as he could, sprinkled fresh sand over the spot from which it had been taken, and then carefully trod down the earth to give it everywhere a uniform appearance; then, quitting the grotto, he replaced the stone, heaping on it broken masses of rocks and rough fragments of crumbling granite, filling the interstices with earth, into which he deftly inserted rapidly growing plants, such as the wild myrtle and flowering thorn, then carefully watering these new plantations, he scrupulously effaced every trace of footsteps, leaving the approach to the cavern as savage-looking and untrodden as he had found it. This done, he impatiently awaited the return of his companions. To wait at Monte Cristo for the purpose of watching like a dragon over the almost incalculable riches that had thus fallen into his possession satisfied not the cravings of his heart, which yearned to return to dwell among mankind, and to assume the rank, power, and influence which are always accorded to wealth—that first and greatest of all the forces within the grasp of man.

On the sixth day, the smugglers returned. From a distance Dantès recognized the rig and handling of _La Jeune Amélie_, and dragging himself with affected difficulty towards the landing-place, he met his companions with an assurance that, although considerably better than when they quitted him, he still suffered acutely from his late accident. He then inquired how they had fared in their trip. To this question the smugglers replied that, although successful in landing their cargo in safety, they had scarcely done so when they received intelligence that a guard-ship had just quitted the port of Toulon and was crowding all sail towards them. This obliged them to make all the speed they could to evade the enemy, when they could but lament the absence of Dantès, whose superior skill in the management of a vessel would have availed them so materially. In fact, the pursuing vessel had almost overtaken them when, fortunately, night came on, and enabled them to double the Cape of Corsica, and so elude all further pursuit. Upon the whole, however, the trip had been sufficiently successful to satisfy all concerned; while the crew, and particularly Jacopo, expressed great regrets that Dantès had not been an equal sharer with themselves in the profits, which amounted to no less a sum than fifty piastres each.

0311m

Edmond preserved the most admirable self-command, not suffering the faintest indication of a smile to escape him at the enumeration of all the benefits he would have reaped had he been able to quit the island; but as _La Jeune Amélie_ had merely come to Monte Cristo to fetch him away, he embarked that same evening, and proceeded with the captain to Leghorn.

Arrived at Leghorn, he repaired to the house of a Jew, a dealer in precious stones, to whom he disposed of four of his smallest diamonds for five thousand francs each. Dantès half feared that such valuable jewels in the hands of a poor sailor like himself might excite suspicion; but the cunning purchaser asked no troublesome questions concerning a bargain by which he gained a round

profit of at least eighty per cent.

The following day Dantès presented Jacopo with an entirely new vessel, accompanying the gift by a donation of one hundred piastres, that he might provide himself with a suitable crew and other requisites for his outfit, upon condition that he would go at once to Marseilles for the purpose of inquiring after an old man named Louis Dantès, residing in the Allées de Meilhan, and also a young woman called Mercédès, an inhabitant of the Catalan village.

Jacopo could scarcely believe his senses at receiving this magnificent present, which Dantès hastened to account for by saying that he had merely been a sailor from whim and a desire to spite his family, who did not allow him as much money as he liked to spend; but that on his arrival at Leghorn he had come into possession of a large fortune, left him by an uncle, whose sole heir he was. The superior education of Dantès gave an air of such extreme probability to this statement that it never once occurred to Jacopo to doubt its accuracy.

The term for which Edmond had engaged to serve on board _La Jeune Amélie_ having expired, Dantès took leave of the captain, who at first tried all his powers of persuasion to induce him to remain as one of the crew, but having been told the history of the legacy, he ceased to importune him further.

The following morning Jacopo set sail for Marseilles, with directions from Dantès to join him at the Island of Monte Cristo.

Having seen Jacopo fairly out of the harbor, Dantès proceeded to make his final adieus on board _La Jeune Amélie_, distributing so liberal a gratuity among her crew as to secure for him the good wishes of all, and expressions of cordial interest in all that concerned him. To the captain he promised to write when he had made up his mind as to his future plans. Then Dantès departed for Genoa.

At the moment of his arrival a small yacht was under trial in the bay; this yacht had been built by order of an Englishman, who, having heard that the Genoese excelled all other builders along the shores of the Mediterranean in the construction of fast-sailing vessels, was desirous of possessing a specimen of their skill; the price agreed upon between the Englishman and the Genoese builder was forty thousand francs. Dantès, struck with the beauty and capability of the little vessel, applied to its owner to transfer it to him, offering sixty thousand francs, upon condition that he should be allowed to take immediate possession. The proposal was too advantageous to be refused, the more so as the person for whom the yacht was intended had gone upon a tour through Switzerland, and was not expected back in less than three weeks or a month, by which time the builder reckoned upon being able to complete another. A bargain was therefore struck. Dantès led the owner of the yacht to the dwelling of a Jew; retired with the latter for a few minutes to a small back parlor, and upon their return the Jew counted out to the shipbuilder the sum of sixty thousand francs in bright gold pieces.

The delighted builder then offered his services in providing a suitable crew for the little vessel, but this Dantès declined with many thanks, saying he was accustomed to cruise about quite alone, and his principal pleasure consisted in managing his yacht himself; the only thing the builder could oblige him in would be to contrive a sort of secret closet in the cabin at his bed’s head, the closet to contain three divisions, so constructed as to be concealed from all but himself. The builder cheerfully undertook the commission, and promised to have these secret places completed by the next day, Dantès furnishing the dimensions and plan in accordance with which they were to be constructed.

0313m

Two hours afterward Dantès sailed from the port of Genoa, under the inspection of an immense crowd drawn together by curiosity to see the rich Spanish nobleman who preferred managing his own yacht. But their wonder was soon changed to admiration at seeing the perfect skill with which Dantès handled the helm. The boat, indeed, seemed to be animated with almost human intelligence, so promptly did it obey the slightest touch; and Dantès required but a short trial of his beautiful craft to acknowledge that the Genoese had not without reason attained their high reputation in the art of shipbuilding.

The spectators followed the little vessel with their eyes as long as it remained visible; they then turned their conjectures upon her probable destination. Some insisted she was making for Corsica, others the Island of Elba; bets were offered to any amount that she was bound for Spain; while Africa was positively reported by many persons as her intended course; but no one thought of Monte Cristo.

Yet thither it was that Dantès guided his vessel, and at Monte Cristo he arrived at the close of the second day; his boat had proved herself a first-class sailor, and had come the distance from Genoa in thirty-five hours. Dantès had carefully noted the general appearance of the shore, and, instead of landing at the usual place, he dropped anchor in the little creek. The island was utterly deserted, and bore no evidence of having been visited since he went away; his treasure was just as he had left it.

Early on the following morning he commenced the removal of his riches, and ere nightfall the whole of his immense wealth was safely deposited in the compartments of the secret locker.

A week passed by. Dantès employed it in manœuvring his yacht round the island, studying it as a skilful horseman would the animal he destined for some important service, till at the end of that time he was perfectly conversant with its good and bad qualities. The former Dantès proposed to augment, the latter to remedy.

Upon the eighth day he discerned a small vessel under full sail approaching Monte Cristo. As it drew near, he recognized it as the boat he had given to Jacopo. He immediately signalled it. His signal was returned, and in two hours afterwards the new-comer lay at anchor beside the yacht.

A mournful answer awaited each of Edmond's eager inquiries as to the information Jacopo had obtained. Old Dantès was dead, and Mercédès had disappeared.

Dantès listened to these melancholy tidings with outward calmness; but, leaping lightly ashore, he signified his desire to be quite alone. In a couple of hours he returned. Two of the men from Jacopo's boat came on board the yacht to assist in navigating it, and he gave orders that she should be steered direct to Marseilles. For his father's death he was in some manner prepared; but he knew not how to account for the mysterious disappearance of Mercédès.

Without divulging his secret, Dantès could not give sufficiently clear instructions to an agent. There were, besides, other particulars he was desirous of ascertaining, and those were of a nature he alone could investigate in a manner satisfactory to himself. His looking-glass had assured him, during his stay at Leghorn, that he ran no risk of recognition; moreover, he had now the means of adopting any disguise he thought proper. One fine morning, then, his yacht, followed by the little fishing-boat, boldly entered the port of Marseilles, and anchored exactly opposite the spot from whence, on the never-to-be-forgotten night of his departure for the Château d'If, he had been put on board the boat destined to convey him thither.

0315m

Still Dantès could not view without a shudder the approach of a gendarme who accompanied the officers deputed to demand his bill of health ere the yacht was permitted to hold communication with the shore; but with that perfect self-possession he had acquired during his acquaintance with Faria, Dantès coolly presented an English passport he had obtained from Leghorn, and as this gave him a standing which a French passport would not have afforded, he was informed that there existed no obstacle to his immediate debarkation.

The first person to attract the attention of Dantès, as he landed on the Canebière, was one of the crew belonging to the _Pharaon_. Edmond welcomed the meeting with this fellow—who had been one of his own sailors—as a sure means of testing the extent of the change which time had worked in his own appearance. Going straight towards him, he propounded a variety of questions on different subjects, carefully watching the man's countenance as he did so; but not a word or look implied that he had the slightest idea of ever having seen before the person with whom he was then conversing.

Giving the sailor a piece of money in return for his civility, Dantès proceeded onwards; but ere he had gone many steps he heard the man loudly calling him to stop.

Dantès instantly turned to meet him.

"I beg your pardon, sir," said the honest fellow, in almost breathless haste, "but I believe you made a mistake; you intended to give me a two-franc piece, and see, you gave me a double Napoleon."

"Thank you, my good friend. I see that I have made a trifling mistake, as you say; but by way of rewarding your honesty I give you another double Napoleon, that you may drink to my health, and be able to ask your messmates to join you."

So extreme was the surprise of the sailor, that he was unable even to thank Edmond, whose receding figure he continued to gaze after in speechless astonishment. “Some nabob from India,” was his comment.

Dantès, meanwhile, went on his way. Each step he trod oppressed his heart with fresh emotion; his first and most indelible recollections were there; not a tree, not a street, that he passed but seemed filled with dear and cherished memories. And thus he proceeded onwards till he arrived at the end of the Rue de Noailles, from whence a full view of the Allées de Meilhan was obtained. At this spot, so pregnant with fond and filial remembrances, his heart beat almost to bursting, his knees tottered under him, a mist floated over his sight, and had he not clung for support to one of the trees, he would inevitably have fallen to the ground and been crushed beneath the many vehicles continually passing there. Recovering himself, however, he wiped the perspiration from his brows, and stopped not again till he found himself at the door of the house in which his father had lived.

The nasturtiums and other plants, which his father had delighted to train before his window, had all disappeared from the upper part of the house.

Leaning against the tree, he gazed thoughtfully for a time at the upper stories of the shabby little house. Then he advanced to the door, and asked whether there were any rooms to be let. Though answered in the negative, he begged so earnestly to be permitted to visit those on the fifth floor, that, in despite of the oft-repeated assurance of the _concierge_ that they were occupied, Dantès succeeded in inducing the man to go up to the tenants, and ask permission for a gentleman to be allowed to look at them.

The tenants of the humble lodging were a young couple who had been scarcely married a week; and seeing them, Dantès sighed heavily. Nothing in the two small chambers forming the apartments remained as it had been in the time of the elder Dantès; the very paper was different, while the articles of antiquated furniture with which the rooms had been filled in Edmond’s time had all disappeared; the four walls alone remained as he had left them.

The bed belonging to the present occupants was placed as the former owner of the chamber had been accustomed to have his; and, in spite of his efforts to prevent it, the eyes of Edmond were suffused in tears as he reflected that on that spot the old man had breathed his last, vainly calling for his son.

The young couple gazed with astonishment at the sight of their visitor’s emotion, and wondered to see the large tears silently chasing each other down his otherwise stern and immovable features; but they felt the sacredness of his grief, and kindly refrained from questioning him as to its cause, while, with instinctive delicacy, they left him to indulge his sorrow alone.

0317m

When he withdrew from the scene of his painful recollections, they both accompanied him downstairs, reiterating their hope that he would come again whenever he pleased, and assuring him that their poor dwelling would ever be open to him.

As Edmond passed the door on the fourth floor, he paused to inquire whether Caderousse the tailor still dwelt there; but he received for reply, that the person in question had got into difficulties, and at the present time kept a small inn on the route from Bellegarde to Beaucaire.

Having obtained the address of the person to whom the house in the Allées de Meilhan belonged, Dantès next proceeded thither, and, under the name of Lord Wilmore (the name and title inscribed on his passport), purchased the small dwelling for the sum of twenty-five thousand francs, at least ten thousand more than it was worth; but had its owner asked half a million, it would unhesitatingly have been given.

The very same day the occupants of the apartments on the fifth floor of the house, now become the property of Dantès, were duly informed by the notary who had arranged the necessary transfer of deeds, etc., that the new landlord gave them their choice of any of the rooms in the house, without the least augmentation of rent, upon condition of their giving instant possession of the two small chambers they at present inhabited.

This strange event aroused great wonder and curiosity in the neighborhood of the Allées de Meilhan, and a multitude of theories were afloat, none of which was anywhere near the truth. But what raised public astonishment to a climax, and set all conjecture at defiance, was the knowledge that the same stranger who had in the morning visited the Allées de Meilhan had been seen in the evening walking in the little village of the Catalans, and afterwards observed to enter a poor fisherman’s hut, and to pass more than an hour in inquiring after persons who had either been dead or gone away for more than fifteen or sixteen years.

But on the following day the family from whom all these particulars had been asked received a handsome present, consisting of an entirely new fishing-boat, with two seines and a tender.

The delighted recipients of these munificent gifts would gladly have poured out their thanks to their generous benefactor, but they had seen him, upon quitting the hut, merely give some orders to a sailor, and then springing lightly on horseback, leave Marseilles by the Porte d'Aix.

Chapter 26. The Pont du Gard Inn

Such of my readers as have made a pedestrian excursion to the south of France may perchance have noticed, about midway between the town of Beaucaire and the village of Bellegarde,—a little nearer to the former than to the latter,—a small roadside inn, from the front of which hung, creaking and flapping in the wind, a sheet of tin covered with a grotesque representation of the Pont du Gard. This modern place of entertainment stood on the left-hand side of the post road, and backed upon the Rhône. It also boasted of what in Languedoc is styled a garden, consisting of a small plot of ground, on the side opposite to the main entrance reserved for the reception of guests. A few dingy olives and stunted fig-trees struggled hard for existence, but their withered dusty foliage abundantly proved how unequal was the conflict. Between these sickly shrubs grew a scanty supply of garlic, tomatoes, and eschalots; while, lone and solitary, like a forgotten sentinel, a tall pine raised its melancholy head in one of the corners of this unattractive spot, and displayed its flexible stem and fan-shaped summit dried and cracked by the fierce heat of the sub-tropical sun.

All these trees, great or small, were turned in the direction to which the Mistral blows, one of the three curses of Provence, the others being the Durance and the Parliament.

In the surrounding plain, which more resembled a dusty lake than solid ground, were scattered a few miserable stalks of wheat, the effect, no doubt, of a curious desire on the part of the agriculturists of the country to see whether such a thing as the raising of grain in those parched regions was practicable. Each stalk served as a perch for a grasshopper, which regaled the passers-by through this Egyptian scene with its strident, monotonous note.

For about seven or eight years the little tavern had been kept by a man and his wife, with two servants,—a chambermaid named Trinette, and a hostler called Pecaud. This small staff was quite equal to all the requirements, for a canal between Beaucaire and Aiguemortes had revolutionized transportation by substituting boats for the cart and the stagecoach. And, as though to add to the daily misery which this prosperous canal inflicted on the unfortunate innkeeper, whose utter ruin it was fast accomplishing, it was situated between the Rhône from which it had its source and the post-road it had depleted, not a hundred steps from the inn, of which we have given a brief but faithful description.

The innkeeper himself was a man of from forty to fifty-five years of age, tall, strong, and bony, a perfect specimen of the natives of those southern latitudes; he had dark, sparkling, and deep-set eyes, hooked nose, and teeth white as those of a carnivorous animal; his hair, like his beard, which he wore under his chin, was thick and curly, and in spite of his age but slightly interspersed with a few silvery threads. His naturally dark complexion had assumed a still further shade of brown from the habit the unfortunate man had acquired of stationing himself from morning till eve at the threshold of his door, on the lookout for guests who seldom came, yet there he stood, day after day, exposed to the meridional rays of a burning sun, with no other protection for his head than a red handkerchief twisted around it, after the manner of the Spanish muleteers. This man was our old acquaintance, Gaspard Caderousse.

His wife, on the contrary, whose maiden name had been Madeleine Radelle, was pale, meagre, and sickly-looking. Born in the neighborhood of Arles, she had shared in the beauty for which its women are proverbial; but that beauty had gradually withered beneath the devastating influence of the slow fever so prevalent among dwellers by the ponds of Aiguemortes and the marshes of Camargue. She remained nearly always in her second-floor chamber, shivering in her chair, or stretched languid and feeble on her bed, while her husband kept his daily watch at the door—a duty he performed with so much the greater willingness, as it saved him the necessity of listening to the endless plaints and murmurs of his helpmate, who never saw him without breaking out into bitter invectives against fate; to all of which her husband would calmly return an unvarying reply, in these philosophic words:

"Hush, La Carconte. It is God's pleasure that things should be so."

The sobriquet of La Carconte had been bestowed on Madeleine Radelle from the fact that she had been born in a village, so called, situated between Salon and Lambesc; and as a custom existed among the inhabitants of that part of France where Caderousse lived of styling every person by some particular and distinctive appellation, her husband had bestowed on her the name of La Carconte in place of her sweet and euphonious name of Madeleine, which, in all probability, his rude guttural language would not have enabled him to pronounce.

Still, let it not be supposed that amid this affected resignation to the will of Providence, the unfortunate innkeeper did not writhe under the double misery of seeing the hateful canal carry off his customers and his profits, and the daily infliction of his peevish partner's murmurs and lamentations.

0323m

Like other dwellers in the south, he was a man of sober habits and moderate desires, but fond of external show, vain, and addicted to display. During the days of his prosperity, not a festivity took place without himself and wife being among the spectators. He dressed in the picturesque costume worn upon grand occasions by the inhabitants of the south of France, bearing equal resemblance to the style adopted both by the Catalans and Andalusians; while La Carconte displayed the charming fashion prevalent among the women of Arles, a mode of attire borrowed equally from Greece and Arabia. But, by degrees, watch-chains, necklaces, parti-colored scarves, embroidered bodices, velvet vests, elegantly worked stockings, striped gaiters, and silver buckles for the shoes, all disappeared; and Gaspard Caderousse, unable to appear abroad in his pristine splendor, had given up any further participation in the pomps and vanities, both for himself and wife, although a bitter feeling of envious discontent filled his mind as the sound of mirth and merry music from the joyous revellers reached even the miserable hostelry to which he still clung, more for the shelter than the profit it afforded.

Caderousse, then, was, as usual, at his place of observation before the door, his eyes glancing listlessly from a piece of closely shaven grass—on which some fowls were industriously, though fruitlessly, endeavoring to turn up some grain or insect suited to their palate—to the deserted road, which led away to the north and south, when he was aroused by the shrill voice of his wife, and grumbling to himself as he went, he mounted to her chamber, first taking care, however, to set the entrance door wide open, as an invitation to any chance traveller who might be passing.

At the moment Caderousse quitted his sentry-like watch before the door, the road on which he so eagerly strained his sight was void and lonely as a desert at midday. There it lay stretching out into one interminable line of dust and sand, with its sides bordered by tall, meagre trees, altogether presenting so uninviting an appearance, that no one in his senses could have imagined that any traveller, at liberty to regulate his hours for journeying, would choose to expose himself in such a formidable Sahara.

Nevertheless, had Caderousse but retained his post a few minutes longer, he might have caught a dim outline of something approaching from the direction of Bellegarde; as the moving object drew nearer, he would easily have perceived that it consisted of a man and horse, between whom the kindest and most amiable understanding appeared to exist. The horse was of Hungarian breed, and ambled along at an easy pace. His rider was a priest, dressed in black, and wearing a three-cornered hat; and, despite of the ardent rays of a noonday sun, the pair came on with a fair degree of rapidity.

Having arrived before the Pont du Gard, the horse stopped, but whether for his own pleasure or that of his rider would have been difficult to say. However that might have been, the priest, dismounting, led his steed by the bridle in search of some place to which he could secure him. Availing himself of a handle that projected from a half-fallen door, he tied the animal safely and having drawn a red cotton handkerchief, from his pocket, wiped away the perspiration that streamed from his brow, then, advancing to the door, struck thrice with the end of his iron-shod stick.

At this unusual sound, a huge black dog came rushing to meet the daring assailant of his ordinarily tranquil abode, snarling and displaying his sharp white teeth with a determined hostility that abundantly proved how little he was accustomed to society. At that moment a heavy footstep was heard descending the wooden staircase that led from the upper floor, and, with many bows and courteous smiles, the host of the Pont du Gard besought his guest to enter.

0319m

"You are welcome, sir, most welcome!" repeated the astonished Caderousse. "Now, then, Margotin," cried he, speaking to the dog, "will you be quiet? Pray don't heed him, sir!—he only barks, he never bites. I make no doubt a glass of good wine would be

acceptable this dreadfully hot day.” Then perceiving for the first time the garb of the traveller he had to entertain, Caderousse hastily exclaimed: “A thousand pardons! I really did not observe whom I had the honor to receive under my poor roof. What would the abbé please to have? What refreshment can I offer? All I have is at his service.”

The priest gazed on the person addressing him with a long and searching gaze—there even seemed a disposition on his part to court a similar scrutiny on the part of the innkeeper; then, observing in the countenance of the latter no other expression than extreme surprise at his own want of attention to an inquiry so courteously worded, he deemed it as well to terminate this dumb show, and therefore said, speaking with a strong Italian accent, “You are, I presume, M. Caderousse?”

“Yes, sir,” answered the host, even more surprised at the question than he had been by the silence which had preceded it; “I am Gaspard Caderousse, at your service.”

“Gaspard Caderousse,” rejoined the priest. “Yes,—Christian and surname are the same. You formerly lived, I believe in the Allées de Meilhan, on the fourth floor?”

0325m

“I did.”

“And you followed the business of a tailor?”

“True, I was a tailor, till the trade fell off. It is so hot at Marseilles, that really I believe that the respectable inhabitants will in time go without any clothing whatever. But talking of heat, is there nothing I can offer you by way of refreshment?”

“Yes; let me have a bottle of your best wine, and then, with your permission, we will resume our conversation from where we left off.”

“As you please, sir,” said Caderousse, who, anxious not to lose the present opportunity of finding a customer for one of the few bottles of Cahors still remaining in his possession, hastily raised a trap-door in the floor of the apartment they were in, which served both as parlor and kitchen.

Upon issuing forth from his subterranean retreat at the expiration of five minutes, he found the abbé seated upon a wooden stool, leaning his elbow on a table, while Margotin, whose animosity seemed appeased by the unusual command of the traveller for refreshments, had crept up to him, and had established himself very comfortably between his knees, his long, skinny neck resting on his lap, while his dim eye was fixed earnestly on the traveller’s face.

“Are you quite alone?” inquired the guest, as Caderousse placed before him the bottle of wine and a glass.

“Quite, quite alone,” replied the man—“or, at least, practically so, for my poor wife, who is the only person in the house besides myself, is laid up with illness, and unable to render me the least assistance, poor thing!”

“You are married, then?” said the priest, with a show of interest, glancing round as he spoke at the scanty furnishings of the apartment.

“Ah, sir,” said Caderousse with a sigh, “it is easy to perceive I am not a rich man; but in this world a man does not thrive the better for being honest.” The abbé fixed on him a searching, penetrating glance.

“Yes, honest—I can certainly say that much for myself,” continued the innkeeper, fairly sustaining the scrutiny of the abbé’s gaze; “I can boast with truth of being an honest man; and,” continued he significantly, with a hand on his breast and shaking his head, “that is more than everyone can say nowadays.”

0327m

“So much the better for you, if what you assert be true,” said the abbé; “for I am firmly persuaded that, sooner or later, the good will be rewarded, and the wicked punished.”

“Such words as those belong to your profession,” answered Caderousse, “and you do well to repeat them; but,” added he, with a bitter expression of countenance, “one is free to believe them or not, as one pleases.”

“You are wrong to speak thus,” said the abbé; “and perhaps I may, in my own person, be able to prove to you how completely you are in error.”

“What mean you?” inquired Caderousse with a look of surprise.

“In the first place, I must be satisfied that you are the person I am in search of.”

“What proofs do you require?”

“Did you, in the year 1814 or 1815, know anything of a young sailor named Dantès?”

“Dantès? Did I know poor dear Edmond? Why, Edmond Dantès and myself were intimate friends!” exclaimed Caderousse, whose countenance flushed darkly as he caught the penetrating gaze of the abbé fixed on him, while the clear, calm eye of the questioner seemed to dilate with feverish scrutiny.

“You remind me,” said the priest, “that the young man concerning whom I asked you was said to bear the name of Edmond.”

“Said to bear the name!” repeated Caderousse, becoming excited and eager. “Why, he was so called as truly as I myself bore the appellation of Gaspard Caderousse; but tell me, I pray, what has become of poor Edmond? Did you know him? Is he alive and at liberty? Is he prosperous and happy?”

“He died a more wretched, hopeless, heart-broken prisoner than the felons who pay the penalty of their crimes at the galleys of Toulon.”

A deadly pallor followed the flush on the countenance of Caderousse, who turned away, and the priest saw him wiping the tears from his eyes with the corner of the red handkerchief twisted round his head.

“Poor fellow, poor fellow!” murmured Caderousse. “Well, there, sir, is another proof that good people are never rewarded on this earth, and that none but the wicked prosper. Ah,” continued Caderousse, speaking in the highly colored language of the South, “the world grows worse and worse. Why does not God, if he really hates the wicked, as he is said to do, send down brimstone and fire, and consume them altogether?”

“You speak as though you had loved this young Dantès,” observed the abbé, without taking any notice of his companion’s vehemence.

“And so I did,” replied Caderousse; “though once, I confess, I envied him his good fortune. But I swear to you, sir, I swear to you, by everything a man holds dear, I have, since then, deeply and sincerely lamented his unhappy fate.”

There was a brief silence, during which the fixed, searching eye of the abbé was employed in scrutinizing the agitated features of the innkeeper.

“You knew the poor lad, then?” continued Caderousse.

“I was called to see him on his dying bed, that I might administer to him the consolations of religion.”

“And of what did he die?” asked Caderousse in a choking voice.

“Of what, think you, do young and strong men die in prison, when they have scarcely numbered their thirtieth year, unless it be of imprisonment?” Caderousse wiped away the large beads of perspiration that gathered on his brow.

0329m

“But the strangest part of the story is,” resumed the abbé, “that Dantès, even in his dying moments, swore by his crucified Redeemer, that he was utterly ignorant of the cause of his detention.”

“And so he was,” murmured Caderousse. “How should he have been otherwise? Ah, sir, the poor fellow told you the truth.”

“And for that reason, he besought me to try and clear up a mystery he had never been able to penetrate, and to clear his memory should any foul spot or stain have fallen on it.”

And here the look of the abbé, becoming more and more fixed, seemed to rest with ill-concealed satisfaction on the gloomy depression which was rapidly spreading over the countenance of Caderousse.

“A rich Englishman,” continued the abbé, “who had been his companion in misfortune, but had been released from prison during the second restoration, was possessed of a diamond of immense value; this jewel he bestowed on Dantès upon himself quitting the prison, as a mark of his gratitude for the kindness and brotherly care with which Dantès had nursed him in a severe illness he underwent during his confinement. Instead of employing this diamond in attempting to bribe his jailers, who might only have taken it and then betrayed him to the governor, Dantès carefully preserved it, that in the event of his getting out of prison he might have wherewithal to live, for the sale of such a diamond would have quite sufficed to make his fortune.”

“Then, I suppose,” asked Caderousse, with eager, glowing looks, “that it was a stone of immense value?”

“Why, everything is relative,” answered the abbé. “To one in Edmond’s position the diamond certainly was of great value. It was estimated at fifty thousand francs.”

“Bless me!” exclaimed Caderousse, “fifty thousand francs! Surely the diamond was as large as a nut to be worth all that.”

“No,” replied the abbé, “it was not of such a size as that; but you shall judge for yourself. I have it with me.”

The sharp gaze of Caderousse was instantly directed towards the priest’s garments, as though hoping to discover the location of the treasure. Calmly drawing forth from his pocket a small box covered with black shagreen, the abbé opened it, and displayed to the dazzled eyes of Caderousse the sparkling jewel it contained, set in a ring of admirable workmanship.

“And that diamond,” cried Caderousse, almost breathless with eager admiration, “you say, is worth fifty thousand francs?”

“It is, without the setting, which is also valuable,” replied the abbé, as he closed the box, and returned it to his pocket, while its brilliant hues seemed still to dance before the eyes of the fascinated innkeeper.

“But how comes the diamond in your possession, sir? Did Edmond make you his heir?”

“No, merely his testamentary executor. ‘I once possessed four dear and faithful friends, besides the maiden to whom I was betrothed’ he said; ‘and I feel convinced they have all unfeignedly grieved over my loss. The name of one of the four friends is Caderousse.’” The innkeeper shivered.

“‘Another of the number,’” continued the abbé, without seeming to notice the emotion of Caderousse, “‘is called Danglars; and the third, in spite of being my rival, entertained a very sincere affection for me.’”

A fiendish smile played over the features of Caderousse, who was about to break in upon the abbé’s speech, when the latter, waving his hand, said, “Allow me to finish first, and then if you have any observations to make, you can do so afterwards. ‘The third of my friends, although my rival, was much attached to me,—his name was Fernand; that of my betrothed was’—Stay, stay,” continued the abbé, “I have forgotten what he called her.”

“Mercédès,” said Caderousse eagerly.

“True,” said the abbé, with a stifled sigh, “Mercédès it was.”

“Go on,” urged Caderousse.

“Bring me a _carafe_ of water,” said the abbé.

Caderousse quickly performed the stranger’s bidding; and after pouring some into a glass, and slowly swallowing its contents, the abbé, resuming his usual placidity of manner, said, as he placed his empty glass on the table:

“Where did we leave off?”

“The name of Edmond’s betrothed was Mercédès.”

“To be sure. ‘You will go to Marseilles,’ said Dantès,—for you understand, I repeat his words just as he uttered them. Do you understand?”

“Perfectly.”

“‘You will sell this diamond; you will divide the money into five equal parts, and give an equal portion to these good friends, the only persons who have loved me upon earth.’”

“But why into five parts?” asked Caderousse; “you only mentioned four persons.”

“Because the fifth is dead, as I hear. The fifth sharer in Edmond’s bequest, was his own father.”

“Too true, too true!” ejaculated Caderousse, almost suffocated by the contending passions which assailed him, “the poor old man did die.”

“I learned so much at Marseilles,” replied the abbé, making a strong effort to appear indifferent; “but from the length of time that has elapsed since the death of the elder Dantès, I was unable to obtain any particulars of his end. Can you enlighten me on that point?”

“I do not know who could if I could not,” said Caderousse. “Why, I lived almost on the same floor with the poor old man. Ah, yes, about a year after the disappearance of his son the poor old man died.”

“Of what did he die?”

“Why, the doctors called his complaint gastro-enteritis, I believe; his acquaintances say he died of grief; but I, who saw him in his dying moments, I say he died of——”

Caderousse paused.

“Of what?” asked the priest, anxiously and eagerly.

“Why, of downright starvation.”

“Starvation!” exclaimed the abbé, springing from his seat. “Why, the vilest animals are not suffered to die by such a death as that. The very dogs that wander houseless and homeless in the streets find some pitying hand to cast them a mouthful of bread; and that a man, a Christian, should be allowed to perish of hunger in the midst of other men who call themselves Christians, is too horrible for belief. Oh, it is impossible!—utterly impossible!”

“What I have said, I have said,” answered Caderousse.

“And you are a fool for having said anything about it,” said a voice from the top of the stairs. “Why should you meddle with what does not concern you?”

The two men turned quickly, and saw the sickly countenance of La Carconte peering between the baluster rails; attracted by the sound of voices, she had feebly dragged herself down the stairs, and, seated on the lower step, head on knees, she had listened to the foregoing conversation.

“Mind your own business, wife,” replied Caderousse sharply. “This gentleman asks me for information, which common politeness will not permit me to refuse.”

“Politeness, you simpleton!” retorted La Carconte. “What have you to do with politeness, I should like to know? Better study a little common prudence. How do you know the motives that person may have for trying to extract all he can from you?”

“I pledge you my word, madam,” said the abbé, “that my intentions are good; and that your husband can incur no risk, provided he answers me candidly.”

“Ah, that’s all very fine,” retorted the woman. “Nothing is easier than to begin with fair promises and assurances of nothing to fear; but when poor, silly folks, like my husband there, have been persuaded to tell all they know, the promises and assurances of safety are quickly forgotten; and at some moment when nobody is expecting it, behold trouble and misery, and all sorts of persecutions, are heaped on the unfortunate wretches, who cannot even see whence all their afflictions come.”

“Nay, nay, my good woman, make yourself perfectly easy, I beg of you. Whatever evils may befall you, they will not be occasioned by my instrumentality, that I solemnly promise you.”

La Carconte muttered a few inarticulate words, then let her head again drop upon her knees, and went into a fit of ague, leaving the two speakers to resume the conversation, but remaining so as to be able to hear every word they uttered. Again the abbé had been

obliged to swallow a draught of water to calm the emotions that threatened to overpower him.

When he had sufficiently recovered himself, he said, “It appears, then, that the miserable old man you were telling me of was forsaken by everyone. Surely, had not such been the case, he would not have perished by so dreadful a death.”

“Why, he was not altogether forsaken,” continued Caderousse, “for Mercédès the Catalan and Monsieur Morrel were very kind to him; but somehow the poor old man had contracted a profound hatred for Fernand—the very person,” added Caderousse with a bitter smile, “that you named just now as being one of Dantès’ faithful and attached friends.”

“And was he not so?” asked the abbé.

“Gaspard, Gaspard!” murmured the woman, from her seat on the stairs, “mind what you are saying!”

Caderousse made no reply to these words, though evidently irritated and annoyed by the interruption, but, addressing the abbé, said, “Can a man be faithful to another whose wife he covets and desires for himself? But Dantès was so honorable and true in his own nature, that he believed everybody’s professions of friendship. Poor Edmond, he was cruelly deceived; but it was fortunate that he never knew, or he might have found it more difficult, when on his deathbed, to pardon his enemies. And, whatever people may say,” continued Caderousse, in his native language, which was not altogether devoid of rude poetry, “I cannot help being more frightened at the idea of the malediction of the dead than the hatred of the living.”

“Imbecile!” exclaimed La Carconte.

“Do you, then, know in what manner Fernand injured Dantès?” inquired the abbé of Caderousse.

“Do I? No one better.”

“Speak out then, say what it was!”

“Gaspard!” cried La Carconte, “do as you will; you are master—but if you take my advice you’ll hold your tongue.”

“Well, wife,” replied Caderousse, “I don’t know but what you’re right!”

“So you will say nothing?” asked the abbé.

“Why, what good would it do?” asked Caderousse. “If the poor lad were living, and came to me and begged that I would candidly tell which were his true and which his false friends, why, perhaps, I should not hesitate. But you tell me he is no more, and therefore can have nothing to do with hatred or revenge, so let all such feeling be buried with him.”

“You prefer, then,” said the abbé, “that I should bestow on men you say are false and treacherous, the reward intended for faithful friendship?”

“That is true enough,” returned Caderousse. “You say truly, the gift of poor Edmond was not meant for such traitors as Fernand and Danglars; besides, what would it be to them? no more than a drop of water in the ocean.”

“Remember,” chimed in La Carconte, “those two could crush you at a single blow!”

“How so?” inquired the abbé. “Are these persons, then, so rich and powerful?”

“Do you not know their history?”

“I do not. Pray relate it to me!”

Caderousse seemed to reflect for a few moments, then said, “No, truly, it would take up too much time.”

“Well, my good friend,” returned the abbé, in a tone that indicated utter indifference on his part, “you are at liberty, either to speak or be silent, just as you please; for my own part, I respect your scruples and admire your sentiments; so let the matter end. I shall do my duty as conscientiously as I can, and fulfil my promise to the dying man. My first business will be to dispose of this diamond.”

So saying, the abbé again drew the small box from his pocket, opened it, and contrived to hold it in such a light, that a bright flash of brilliant hues passed before the dazzled gaze of Caderousse.

“Wife, wife!” cried he in a hoarse voice, “come here!”

“Diamond!” exclaimed La Carconte, rising and descending to the chamber with a tolerably firm step; “what diamond are you talking about?”

“Why, did you not hear all we said?” inquired Caderousse. “It is a beautiful diamond left by poor Edmond Dantès, to be sold, and the money divided between his father, Mercédès, his betrothed bride, Fernand, Danglars, and myself. The jewel is worth at least fifty thousand francs.”

“Oh, what a magnificent jewel!” cried the astonished woman.

“The fifth part of the profits from this stone belongs to us then, does it not?” asked Caderousse.

“It does,” replied the abbé; “with the addition of an equal division of that part intended for the elder Dantès, which I believe myself at liberty to divide equally with the four survivors.”

“And why among us four?” inquired Caderousse.

“As being the friends Edmond esteemed most faithful and devoted to him.”

“I don’t call those friends who betray and ruin you,” murmured the wife in her turn, in a low, muttering voice.

“Of course not!” rejoined Caderousse quickly; “no more do I, and that was what I was observing to this gentleman just now. I said I looked upon it as a sacrilegious profanation to reward treachery, perhaps crime.”

“Remember,” answered the abbé calmly, as he replaced the jewel and its case in the pocket of his cassock, “it is your fault, not mine, that I do so. You will have the goodness to furnish me with the address of both Fernand and Danglars, in order that I may execute Edmond’s last wishes.”

The agitation of Caderousse became extreme, and large drops of perspiration rolled from his heated brow. As he saw the abbé rise from his seat and go towards the door, as though to ascertain if his horse were sufficiently refreshed to continue his journey, Caderousse and his wife exchanged looks of deep meaning.

0335m

“There, you see, wife,” said the former, “this splendid diamond might all be ours, if we chose!”

“Do you believe it?”

“Why, surely a man of his holy profession would not deceive us!”

“Well,” replied La Carconte, “do as you like. For my part, I wash my hands of the affair.”

So saying, she once more climbed the staircase leading to her chamber, her body convulsed with chills, and her teeth rattling in her head, in spite of the intense heat of the weather. Arrived at the top stair, she turned round, and called out, in a warning tone, to her husband, “Gaspard, consider well what you are about to do!”

“I have both reflected and decided,” answered he.

La Carconte then entered her chamber, the flooring of which creaked beneath her heavy, uncertain tread, as she proceeded towards her armchair, into which she fell as though exhausted.

“Well,” asked the abbé, as he returned to the apartment below, “what have you made up your mind to do?”

“To tell you all I know,” was the reply.

“I certainly think you act wisely in so doing,” said the priest. “Not because I have the least desire to learn anything you may please to conceal from me, but simply that if, through your assistance, I could distribute the legacy according to the wishes of the testator, why, so much the better, that is all.”

“I hope it may be so,” replied Caderousse, his face flushed with cupidity.

“I am all attention,” said the abbé.

“Stop a minute,” answered Caderousse; “we might be interrupted in the most interesting part of my story, which would be a pity; and it is as well that your visit hither should be made known only to ourselves.”

With these words he went stealthily to the door, which he closed, and, by way of still greater precaution, bolted and barred it, as he was accustomed to do at night.

During this time the abbé had chosen his place for listening at his ease. He removed his seat into a corner of the room, where he himself would be in deep shadow, while the light would be fully thrown on the narrator; then, with head bent down and hands clasped, or rather clenched together, he prepared to give his whole attention to Caderousse, who seated himself on the little stool, exactly opposite to him.

“Remember, this is no affair of mine,” said the trembling voice of La Carconte, as though through the flooring of her chamber she viewed the scene that was enacting below.

“Enough, enough!” replied Caderousse; “say no more about it; I will take all the consequences upon myself.”

And he began his story.

Chapter 27. The Story

First, sir,” said Caderousse, “you must make me a promise.”

“What is that?” inquired the abbé.

“Why, if you ever make use of the details I am about to give you, that you will never let anyone know that it was I who supplied them; for the persons of whom I am about to talk are rich and powerful, and if they only laid the tips of their fingers on me, I should break to pieces like glass.”

“Make yourself easy, my friend,” replied the abbé. “I am a priest, and confessions die in my breast. Recollect, our only desire is to carry out, in a fitting manner, the last wishes of our friend. Speak, then, without reserve, as without hatred; tell the truth, the whole truth; I do not know, never may know, the persons of whom you are about to speak; besides, I am an Italian, and not a Frenchman, and belong to God, and not to man, and I shall shortly retire to my convent, which I have only quitted to fulfil the last wishes of a dying man.”

This positive assurance seemed to give Caderousse a little courage.

“Well, then, under these circumstances,” said Caderousse, “I will, I even believe I ought to undeceive you as to the friendship which poor Edmond thought so sincere and unquestionable.”

“Begin with his father, if you please.” said the abbé; “Edmond talked to me a great deal about the old man for whom he had the deepest love.”

“The history is a sad one, sir,” said Caderousse, shaking his head; “perhaps you know all the earlier part of it?”

“Yes.” answered the abbé; “Edmond related to me everything until the moment when he was arrested in a small cabaret close to Marseilles.”

“At La Réserve! Oh, yes; I can see it all before me this moment.”

“Was it not his betrothal feast?”

“It was and the feast that began so gayly had a very sorrowful ending; a police commissary, followed by four soldiers, entered, and Dantès was arrested.”

“Yes, and up to this point I know all,” said the priest. “Dantès himself only knew that which personally concerned him, for he never beheld again the five persons I have named to you, or heard mention of anyone of them.”

“Well, when Dantès was arrested, Monsieur Morrel hastened to obtain the particulars, and they were very sad. The old man returned alone to his home, folded up his wedding suit with tears in his eyes, and paced up and down his chamber the whole day, and would not go to bed at all, for I was underneath him and heard him walking the whole night; and for myself, I assure you I could

not sleep either, for the grief of the poor father gave me great uneasiness, and every step he took went to my heart as really as if his foot had pressed against my breast.

“The next day Mercédès came to implore the protection of M. de Villefort; she did not obtain it, however, and went to visit the old man; when she saw him so miserable and heart-broken, having passed a sleepless night, and not touched food since the previous day, she wished him to go with her that she might take care of him; but the old man would not consent. ‘No,’ was the old man’s reply, ‘I will not leave this house, for my poor dear boy loves me better than anything in the world; and if he gets out of prison he will come and see me the first thing, and what would he think if I did not wait here for him?’ I heard all this from the window, for I was anxious that Mercédès should persuade the old man to accompany her, for his footsteps over my head night and day did not leave me a moment’s repose.”

“But did you not go upstairs and try to console the poor old man?” asked the abbé.

“Ah, sir,” replied Caderousse, “we cannot console those who will not be consoled, and he was one of these; besides, I know not why, but he seemed to dislike seeing me. One night, however, I heard his sobs, and I could not resist my desire to go up to him, but when I reached his door he was no longer weeping but praying. I cannot now repeat to you, sir, all the eloquent words and imploring language he made use of; it was more than piety, it was more than grief, and I, who am no canter, and hate the Jesuits, said then to myself, ‘It is really well, and I am very glad that I have not any children; for if I were a father and felt such excessive grief as the old man does, and did not find in my memory or heart all he is now saying, I should throw myself into the sea at once, for I could not bear it.’”

“Poor father!” murmured the priest.

“From day to day he lived on alone, and more and more solitary. M. Morrel and Mercédès came to see him, but his door was closed; and, although I was certain he was at home, he would not make any answer. One day, when, contrary to his custom, he had admitted Mercédès, and the poor girl, in spite of her own grief and despair, endeavored to console him, he said to her,—‘Be assured, my dear daughter, he is dead; and instead of expecting him, it is he who is awaiting us; I am quite happy, for I am the oldest, and of course shall see him first.’

“However well disposed a person may be, why, you see we leave off after a time seeing persons who are in sorrow, they make one melancholy; and so at last old Dantès was left all to himself, and I only saw from time to time strangers go up to him and come down again with some bundle they tried to hide; but I guessed what these bundles were, and that he sold by degrees what he had to pay for his subsistence. At length the poor old fellow reached the end of all he had; he owed three quarters’ rent, and they threatened to turn him out; he begged for another week, which was granted to him. I know this, because the landlord came into my apartment when he left his.

“For the first three days I heard him walking about as usual, but, on the fourth I heard nothing. I then resolved to go up to him at all risks. The door was closed, but I looked through the keyhole, and saw him so pale and haggard, that believing him very ill, I went and told M. Morrel and then ran on to Mercédès. They both came immediately, M. Morrel bringing a doctor, and the doctor said it was inflammation of the bowels, and ordered him a limited diet. I was there, too, and I never shall forget the old man’s smile at this prescription.

“From that time he received all who came; he had an excuse for not eating any more; the doctor had put him on a diet.”

The abbé uttered a kind of groan.

“The story interests you, does it not, sir?” inquired Caderousse.

“Yes,” replied the abbé, “it is very affecting.”

“Mercédès came again, and she found him so altered that she was even more anxious than before to have him taken to her own home. This was M. Morrel’s wish also, who would fain have conveyed the old man against his consent; but the old man resisted, and cried so that they were actually frightened. Mercédès remained, therefore, by his bedside, and M. Morrel went away, making a sign to the Catalan that he had left his purse on the chimney-piece; but, availing himself of the doctor’s order, the old man would not take any sustenance; at length (after nine days of despair and fasting), the old man died, cursing those who had caused his misery, and saying to Mercédès, ‘If you ever see my Edmond again, tell him I die blessing him.’”

The abbé rose from his chair, made two turns round the chamber, and pressed his trembling hand against his parched throat.

“And you believe he died——”

“Of hunger, sir, of hunger,” said Caderousse. “I am as certain of it as that we two are Christians.”

The abbé, with a shaking hand, seized a glass of water that was standing by him half-full, swallowed it at one gulp, and then resumed his seat, with red eyes and pale cheeks.

“This was, indeed, a horrid event,” said he in a hoarse voice.

“The more so, sir, as it was men’s and not God’s doing.”

“Tell me of those men,” said the abbé, “and remember too,” he added in an almost menacing tone, “you have promised to tell me everything. Tell me, therefore, who are these men who killed the son with despair, and the father with famine?”

“Two men jealous of him, sir; one from love, and the other from ambition,—Fernand and Danglars.”

“How was this jealousy manifested? Speak on.”

“They denounced Edmond as a Bonapartist agent.”

“Which of the two denounced him? Which was the real delinquent?”

“Both, sir; one with a letter, and the other put it in the post.”

“And where was this letter written?”

“At La Réserve, the day before the betrothal feast.”

“’Twas so, then—’twas so, then,” murmured the abbé. “Oh, Faria, Faria, how well did you judge men and things!”

“What did you please to say, sir?” asked Caderousse.

“Nothing, nothing,” replied the priest; “go on.”

“It was Danglars who wrote the denunciation with his left hand, that his writing might not be recognized, and Fernand who put it in the post.”

“But,” exclaimed the abbé suddenly, “you were there yourself.”

“I!” said Caderousse, astonished; “who told you I was there?”

The abbé saw he had overshot the mark, and he added quickly,—“No one; but in order to have known everything so well, you must have been an eye-witness.”

“True, true!” said Caderousse in a choking voice, “I was there.”

“And did you not remonstrate against such infamy?” asked the abbé; “if not, you were an accomplice.”

“Sir,” replied Caderousse, “they had made me drink to such an excess that I nearly lost all perception. I had only an indistinct understanding of what was passing around me. I said all that a man in such a state could say; but they both assured me that it was a jest they were carrying on, and perfectly harmless.”

“Next day—next day, sir, you must have seen plain enough what they had been doing, yet you said nothing, though you were present when Dantès was arrested.”

“Yes, sir, I was there, and very anxious to speak; but Danglars restrained me. ‘If he should really be guilty,’ said he, ‘and did really put in to the Island of Elba; if he is really charged with a letter for the Bonapartist committee at Paris, and if they find this letter upon him, those who have supported him will pass for his accomplices.’ I confess I had my fears, in the state in which politics then were, and I held my tongue. It was cowardly, I confess, but it was not criminal.”

“I understand—you allowed matters to take their course, that was all.”

“Yes, sir,” answered Caderousse; “and remorse preys on me night and day. I often ask pardon of God, I swear to you, because this action, the only one with which I have seriously to reproach myself in all my life, is no doubt the cause of my abject condition. I am expiating a moment of selfishness, and so I always say to La Carconte, when she complains, ‘Hold your tongue, woman; it is the will of God.’” And Caderousse bowed his head with every sign of real repentance.

“Well, sir,” said the abbé, “you have spoken unreservedly; and thus to accuse yourself is to deserve pardon.”

“Unfortunately, Edmond is dead, and has not pardoned me.”

“He did not know,” said the abbé.

“But he knows it all now,” interrupted Caderousse; “they say the dead know everything.”

There was a brief silence; the abbé rose and paced up and down pensively, and then resumed his seat.

“You have two or three times mentioned a M. Morrel,” he said; “who was he?”

“The owner of the _Pharaon_ and patron of Dantès.”

“And what part did he play in this sad drama?” inquired the abbé.

“The part of an honest man, full of courage and real regard. Twenty times he interceded for Edmond. When the emperor returned, he wrote, implored, threatened, and so energetically, that on the second restoration he was persecuted as a Bonapartist. Ten times, as I told you, he came to see Dantès’ father, and offered to receive him in his own house; and the night or two before his death, as I have already said, he left his purse on the mantelpiece, with which they paid the old man’s debts, and buried him decently; and so Edmond’s father died, as he had lived, without doing harm to anyone. I have the purse still by me—a large one, made of red silk.”

“And,” asked the abbé, “is M. Morrel still alive?”

“Yes,” replied Caderousse.

“In that case,” replied the abbé, “he should be a man blessed of God, rich, happy.”

Caderousse smiled bitterly. “Yes, happy as myself,” said he.

“What! M. Morrel unhappy?” exclaimed the abbé.

“He is reduced almost to the last extremity—nay, he is almost at the point of dishonor.”

“How?”

“Yes,” continued Caderousse, “so it is; after five-and-twenty years of labor, after having acquired a most honorable name in the trade of Marseilles, M. Morrel is utterly ruined; he has lost five ships in two years, has suffered by the bankruptcy of three large houses, and his only hope now is in that very _Pharaon_ which poor Dantès commanded, and which is expected from the Indies with a cargo of cochineal and indigo. If this ship founders, like the others, he is a ruined man.”

“And has the unfortunate man wife or children?” inquired the abbé.

“Yes, he has a wife, who through everything has behaved like an angel; he has a daughter, who was about to marry the man she loved, but whose family now will not allow him to wed the daughter of a ruined man; he has, besides, a son, a lieutenant in the army; and, as you may suppose, all this, instead of lessening, only augments his sorrows. If he were alone in the world he would blow out his brains, and there would be an end.”

“Horrible!” ejaculated the priest.

“And it is thus heaven recompenses virtue, sir,” added Caderousse. “You see, I, who never did a bad action but that I have told you of—am in destitution, with my poor wife dying of fever before my very eyes, and I unable to do anything in the world for her; I shall die of hunger, as old Dantès did, while Fernand and Danglars are rolling in wealth.”

“How is that?”

“Because their deeds have brought them good fortune, while honest men have been reduced to misery.”

“What has become of Danglars, the instigator, and therefore the most guilty?”

“What has become of him? Why, he left Marseilles, and was taken, on the recommendation of M. Morrel, who did not know his crime, as cashier into a Spanish bank. During the war with Spain he was employed in the commissariat of the French army, and made a fortune; then with that money he speculated in the funds, and trebled or quadrupled his capital; and, having first married his banker’s daughter, who left him a widower, he has married a second time, a widow, a Madame de Nargonne, daughter of M. de Servieux, the king’s chamberlain, who is in high favor at court. He is a millionaire, and they have made him a baron, and now he is the Baron Danglars, with a fine residence in the Rue du Mont-Blanc, with ten horses in his stables, six footmen in his antechamber, and I know not how many millions in his strongbox.”

“Ah!” said the abbé, in a peculiar tone, “he is happy.”

“Happy? Who can answer for that? Happiness or unhappiness is the secret known but to one’s self and the walls—walls have ears but no tongue; but if a large fortune produces happiness, Danglars is happy.”

“And Fernand?”

“Fernand? Why, much the same story.”

“But how could a poor Catalan fisher-boy, without education or resources, make a fortune? I confess this staggers me.”

“And it has staggered everybody. There must have been in his life some strange secret that no one knows.”

“But, then, by what visible steps has he attained this high fortune or high position?”

“Both, sir—he has both fortune and position—both.”

“This must be impossible!”

“It would seem so; but listen, and you will understand. Some days before the return of the emperor, Fernand was drafted. The Bourbons left him quietly enough at the Catalans, but Napoleon returned, a special levy was made, and Fernand was compelled to join. I went too; but as I was older than Fernand, and had just married my poor wife, I was only sent to the coast. Fernand was enrolled in the active army, went to the frontier with his regiment, and was at the battle of Ligny. The night after that battle he was sentry at the door of a general who carried on a secret correspondence with the enemy. That same night the general was to go over to the English. He proposed to Fernand to accompany him; Fernand agreed to do so, deserted his post, and followed the general.

“Fernand would have been court-martialed if Napoleon had remained on the throne, but his action was rewarded by the Bourbons. He returned to France with the epaulet of sub-lieutenant, and as the protection of the general, who is in the highest favor, was accorded to him, he was a captain in 1823, during the Spanish war—that is to say, at the time when Danglars made his early speculations. Fernand was a Spaniard, and being sent to Spain to ascertain the feeling of his fellow-countrymen, found Danglars there, got on very intimate terms with him, won over the support of the royalists at the capital and in the provinces, received promises and made pledges on his own part, guided his regiment by paths known to himself alone through the mountain gorges which were held by the royalists, and, in fact, rendered such services in this brief campaign that, after the taking of Trocadero, he was made colonel, and received the title of count and the cross of an officer of the Legion of Honor.”

“Destiny! destiny!” murmured the abbé.

“Yes, but listen: this was not all. The war with Spain being ended, Fernand’s career was checked by the long peace which seemed likely to endure throughout Europe. Greece only had risen against Turkey, and had begun her war of independence; all eyes were turned towards Athens—it was the fashion to pity and support the Greeks. The French government, without protecting them openly, as you know, gave countenance to volunteer assistance. Fernand sought and obtained leave to go and serve in Greece, still having his name kept on the army roll.

Some time after, it was stated that the Comte de Morcerf (this was the name he bore) had entered the service of Ali Pasha with the rank of instructor-general. Ali Pasha was killed, as you know, but before he died he recompensed the services of Fernand by leaving him a considerable sum, with which he returned to France, when he was gazetted lieutenant-general."

"So that now——?" inquired the abbé.

"So that now," continued Caderousse, "he owns a magnificent house—No. 27, Rue du Helder, Paris."

The abbé opened his mouth, hesitated for a moment, then, making an effort at self-control, he said, "And Mercédès—they tell me that she has disappeared?"

"Disappeared," said Caderousse, "yes, as the sun disappears, to rise the next day with still more splendor."

"Has she made a fortune also?" inquired the abbé, with an ironical smile.

"Mercédès is at this moment one of the greatest ladies in Paris," replied Caderousse.

"Go on," said the abbé; "it seems as if I were listening to the story of a dream. But I have seen things so extraordinary, that what you tell me seems less astonishing than it otherwise might."

"Mercédès was at first in the deepest despair at the blow which deprived her of Edmond. I have told you of her attempts to propitiate M. de Villefort, her devotion to the elder Dantès. In the midst of her despair, a new affliction overtook her. This was the departure of Fernand—of Fernand, whose crime she did not know, and whom she regarded as her brother. Fernand went, and Mercédès remained alone.

"Three months passed and still she wept—no news of Edmond, no news of Fernand, no companionship save that of an old man who was dying with despair. One evening, after a day of accustomed vigil at the angle of two roads leading to Marseilles from the Catalans, she returned to her home more depressed than ever. Suddenly she heard a step she knew, turned anxiously around, the door opened, and Fernand, dressed in the uniform of a sub-lieutenant, stood before her.

"It was not the one she wished for most, but it seemed as if a part of her past life had returned to her.

"Mercédès seized Fernand's hands with a transport which he took for love, but which was only joy at being no longer alone in the world, and seeing at last a friend, after long hours of solitary sorrow. And then, it must be confessed, Fernand had never been hated—he was only not precisely loved. Another possessed all Mercédès' heart; that other was absent, had disappeared, perhaps was dead. At this last thought Mercédès burst into a flood of tears, and wrung her hands in agony; but the thought, which she had always repelled before when it was suggested to her by another, came now in full force upon her mind; and then, too, old Dantès incessantly said to her, 'Our Edmond is dead; if he were not, he would return to us.'

"The old man died, as I have told you; had he lived, Mercédès, perchance, had not become the wife of another, for he would have been there to reproach her infidelity. Fernand saw this, and when he learned of the old man's death he returned. He was now a lieutenant. At his first coming he had not said a word of love to Mercédès; at the second he reminded her that he loved her.

"Mercédès begged for six months more in which to await and mourn for Edmond."

"So that," said the abbé, with a bitter smile, "that makes eighteen months in all. What more could the most devoted lover desire?" Then he murmured the words of the English poet, "'Frailty, thy name is woman.'"

"Six months afterwards," continued Caderousse, "the marriage took place in the church of Accoules."

"The very church in which she was to have married Edmond," murmured the priest; "there was only a change of bridegrooms."

"Well, Mercédès was married," proceeded Caderousse; "but although in the eyes of the world she appeared calm, she nearly fainted as she passed La Réserve, where, eighteen months before, the betrothal had been celebrated with him whom she might have known she still loved, had she looked to the bottom of her heart. Fernand, more happy, but not more at his ease—for I saw at this time he was in constant dread of Edmond's return—Fernand was very anxious to get his wife away, and to depart himself. There were too many unpleasant possibilities associated with the Catalans, and eight days after the wedding they left Marseilles."

"Did you ever see Mercédès again?" inquired the priest.

“Yes, during the Spanish war, at Perpignan, where Fernand had left her; she was attending to the education of her son.”

The abbé started. “Her son?” said he.

“Yes,” replied Caderousse, “little Albert.”

“But, then, to be able to instruct her child,” continued the abbé, “she must have received an education herself. I understood from Edmond that she was the daughter of a simple fisherman, beautiful but uneducated.”

“Oh,” replied Caderousse, “did he know so little of his lovely betrothed? Mercédès might have been a queen, sir, if the crown were to be placed on the heads of the loveliest and most intelligent. Fernand’s fortune was already waxing great, and she developed with his growing fortune. She learned drawing, music—everything. Besides, I believe, between ourselves, she did this in order to distract her mind, that she might forget; and she only filled her head in order to alleviate the weight on her heart. But now her position in life is assured,” continued Caderousse; “no doubt fortune and honors have comforted her; she is rich, a countess, and yet——”

Caderousse paused.

“And yet what?” asked the abbé.

“Yet, I am sure, she is not happy,” said Caderousse.

“What makes you believe this?”

“Why, when I found myself utterly destitute, I thought my old friends would, perhaps, assist me. So I went to Danglars, who would not even receive me. I called on Fernand, who sent me a hundred francs by his valet-de-chambre.”

“Then you did not see either of them?”

“No, but Madame de Morcerf saw me.”

“How was that?”

“As I went away a purse fell at my feet—it contained five-and-twenty louis; I raised my head quickly, and saw Mercédès, who at once shut the blind.”

“And M. de Villefort?” asked the abbé.

“Oh, he never was a friend of mine, I did not know him, and I had nothing to ask of him.”

“Do you not know what became of him, and the share he had in Edmond’s misfortunes?”

“No; I only know that some time after Edmond’s arrest, he married Mademoiselle de Saint-Méran, and soon after left Marseilles; no doubt he has been as lucky as the rest; no doubt he is as rich as Danglars, as high in station as Fernand. I only, as you see, have remained poor, wretched, and forgotten.”

“You are mistaken, my friend,” replied the abbé; “God may seem sometimes to forget for a time, while his justice reposes, but there always comes a moment when he remembers—and behold—a proof!”

As he spoke, the abbé took the diamond from his pocket, and giving it to Caderousse, said, “Here, my friend, take this diamond, it is yours.”

“What, for me only?” cried Caderousse, “ah, sir, do not jest with me!”

“This diamond was to have been shared among his friends. Edmond had one friend only, and thus it cannot be divided. Take the diamond, then, and sell it; it is worth fifty thousand francs, and I repeat my wish that this sum may suffice to release you from your wretchedness.”

0351m

“Oh, sir,” said Caderousse, putting out one hand timidly, and with the other wiping away the perspiration which bedewed his brow,—“Oh, sir, do not make a jest of the happiness or despair of a man.”

“I know what happiness and what despair are, and I never make a jest of such feelings. Take it, then, but in exchange——”

Caderousse, who touched the diamond, withdrew his hand.

The abbé smiled.

“In exchange,” he continued, “give me the red silk purse that M. Morrel left on old Dantès’ chimney-piece, and which you tell me is still in your hands.”

Caderousse, more and more astonished, went toward a large oaken cupboard, opened it, and gave the abbé a long purse of faded red silk, round which were two copper runners that had once been gilt. The abbé took it, and in return gave Caderousse the diamond.

“Oh, you are a man of God, sir,” cried Caderousse; “for no one knew that Edmond had given you this diamond, and you might have kept it.”

“Which,” said the abbé to himself, “you would have done.” The abbé rose, took his hat and gloves. “Well,” he said, “all you have told me is perfectly true, then, and I may believe it in every particular.”

“See, sir,” replied Caderousse, “in this corner is a crucifix in holy wood—here on this shelf is my wife’s testament; open this book, and I will swear upon it with my hand on the crucifix. I will swear to you by my soul’s salvation, my faith as a Christian, I have told everything to you as it occurred, and as the recording angel will tell it to the ear of God at the day of the last judgment!”

“’Tis well,” said the abbé, convinced by his manner and tone that Caderousse spoke the truth. “’Tis well, and may this money profit you! Adieu; I go far from men who thus so bitterly injure each other.”

The abbé with difficulty got away from the enthusiastic thanks of Caderousse, opened the door himself, got out and mounted his horse, once more saluted the innkeeper, who kept uttering his loud farewells, and then returned by the road he had travelled in coming.

When Caderousse turned around, he saw behind him La Carconte, paler and trembling more than ever.

“Is, then, all that I have heard really true?” she inquired.

“What? That he has given the diamond to us only?” inquired Caderousse, half bewildered with joy; “yes, nothing more true! See, here it is.”

The woman gazed at it a moment, and then said, in a gloomy voice, “Suppose it’s false?”

Caderousse started and turned pale.

“False!” he muttered. “False! Why should that man give me a false diamond?”

0349m

“To get your secret without paying for it, you blockhead!”

Caderousse remained for a moment aghast under the weight of such an idea.

“Oh!” he said, taking up his hat, which he placed on the red handkerchief tied round his head, “we will soon find out.”

“In what way?”

“Why, the fair is on at Beaucaire, there are always jewellers from Paris there, and I will show it to them. Look after the house, wife, and I shall be back in two hours,” and Caderousse left the house in haste, and ran rapidly in the direction opposite to that which the priest had taken.

“Fifty thousand francs!” muttered La Carconte when left alone; “it is a large sum of money, but it is not a fortune.”

Chapter 28. The Prison Register

The day after that in which the scene we have just described had taken place on the road between Bellegarde and Beaucaire, a man of about thirty or two-and-thirty, dressed in a bright blue frock coat, nankeen trousers, and a white waistcoat, having the appearance and accent of an Englishman, presented himself before the mayor of Marseilles.

“Sir,” said he, “I am chief clerk of the house of Thomson & French, of Rome. We are, and have been these ten years, connected with the house of Morrel & Son, of Marseilles. We have a hundred thousand francs or thereabouts loaned on their securities, and we are a little uneasy at reports that have reached us that the firm is on the brink of ruin. I have come, therefore, express from Rome, to ask you for information.”

“Sir,” replied the mayor. “I know very well that during the last four or five years misfortune has seemed to pursue M. Morrel. He has lost four or five vessels, and suffered by three or four bankruptcies; but it is not for me, although I am a creditor myself to the amount of ten thousand francs, to give any information as to the state of his finances. Ask of me, as mayor, what is my opinion of M. Morrel, and I shall say that he is a man honorable to the last degree, and who has up to this time fulfilled every engagement with scrupulous punctuality. This is all I can say, sir; if you wish to learn more, address yourself to M. de Boville, the inspector of prisons, No. 15, Rue de Nouailles; he has, I believe, two hundred thousand francs in Morrel’s hands, and if there be any grounds for apprehension, as this is a greater amount than mine, you will most probably find him better informed than myself.”

The Englishman seemed to appreciate this extreme delicacy, made his bow and went away, proceeding with a characteristic British stride towards the street mentioned.

M. de Boville was in his private room, and the Englishman, on perceiving him, made a gesture of surprise, which seemed to indicate that it was not the first time he had been in his presence. As to M. de Boville, he was in such a state of despair, that it was evident all the faculties of his mind, absorbed in the thought which occupied him at the moment, did not allow either his memory or his imagination to stray to the past.

The Englishman, with the coolness of his nation, addressed him in terms nearly similar to those with which he had accosted the mayor of Marseilles.

“Oh, sir,” exclaimed M. de Boville, “your fears are unfortunately but too well founded, and you see before you a man in despair. I had two hundred thousand francs placed in the hands of Morrel & Son; these two hundred thousand francs were the dowry of my daughter, who was to be married in a fortnight, and these two hundred thousand francs were payable, half on the 15th of this month, and the other half on the 15th of next month. I had informed M. Morrel of my desire to have these payments punctually, and he has been here within the last half-hour to tell me that if his ship, the _Pharaon_, did not come into port on the 15th, he would be wholly unable to make this payment.”

“But,” said the Englishman, “this looks very much like a suspension of payment.”

“It looks more like bankruptcy!” exclaimed M. de Boville despairingly.

The Englishman appeared to reflect a moment, and then said, “From which it would appear, sir, that this credit inspires you with considerable apprehension?”

“To tell you the truth, I consider it lost.”

“Well, then, I will buy it of you!”

“You?”

“Yes, I!”

“But at a tremendous discount, of course?”

“No, for two hundred thousand francs. Our house,” added the Englishman with a laugh, “does not do things in that way.”

“And you will pay——”

“Ready money.”

20023m

And the Englishman drew from his pocket a bundle of bank-notes, which might have been twice the sum M. de Boville feared to lose. A ray of joy passed across M. de Boville’s countenance, yet he made an effort at self-control, and said:

“Sir, I ought to tell you that, in all probability, you will not realize six per cent of this sum.”

“That’s no affair of mine,” replied the Englishman, “that is the affair of the house of Thomson & French, in whose name I act. They have, perhaps, some motive to serve in hastening the ruin of a rival firm. But all I know, sir, is, that I am ready to hand you over this sum in exchange for your assignment of the debt. I only ask a brokerage.”

“Of course, that is perfectly just,” cried M. de Boville. “The commission is usually one and a half; will you have two—three—five per cent, or even more? Whatever you say.”

“Sir,” replied the Englishman, laughing, “I am like my house, and do not do such things—no, the commission I ask is quite different.”

“Name it, sir, I beg.”

“You are the inspector of prisons?”

“I have been so these fourteen years.”

“You keep the registers of entries and departures?”

“I do.”

“To these registers there are added notes relative to the prisoners?”

“There are special reports on every prisoner.”

“Well, sir, I was educated at Rome by a poor devil of an abbé, who disappeared suddenly. I have since learned that he was confined in the Château d’If, and I should like to learn some particulars of his death.”

“What was his name?”

“The Abbé Faria.”

“Oh, I recollect him perfectly,” cried M. de Boville; “he was crazy.”

“So they said.”

“Oh, he was, decidedly.”

“Very possibly; but what sort of madness was it?”

“He pretended to know of an immense treasure, and offered vast sums to the government if they would liberate him.”

“Poor devil!—and he is dead?”

“Yes, sir, five or six months ago, last February.”

“You have a good memory, sir, to recollect dates so well.”

“I recollect this, because the poor devil’s death was accompanied by a singular incident.”

“May I ask what that was?” said the Englishman with an expression of curiosity, which a close observer would have been astonished at discovering in his phlegmatic countenance.

“Oh dear, yes, sir; the abbé’s dungeon was forty or fifty feet distant from that of one of Bonaparte’s emissaries,—one of those who had contributed the most to the return of the usurper in 1815, a very resolute and very dangerous man.”

“Indeed!” said the Englishman.

“Yes,” replied M. de Boville; “I myself had occasion to see this man in 1816 or 1817, and we could only go into his dungeon with a file of soldiers. That man made a deep impression on me; I shall never forget his countenance!”

20025m

The Englishman smiled imperceptibly.

“And you say, sir,” he interposed, “that the two dungeons——”

“Were separated by a distance of fifty feet; but it appears that this Edmond Dantès——”

“This dangerous man’s name was——”

“Edmond Dantès. It appears, sir, that this Edmond Dantès had procured tools, or made them, for they found a tunnel through which the prisoners held communication with one another.”

“This tunnel was dug, no doubt, with an intention of escape?”

“No doubt; but unfortunately for the prisoners, the Abbé Faria had an attack of catalepsy, and died.”

“That must have cut short the projects of escape.”

“For the dead man, yes,” replied M. de Boville, “but not for the survivor; on the contrary, this Dantès saw a means of accelerating his escape. He, no doubt, thought that prisoners who died in the Château d’If were interred in an ordinary burial-ground, and he conveyed the dead man into his own cell, took his place in the sack in which they had sewed up the corpse, and awaited the moment of interment.”

“It was a bold step, and one that showed some courage,” remarked the Englishman.

“As I have already told you, sir, he was a very dangerous man; and, fortunately, by his own act disembarrassed the government of the fears it had on his account.”

“How was that?”

“How? Do you not comprehend?”

“No.”

“The Château d’If has no cemetery, and they simply throw the dead into the sea, after fastening a thirty-six-pound cannon-ball to their feet.”

“Well?” observed the Englishman as if he were slow of comprehension.

“Well, they fastened a thirty-six-pound ball to his feet, and threw him into the sea.”

“Really!” exclaimed the Englishman.

“Yes, sir,” continued the inspector of prisons. “You may imagine the amazement of the fugitive when he found himself flung headlong over the rocks! I should like to have seen his face at that moment.”

“That would have been difficult.”

“No matter,” replied De Boville, in supreme good-humor at the certainty of recovering his two hundred thousand francs,—“no matter, I can fancy it.” And he shouted with laughter.

“So can I,” said the Englishman, and he laughed too; but he laughed as the English do, “at the end of his teeth.”

“And so,” continued the Englishman who first gained his composure, “he was drowned?”

“Unquestionably.”

“So that the governor got rid of the dangerous and the crazy prisoner at the same time?”

“Precisely.”

20027m

“But some official document was drawn up as to this affair, I suppose?” inquired the Englishman.

“Yes, yes, the mortuary deposition. You understand, Dantès’ relations, if he had any, might have some interest in knowing if he were dead or alive.”

“So that now, if there were anything to inherit from him, they may do so with easy conscience. He is dead, and no mistake about it.”

“Oh, yes; and they may have the fact attested whenever they please.”

“So be it,” said the Englishman. “But to return to these registers.”

“True, this story has diverted our attention from them. Excuse me.”

“Excuse you for what? For the story? By no means; it really seems to me very curious.”

“Yes, indeed. So, sir, you wish to see all relating to the poor abbé, who really was gentleness itself.”

“Yes, you will much oblige me.”

“Go into my study here, and I will show it to you.”

And they both entered M. de Boville’s study. Everything was here arranged in perfect order; each register had its number, each file of papers its place. The inspector begged the Englishman to seat himself in an armchair, and placed before him the register and documents relative to the Château d’If, giving him all the time he desired for the examination, while De Boville seated himself in a corner, and began to read his newspaper. The Englishman easily found the entries relative to the Abbé Faria; but it seemed that the history which the inspector had related interested him greatly, for after having perused the first documents he turned over the leaves until he reached the deposition respecting Edmond Dantès. There he found everything arranged in due order,—the accusation, examination, Morrel’s petition, M. de Villefort’s marginal notes. He folded up the accusation quietly, and put it as quietly in his pocket; read the examination, and saw that the name of Noirtier was not mentioned in it; perused, too, the application dated 10th April, 1815, in which Morrel, by the deputy procureur’s advice, exaggerated with the best intentions (for Napoleon was then on the throne) the services Dantès had rendered to the imperial cause—services which Villefort’s certificates rendered indisputable. Then he saw through the whole thing. This petition to Napoleon, kept back by Villefort, had become, under the second restoration, a terrible weapon against him in the hands of the king’s attorney. He was no longer astonished when he searched on to find in the register this note, placed in a bracket against his name:

Edmond Dantès.

An inveterate Bonapartist; took an active part in the return from the Island of Elba.

To be kept in strict solitary confinement, and to be closely watched and guarded.

Beneath these lines was written in another hand: “See note above—nothing can be done.”

He compared the writing in the bracket with the writing of the certificate placed beneath Morrel’s petition, and discovered that the note in the bracket was the same writing as the certificate—that is to say, was in Villefort’s handwriting.

20029m

As to the note which accompanied this, the Englishman understood that it might have been added by some inspector who had taken a momentary interest in Dantès' situation, but who had, from the remarks we have quoted, found it impossible to give any effect to the interest he had felt.

As we have said, the inspector, from discretion, and that he might not disturb the Abbé Faria's pupil in his researches, had seated himself in a corner, and was reading _Le Drapeau Blanc_. He did not see the Englishman fold up and place in his pocket the accusation written by Danglars under the arbor of La Réserve, and which had the postmark, "Marseilles, 27th February, delivery 6 o'clock, P.M."

But it must be said that if he had seen it, he attached so little importance to this scrap of paper, and so much importance to his two hundred thousand francs, that he would not have opposed whatever the Englishman might do, however irregular it might be.

"Thanks," said the latter, closing the register with a slam, "I have all I want; now it is for me to perform my promise. Give me a simple assignment of your debt; acknowledge therein the receipt of the cash, and I will hand you over the money."

He rose, gave his seat to M. de Boville, who took it without ceremony, and quickly drew up the required assignment, while the Englishman counted out the bank-notes on the other side of the desk.

Chapter 29. The House of Morrel & Son

Anyone who had quitted Marseilles a few years previously, well acquainted with the interior of Morrel's warehouse, and had returned at this date, would have found a great change. Instead of that air of life, of comfort, and of happiness that permeates a flourishing and prosperous business establishment—instead of merry faces at the windows, busy clerks hurrying to and fro in the long corridors—instead of the court filled with bales of goods, re-echoing with the cries and the jokes of porters, one would have immediately perceived all aspect of sadness and gloom. Out of all the numerous clerks that used to fill the deserted corridor and the empty office, but two remained. One was a young man of three or four-and-twenty, who was in love with M. Morrel's daughter, and had remained with him in spite of the efforts of his friends to induce him to withdraw; the other was an old one-eyed cashier, called "Cocles," or "Cock-eye," a nickname given him by the young men who used to throng this vast now almost deserted bee-hive, and which had so completely replaced his real name that he would not, in all probability, have replied to anyone who addressed him by it.

Cocles remained in M. Morrel's service, and a most singular change had taken place in his position; he had at the same time risen to the rank of cashier, and sunk to the rank of a servant. He was, however, the same Cocles, good, patient, devoted, but inflexible on the subject of arithmetic, the only point on which he would have stood firm against the world, even against M. Morrel; and strong in the multiplication-table, which he had at his fingers' ends, no matter what scheme or what trap was laid to catch him.

In the midst of the disasters that befell the house, Cocles was the only one unmoved. But this did not arise from a want of affection; on the contrary, from a firm conviction. Like the rats that one by one forsake the doomed ship even before the vessel weighs anchor, so all the numerous clerks had by degrees deserted the office and the warehouse. Cocles had seen them go without thinking of inquiring the cause of their departure. Everything was as we have said, a question of arithmetic to Cocles, and during twenty years he had always seen all payments made with such exactitude, that it seemed as impossible to him that the house should stop payment, as it would to a miller that the river that had so long turned his mill should cease to flow.

Nothing had as yet occurred to shake Cocles' belief; the last month's payment had been made with the most scrupulous exactitude; Cocles had detected an overbalance of fourteen sous in his cash, and the same evening he had brought them to M. Morrel, who, with a melancholy smile, threw them into an almost empty drawer, saying:

"Thanks, Cocles; you are the pearl of cashiers."

Cocles went away perfectly happy, for this eulogium of M. Morrel, himself the pearl of the honest men of Marseilles, flattered him more than a present of fifty crowns. But since the end of the month M. Morrel had passed many an anxious hour.

In order to meet the payments then due; he had collected all his resources, and, fearing lest the report of his distress should get bruited abroad at Marseilles when he was known to be reduced to such an extremity, he went to the Beaucaire fair to sell his wife's and daughter's jewels and a portion of his plate. By this means the end of the month was passed, but his resources were now exhausted. Credit, owing to the reports afloat, was no longer to be had; and to meet the one hundred thousand francs due on the

15th of the present month, and the one hundred thousand francs due on the 15th of the next month to M. de Boville, M. Morrel had, in reality, no hope but the return of the _Pharaon_, of whose departure he had learnt from a vessel which had weighed anchor at the same time, and which had already arrived in harbor.

But this vessel which, like the _Pharaon_, came from Calcutta, had been in for a fortnight, while no intelligence had been received of the _Pharaon_.

20033m

Such was the state of affairs when, the day after his interview with M. de Boville, the confidential clerk of the house of Thomson & French of Rome, presented himself at M. Morrel's.

Emmanuel received him; this young man was alarmed by the appearance of every new face, for every new face might be that of a new creditor, come in anxiety to question the head of the house. The young man, wishing to spare his employer the pain of this interview, questioned the new-comer; but the stranger declared that he had nothing to say to M. Emmanuel, and that his business was with M. Morrel in person.

Emmanuel sighed, and summoned Cocles. Cocles appeared, and the young man bade him conduct the stranger to M. Morrel's apartment. Cocles went first, and the stranger followed him. On the staircase they met a beautiful girl of sixteen or seventeen, who looked with anxiety at the stranger.

"M. Morrel is in his room, is he not, Mademoiselle Julie?" said the cashier.

"Yes; I think so, at least," said the young girl hesitatingly. "Go and see, Cocles, and if my father is there, announce this gentleman."

"It will be useless to announce me, mademoiselle," returned the Englishman. "M. Morrel does not know my name; this worthy gentleman has only to announce the confidential clerk of the house of Thomson & French of Rome, with whom your father does business."

The young girl turned pale and continued to descend, while the stranger and Cocles continued to mount the staircase. She entered the office where Emmanuel was, while Cocles, by the aid of a key he possessed, opened a door in the corner of a landing-place on the second staircase, conducted the stranger into an antechamber, opened a second door, which he closed behind him, and after having left the clerk of the house of Thomson & French alone, returned and signed to him that he could enter.

The Englishman entered, and found Morrel seated at a table, turning over the formidable columns of his ledger, which contained the list of his liabilities. At the sight of the stranger, M. Morrel closed the ledger, arose, and offered a seat to the stranger; and when he had seen him seated, resumed his own chair. Fourteen years had changed the worthy merchant, who, in his thirty-sixth year at the opening of this history, was now in his fiftieth; his hair had turned white, time and sorrow had ploughed deep furrows on his brow, and his look, once so firm and penetrating, was now irresolute and wandering, as if he feared being forced to fix his attention on some particular thought or person.

The Englishman looked at him with an air of curiosity, evidently mingled with interest. "Monsieur," said Morrel, whose uneasiness was increased by this examination, "you wish to speak to me?"

"Yes, monsieur; you are aware from whom I come?"

"The house of Thomson & French; at least, so my cashier tells me."

"He has told you rightly. The house of Thomson & French had 300,000 or 400,000 francs to pay this month in France; and, knowing your strict punctuality, have collected all the bills bearing your signature, and charged me as they became due to present them, and to employ the money otherwise."

Morrel sighed deeply, and passed his hand over his forehead, which was covered with perspiration.

"So then, sir," said Morrel, "you hold bills of mine?"

"Yes, and for a considerable sum."

"What is the amount?" asked Morrel with a voice he strove to render firm.

20035m

“Here is,” said the Englishman, taking a quantity of papers from his pocket, “an assignment of 200,000 francs to our house by M. de Boville, the inspector of prisons, to whom they are due. You acknowledge, of course, that you owe this sum to him?”

“Yes; he placed the money in my hands at four and a half per cent nearly five years ago.”

“When are you to pay?”

“Half the 15th of this month, half the 15th of next.”

“Just so; and now here are 32,500 francs payable shortly; they are all signed by you, and assigned to our house by the holders.”

“I recognize them,” said Morrel, whose face was suffused, as he thought that, for the first time in his life, he would be unable to honor his own signature. “Is this all?”

“No, I have for the end of the month these bills which have been assigned to us by the house of Pascal, and the house of Wild & Turner of Marseilles, amounting to nearly 55,000 francs; in all, 287,500 francs.”

It is impossible to describe what Morrel suffered during this enumeration. “Two hundred and eighty-seven thousand five hundred francs,” repeated he.

“Yes, sir,” replied the Englishman. “I will not,” continued he, after a moment’s silence, “conceal from you, that while your probity and exactitude up to this moment are universally acknowledged, yet the report is current in Marseilles that you are not able to meet your liabilities.”

At this almost brutal speech Morrel turned deathly pale.

“Sir,” said he, “up to this time—and it is now more than four-and-twenty years since I received the direction of this house from my father, who had himself conducted it for five-and-thirty years—never has anything bearing the signature of Morrel & Son been dishonored.”

“I know that,” replied the Englishman. “But as a man of honor should answer another, tell me fairly, shall you pay these with the same punctuality?”

Morrel shuddered, and looked at the man, who spoke with more assurance than he had hitherto shown.

“To questions frankly put,” said he, “a straightforward answer should be given. Yes, I shall pay, if, as I hope, my vessel arrives safely; for its arrival will again procure me the credit which the numerous accidents, of which I have been the victim, have deprived me; but if the _Pharaon_ should be lost, and this last resource be gone——”

The poor man’s eyes filled with tears.

“Well,” said the other, “if this last resource fail you?”

“Well,” returned Morrel, “it is a cruel thing to be forced to say, but, already used to misfortune, I must habituate myself to shame. I fear I shall be forced to suspend payment.”

“Have you no friends who could assist you?”

Morrel smiled mournfully.

“In business, sir,” said he, “one has no friends, only correspondents.”

“It is true,” murmured the Englishman; “then you have but one hope.”

“But one.”

“The last?”

“The last.”

“So that if this fail——”

“I am ruined,—completely ruined!”

“As I was on my way here, a vessel was coming into port.”

“I know it, sir; a young man, who still adheres to my fallen fortunes, passes a part of his time in a belvedere at the top of the house, in hopes of being the first to announce good news to me; he has informed me of the arrival of this ship.”

“And it is not yours?”

“No, she is a Bordeaux vessel, _La Gironde_; she comes from India also; but she is not mine.”

“Perhaps she has spoken to the _Pharaon_, and brings you some tidings of her?”

“Shall I tell you plainly one thing, sir? I dread almost as much to receive any tidings of my vessel as to remain in doubt. Uncertainty is still hope.” Then in a low voice Morrel added,—“This delay is not natural. The _Pharaon_ left Calcutta the 5th of February; she ought to have been here a month ago.”

“What is that?” said the Englishman. “What is the meaning of that noise?”

“Oh, my God!” cried Morrel, turning pale, “what is it?”

A loud noise was heard on the stairs of people moving hastily, and half-stifled sobs. Morrel rose and advanced to the door; but his strength failed him and he sank into a chair. The two men remained opposite one another, Morrel trembling in every limb, the stranger gazing at him with an air of profound pity. The noise had ceased; but it seemed that Morrel expected something—something had occasioned the noise, and something must follow. The stranger fancied he heard footsteps on the stairs; and that the footsteps, which were those of several persons, stopped at the door. A key was inserted in the lock of the first door, and the creaking of hinges was audible.

“There are only two persons who have the key to that door,” murmured Morrel, “Cocles and Julie.”

At this instant the second door opened, and the young girl, her eyes bathed with tears, appeared. Morrel rose tremblingly, supporting himself by the arm of the chair. He would have spoken, but his voice failed him.

“Oh, father!” said she, clasping her hands, “forgive your child for being the bearer of evil tidings.”

Morrel again changed color. Julie threw herself into his arms.

“Oh, father, father!” murmured she, “courage!”

“The _Pharaon_ has gone down, then?” said Morrel in a hoarse voice. The young girl did not speak; but she made an affirmative sign with her head as she lay on her father’s breast.

“And the crew?” asked Morrel.

“Saved,” said the girl; “saved by the crew of the vessel that has just entered the harbor.”

Morrel raised his two hands to heaven with an expression of resignation and sublime gratitude.

“Thanks, my God,” said he, “at least thou strikest but me alone.”

A tear moistened the eye of the phlegmatic Englishman.

“Come in, come in,” said Morrel, “for I presume you are all at the door.”

Scarcely had he uttered those words when Madame Morrel entered weeping bitterly. Emmanuel followed her, and in the antechamber were visible the rough faces of seven or eight half-naked sailors. At the sight of these men the Englishman started and advanced a step; then restrained himself, and retired into the farthest and most obscure corner of the apartment. Madame Morrel sat down by her husband and took one of his hands in hers, Julie still lay with her head on his shoulder, Emmanuel stood in the centre of the chamber and seemed to form the link between Morrel’s family and the sailors at the door.

“How did this happen?” said Morrel.

“Draw nearer, Penelon,” said the young man, “and tell us all about it.”

An old seaman, bronzed by the tropical sun, advanced, twirling the remains of a hat between his hands.

“Good-day, M. Morrel,” said he, as if he had just quitted Marseilles the previous evening, and had just returned from Aix or Toulon.

“Good-day, Penelon,” returned Morrel, who could not refrain from smiling through his tears, “where is the captain?”

“The captain, M. Morrel,—he has stayed behind sick at Palma; but please God, it won’t be much, and you will see him in a few days all alive and hearty.”

“Well, now tell your story, Penelon.”

20039m

Penelon rolled his quid in his cheek, placed his hand before his mouth, turned his head, and sent a long jet of tobacco-juice into the antechamber, advanced his foot, balanced himself, and began.

“You see, M. Morrel,” said he, “we were somewhere between Cape Blanc and Cape Boyador, sailing with a fair breeze, south-south-west after a week’s calm, when Captain Gaumard comes up to me—I was at the helm I should tell you—and says, ‘Penelon, what do you think of those clouds coming up over there?’ I was just then looking at them myself. ‘What do I think, captain? Why I think that they are rising faster than they have any business to do, and that they would not be so black if they didn’t mean mischief.’—‘That’s my opinion too,’ said the captain, ‘and I’ll take precautions accordingly. We are carrying too much canvas. Avast, there, all hands! Take in the studding-sails and stow the flying jib.’ It was time; the squall was on us, and the vessel began to heel. ‘Ah,’ said the captain, ‘we have still too much canvas set; all hands lower the mainsail!’ Five minutes after, it was down; and we sailed under mizzen-topsails and top-gallant sails. ‘Well, Penelon,’ said the captain, ‘what makes you shake your head?’ ‘Why,’ I says, ‘I still think you’ve got too much on.’ ‘I think you’re right,’ answered he, ‘we shall have a gale.’ ‘A gale? More than that, we shall have a tempest, or I don’t know what’s what.’ You could see the wind coming like the dust at Montredon; luckily the captain understood his business. ‘Take in two reefs in the top-sails,’ cried the captain; ‘let go the bowlin’s, haul the brace, lower the top-gallant sails, haul out the reef-tackles on the yards.’”

20041m

“That was not enough for those latitudes,” said the Englishman; “I should have taken four reefs in the topsails and furled the spanker.”

His firm, sonorous, and unexpected voice made everyone start. Penelon put his hand over his eyes, and then stared at the man who thus criticized the manœuvres of his captain.

“We did better than that, sir,” said the old sailor respectfully; “we put the helm up to run before the tempest; ten minutes after we struck our top-sails and scudded under bare poles.”

“The vessel was very old to risk that,” said the Englishman.

“Eh, it was that that did the business; after pitching heavily for twelve hours we sprung a leak. ‘Penelon,’ said the captain, ‘I think we are sinking, give me the helm, and go down into the hold.’ I gave him the helm, and descended; there was already three feet of water. ‘All hands to the pumps!’ I shouted; but it was too late, and it seemed the more we pumped the more came in. ‘Ah,’ said I, after four hours’ work, ‘since we are sinking, let us sink; we can die but once.’ ‘Is that the example you set, Penelon?’ cries the captain; ‘very well, wait a minute.’ He went into his cabin and came back with a brace of pistols. ‘I will blow the brains out of the first man who leaves the pump,’ said he.”

“Well done!” said the Englishman.

20043m

“There’s nothing gives you so much courage as good reasons,” continued the sailor; “and during that time the wind had abated, and the sea gone down, but the water kept rising; not much, only two inches an hour, but still it rose. Two inches an hour does not seem much, but in twelve hours that makes two feet, and three we had before, that makes five. ‘Come,’ said the captain, ‘we have done all in our power, and M. Morrel will have nothing to reproach us with, we have tried to save the ship, let us now save ourselves. To the boats, my lads, as quick as you can.’ Now,” continued Penelon, “you see, M. Morrel, a sailor is attached to his ship, but still more to his life, so we did not wait to be told twice; the more so, that the ship was sinking under us, and seemed to say, ‘Get along—save yourselves.’ We soon launched the boat, and all eight of us got into it. The captain descended last, or rather, he did not descend, he would not quit the vessel; so I took him round the waist, and threw him into the boat, and then I jumped after him. It was time, for just as I jumped the deck burst with a noise like the broadside of a man-of-war. Ten minutes after she pitched forward, then the other way, spun round and round, and then good-bye to the _Pharaon_. As for us, we were three days without anything to eat or drink, so that we began to think of drawing lots who should feed the rest, when we saw _La Gironde_; we made signals of distress, she perceived us, made for us, and took us all on board. There now, M. Morrel, that’s the whole truth, on the honor of a sailor; is not it true, you fellows there?” A general murmur of approbation showed that the narrator had faithfully detailed their misfortunes and sufferings.

“Well, well,” said M. Morrel, “I know there was no one in fault but destiny. It was the will of God that this should happen, blessed be his name. What wages are due to you?”

“Oh, don’t let us talk of that, M. Morrel.”

“Yes, but we will talk of it.”

“Well, then, three months,” said Penelon.

“Cocles, pay two hundred francs to each of these good fellows,” said Morrel. “At another time,” added he, “I should have said, Give them, besides, two hundred francs over as a present; but times are changed, and the little money that remains to me is not my own, so do not think me mean on this account.”

Penelon turned to his companions, and exchanged a few words with them.

“As for that, M. Morrel,” said he, again turning his quid, “as for that——”

“As for what?”

“The money.”

“Well——”

“Well, we all say that fifty francs will be enough for us at present, and that we will wait for the rest.”

“Thanks, my friends, thanks!” cried Morrel gratefully; “take it—take it; and if you can find another employer, enter his service; you are free to do so.”

These last words produced a prodigious effect on the seaman. Penelon nearly swallowed his quid; fortunately he recovered.

“What, M. Morrel!” said he in a low voice, “you send us away; you are then angry with us!”

“No, no,” said M. Morrel, “I am not angry, quite the contrary, and I do not send you away; but I have no more ships, and therefore I do not want any sailors.”

“No more ships!” returned Penelon; “well, then, you’ll build some; we’ll wait for you.”

“I have no money to build ships with, Penelon,” said the poor owner mournfully, “so I cannot accept your kind offer.”

“No more money? Then you must not pay us; we can scud, like the _Pharaon_, under bare poles.”

“Enough, enough!” cried Morrel, almost overpowered; “leave me, I pray you; we shall meet again in a happier time. Emmanuel, go with them, and see that my orders are executed.”

“At least, we shall see each other again, M. Morrel?” asked Penelon.

“Yes; I hope so, at least. Now go.” He made a sign to Cocles, who went first; the seamen followed him and Emmanuel brought up the rear. “Now,” said the owner to his wife and daughter, “leave me; I wish to speak with this gentleman.”

20045m

And he glanced towards the clerk of Thomson & French, who had remained motionless in the corner during this scene, in which he had taken no part, except the few words we have mentioned. The two women looked at this person whose presence they had entirely forgotten, and retired; but, as she left the apartment, Julie gave the stranger a supplicating glance, to which he replied by a smile that an indifferent spectator would have been surprised to see on his stern features. The two men were left alone. “Well, sir,” said Morrel, sinking into a chair, “you have heard all, and I have nothing further to tell you.”

“I see,” returned the Englishman, “that a fresh and unmerited misfortune has overwhelmed you, and this only increases my desire to serve you.”

“Oh, sir!” cried Morrel.

“Let me see,” continued the stranger, “I am one of your largest creditors.”

“Your bills, at least, are the first that will fall due.”

“Do you wish for time to pay?”

“A delay would save my honor, and consequently my life.”

“How long a delay do you wish for?”

Morrel reflected. “Two months,” said he.

“I will give you three,” replied the stranger.

“But,” asked Morrel, “will the house of Thomson & French consent?”

“Oh, I take everything on myself. Today is the 5th of June.”

“Yes.”

“Well, renew these bills up to the 5th of September; and on the 5th of September at eleven o’clock (the hand of the clock pointed to eleven), I shall come to receive the money.”

“I shall expect you,” returned Morrel; “and I will pay you—or I shall be dead.” These last words were uttered in so low a tone that the stranger could not hear them. The bills were renewed, the old ones destroyed, and the poor ship-owner found himself with three months before him to collect his resources. The Englishman received his thanks with the phlegm peculiar to his nation; and Morrel, overwhelming him with grateful blessings, conducted him to the staircase. The stranger met Julie on the stairs; she pretended to be descending, but in reality she was waiting for him. “Oh, sir”—said she, clasping her hands.

“Mademoiselle,” said the stranger, “one day you will receive a letter signed ‘Sinbad the Sailor.’ Do exactly what the letter bids you, however strange it may appear.”

“Yes, sir,” returned Julie.

“Do you promise?”

“I swear to you I will.”

“It is well. Adieu, mademoiselle. Continue to be the good, sweet girl you are at present, and I have great hopes that Heaven will reward you by giving you Emmanuel for a husband.”

Julie uttered a faint cry, blushed like a rose, and leaned against the baluster. The stranger waved his hand, and continued to descend. In the court he found Penelon, who, with a rouleau of a hundred francs in either hand, seemed unable to make up his mind to retain them. “Come with me, my friend,” said the Englishman; “I wish to speak to you.”

Chapter 30. The Fifth of September

The extension provided for by the agent of Thomson & French, at the moment when Morrel expected it least, was to the poor shipowner so decided a stroke of good fortune that he almost dared to believe that fate was at length grown weary of wasting her spite upon him. The same day he told his wife, Emmanuel, and his daughter all that had occurred; and a ray of hope, if not of tranquillity, returned to the family. Unfortunately, however, Morrel had not only engagements with the house of Thomson & French, who had shown themselves so considerate towards him; and, as he had said, in business he had correspondents, and not friends. When he thought the matter over, he could by no means account for this generous conduct on the part of Thomson & French towards him; and could only attribute it to some such selfish argument as this: “We had better help a man who owes us nearly 300,000 francs, and have those 300,000 francs at the end of three months than hasten his ruin, and get only six or eight per cent of our money back again.”

Unfortunately, whether through envy or stupidity, all Morrel’s correspondents did not take this view; and some even came to a contrary decision. The bills signed by Morrel were presented at his office with scrupulous exactitude, and, thanks to the delay granted by the Englishman, were paid by Cocles with equal punctuality. Cocles thus remained in his accustomed tranquillity. It was Morrel alone who remembered with alarm, that if he had to repay on the 15th the 50,000 francs of M. de Boville, and on the 30th the 32,500 francs of bills, for which, as well as the debt due to the inspector of prisons, he had time granted, he must be a ruined man.

The opinion of all the commercial men was that, under the reverses which had successively weighed down Morrel, it was impossible for him to remain solvent. Great, therefore, was the astonishment when at the end of the month, he cancelled all his obligations with his usual punctuality. Still confidence was not restored to all minds, and the general opinion was that the complete ruin of the unfortunate shipowner had been postponed only until the end of the month.

The month passed, and Morrel made extraordinary efforts to get in all his resources. Formerly his paper, at any date, was taken with confidence, and was even in request. Morrel now tried to negotiate bills at ninety days only, and none of the banks would give him credit. Fortunately, Morrel had some funds coming in on which he could rely; and, as they reached him, he found himself in a condition to meet his engagements when the end of July came.

The agent of Thomson & French had not been again seen at Marseilles; the day after, or two days after his visit to Morrel, he had disappeared; and as in that city he had had no intercourse but with the mayor, the inspector of prisons, and M. Morrel, his departure left no trace except in the memories of these three persons. As to the sailors of the _Pharaon_, they must have found snug berths elsewhere, for they also had disappeared.

Captain Gaumard, recovered from his illness, had returned from Palma. He delayed presenting himself at Morrel’s, but the owner, hearing of his arrival, went to see him. The worthy shipowner knew, from Penelon’s recital, of the captain’s brave conduct during the storm, and tried to console him. He brought him also the amount of his wages, which Captain Gaumard had not dared to apply for.

As he descended the staircase, Morrel met Penelon, who was going up. Penelon had, it would seem, made good use of his money, for he was newly clad. When he saw his employer, the worthy tar seemed much embarrassed, drew on one side into the corner of the landing-place, passed his quid from one cheek to the other, stared stupidly with his great eyes, and only acknowledged the squeeze of the hand which Morrel as usual gave him by a slight pressure in return. Morrel attributed Penelon’s embarrassment to the elegance of his attire; it was evident the good fellow had not gone to such an expense on his own account; he was, no doubt, engaged on board some other vessel, and thus his bashfulness arose from the fact of his not having, if we may so express ourselves, worn mourning for the _Pharaon_ longer. Perhaps he had come to tell Captain Gaumard of his good luck, and to offer him employment from his new master.

“Worthy fellows!” said Morrel, as he went away, “may your new master love you as I loved you, and be more fortunate than I have been!”

20049m

August rolled by in unceasing efforts on the part of Morrel to renew his credit or revive the old. On the 20th of August it was known at Marseilles that he had left town in the mailcoach, and then it was said that the bills would go to protest at the end of the month,

and that Morrel had gone away and left his chief clerk Emmanuel, and his cashier Cocles, to meet the creditors. But, contrary to all expectation, when the 31st of August came, the house opened as usual, and Cocles appeared behind the grating of the counter, examined all bills presented with the usual scrutiny, and, from first to last, paid all with the usual precision. There came in, moreover, two drafts which M. Morrel had fully anticipated, and which Cocles paid as punctually as the bills which the shipowner had accepted. All this was incomprehensible, and then, with the tenacity peculiar to prophets of bad news, the failure was put off until the end of September.

On the 1st, Morrel returned; he was awaited by his family with extreme anxiety, for from this journey to Paris they hoped great things. Morrel had thought of Danglars, who was now immensely rich, and had lain under great obligations to Morrel in former days, since to him it was owing that Danglars entered the service of the Spanish banker, with whom he had laid the foundations of his vast wealth. It was said at this moment that Danglars was worth from six to eight millions of francs, and had unlimited credit. Danglars, then, without taking a crown from his pocket, could save Morrel; he had but to pass his word for a loan, and Morrel was saved. Morrel had long thought of Danglars, but had kept away from some instinctive motive, and had delayed as long as possible availing himself of this last resource. And Morrel was right, for he returned home crushed by the humiliation of a refusal.

Yet, on his arrival, Morrel did not utter a complaint, or say one harsh word. He embraced his weeping wife and daughter, pressed Emmanuel's hand with friendly warmth, and then going to his private room on the second floor had sent for Cocles.

"Then," said the two women to Emmanuel, "we are indeed ruined."

It was agreed in a brief council held among them, that Julie should write to her brother, who was in garrison at Nîmes, to come to them as speedily as possible. The poor women felt instinctively that they required all their strength to support the blow that impended. Besides, Maximilian Morrel, though hardly two-and-twenty, had great influence over his father.

He was a strong-minded, upright young man. At the time when he decided on his profession his father had no desire to choose for him, but had consulted young Maximilian's taste. He had at once declared for a military life, and had in consequence studied hard, passed brilliantly through the Polytechnic School, and left it as sub-lieutenant of the 53rd of the line. For a year he had held this rank, and expected promotion on the first vacancy. In his regiment Maximilian Morrel was noted for his rigid observance, not only of the obligations imposed on a soldier, but also of the duties of a man; and he thus gained the name of "the stoic." We need hardly say that many of those who gave him this epithet repeated it because they had heard it, and did not even know what it meant.

This was the young man whom his mother and sister called to their aid to sustain them under the serious trial which they felt they would soon have to endure. They had not mistaken the gravity of this event, for the moment after Morrel had entered his private office with Cocles, Julie saw the latter leave it pale, trembling, and his features betraying the utmost consternation. She would have questioned him as he passed by her, but the worthy creature hastened down the staircase with unusual precipitation, and only raised his hands to heaven and exclaimed:

"Oh, mademoiselle, mademoiselle, what a dreadful misfortune! Who could ever have believed it!"

A moment afterwards Julie saw him go upstairs carrying two or three heavy ledgers, a portfolio, and a bag of money.

Morrel examined the ledgers, opened the portfolio, and counted the money. All his funds amounted to 6,000 or 8,000 francs, his bills receivable up to the 5th to 4,000 or 5,000, which, making the best of everything, gave him 14,000 francs to meet debts amounting to 287,500 francs. He had not even the means for making a possible settlement on account.

However, when Morrel went down to his dinner, he appeared very calm. This calmness was more alarming to the two women than the deepest dejection would have been. After dinner Morrel usually went out and used to take his coffee at the club of the Phocéens, and read the _Semaphore_; this day he did not leave the house, but returned to his office.

As to Cocles, he seemed completely bewildered. For part of the day he went into the courtyard, seated himself on a stone with his head bare and exposed to the blazing sun. Emmanuel tried to comfort the women, but his eloquence faltered. The young man was too well acquainted with the business of the house, not to feel that a great catastrophe hung over the Morrel family. Night came, the two women had watched, hoping that when he left his room Morrel would come to them, but they heard him pass before their door, and trying to conceal the noise of his footsteps. They listened; he went into his sleeping-room, and fastened the door inside. Madame Morrel sent her daughter to bed, and half an hour after Julie had retired, she rose, took off her shoes, and went stealthily along the passage, to see through the keyhole what her husband was doing.

In the passage she saw a retreating shadow; it was Julie, who, uneasy herself, had anticipated her mother. The young lady went towards Madame Morrel.

“He is writing,” she said.

They had understood each other without speaking. Madame Morrel looked again through the keyhole, Morrel was writing; but Madame Morrel remarked, what her daughter had not observed, that her husband was writing on stamped paper. The terrible idea that he was writing his will flashed across her; she shuddered, and yet had not strength to utter a word.

Next day M. Morrel seemed as calm as ever, went into his office as usual, came to his breakfast punctually, and then, after dinner, he placed his daughter beside him, took her head in his arms, and held her for a long time against his bosom. In the evening, Julie told her mother, that although he was apparently so calm, she had noticed that her father’s heart beat violently.

The next two days passed in much the same way. On the evening of the 4th of September, M. Morrel asked his daughter for the key of his study. Julie trembled at this request, which seemed to her of bad omen. Why did her father ask for this key which she always kept, and which was only taken from her in childhood as a punishment? The young girl looked at Morrel.

“What have I done wrong, father,” she said, “that you should take this key from me?”

“Nothing, my dear,” replied the unhappy man, the tears starting to his eyes at this simple question,—“nothing, only I want it.”

Julie made a pretence to feel for the key. “I must have left it in my room,” she said.

And she went out, but instead of going to her apartment she hastened to consult Emmanuel.

“Do not give this key to your father,” said he, “and tomorrow morning, if possible, do not quit him for a moment.”

She questioned Emmanuel, but he knew nothing, or would not say what he knew.

During the night, between the 4th and 5th of September, Madame Morrel remained listening for every sound, and, until three o’clock in the morning, she heard her husband pacing the room in great agitation. It was three o’clock when he threw himself on the bed. The mother and daughter passed the night together. They had expected Maximilian since the previous evening. At eight o’clock in the morning Morrel entered their chamber. He was calm; but the agitation of the night was legible in his pale and careworn visage. They did not dare to ask him how he had slept. Morrel was kinder to his wife, more affectionate to his daughter, than he had ever been. He could not cease gazing at and kissing the sweet girl. Julie, mindful of Emmanuel’s request, was following her father when he quitted the room, but he said to her quickly:

“Remain with your mother, dearest.” Julie wished to accompany him. “I wish you to do so,” said he.

This was the first time Morrel had ever so spoken, but he said it in a tone of paternal kindness, and Julie did not dare to disobey. She remained at the same spot standing mute and motionless. An instant afterwards the door opened, she felt two arms encircle her, and a mouth pressed her forehead. She looked up and uttered an exclamation of joy.

20053m

“Maximilian, my dearest brother!” she cried.

At these words Madame Morrel rose, and threw herself into her son’s arms.

“Mother,” said the young man, looking alternately at Madame Morrel and her daughter, “what has occurred—what has happened? Your letter has frightened me, and I have come hither with all speed.”

“Julie,” said Madame Morrel, making a sign to the young man, “go and tell your father that Maximilian has just arrived.”

The young lady rushed out of the apartment, but on the first step of the staircase she found a man holding a letter in his hand.

“Are you not Mademoiselle Julie Morrel?” inquired the man, with a strong Italian accent.

“Yes, sir,” replied Julie with hesitation; “what is your pleasure? I do not know you.”

“Read this letter,” he said, handing it to her. Julie hesitated. “It concerns the best interests of your father,” said the messenger.

The young girl hastily took the letter from him. She opened it quickly and read:

“Go this moment to the Allées de Meilhan, enter the house No. 15, ask the porter for the key of the room on the fifth floor, enter the apartment, take from the corner of the mantelpiece a purse netted in red silk, and give it to your father. It is important that he should receive it before eleven o’clock. You promised to obey me implicitly. Remember your oath.

“Sinbad the Sailor.”

The young girl uttered a joyful cry, raised her eyes, looked round to question the messenger, but he had disappeared. She cast her eyes again over the note to peruse it a second time, and saw there was a postscript. She read:

“It is important that you should fulfil this mission in person and alone. If you go accompanied by any other person, or should anyone else go in your place, the porter will reply that he does not know anything about it.”

This postscript decreased greatly the young girl’s happiness. Was there nothing to fear? was there not some snare laid for her? Her innocence had kept her in ignorance of the dangers that might assail a young girl of her age. But there is no need to know danger in order to fear it; indeed, it may be observed, that it is usually unknown perils that inspire the greatest terror.

Julie hesitated, and resolved to take counsel. Yet, through a singular impulse, it was neither to her mother nor her brother that she applied, but to Emmanuel. She hastened down and told him what had occurred on the day when the agent of Thomson & French had come to her father’s, related the scene on the staircase, repeated the promise she had made, and showed him the letter.

“You must go, then, mademoiselle,” said Emmanuel.

“Go there?” murmured Julie.

“Yes; I will accompany you.”

“But did you not read that I must be alone?” said Julie.

“And you shall be alone,” replied the young man. “I will await you at the corner of the Rue du Musée, and if you are so long absent as to make me uneasy, I will hasten to rejoin you, and woe to him of whom you shall have cause to complain to me!”

“Then, Emmanuel?” said the young girl with hesitation, “it is your opinion that I should obey this invitation?”

“Yes. Did not the messenger say your father’s safety depended upon it?”

“But what danger threatens him, then, Emmanuel?” she asked.

Emmanuel hesitated a moment, but his desire to make Julie decide immediately made him reply.

“Listen,” he said; “today is the 5th of September, is it not?”

“Yes.”

“Today, then, at eleven o’clock, your father has nearly three hundred thousand francs to pay?”

“Yes, we know that.”

“Well, then,” continued Emmanuel, “we have not fifteen thousand francs in the house.”

“What will happen then?”

“Why, if today before eleven o’clock your father has not found someone who will come to his aid, he will be compelled at twelve o’clock to declare himself a bankrupt.”

“Oh, come, then, come!” cried she, hastening away with the young man.

During this time, Madame Morrel had told her son everything. The young man knew quite well that, after the succession of misfortunes which had befallen his father, great changes had taken place in the style of living and housekeeping; but he did not know that matters had reached such a point. He was thunderstruck. Then, rushing hastily out of the apartment, he ran upstairs, expecting to find his father in his study, but he rapped there in vain.

While he was yet at the door of the study he heard the bedroom door open, turned, and saw his father. Instead of going direct to his study, M. Morrel had returned to his bedchamber, which he was only this moment quitting. Morrel uttered a cry of surprise at the sight of his son, of whose arrival he was ignorant. He remained motionless on the spot, pressing with his left hand something he had concealed under his coat. Maximilian sprang down the staircase, and threw his arms round his father's neck; but suddenly he recoiled, and placed his right hand on Morrel's breast.

"Father," he exclaimed, turning pale as death, "what are you going to do with that brace of pistols under your coat?"

"Oh, this is what I feared!" said Morrel.

"Father, father, in Heaven's name," exclaimed the young man, "what are these weapons for?"

"Maximilian," replied Morrel, looking fixedly at his son, "you are a man, and a man of honor. Come, and I will explain to you."

And with a firm step Morrel went up to his study, while Maximilian followed him, trembling as he went. Morrel opened the door, and closed it behind his son; then, crossing the anteroom, went to his desk on which he placed the pistols, and pointed with his finger to an open ledger. In this ledger was made out an exact balance-sheet of his affairs. Morrel had to pay, within half an hour, 287,500 francs. All he possessed was 15,257 francs.

"Read!" said Morrel.

The young man was overwhelmed as he read. Morrel said not a word. What could he say? What need he add to such a desperate proof in figures?

"And have you done all that is possible, father, to meet this disastrous result?" asked the young man, after a moment's pause.

"I have," replied Morrel.

"You have no money coming in on which you can rely?"

"None."

"You have exhausted every resource?"

"All."

"And in half an hour," said Maximilian in a gloomy voice, "our name is dishonored!"

"Blood washes out dishonor," said Morrel.

"You are right, father; I understand you." Then extending his hand towards one of the pistols, he said, "There is one for you and one for me—thanks!"

Morrel caught his hand. "Your mother—your sister! Who will support them?"

A shudder ran through the young man's frame. "Father," he said, "do you reflect that you are bidding me to live?"

"Yes, I do so bid you," answered Morrel, "it is your duty. You have a calm, strong mind, Maximilian. Maximilian, you are no ordinary man. I make no requests or commands; I only ask you to examine my position as if it were your own, and then judge for yourself."

The young man reflected for a moment, then an expression of sublime resignation appeared in his eyes, and with a slow and sad gesture he took off his two epaulets, the insignia of his rank.

"Be it so, then, my father," he said, extending his hand to Morrel, "die in peace, my father; I will live."

Morrel was about to cast himself on his knees before his son, but Maximilian caught him in his arms, and those two noble hearts were pressed against each other for a moment.

"You know it is not my fault," said Morrel.

20057m

Maximilian smiled. “I know, father, you are the most honorable man I have ever known.”

“Good, my son. And now there is no more to be said; go and rejoin your mother and sister.”

“My father,” said the young man, bending his knee, “bless me!” Morrel took the head of his son between his two hands, drew him forward, and kissing his forehead several times said:

“Oh, yes, yes, I bless you in my own name, and in the name of three generations of irreproachable men, who say through me, ‘The edifice which misfortune has destroyed, Providence may build up again.’ On seeing me die such a death, the most inexorable will have pity on you. To you, perhaps, they will accord the time they have refused to me. Then do your best to keep our name free from dishonor. Go to work, labor, young man, struggle ardently and courageously; live, yourself, your mother and sister, with the most rigid economy, so that from day to day the property of those whom I leave in your hands may augment and fructify. Reflect how glorious a day it will be, how grand, how solemn, that day of complete restoration, on which you will say in this very office, ‘My father died because he could not do what I have this day done; but he died calmly and peaceably, because in dying he knew what I should do.’”

“My father, my father!” cried the young man, “why should you not live?”

“If I live, all would be changed; if I live, interest would be converted into doubt, pity into hostility; if I live I am only a man who has broken his word, failed in his engagements—in fact, only a bankrupt. If, on the contrary, I die, remember, Maximilian, my corpse is that of an honest but unfortunate man. Living, my best friends would avoid my house; dead, all Marseilles will follow me in tears to my last home. Living, you would feel shame at my name; dead, you may raise your head and say, ‘I am the son of him you killed, because, for the first time, he has been compelled to break his word.’”

The young man uttered a groan, but appeared resigned.

“And now,” said Morrel, “leave me alone, and endeavor to keep your mother and sister away.”

“Will you not see my sister once more?” asked Maximilian. A last but final hope was concealed by the young man in the effect of this interview, and therefore he had suggested it. Morrel shook his head. “I saw her this morning, and bade her adieu.”

“Have you no particular commands to leave with me, my father?” inquired Maximilian in a faltering voice.

“Yes; my son, and a sacred command.”

“Say it, my father.”

“The house of Thomson & French is the only one who, from humanity, or, it may be, selfishness—it is not for me to read men’s hearts—has had any pity for me. Its agent, who will in ten minutes present himself to receive the amount of a bill of 287,500 francs, I will not say granted, but offered me three months. Let this house be the first repaid, my son, and respect this man.”

“Father, I will,” said Maximilian.

“And now, once more, adieu,” said Morrel. “Go, leave me; I would be alone. You will find my will in the secretaire in my bedroom.”

The young man remained standing and motionless, having but the force of will and not the power of execution.

“Hear me, Maximilian,” said his father. “Suppose I were a soldier like you, and ordered to carry a certain redoubt, and you knew I must be killed in the assault, would you not say to me, as you said just now, ‘Go, father; for you are dishonored by delay, and death is preferable to shame!’”

“Yes, yes,” said the young man, “yes;” and once again embracing his father with convulsive pressure, he said, “Be it so, my father.”

And he rushed out of the study. When his son had left him, Morrel remained an instant standing with his eyes fixed on the door; then putting forth his arm, he pulled the bell. After a moment’s interval, Cocles appeared.

It was no longer the same man—the fearful revelations of the three last days had crushed him. This thought—the house of Morrel is about to stop payment—bent him to the earth more than twenty years would otherwise have done.

“My worthy Cocles,” said Morrel in a tone impossible to describe, “do you remain in the antechamber. When the gentleman who came three months ago—the agent of Thomson & French—arrives, announce his arrival to me.”

Cocles made no reply; he made a sign with his head, went into the anteroom, and seated himself. Morrel fell back in his chair, his eyes fixed on the clock; there were seven minutes left, that was all. The hand moved on with incredible rapidity, he seemed to see its motion.

What passed in the mind of this man at the supreme moment of his agony cannot be told in words. He was still comparatively young, he was surrounded by the loving care of a devoted family, but he had convinced himself by a course of reasoning, illogical perhaps, yet certainly plausible, that he must separate himself from all he held dear in the world, even life itself. To form the slightest idea of his feelings, one must have seen his face with its expression of enforced resignation and its tear-moistened eyes raised to heaven. The minute hand moved on. The pistols were loaded; he stretched forth his hand, took one up, and murmured his daughter’s name. Then he laid it down, seized his pen, and wrote a few words. It seemed to him as if he had not taken a sufficient farewell of his beloved daughter. Then he turned again to the clock, counting time now not by minutes, but by seconds.

He took up the deadly weapon again, his lips parted and his eyes fixed on the clock, and then shuddered at the click of the trigger as he cocked the pistol. At this moment of mortal anguish the cold sweat came forth upon his brow, a pang stronger than death clutched at his heart-strings. He heard the door of the staircase creak on its hinges—the clock gave its warning to strike eleven—the door of his study opened. Morrel did not turn round—he expected these words of Cocles, “The agent of Thomson & French.”

He placed the muzzle of the pistol between his teeth. Suddenly he heard a cry—it was his daughter’s voice. He turned and saw Julie. The pistol fell from his hands.

“My father!” cried the young girl, out of breath, and half dead with joy—“saved, you are saved!” And she threw herself into his arms, holding in her extended hand a red, netted silk purse.

20061m

“Saved, my child!” said Morrel; “what do you mean?”

“Yes, saved—saved! See, see!” said the young girl.

Morrel took the purse, and started as he did so, for a vague remembrance reminded him that it once belonged to himself. At one end was the receipted bill for the 287,000 francs, and at the other was a diamond as large as a hazel-nut, with these words on a small slip of parchment: _Julie’s Dowry_.

Morrel passed his hand over his brow; it seemed to him a dream. At this moment the clock struck eleven. He felt as if each stroke of the hammer fell upon his heart.

“Explain, my child,” he said, “Explain, my child,” he said, “explain—where did you find this purse?”

“In a house in the Allées de Meilhan, No. 15, on the corner of a mantelpiece in a small room on the fifth floor.”

“But,” cried Morrel, “this purse is not yours!” Julie handed to her father the letter she had received in the morning.

“And did you go alone?” asked Morrel, after he had read it.

“Emmanuel accompanied me, father. He was to have waited for me at the corner of the Rue du Musée, but, strange to say, he was not there when I returned.”

“Monsieur Morrel!” exclaimed a voice on the stairs; “Monsieur Morrel!”

“It is his voice!” said Julie. At this moment Emmanuel entered, his countenance full of animation and joy.

“The _Pharaon_!” he cried; “the _Pharaon_!”

“What!—what!—the _Pharaon_! Are you mad, Emmanuel? You know the vessel is lost.”

“The _Pharaon_, sir—they signal the _Pharaon_! The _Pharaon_ is entering the harbor!”

Morrel fell back in his chair, his strength was failing him; his understanding weakened by such events, refused to comprehend such incredible, unheard-of, fabulous facts. But his son came in.

“Father,” cried Maximilian, “how could you say the _Pharaon_ was lost? The lookout has signalled her, and they say she is now coming into port.”

20063m

“My dear friends,” said Morrel, “if this be so, it must be a miracle of heaven! Impossible, impossible!”

But what was real and not less incredible was the purse he held in his hand, the acceptance receipted—the splendid diamond.

“Ah, sir,” exclaimed Cocles, “what can it mean?—the _Pharaon_?”

“Come, dear ones,” said Morrel, rising from his seat, “let us go and see, and Heaven have pity upon us if it be false intelligence!”

They all went out, and on the stairs met Madame Morrel, who had been afraid to go up into the study. In a moment they were at the Canebière. There was a crowd on the pier. All the crowd gave way before Morrel. “The _Pharaon_! the _Pharaon_!” said every voice.

And, wonderful to see, in front of the tower of Saint-Jean, was a ship bearing on her stern these words, printed in white letters, “The _Pharaon_, Morrel & Son, of Marseilles.” She was the exact duplicate of the other _Pharaon_, and loaded, as that had been, with cochineal and indigo. She cast anchor, clued up sails, and on the deck was Captain Gaumard giving orders, and good old Penelon making signals to M. Morrel. To doubt any longer was impossible; there was the evidence of the senses, and ten thousand persons who came to corroborate the testimony.

As Morrel and his son embraced on the pier-head, in the presence and amid the applause of the whole city witnessing this event, a man, with his face half-covered by a black beard, and who, concealed behind the sentry-box, watched the scene with delight, uttered these words in a low tone:

“Be happy, noble heart, be blessed for all the good thou hast done and wilt do hereafter, and let my gratitude remain in obscurity like your good deeds.”

20064m

And with a smile expressive of supreme content, he left his hiding-place, and without being observed, descended one of the flights of steps provided for debarkation, and hailing three times, shouted “Jacopo, Jacopo, Jacopo!”

Then a launch came to shore, took him on board, and conveyed him to a yacht splendidly fitted up, on whose deck he sprung with the activity of a sailor; thence he once again looked towards Morrel, who, weeping with joy, was shaking hands most cordially with all the crowd around him, and thanking with a look the unknown benefactor whom he seemed to be seeking in the skies.

“And now,” said the unknown, “farewell kindness, humanity, and gratitude! Farewell to all the feelings that expand the heart! I have been Heaven’s substitute to recompense the good—now the god of vengeance yields to me his power to punish the wicked!”

At these words he gave a signal, and, as if only awaiting this signal, the yacht instantly put out to sea.

Chapter 31. Italy: Sinbad the Sailor

Towards the beginning of the year 1838, two young men belonging to the first society of Paris, the Viscount Albert de Morcerf and the Baron Franz d’Épinay, were at Florence. They had agreed to see the Carnival at Rome that year, and that Franz, who for the last three or four years had inhabited Italy, should act as _cicerone_ to Albert.

As it is no inconsiderable affair to spend the Carnival at Rome, especially when you have no great desire to sleep on the Piazza del Popolo, or the Campo Vaccino, they wrote to Signor Pastrini, the proprietor of the Hôtel de Londres, Piazza di Spagna, to reserve comfortable apartments for them. Signor Pastrini replied that he had only two rooms and a parlor on the third floor, which he offered at the low charge of a louis per diem. They accepted his offer; but wishing to make the best use of the time that was left, Albert started for Naples. As for Franz, he remained at Florence, and after having passed a few days in exploring the paradise of the

Cascine, and spending two or three evenings at the houses of the Florentine nobility, he took a fancy into his head (having already visited Corsica, the cradle of Bonaparte) to visit Elba, the waiting-place of Napoleon.

One evening he cast off the painter of a sailboat from the iron ring that secured it to the dock at Leghorn, wrapped himself in his coat and lay down, and said to the crew,—"To the Island of Elba!"

The boat shot out of the harbor like a bird and the next morning Franz disembarked at Porto-Ferrajo. He traversed the island, after having followed the traces which the footsteps of the giant have left, and re-embarked for Marciana.

Two hours after he again landed at Pianosa, where he was assured that red partridges abounded. The sport was bad; Franz only succeeded in killing a few partridges, and, like every unsuccessful sportsman, he returned to the boat very much out of temper.

"Ah, if your excellency chose," said the captain, "you might have capital sport."

"Where?"

"Do you see that island?" continued the captain, pointing to a conical pile rising from the indigo sea.

"Well, what is this island?"

"The Island of Monte Cristo."

"But I have no permission to shoot over this island."

"Your excellency does not require a permit, for the island is uninhabited."

"Ah, indeed!" said the young man. "A desert island in the midst of the Mediterranean must be a curiosity."

"It is very natural; this island is a mass of rocks, and does not contain an acre of land capable of cultivation."

"To whom does this island belong?"

"To Tuscany."

"What game shall I find there!"

"Thousands of wild goats."

"Who live upon the stones, I suppose," said Franz with an incredulous smile.

"No, but by browsing the shrubs and trees that grow out of the crevices of the rocks."

"Where can I sleep?"

"On shore in the grottos, or on board in your cloak; besides, if your excellency pleases, we can leave as soon as you like—we can sail as well by night as by day, and if the wind drops we can use our oars."

As Franz had sufficient time, and his apartments at Rome were not yet available, he accepted the proposition. Upon his answer in the affirmative, the sailors exchanged a few words together in a low tone. "Well," asked he, "what now? Is there any difficulty in the way?"

"No." replied the captain, "but we must warn your excellency that the island is an infected port."

"What do you mean?"

"Monte Cristo although uninhabited, yet serves occasionally as a refuge for the smugglers and pirates who come from Corsica, Sardinia, and Africa, and if it becomes known that we have been there, we shall have to perform quarantine for six days on our return to Leghorn."

"The deuce! That puts a different face on the matter. Six days! Why, that's as long as the Almighty took to make the world! Too long a wait—too long."

"But who will say your excellency has been to Monte Cristo?"

“Oh, I shall not,” cried Franz.

“Nor I, nor I,” chorused the sailors.

“Then steer for Monte Cristo.”

The captain gave his orders, the helm was put up, and the boat was soon sailing in the direction of the island. Franz waited until all was in order, and when the sail was filled, and the four sailors had taken their places—three forward, and one at the helm—he resumed the conversation. “Gaetano,” said he to the captain, “you tell me Monte Cristo serves as a refuge for pirates, who are, it seems to me, a very different kind of game from the goats.”

“Yes, your excellency, and it is true.”

“I knew there were smugglers, but I thought that since the capture of Algiers, and the destruction of the regency, pirates existed only in the romances of Cooper and Captain Marryat.”

“Your excellency is mistaken; there are pirates, like the bandits who were believed to have been exterminated by Pope Leo XII., and who yet, every day, rob travellers at the gates of Rome. Has not your excellency heard that the French _chargé d’affaires_ was robbed six months ago within five hundred paces of Velletri?”

“Oh, yes, I heard that.”

“Well, then, if, like us, your excellency lived at Leghorn, you would hear, from time to time, that a little merchant vessel, or an English yacht that was expected at Bastia, at Porto-Ferrajo, or at Civita Vecchia, has not arrived; no one knows what has become of it, but, doubtless, it has struck on a rock and foundered. Now this rock it has met has been a long and narrow boat, manned by six or eight men, who have surprised and plundered it, some dark and stormy night, near some desert and gloomy island, as bandits plunder a carriage in the recesses of a forest.”

“But,” asked Franz, who lay wrapped in his cloak at the bottom of the boat, “why do not those who have been plundered complain to the French, Sardinian, or Tuscan governments?”

“Why?” said Gaetano with a smile.

“Yes, why?”

“Because, in the first place, they transfer from the vessel to their own boat whatever they think worth taking, then they bind the crew hand and foot, they attach to everyone’s neck a four-and-twenty-pound ball, a large hole is chopped in the vessel’s bottom, and then they leave her. At the end of ten minutes the vessel begins to roll heavily and settle down. First one gun’l goes under, then the other. Then they lift and sink again, and both go under at once. All at once there’s a noise like a cannon—that’s the air blowing up the deck. Soon the water rushes out of the scupper-holes like a whale spouting, the vessel gives a last groan, spins round and round, and disappears, forming a vast whirlpool in the ocean, and then all is over, so that in five minutes nothing but the eye of God can see the vessel where she lies at the bottom of the sea. Do you understand now,” said the captain, “why no complaints are made to the government, and why the vessel never reaches port?”

It is probable that if Gaetano had related this previous to proposing the expedition, Franz would have hesitated, but now that they had started, he thought it would be cowardly to draw back. He was one of those men who do not rashly court danger, but if danger presents itself, combat it with the most unalterable coolness. Calm and resolute, he treated any peril as he would an adversary in a duel,—calculated its probable method of approach; retreated, if at all, as a point of strategy and not from cowardice; was quick to see an opening for attack, and won victory at a single thrust.

“Bah!” said he, “I have travelled through Sicily and Calabria—I have sailed two months in the Archipelago, and yet I never saw even the shadow of a bandit or a pirate.”

“I did not tell your excellency this to deter you from your project,” replied Gaetano, “but you questioned me, and I have answered; that’s all.”

“Yes, and your conversation is most interesting; and as I wish to enjoy it as long as possible, steer for Monte Cristo.”

The wind blew strongly, the boat made six or seven knots an hour, and they were rapidly reaching the end of their voyage. As they drew near the island seemed to lift from the sea, and the air was so clear that they could already distinguish the rocks heaped on one another, like cannon balls in an arsenal, with green bushes and trees growing in the crevices. As for the sailors, although they appeared perfectly tranquil yet it was evident that they were on the alert, and that they carefully watched the glassy surface over which they were sailing, and on which a few fishing-boats, with their white sails, were alone visible.

They were within fifteen miles of Monte Cristo when the sun began to set behind Corsica, whose mountains appeared against the sky, showing their rugged peaks in bold relief; this mass of rock, like the giant Adamastor, rose dead ahead, a formidable barrier, and intercepting the light that gilded its massive peaks so that the voyagers were in shadow. Little by little the shadow rose higher and seemed to drive before it the last rays of the expiring day; at last the reflection rested on the summit of the mountain, where it paused an instant, like the fiery crest of a volcano, then gloom gradually covered the summit as it had covered the base, and the island now only appeared to be a gray mountain that grew continually darker; half an hour after, the night was quite dark.

Fortunately, the mariners were used to these latitudes, and knew every rock in the Tuscan Archipelago; for in the midst of this obscurity Franz was not without uneasiness—Corsica had long since disappeared, and Monte Cristo itself was invisible; but the sailors seemed, like the lynx, to see in the dark, and the pilot who steered did not evince the slightest hesitation.

An hour had passed since the sun had set, when Franz fancied he saw, at a quarter of a mile to the left, a dark mass, but he could not precisely make out what it was, and fearing to excite the mirth of the sailors by mistaking a floating cloud for land, he remained silent; suddenly a great light appeared on the strand; land might resemble a cloud, but the fire was not a meteor.

“What is this light?” asked he.

“Hush!” said the captain; “it is a fire.”

“But you told me the island was uninhabited?”

“I said there were no fixed habitations on it, but I said also that it served sometimes as a harbor for smugglers.”

“And for pirates?”

“And for pirates,” returned Gaetano, repeating Franz’s words. “It is for that reason I have given orders to pass the island, for, as you see, the fire is behind us.”

“But this fire?” continued Franz. “It seems to me rather reassuring than otherwise; men who did not wish to be seen would not light a fire.”

“Oh, that goes for nothing,” said Gaetano. “If you can guess the position of the island in the darkness, you will see that the fire cannot be seen from the side or from Pianosa, but only from the sea.”

“You think, then, this fire indicates the presence of unpleasant neighbors?”

“That is what we must find out,” returned Gaetano, fixing his eyes on this terrestrial star.

“How can you find out?”

“You shall see.”

Gaetano consulted with his companions, and after five minutes’ discussion a manœuvre was executed which caused the vessel to tack about, they returned the way they had come, and in a few minutes the fire disappeared, hidden by an elevation of the land. The pilot again changed the course of the boat, which rapidly approached the island, and was soon within fifty paces of it. Gaetano lowered the sail, and the boat came to rest. All this was done in silence, and from the moment that their course was changed not a word was spoken.

Gaetano, who had proposed the expedition, had taken all the responsibility on himself; the four sailors fixed their eyes on him, while they got out their oars and held themselves in readiness to row away, which, thanks to the darkness, would not be difficult. As for Franz, he examined his arms with the utmost coolness; he had two double-barrelled guns and a rifle; he loaded them, looked at the priming, and waited quietly.

During this time the captain had thrown off his vest and shirt, and secured his trousers round his waist; his feet were naked, so he had no shoes and stockings to take off; after these preparations he placed his finger on his lips, and lowering himself noiselessly into the sea, swam towards the shore with such precaution that it was impossible to hear the slightest sound; he could only be traced by the phosphorescent line in his wake. This track soon disappeared; it was evident that he had touched the shore.

Everyone on board remained motionless for half an hour, when the same luminous track was again observed, and the swimmer was soon on board.

“Well?” exclaimed Franz and the sailors in unison.

“They are Spanish smugglers,” said he; “they have with them two Corsican bandits.”

“And what are these Corsican bandits doing here with Spanish smugglers?”

“Alas,” returned the captain with an accent of the most profound pity, “we ought always to help one another. Very often the bandits are hard pressed by gendarmes or carbineers; well, they see a vessel, and good fellows like us on board, they come and demand hospitality of us; you can’t refuse help to a poor hunted devil; we receive them, and for greater security we stand out to sea. This costs us nothing, and saves the life, or at least the liberty, of a fellow-creature, who on the first occasion returns the service by pointing out some safe spot where we can land our goods without interruption.”

“Ah!” said Franz, “then you are a smuggler occasionally, Gaetano?”

“Your excellency, we must live somehow,” returned the other, smiling impenetrably.

“Then you know the men who are now on Monte Cristo?”

“Oh, yes, we sailors are like freemasons, and recognize each other by signs.”

“And do you think we have nothing to fear if we land?”

“Nothing at all; smugglers are not thieves.”

“But these two Corsican bandits?” said Franz, calculating the chances of peril.

“It is not their fault that they are bandits, but that of the authorities.”

“How so?”

“Because they are pursued for having made a stiff, as if it was not in a Corsican’s nature to revenge himself.”

“What do you mean by having made a stiff?—having assassinated a man?” said Franz, continuing his investigation.

“I mean that they have killed an enemy, which is a very different thing,” returned the captain.

“Well,” said the young man, “let us demand hospitality of these smugglers and bandits. Do you think they will grant it?”

“Without doubt.”

“How many are they?”

“Four, and the two bandits make six.”

“Just our number, so that if they prove troublesome, we shall be able to hold them in check; so, for the last time, steer to Monte Cristo.”

“Yes, but your excellency will permit us to take all due precautions.”

“By all means, be as wise as Nestor and as prudent as Ulysses; I do more than permit, I exhort you.”

“Silence, then!” said Gaetano.

Everyone obeyed. For a man who, like Franz, viewed his position in its true light, it was a grave one. He was alone in the darkness with sailors whom he did not know, and who had no reason to be devoted to him; who knew that he had several thousand francs in

his belt, and who had often examined his weapons,—which were very beautiful,—if not with envy, at least with curiosity. On the other hand, he was about to land, without any other escort than these men, on an island which had, indeed, a very religious name, but which did not seem to Franz likely to afford him much hospitality, thanks to the smugglers and bandits. The history of the scuttled vessels, which had appeared improbable during the day, seemed very probable at night; placed as he was between two possible sources of danger, he kept his eye on the crew, and his gun in his hand.

The sailors had again hoisted sail, and the vessel was once more cleaving the waves. Through the darkness Franz, whose eyes were now more accustomed to it, could see the looming shore along which the boat was sailing, and then, as they rounded a rocky point, he saw the fire more brilliant than ever, and about it five or six persons seated. The blaze illumined the sea for a hundred paces around. Gaetano skirted the light, carefully keeping the boat in the shadow; then, when they were opposite the fire, he steered to the centre of the circle, singing a fishing song, of which his companions sung the chorus.

At the first words of the song the men seated round the fire arose and approached the landing-place, their eyes fixed on the boat, evidently seeking to know who the new-comers were and what were their intentions. They soon appeared satisfied and returned (with the exception of one, who remained at the shore) to their fire, at which the carcass of a goat was roasting. When the boat was within twenty paces of the shore, the man on the beach, who carried a carbine, presented arms after the manner of a sentinel, and cried, “Who comes there?” in Sardinian.

Franz coolly cocked both barrels. Gaetano then exchanged a few words with this man which the traveller did not understand, but which evidently concerned him.

“Will your excellency give your name, or remain _incognito_?” asked the captain.

“My name must rest unknown,” replied Franz; “merely say I am a Frenchman travelling for pleasure.”

As soon as Gaetano had transmitted this answer, the sentinel gave an order to one of the men seated round the fire, who rose and disappeared among the rocks. Not a word was spoken, everyone seemed occupied, Franz with his disembarkment, the sailors with their sails, the smugglers with their goat; but in the midst of all this carelessness it was evident that they mutually observed each other.

The man who had disappeared returned suddenly on the opposite side to that by which he had left; he made a sign with his head to the sentinel, who, turning to the boat, said, “_S’accommodi_.” The Italian _s’accommodi_ is untranslatable; it means at once, “Come, enter, you are welcome; make yourself at home; you are the master.” It is like that Turkish phrase of Molière’s that so astonished the bourgeois gentleman by the number of things implied in its utterance.

The sailors did not wait for a second invitation; four strokes of the oar brought them to land; Gaetano sprang to shore, exchanged a few words with the sentinel, then his comrades disembarked, and lastly came Franz. One of his guns was swung over his shoulder, Gaetano had the other, and a sailor held his rifle; his dress, half artist, half dandy, did not excite any suspicion, and, consequently, no disquietude. The boat was moored to the shore, and they advanced a few paces to find a comfortable bivouac; but, doubtless, the spot they chose did not suit the smuggler who filled the post of sentinel, for he cried out:

“Not that way, if you please.”

Gaetano faltered an excuse, and advanced to the opposite side, while two sailors kindled torches at the fire to light them on their way.

They advanced about thirty paces, and then stopped at a small esplanade surrounded with rocks, in which seats had been cut, not unlike sentry-boxes. Around in the crevices of the rocks grew a few dwarf oaks and thick bushes of myrtles. Franz lowered a torch, and saw by the mass of cinders that had accumulated that he was not the first to discover this retreat, which was, doubtless, one of the halting-places of the wandering visitors of Monte Cristo.

As for his suspicions, once on _terra firma_, once that he had seen the indifferent, if not friendly, appearance of his hosts, his anxiety had quite disappeared, or rather, at sight of the goat, had turned to appetite. He mentioned this to Gaetano, who replied that nothing could be more easy than to prepare a supper when they had in their boat, bread, wine, half a dozen partridges, and a good fire to roast them by.

“Besides,” added he, “if the smell of their roast meat tempts you, I will go and offer them two of our birds for a slice.”

“You are a born diplomat,” returned Franz; “go and try.”

Meanwhile the sailors had collected dried sticks and branches with which they made a fire. Franz waited impatiently, inhaling the aroma of the roasted meat, when the captain returned with a mysterious air.

“Well,” said Franz, “anything new?—do they refuse?”

“On the contrary,” returned Gaetano, “the chief, who was told you were a young Frenchman, invites you to sup with him.”

“Well,” observed Franz, “this chief is very polite, and I see no objection—the more so as I bring my share of the supper.”

“Oh, it is not that; he has plenty, and to spare, for supper; but he makes one condition, and rather a peculiar one, before he will receive you at his house.”

“His house? Has he built one here, then?”

“No, but he has a very comfortable one all the same, so they say.”

“You know this chief, then?”

“I have heard talk of him.”

“Favorably or otherwise?”

“Both.”

“The deuce!—and what is this condition?”

“That you are blindfolded, and do not take off the bandage until he himself bids you.”

Franz looked at Gaetano, to see, if possible, what he thought of this proposal. “Ah,” replied he, guessing Franz’s thought, “I know this is a serious matter.”

“What should you do in my place?”

“I, who have nothing to lose,—I should go.”

20075m

“You would accept?”

“Yes, were it only out of curiosity.”

“There is something very peculiar about this chief, then?”

“Listen,” said Gaetano, lowering his voice, “I do not know if what they say is true”—he stopped to see if anyone was near.

“What do they say?”

“That this chief inhabits a cavern to which the Pitti Palace is nothing.”

“What nonsense!” said Franz, reseating himself.

“It is no nonsense; it is quite true. Cama, the pilot of the _Saint Ferdinand_, went in once, and he came back amazed, vowing that such treasures were only to be heard of in fairy tales.”

“Do you know,” observed Franz, “that with such stories you make me think of Ali Baba’s enchanted cavern?”

“I tell you what I have been told.”

“Then you advise me to accept?”

“Oh, I don’t say that; your excellency will do as you please; I should be sorry to advise you in the matter.”

Franz pondered the matter for a few moments, concluded that a man so rich could not have any intention of plundering him of what little he had, and seeing only the prospect of a good supper, accepted. Gaetano departed with the reply. Franz was prudent, and wished to learn all he possibly could concerning his host. He turned towards the sailor, who, during this dialogue, had sat gravely plucking the partridges with the air of a man proud of his office, and asked him how these men had landed, as no vessel of any kind was visible.

“Never mind that,” returned the sailor, “I know their vessel.”

“Is it a very beautiful vessel?”

“I would not wish for a better to sail round the world.”

“Of what burden is she?”

“About a hundred tons; but she is built to stand any weather. She is what the English call a yacht.”

“Where was she built?”

“I know not; but my own opinion is she is a Genoese.”

“And how did a leader of smugglers,” continued Franz, “venture to build a vessel designed for such a purpose at Genoa?”

“I did not say that the owner was a smuggler,” replied the sailor.

“No; but Gaetano did, I thought.”

“Gaetano had only seen the vessel from a distance, he had not then spoken to anyone.”

“And if this person be not a smuggler, who is he?”

“A wealthy signor, who travels for his pleasure.”

“Come,” thought Franz, “he is still more mysterious, since the two accounts do not agree.”

“What is his name?”

“If you ask him, he says Sinbad the Sailor; but I doubt if it be his real name.”

“Sinbad the Sailor?”

“Yes.”

“And where does he reside?”

“On the sea.”

“What country does he come from?”

“I do not know.”

“Have you ever seen him?”

“Sometimes.”

“What sort of a man is he?”

“Your excellency will judge for yourself.”

“Where will he receive me?”

“No doubt in the subterranean palace Gaetano told you of.”

“Have you never had the curiosity, when you have landed and found this island deserted, to seek for this enchanted palace?”

“Oh, yes, more than once, but always in vain; we examined the grotto all over, but we never could find the slightest trace of any opening; they say that the door is not opened by a key, but a magic word.”

“Decidedly,” muttered Franz, “this is an Arabian Nights’ adventure.”

“His excellency waits for you,” said a voice, which he recognized as that of the sentinel. He was accompanied by two of the yacht’s crew.

Franz drew his handkerchief from his pocket, and presented it to the man who had spoken to him. Without uttering a word, they bandaged his eyes with a care that showed their apprehensions of his committing some indiscretion. Afterwards he was made to promise that he would not make the least attempt to raise the bandage. He promised.

Then his two guides took his arms, and he went on, guided by them, and preceded by the sentinel. After going about thirty paces, he smelt the appetizing odor of the kid that was roasting, and knew thus that he was passing the bivouac; they then led him on about fifty paces farther, evidently advancing towards that part of the shore where they would not allow Gaetano to go—a refusal he could now comprehend.

Presently, by a change in the atmosphere, he knew that they were entering a cave; after going on for a few seconds more he heard a crackling, and it seemed to him as though the atmosphere again changed, and became balmy and perfumed. At length his feet touched on a thick and soft carpet, and his guides let go their hold of him. There was a moment’s silence, and then a voice, in excellent French, although, with a foreign accent, said:

“Welcome, sir. I beg you will remove your bandage.”

It may be supposed, then, Franz did not wait for a repetition of this permission, but took off the handkerchief, and found himself in the presence of a man from thirty-eight to forty years of age, dressed in a Tunisian costume, that is to say, a red cap with a long blue silk tassel, a vest of black cloth embroidered with gold, pantaloons of deep red, large and full gaiters of the same color, embroidered with gold like the vest, and yellow slippers; he had a splendid cashmere round his waist, and a small sharp and crooked cangiar was passed through his girdle.

Although of a paleness that was almost livid, this man had a remarkably handsome face; his eyes were penetrating and sparkling; his nose, quite straight, and projecting direct from the brow, was of the pure Greek type, while his teeth, as white as pearls, were set off to admiration by the black moustache that encircled them.

His pallor was so peculiar, that it seemed to pertain to one who had been long entombed, and who was incapable of resuming the healthy glow and hue of life. He was not particularly tall, but extremely well made, and, like the men of the South, had small hands and feet. But what astonished Franz, who had treated Gaetano’s description as a fable, was the splendor of the apartment in which he found himself.

The entire chamber was lined with crimson brocade, worked with flowers of gold. In a recess was a kind of divan, surmounted with a stand of Arabian swords in silver scabbards, and the handles resplendent with gems; from the ceiling hung a lamp of Venetian glass, of beautiful shape and color, while the feet rested on a Turkey carpet, in which they sunk to the instep; tapestry hung before the door by which Franz had entered, and also in front of another door, leading into a second apartment which seemed to be brilliantly illuminated.

The host gave Franz time to recover from his surprise, and, moreover, returned look for look, not even taking his eyes off him.

“Sir,” he said, after a pause, “a thousand excuses for the precaution taken in your introduction hither; but as, during the greater portion of the year, this island is deserted, if the secret of this abode were discovered, I should doubtless, find on my return my temporary retirement in a state of great disorder, which would be exceedingly annoying, not for the loss it occasioned me, but because I should not have the certainty I now possess of separating myself from all the rest of mankind at pleasure. Let me now endeavor to make you forget this temporary unpleasantness, and offer you what no doubt you did not expect to find here—that is to say, a tolerable supper and pretty comfortable beds.”

“_Ma foi_, my dear sir,” replied Franz, “make no apologies. I have always observed that they bandage people’s eyes who penetrate enchanted palaces, for instance, those of Raoul in the _Huguenots_, and really I have nothing to complain of, for what I see makes me think of the wonders of the _Arabian Nights_.”

20079m

“Alas! I may say with Lucullus, if I could have anticipated the honor of your visit, I would have prepared for it. But such as is my hermitage, it is at your disposal; such as is my supper, it is yours to share, if you will. Ali, is the supper ready?”

At this moment the tapestry moved aside, and a Nubian, black as ebony, and dressed in a plain white tunic, made a sign to his master that all was prepared in the dining-room.

“Now,” said the unknown to Franz, “I do not know if you are of my opinion, but I think nothing is more annoying than to remain two or three hours together without knowing by name or appellation how to address one another. Pray observe, that I too much respect the laws of hospitality to ask your name or title. I only request you to give me one by which I may have the pleasure of addressing you. As for myself, that I may put you at your ease, I tell you that I am generally called ‘Sinbad the Sailor.’”

“And I,” replied Franz, “will tell you, as I only require his wonderful lamp to make me precisely like Aladdin, that I see no reason why at this moment I should not be called Aladdin. That will keep us from going away from the East whither I am tempted to think I have been conveyed by some good genius.”

“Well, then, Signor Aladdin,” replied the singular Amphitryon, “you heard our repast announced, will you now take the trouble to enter the dining-room, your humble servant going first to show the way?”

At these words, moving aside the tapestry, Sinbad preceded his guest. Franz now looked upon another scene of enchantment; the table was splendidly covered, and once convinced of this important point he cast his eyes around him. The dining-room was scarcely less striking than the room he had just left; it was entirely of marble, with antique bas-reliefs of priceless value; and at the four corners of this apartment, which was oblong, were four magnificent statues, having baskets in their hands. These baskets contained four pyramids of most splendid fruit; there were Sicily pine-apples, pomegranates from Malaga, oranges from the Balearic Isles, peaches from France, and dates from Tunis.

The supper consisted of a roast pheasant garnished with Corsican blackbirds; a boar’s ham with jelly, a quarter of a kid with tartar sauce, a glorious turbot, and a gigantic lobster. Between these large dishes were smaller ones containing various dainties. The dishes were of silver, and the plates of Japanese china.

Franz rubbed his eyes in order to assure himself that this was not a dream. Ali alone was present to wait at table, and acquitted himself so admirably, that the guest complimented his host thereupon.

“Yes,” replied he, while he did the honors of the supper with much ease and grace—“yes, he is a poor devil who is much devoted to me, and does all he can to prove it. He remembers that I saved his life, and as he has a regard for his head, he feels some gratitude towards me for having kept it on his shoulders.”

Ali approached his master, took his hand, and kissed it.

“Would it be impertinent, Signor Sinbad,” said Franz, “to ask you the particulars of this kindness?”

20081m

“Oh, they are simple enough,” replied the host. “It seems the fellow had been caught wandering nearer to the harem of the Bey of Tunis than etiquette permits to one of his color, and he was condemned by the Bey to have his tongue cut out, and his hand and head cut off; the tongue the first day, the hand the second, and the head the third. I always had a desire to have a mute in my service, so learning the day his tongue was cut out, I went to the Bey, and proposed to give him for Ali a splendid double-barreled gun, which I knew he was very desirous of having. He hesitated a moment, he was so very desirous to complete the poor devil’s punishment. But when I added to the gun an English cutlass with which I had shivered his highness’s yataghan to pieces, the Bey yielded, and agreed to forgive the hand and head, but on condition that the poor fellow never again set foot in Tunis. This was a useless clause in the bargain, for whenever the coward sees the first glimpse of the shores of Africa, he runs down below, and can only be induced to appear again when we are out of sight of that quarter of the globe.”

Franz remained a moment silent and pensive, hardly knowing what to think of the half-kindness, half-cruelty, with which his host related the brief narrative.

“And like the celebrated sailor whose name you have assumed,” he said, by way of changing the conversation, “you pass your life in travelling?”

“Yes. I made a vow at a time when I little thought I should ever be able to accomplish it,” said the unknown with a singular smile; “and I made some others also which I hope I may fulfil in due season.”

Although Sinbad pronounced these words with much calmness, his eyes gave forth gleams of extraordinary ferocity.

“You have suffered a great deal, sir?” said Franz inquiringly.

Sinbad started and looked fixedly at him, as he replied, “What makes you suppose so?”

“Everything,” answered Franz,—“your voice, your look, your pallid complexion, and even the life you lead.”

“I?—I live the happiest life possible, the real life of a pasha. I am king of all creation. I am pleased with one place, and stay there; I get tired of it, and leave it; I am free as a bird and have wings like one; my attendants obey my slightest wish. Sometimes I amuse myself by delivering some bandit or criminal from the bonds of the law. Then I have my mode of dispensing justice, silent and sure, without respite or appeal, which condemns or pardons, and which no one sees. Ah, if you had tasted my life, you would not desire any other, and would never return to the world unless you had some great project to accomplish there.”

“Revenge, for instance!” observed Franz.

The unknown fixed on the young man one of those looks which penetrate into the depth of the heart and thoughts. “And why revenge?” he asked.

“Because,” replied Franz, “you seem to me like a man who, persecuted by society, has a fearful account to settle with it.”

“Ah!” responded Sinbad, laughing with his singular laugh, which displayed his white and sharp teeth. “You have not guessed rightly. Such as you see me I am, a sort of philosopher, and one day perhaps I shall go to Paris to rival Monsieur Appert, and the man in the little blue cloak.”

“And will that be the first time you ever took that journey?”

“Yes; it will. I must seem to you by no means curious, but I assure you that it is not my fault I have delayed it so long—it will happen one day or the other.”

20083m

“And do you propose to make this journey very shortly?”

“I do not know; it depends on circumstances which depend on certain arrangements.”

“I should like to be there at the time you come, and I will endeavor to repay you, as far as lies in my power, for your liberal hospitality displayed to me at Monte Cristo.”

“I should avail myself of your offer with pleasure,” replied the host, “but, unfortunately, if I go there, it will be, in all probability, _incognito_.”

The supper appeared to have been supplied solely for Franz, for the unknown scarcely touched one or two dishes of the splendid banquet to which his guest did ample justice. Then Ali brought on the dessert, or rather took the baskets from the hands of the statues and placed them on the table. Between the two baskets he placed a small silver cup with a silver cover. The care with which Ali placed this cup on the table roused Franz’s curiosity. He raised the cover and saw a kind of greenish paste, something like preserved angelica, but which was perfectly unknown to him. He replaced the lid, as ignorant of what the cup contained as he was before he had looked at it, and then casting his eyes towards his host he saw him smile at his disappointment.

“You cannot guess,” said he, “what there is in that small vase, can you?”

“No, I really cannot.”

“Well, then, that green preserve is nothing less than the ambrosia which Hebe served at the table of Jupiter.”

“But,” replied Franz, “this ambrosia, no doubt, in passing through mortal hands has lost its heavenly appellation and assumed a human name; in vulgar phrase, what may you term this composition, for which, to tell the truth, I do not feel any particular desire?”

“Ah, thus it is that our material origin is revealed,” cried Sinbad; “we frequently pass so near to happiness without seeing, without regarding it, or if we do see and regard it, yet without recognizing it. Are you a man for the substantials, and is gold your god? taste this, and the mines of Peru, Guzerat, and Golconda are opened to you. Are you a man of imagination—a poet? taste this, and the boundaries of possibility disappear; the fields of infinite space open to you, you advance free in heart, free in mind, into the boundless realms of unfettered reverie. Are you ambitious, and do you seek after the greatnesses of the earth? taste this, and in an hour you will be a king, not a king of a petty kingdom hidden in some corner of Europe like France, Spain, or England, but king of the world, king of the universe, king of creation; without bowing at the feet of Satan, you will be king and master of all the kingdoms of the earth. Is it not tempting what I offer you, and is it not an easy thing, since it is only to do thus? look!”

At these words he uncovered the small cup which contained the substance so lauded, took a teaspoonful of the magic sweetmeat, raised it to his lips, and swallowed it slowly with his eyes half shut and his head bent backwards. Franz did not disturb him whilst he absorbed his favorite sweetmeat, but when he had finished, he inquired:

“What, then, is this precious stuff?”

“Did you ever hear,” he replied, “of the Old Man of the Mountain, who attempted to assassinate Philippe Auguste?”

“Of course I have.”

“Well, you know he reigned over a rich valley which was overhung by the mountain whence he derived his picturesque name. In this valley were magnificent gardens planted by Hassen-ben-Sabah, and in these gardens isolated pavilions. Into these pavilions he admitted the elect, and there, says Marco Polo, gave them to eat a certain herb, which transported them to Paradise, in the midst of ever-blooming shrubs, ever-ripe fruit, and ever-lovely virgins. What these happy persons took for reality was but a dream; but it was a dream so soft, so voluptuous, so enthralling, that they sold themselves body and soul to him who gave it to them, and obedient to his orders as to those of a deity, struck down the designated victim, died in torture without a murmur, believing that the death they underwent was but a quick transition to that life of delights of which the holy herb, now before you, had given them a slight foretaste.”

“Then,” cried Franz, “it is hashish! I know that—by name at least.”

“That is it precisely, Signor Aladdin; it is hashish—the purest and most unadulterated hashish of Alexandria,—the hashish of Abou-Gor, the celebrated maker, the only man, the man to whom there should be built a palace, inscribed with these words, _A grateful world to the dealer in happiness_.”

“Do you know,” said Franz, “I have a very great inclination to judge for myself of the truth or exaggeration of your eulogies.”

“Judge for yourself, Signor Aladdin—judge, but do not confine yourself to one trial. Like everything else, we must habituate the senses to a fresh impression, gentle or violent, sad or joyous. There is a struggle in nature against this divine substance,—in nature which is not made for joy and clings to pain. Nature subdued must yield in the combat, the dream must succeed to reality, and then the dream reigns supreme, then the dream becomes life, and life becomes the dream. But what changes occur! It is only by comparing the pains of actual being with the joys of the assumed existence, that you would desire to live no longer, but to dream thus forever. When you return to this mundane sphere from your visionary world, you would seem to leave a Neapolitan spring for a Lapland winter—to quit paradise for earth—heaven for hell! Taste the hashish, guest of mine—taste the hashish.”

Franz’s only reply was to take a teaspoonful of the marvellous preparation, about as much in quantity as his host had eaten, and lift it to his mouth.

“_Diable!_” he said, after having swallowed the divine preserve. “I do not know if the result will be as agreeable as you describe, but the thing does not appear to me as palatable as you say.”

“Because your palate his not yet been attuned to the sublimity of the substances it flavors. Tell me, the first time you tasted oysters, tea, porter, truffles, and sundry other dainties which you now adore, did you like them? Could you comprehend how the Romans stuffed their pheasants with assafœtida, and the Chinese eat swallows’ nests? Eh? no! Well, it is the same with hashish; only eat for a week, and nothing in the world will seem to you to equal the delicacy of its flavor, which now appears to you flat and

distasteful. Let us now go into the adjoining chamber, which is your apartment, and Ali will bring us coffee and pipes."

They both arose, and while he who called himself Sinbad—and whom we have occasionally named so, that we might, like his guest, have some title by which to distinguish him—gave some orders to the servant, Franz entered still another apartment.

It was simply yet richly furnished. It was round, and a large divan completely encircled it. Divan, walls, ceiling, floor, were all covered with magnificent skins as soft and downy as the richest carpets; there were heavy-maned lion-skins from Atlas, striped tiger-skins from Bengal; panther-skins from the Cape, spotted beautifully, like those that appeared to Dante; bear-skins from Siberia, fox-skins from Norway, and so on; and all these skins were strewn in profusion one on the other, so that it seemed like walking over the most mossy turf, or reclining on the most luxurious bed.

Both laid themselves down on the divan; chibouques with jasmine tubes and amber mouthpieces were within reach, and all prepared so that there was no need to smoke the same pipe twice. Each of them took one, which Ali lighted and then retired to prepare the coffee.

There was a moment's silence, during which Sinbad gave himself up to thoughts that seemed to occupy him incessantly, even in the midst of his conversation; and Franz abandoned himself to that mute reverie, into which we always sink when smoking excellent tobacco, which seems to remove with its fume all the troubles of the mind, and to give the smoker in exchange all the visions of the soul. Ali brought in the coffee.

"How do you take it?" inquired the unknown; "in the French or Turkish style, strong or weak, sugar or none, cool or boiling? As you please; it is ready in all ways."

"I will take it in the Turkish style," replied Franz.

"And you are right," said his host; "it shows you have a tendency for an Oriental life. Ah, those Orientals; they are the only men who know how to live. As for me," he added, with one of those singular smiles which did not escape the young man, "when I have completed my affairs in Paris, I shall go and die in the East; and should you wish to see me again, you must seek me at Cairo, Bagdad, or Ispahan."

20087m

"_Ma foi_," said Franz, "it would be the easiest thing in the world; for I feel eagle's wings springing out at my shoulders, and with those wings I could make a tour of the world in four-and-twenty hours."

"Ah, yes, the hashish is beginning its work. Well, unfurl your wings, and fly into superhuman regions; fear nothing, there is a watch over you; and if your wings, like those of Icarus, melt before the sun, we are here to ease your fall."

He then said something in Arabic to Ali, who made a sign of obedience and withdrew, but not to any distance.

As to Franz a strange transformation had taken place in him. All the bodily fatigue of the day, all the preoccupation of mind which the events of the evening had brought on, disappeared as they do at the first approach of sleep, when we are still sufficiently conscious to be aware of the coming of slumber. His body seemed to acquire an airy lightness, his perception brightened in a remarkable manner, his senses seemed to redouble their power, the horizon continued to expand; but it was not the gloomy horizon of vague alarms, and which he had seen before he slept, but a blue, transparent, unbounded horizon, with all the blue of the ocean, all the spangles of the sun, all the perfumes of the summer breeze; then, in the midst of the songs of his sailors,—songs so clear and sonorous, that they would have made a divine harmony had their notes been taken down,—he saw the Island of Monte Cristo, no longer as a threatening rock in the midst of the waves, but as an oasis in the desert; then, as his boat drew nearer, the songs became louder, for an enchanting and mysterious harmony rose to heaven, as if some Loreley had decreed to attract a soul thither, or Amphion, the enchanter, intended there to build a city.

At length the boat touched the shore, but without effort, without shock, as lips touch lips; and he entered the grotto amidst continued strains of most delicious melody. He descended, or rather seemed to descend, several steps, inhaling the fresh and balmy air, like that which may be supposed to reign around the grotto of Circe, formed from such perfumes as set the mind a-dreaming, and such fires as burn the very senses; and he saw again all he had seen before his sleep, from Sinbad, his singular host, to Ali, the mute attendant; then all seemed to fade away and become confused before his eyes, like the last shadows of the magic lantern before it is extinguished, and he was again in the chamber of statues, lighted only by one of those pale and antique

lamps which watch in the dead of the night over the sleep of pleasure.

They were the same statues, rich in form, in attraction, and poesy, with eyes of fascination, smiles of love, and bright and flowing hair. They were Phryne, Cleopatra, Messalina, those three celebrated courtesans. Then among them glided like a pure ray, like a Christian angel in the midst of Olympus, one of those chaste figures, those calm shadows, those soft visions, which seemed to veil its virgin brow before these marble wantons.

Then the three statues advanced towards him with looks of love, and approached the couch on which he was reposing, their feet hidden in their long white tunics, their throats bare, hair flowing like waves, and assuming attitudes which the gods could not resist, but which saints withstood, and looks inflexible and ardent like those with which the serpent charms the bird; and then he gave way before looks that held him in a torturing grasp and delighted his senses as with a voluptuous kiss.

It seemed to Franz that he closed his eyes, and in a last look about him saw the vision of modesty completely veiled; and then followed a dream of passion like that promised by the Prophet to the elect. Lips of stone turned to flame, breasts of ice became like heated lava, so that to Franz, yielding for the first time to the sway of the drug, love was a sorrow and voluptuousness a torture, as burning mouths were pressed to his thirsty lips, and he was held in cool serpent-like embraces. The more he strove against this unhallowed passion the more his senses yielded to its thrall, and at length, weary of a struggle that taxed his very soul, he gave way and sank back breathless and exhausted beneath the kisses of these marble goddesses, and the enchantment of his marvellous dream.

Chapter 32. The Waking

When Franz returned to himself, he seemed still to be in a dream. He thought himself in a sepulchre, into which a ray of sunlight in pity scarcely penetrated. He stretched forth his hand, and touched stone; he rose to his seat, and found himself lying on his bournous in a bed of dry heather, very soft and odoriferous. The vision had fled; and as if the statues had been but shadows from the tomb, they had vanished at his waking.

He advanced several paces towards the point whence the light came, and to all the excitement of his dream succeeded the calmness of reality. He found that he was in a grotto, went towards the opening, and through a kind of fanlight saw a blue sea and an azure sky. The air and water were shining in the beams of the morning sun; on the shore the sailors were sitting, chatting and laughing; and at ten yards from them the boat was at anchor, undulating gracefully on the water.

There for some time he enjoyed the fresh breeze which played on his brow, and listened to the dash of the waves on the beach, that left against the rocks a lace of foam as white as silver. He was for some time without reflection or thought for the divine charm which is in the things of nature, specially after a fantastic dream; then gradually this view of the outer world, so calm, so pure, so grand, reminded him of the illusiveness of his vision, and once more awakened memory. He recalled his arrival on the island, his presentation to a smuggler chief, a subterranean palace full of splendor, an excellent supper, and a spoonful of hashish.

It seemed, however, even in the very face of open day, that at least a year had elapsed since all these things had passed, so deep was the impression made in his mind by the dream, and so strong a hold had it taken of his imagination. Thus every now and then he saw in fancy amid the sailors, seated on a rock, or undulating in the vessel, one of the shadows which had shared his dream with looks and kisses. Otherwise, his head was perfectly clear, and his body refreshed; he was free from the slightest headache; on the contrary, he felt a certain degree of lightness, a faculty for absorbing the pure air, and enjoying the bright sunshine more vividly than ever.

He went gayly up to the sailors, who rose as soon as they perceived him; and the patron, accosting him, said:

“The Signor Sinbad has left his compliments for your excellency, and desires us to express the regret he feels at not being able to take his leave in person; but he trusts you will excuse him, as very important business calls him to Malaga.”

“So, then, Gaetano,” said Franz, “this is, then, all reality; there exists a man who has received me in this island, entertained me right royally, and has departed while I was asleep?”

“He exists as certainly as that you may see his small yacht with all her sails spread; and if you will use your glass, you will, in all probability, recognize your host in the midst of his crew.”

So saying, Gaetano pointed in a direction in which a small vessel was making sail towards the southern point of Corsica. Franz adjusted his telescope, and directed it towards the yacht. Gaetano was not mistaken. At the stern the mysterious stranger was standing up looking towards the shore, and holding a spy-glass in his hand. He was attired as he had been on the previous evening, and waved his pocket-handkerchief to his guest in token of adieu. Franz returned the salute by shaking his handkerchief as an exchange of signals. After a second, a slight cloud of smoke was seen at the stern of the vessel, which rose gracefully as it expanded in the air, and then Franz heard a slight report.

“There, do you hear?” observed Gaetano; “he is bidding you adieu.”

The young man took his carbine and fired it in the air, but without any idea that the noise could be heard at the distance which separated the yacht from the shore.

“What are your excellency’s orders?” inquired Gaetano.

“In the first place, light me a torch.”

“Ah, yes, I understand,” replied the patron, “to find the entrance to the enchanted apartment. With much pleasure, your excellency, if it would amuse you; and I will get you the torch you ask for. But I too have had the idea you have, and two or three times the same fancy has come over me; but I have always given it up. Giovanni, light a torch,” he added, “and give it to his excellency.”

Giovanni obeyed. Franz took the lamp, and entered the subterranean grotto, followed by Gaetano. He recognized the place where he had awaked by the bed of heather that was there; but it was in vain that he carried his torch all round the exterior surface of the grotto. He saw nothing, unless that, by traces of smoke, others had before him attempted the same thing, and, like him, in vain. Yet he did not leave a foot of this granite wall, as impenetrable as futurity, without strict scrutiny; he did not see a fissure without introducing the blade of his hunting sword into it, or a projecting point on which he did not lean and press in the hopes it would give way. All was vain; and he lost two hours in his attempts, which were at last utterly useless. At the end of this time he gave up his search, and Gaetano smiled.

When Franz appeared again on the shore, the yacht only seemed like a small white speck on the horizon. He looked again through his glass, but even then he could not distinguish anything.

Gaetano reminded him that he had come for the purpose of shooting goats, which he had utterly forgotten. He took his fowling-piece, and began to hunt over the island with the air of a man who is fulfilling a duty, rather than enjoying a pleasure; and at the end of a quarter of an hour he had killed a goat and two kids. These animals, though wild and agile as chamois, were too much like domestic goats, and Franz could not consider them as game. Moreover, other ideas, much more enthralling, occupied his mind. Since, the evening before, he had really been the hero of one of the tales of the _Thousand and One Nights_, and he was irresistibly attracted towards the grotto.

Then, in spite of the failure of his first search, he began a second, after having told Gaetano to roast one of the two kids. The second visit was a long one, and when he returned the kid was roasted and the repast ready. Franz was sitting on the spot where he was on the previous evening when his mysterious host had invited him to supper; and he saw the little yacht, now like a sea-gull on the wave, continuing her flight towards Corsica.

“Why,” he remarked to Gaetano, “you told me that Signor Sinbad was going to Malaga, while it seems he is in the direction of Porto-Vecchio.”

“Don’t you remember,” said the patron, “I told you that among the crew there were two Corsican brigands?”

“True; and he is going to land them,” added Franz.

“Precisely so,” replied Gaetano. “Ah, he is one who fears neither God nor Satan, they say, and would at any time run fifty leagues out of his course to do a poor devil a service.”

20093m

“But such services as these might involve him with the authorities of the country in which he practices this kind of philanthropy,” said Franz.

“And what cares he for that,” replied Gaetano with a laugh, “or any authorities? He smiles at them. Let them try to pursue him! Why, in the first place, his yacht is not a ship, but a bird, and he would beat any frigate three knots in every nine; and if he were to throw himself on the coast, why, is he not certain of finding friends everywhere?”

It was perfectly clear that the Signor Sinbad, Franz’s host, had the honor of being on excellent terms with the smugglers and bandits along the whole coast of the Mediterranean, and so enjoyed exceptional privileges. As to Franz, he had no longer any inducement to remain at Monte Cristo. He had lost all hope of detecting the secret of the grotto; he consequently despatched his breakfast, and, his boat being ready, he hastened on board, and they were soon under way. At the moment the boat began her course they lost sight of the yacht, as it disappeared in the gulf of Porto-Vecchio. With it was effaced the last trace of the preceding night; and then supper, Sinbad, hashish, statues,—all became a dream for Franz.

The boat sailed on all day and all night, and next morning, when the sun rose, they had lost sight of Monte Cristo.

When Franz had once again set foot on shore, he forgot, for the moment at least, the events which had just passed, while he finished his affairs of pleasure at Florence, and then thought of nothing but how he should rejoin his companion, who was awaiting him at Rome.

He set out, and on the Saturday evening reached the Place de la Douane by the mail-coach. An apartment, as we have said, had been retained beforehand, and thus he had but to go to Signor Pastrini’s hotel. But this was not so easy a matter, for the streets were thronged with people, and Rome was already a prey to that low and feverish murmur which precedes all great events; and at Rome there are four great events in every year,—the Carnival, Holy Week, Corpus Christi, and the Feast of St. Peter.

All the rest of the year the city is in that state of dull apathy, between life and death, which renders it similar to a kind of station between this world and the next—a sublime spot, a resting-place full of poetry and character, and at which Franz had already halted five or six times, and at each time found it more marvellous and striking.

At last he made his way through the mob, which was continually increasing and getting more and more turbulent, and reached the hotel. On his first inquiry he was told, with the impertinence peculiar to hired hackney-coachmen and innkeepers with their houses full, that there was no room for him at the Hôtel de Londres. Then he sent his card to Signor Pastrini, and asked for Albert de Morcerf. This plan succeeded; and Signor Pastrini himself ran to him, excusing himself for having made his excellency wait, scolding the waiters, taking the candlestick from the porter, who was ready to pounce on the traveller and was about to lead him to Albert, when Morcerf himself appeared.

The apartment consisted of two small rooms and a parlor. The two rooms looked on to the street—a fact which Signor Pastrini commented upon as an inappreciable advantage. The rest of the floor was hired by a very rich gentleman who was supposed to be a Sicilian or Maltese; but the host was unable to decide to which of the two nations the traveller belonged.

“Very good, signor Pastrini,” said Franz; “but we must have some supper instantly, and a carriage for tomorrow and the following days.”

“As to supper,” replied the landlord, “you shall be served immediately; but as for the carriage——”

“What as to the carriage?” exclaimed Albert. “Come, come, Signor Pastrini, no joking; we must have a carriage.”

“Sir,” replied the host, “we will do all in our power to procure you one—this is all I can say.”

“And when shall we know?” inquired Franz.

“Tomorrow morning,” answered the innkeeper.

“Oh, the deuce! then we shall pay the more, that’s all, I see plainly enough. At Drake’s or Aaron’s one pays twenty-five lire for common days, and thirty or thirty-five lire a day more for Sundays and feast days; add five lire a day more for extras, that will make forty, and there’s an end of it.”

“I am afraid if we offer them double that we shall not procure a carriage.”

“Then they must put horses to mine. It is a little worse for the journey, but that’s no matter.”

“There are no horses.”

Albert looked at Franz like a man who hears a reply he does not understand.

“Do you understand that, my dear Franz—no horses?” he said, “but can’t we have post-horses?”

“They have been all hired this fortnight, and there are none left but those absolutely requisite for posting.”

“What are we to say to this?” asked Franz.

“I say, that when a thing completely surpasses my comprehension, I am accustomed not to dwell on that thing, but to pass to another. Is supper ready, Signor Pastrini?”

“Yes, your excellency.”

“Well, then, let us sup.”

“But the carriage and horses?” said Franz.

“Be easy, my dear boy; they will come in due season; it is only a question of how much shall be charged for them.” Morcerf then, with that delighted philosophy which believes that nothing is impossible to a full purse or well-lined pocketbook, supped, went to bed, slept soundly, and dreamed he was racing all over Rome at Carnival time in a coach with six horses.

Chapter 33. Roman Bandits

The next morning Franz woke first, and instantly rang the bell. The sound had not yet died away when Signor Pastrini himself entered.

“Well, excellency,” said the landlord triumphantly, and without waiting for Franz to question him, “I feared yesterday, when I would not promise you anything, that you were too late—there is not a single carriage to be had—that is, for the three last days”

“Yes,” returned Franz, “for the very three days it is most needed.”

“What is the matter?” said Albert, entering; “no carriage to be had?”

“Just so,” returned Franz, “you have guessed it.”

“Well, your Eternal City is a nice sort of place.”

“That is to say, excellency,” replied Pastrini, who was desirous of keeping up the dignity of the capital of the Christian world in the eyes of his guest, “that there are no carriages to be had from Sunday to Tuesday evening, but from now till Sunday you can have fifty if you please.”

“Ah, that is something,” said Albert; “today is Thursday, and who knows what may arrive between this and Sunday?”

“Ten or twelve thousand travellers will arrive,” replied Franz, “which will make it still more difficult.”

“My friend,” said Morcerf, “let us enjoy the present without gloomy forebodings for the future.”

“At least we can have a window?”

“Where?”

“In the Corso.”

“Ah, a window!” exclaimed Signor Pastrini,—“utterly impossible; there was only one left on the fifth floor of the Doria Palace, and that has been let to a Russian prince for twenty sequins a day.”

The two young men looked at each other with an air of stupefaction.

“Well,” said Franz to Albert, “do you know what is the best thing we can do? It is to pass the Carnival at Venice; there we are sure of obtaining gondolas if we cannot have carriages.”

“Ah, the devil, no,” cried Albert; “I came to Rome to see the Carnival, and I will, though I see it on stilts.”

“Bravo! an excellent idea. We will disguise ourselves as monster pulchinellos or shepherds of the Landes, and we shall have complete success.”

“Do your excellencies still wish for a carriage from now to Sunday morning?”

“_Parbleu!_” said Albert, “do you think we are going to run about on foot in the streets of Rome, like lawyers’ clerks?”

“I hasten to comply with your excellencies’ wishes; only, I tell you beforehand, the carriage will cost you six piastres a day.”

“And, as I am not a millionaire, like the gentleman in the next apartments,” said Franz, “I warn you, that as I have been four times before at Rome, I know the prices of all the carriages; we will give you twelve piastres for today, tomorrow, and the day after, and then you will make a good profit.”

“But, excellency”—said Pastrini, still striving to gain his point.

“Now go,” returned Franz, “or I shall go myself and bargain with your _affettatore_, who is mine also; he is an old friend of mine, who has plundered me pretty well already, and, in the hope of making more out of me, he will take a less price than the one I offer you; you will lose the preference, and that will be your fault.”

“Do not give yourselves the trouble, excellency,” returned Signor Pastrini, with the smile peculiar to the Italian speculator when he confesses defeat; “I will do all I can, and I hope you will be satisfied.”

“And now we understand each other.”

“When do you wish the carriage to be here?”

“In an hour.”

“In an hour it will be at the door.”

An hour after the vehicle was at the door; it was a hack conveyance which was elevated to the rank of a private carriage in honor of the occasion, but, in spite of its humble exterior, the young men would have thought themselves happy to have secured it for the last three days of the Carnival.

“Excellency,” cried the _cicerone_, seeing Franz approach the window, “shall I bring the carriage nearer to the palace?”

Accustomed as Franz was to the Italian phraseology, his first impulse was to look round him, but these words were addressed to him. Franz was the “excellency,” the vehicle was the “carriage,” and the Hôtel de Londres was the “palace.” The genius for laudation characteristic of the race was in that phrase.

Franz and Albert descended, the carriage approached the palace; their excellencies stretched their legs along the seats; the _cicerone_ sprang into the seat behind.

“Where do your excellencies wish to go?” asked he.

“To Saint Peter’s first, and then to the Colosseum,” returned Albert. But Albert did not know that it takes a day to see Saint Peter’s, and a month to study it. The day was passed at Saint Peter’s alone.

Suddenly the daylight began to fade away; Franz took out his watch—it was half-past four. They returned to the hotel; at the door Franz ordered the coachman to be ready at eight. He wished to show Albert the Colosseum by moonlight, as he had shown him Saint Peter’s by daylight. When we show a friend a city one has already visited, we feel the same pride as when we point out a woman whose lover we have been.

He was to leave the city by the Porta del Popolo, skirt the outer wall, and re-enter by the Porta San Giovanni; thus they would behold the Colosseum without finding their impressions dulled by first looking on the Capitol, the Forum, the Arch of Septimus Severus, the Temple of Antoninus and Faustina, and the Via Sacra.

They sat down to dinner. Signor Pastrini had promised them a banquet; he gave them a tolerable repast. At the end of the dinner he entered in person. Franz thought that he came to hear his dinner praised, and began accordingly, but at the first words he was interrupted.

“Excellency,” said Pastrini, “I am delighted to have your approbation, but it was not for that I came.”

“Did you come to tell us you have procured a carriage?” asked Albert, lighting his cigar.

“No; and your excellencies will do well not to think of that any longer; at Rome things can or cannot be done; when you are told anything cannot be done, there is an end of it.”

“It is much more convenient at Paris,—when anything cannot be done, you pay double, and it is done directly.”

“That is what all the French say,” returned Signor Pastrini, somewhat piqued; “for that reason, I do not understand why they travel.”

“But,” said Albert, emitting a volume of smoke and balancing his chair on its hind legs, “only madmen, or blockheads like us, ever do travel. Men in their senses do not quit their hotel in the Rue du Helder, their walk on the Boulevard de Gand, and the Café de Paris.”

It is of course understood that Albert resided in the aforesaid street, appeared every day on the fashionable walk, and dined frequently at the only restaurant where you can really dine, that is, if you are on good terms with its waiters.

Signor Pastrini remained silent a short time; it was evident that he was musing over this answer, which did not seem very clear.

“But,” said Franz, in his turn interrupting his host’s meditations, “you had some motive for coming here, may I beg to know what it was?”

20099m

“Ah, yes; you have ordered your carriage at eight o’clock precisely?”

“I have.”

“You intend visiting _Il Colosseo_.”

“You mean the Colosseum?”

“It is the same thing. You have told your coachman to leave the city by the Porta del Popolo, to drive round the walls, and re-enter by the Porta San Giovanni?”

“These are my words exactly.”

“Well, this route is impossible.”

“Impossible!”

“Very dangerous, to say the least.”

“Dangerous!—and why?”

“On account of the famous Luigi Vampa.”

“Pray, who may this famous Luigi Vampa be?” inquired Albert; “he may be very famous at Rome, but I can assure you he is quite unknown at Paris.”

“What! do you not know him?”

“I have not that honor.”

“You have never heard his name?”

“Never.”

“Well, then, he is a bandit, compared to whom the Decesaris and the Gasparones were mere children.”

“Now then, Albert,” cried Franz, “here is a bandit for you at last.”

“I forewarn you, Signor Pastrini, that I shall not believe one word of what you are going to tell us; having told you this, begin. ‘Once upon a time——’ Well, go on.”

Signor Pastrini turned toward Franz, who seemed to him the more reasonable of the two; we must do him justice,—he had had a great many Frenchmen in his house, but had never been able to comprehend them.

“Excellency,” said he gravely, addressing Franz, “if you look upon me as a liar, it is useless for me to say anything; it was for your interest I——”

“Albert does not say you are a liar, Signor Pastrini,” said Franz, “but that he will not believe what you are going to tell us,—but I will believe all you say; so proceed.”

“But if your excellency doubt my veracity——”

“Signor Pastrini,” returned Franz, “you are more susceptible than Cassandra, who was a prophetess, and yet no one believed her; while you, at least, are sure of the credence of half your audience. Come, sit down, and tell us all about this Signor Vampa.”

“I had told your excellency he is the most famous bandit we have had since the days of Mastrilla.”

“Well, what has this bandit to do with the order I have given the coachman to leave the city by the Porta del Popolo, and to re-enter by the Porta San Giovanni?”

20101m

“This,” replied Signor Pastrini, “that you will go out by one, but I very much doubt your returning by the other.”

“Why?” asked Franz.

“Because, after nightfall, you are not safe fifty yards from the gates.”

“On your honor, is that true?” cried Albert.

“Count,” returned Signor Pastrini, hurt at Albert’s repeated doubts of the truth of his assertions, “I do not say this to you, but to your companion, who knows Rome, and knows, too, that these things are not to be laughed at.”

“My dear fellow,” said Albert, turning to Franz, “here is an admirable adventure; we will fill our carriage with pistols, blunderbusses, and double-barrelled guns. Luigi Vampa comes to take us, and we take him—we bring him back to Rome, and present him to his holiness the Pope, who asks how he can repay so great a service; then we merely ask for a carriage and a pair of horses, and we see the Carnival in the carriage, and doubtless the Roman people will crown us at the Capitol, and proclaim us, like Curtius and Horatius Cocles, the preservers of their country.”

Whilst Albert proposed this scheme, Signor Pastrini’s face assumed an expression impossible to describe.

“And pray,” asked Franz, “where are these pistols, blunderbusses, and other deadly weapons with which you intend filling the carriage?”

“Not out of my armory, for at Terracina I was plundered even of my hunting-knife. And you?”

“I shared the same fate at Aquapendente.”

“Do you know, Signor Pastrini,” said Albert, lighting a second cigar at the first, “that this practice is very convenient for bandits, and that it seems to be due to an arrangement of their own.”

Doubtless Signor Pastrini found this pleasantry compromising, for he only answered half the question, and then he spoke to Franz, as the only one likely to listen with attention. “Your excellency knows that it is not customary to defend yourself when attacked by bandits.”

“What!” cried Albert, whose courage revolted at the idea of being plundered tamely, “not make any resistance!”

“No, for it would be useless. What could you do against a dozen bandits who spring out of some pit, ruin, or aqueduct, and level their pieces at you?”

“Eh, _parbleu!_—they should kill me.”

The innkeeper turned to Franz with an air that seemed to say, “Your friend is decidedly mad.”

“My dear Albert,” returned Franz, “your answer is sublime, and worthy the ‘_Let him die_,’ of Corneille, only, when Horace made that answer, the safety of Rome was concerned; but, as for us, it is only to gratify a whim, and it would be ridiculous to risk our lives for so foolish a motive.”

Albert poured himself out a glass of _lacryma Christi_, which he sipped at intervals, muttering some unintelligible words.

“Well, Signor Pastrini,” said Franz, “now that my companion is quieted, and you have seen how peaceful my intentions are, tell me who is this Luigi Vampa. Is he a shepherd or a nobleman?—young or old?—tall or short? Describe him, in order that, if we meet him by chance, like Jean Sbogar or Lara, we may recognize him.”

“You could not apply to anyone better able to inform you on all these points, for I knew him when he was a child, and one day that I fell into his hands, going from Ferentino to Alatri, he, fortunately for me, recollected me, and set me free, not only without ransom, but made me a present of a very splendid watch, and related his history to me.”

“Let us see the watch,” said Albert.

Signor Pastrini drew from his fob a magnificent Bréguet, bearing the name of its maker, of Parisian manufacture, and a count’s coronet.

“Here it is,” said he.

“_Peste!_” returned Albert, “I compliment you on it; I have its fellow”—he took his watch from his waistcoat pocket—“and it cost me 3,000 francs.”

“Let us hear the history,” said Franz, motioning Signor Pastrini to seat himself.

“Your excellencies permit it?” asked the host.

“_Pardieu!_” cried Albert, “you are not a preacher, to remain standing!”

The host sat down, after having made each of them a respectful bow, which meant that he was ready to tell them all they wished to know concerning Luigi Vampa.

“You tell me,” said Franz, at the moment Signor Pastrini was about to open his mouth, “that you knew Luigi Vampa when he was a child—he is still a young man, then?”

“A young man? he is only two-and-twenty;—he will gain himself a reputation.”

“What do you think of that, Albert?—at two-and-twenty to be thus famous?”

“Yes, and at his age, Alexander, Cæsar, and Napoleon, who have all made some noise in the world, were quite behind him.”

“So,” continued Franz, “the hero of this history is only two-and-twenty?”

“Scarcely so much.”

“Is he tall or short?”

“Of the middle height—about the same stature as his excellency,” returned the host, pointing to Albert.

“Thanks for the comparison,” said Albert, with a bow.

“Go on, Signor Pastrini,” continued Franz, smiling at his friend’s susceptibility. “To what class of society does he belong?”

“He was a shepherd-boy attached to the farm of the Count of San-Felice, situated between Palestrina and the Lake of Gabri; he was born at Pampinara, and entered the count’s service when he was five years old; his father was also a shepherd, who owned a small flock, and lived by the wool and the milk, which he sold at Rome. When quite a child, the little Vampa displayed a most extraordinary precocity. One day, when he was seven years old, he came to the curate of Palestrina, and asked to be taught to

read; it was somewhat difficult, for he could not quit his flock; but the good curate went every day to say mass at a little hamlet too poor to pay a priest and which, having no other name, was called Borgo; he told Luigi that he might meet him on his return, and that then he would give him a lesson, warning him that it would be short, and that he must profit as much as possible by it. The child accepted joyfully. Every day Luigi led his flock to graze on the road that leads from Palestrina to Borgo; every day, at nine o'clock in the morning, the priest and the boy sat down on a bank by the wayside, and the little shepherd took his lesson out of the priest's breviary. At the end of three months he had learned to read. This was not enough—he must now learn to write. The priest had a writing teacher at Rome make three alphabets—one large, one middling, and one small; and pointed out to him that by the help of a sharp instrument he could trace the letters on a slate, and thus learn to write. The same evening, when the flock was safe at the farm, the little Luigi hastened to the smith at Palestrina, took a large nail, heated and sharpened it, and formed a sort of stylus. The next morning he gathered an armful of pieces of slate and began. At the end of three months he had learned to write. The curate, astonished at his quickness and intelligence, made him a present of pens, paper, and a penknife. This demanded new effort, but nothing compared to the first; at the end of a week he wrote as well with this pen as with the stylus. The curate related the incident to the Count of San-Felice, who sent for the little shepherd, made him read and write before him, ordered his attendant to let him eat with the domestics, and to give him two piastres a month. With this, Luigi purchased books and pencils. He applied his imitative powers to everything, and, like Giotto, when young, he drew on his slate sheep, houses, and trees. Then, with his knife, he began to carve all sorts of objects in wood; it was thus that Pinelli, the famous sculptor, had commenced.

"A girl of six or seven—that is, a little younger than Vampa—tended sheep on a farm near Palestrina; she was an orphan, born at Valmontone and was named Teresa. The two children met, sat down near each other, let their flocks mingle together, played, laughed, and conversed together; in the evening they separated the Count of San-Felice's flock from those of Baron Cervetri, and the children returned to their respective farms, promising to meet the next morning. The next day they kept their word, and thus they grew up together. Vampa was twelve, and Teresa eleven. And yet their natural disposition revealed itself. Beside his taste for the fine arts, which Luigi had carried as far as he could in his solitude, he was given to alternating fits of sadness and enthusiasm, was often angry and capricious, and always sarcastic. None of the lads of Pampinara, Palestrina, or Valmontone had been able to gain any influence over him or even to become his companion. His disposition (always inclined to exact concessions rather than to make them) kept him aloof from all friendships. Teresa alone ruled by a look, a word, a gesture, this impetuous character, which yielded beneath the hand of a woman, and which beneath the hand of a man might have broken, but could never have been bended. Teresa was lively and gay, but coquettish to excess. The two piastres that Luigi received every month from the Count of San-Felice's steward, and the price of all the little carvings in wood he sold at Rome, were expended in ear-rings, necklaces, and gold hairpins. So that, thanks to her friend's generosity, Teresa was the most beautiful and the best-attired peasant near Rome.

"The two children grew up together, passing all their time with each other, and giving themselves up to the wild ideas of their different characters. Thus, in all their dreams, their wishes, and their conversations, Vampa saw himself the captain of a vessel, general of an army, or governor of a province. Teresa saw herself rich, superbly attired, and attended by a train of liveried domestics. Then, when they had thus passed the day in building castles in the air, they separated their flocks, and descended from the elevation of their dreams to the reality of their humble position.

"One day the young shepherd told the count's steward that he had seen a wolf come out of the Sabine mountains, and prowl around his flock. The steward gave him a gun; this was what Vampa longed for. This gun had an excellent barrel, made at Brescia, and carrying a ball with the precision of an English rifle; but one day the count broke the stock, and had then cast the gun aside. This, however, was nothing to a sculptor like Vampa; he examined the broken stock, calculated what change it would require to adapt the gun to his shoulder, and made a fresh stock, so beautifully carved that it would have fetched fifteen or twenty piastres, had he chosen to sell it. But nothing could be farther from his thoughts.

"For a long time a gun had been the young man's greatest ambition. In every country where independence has taken the place of liberty, the first desire of a manly heart is to possess a weapon, which at once renders him capable of defence or attack, and, by rendering its owner terrible, often makes him feared. From this moment Vampa devoted all his leisure time to perfecting himself in the use of his precious weapon; he purchased powder and ball, and everything served him for a mark—the trunk of some old and moss-grown olive-tree, that grew on the Sabine mountains; the fox, as he quitted his earth on some marauding excursion; the eagle that soared above their heads: and thus he soon became so expert, that Teresa overcame the terror she at first felt at the report, and amused herself by watching him direct the ball wherever he pleased, with as much accuracy as if he placed it by hand.

20107m

“One evening a wolf emerged from a pine-wood near which they were usually stationed, but the wolf had scarcely advanced ten yards ere he was dead. Proud of this exploit, Vampa took the dead animal on his shoulders, and carried him to the farm. These exploits had gained Luigi considerable reputation. The man of superior abilities always finds admirers, go where he will. He was spoken of as the most adroit, the strongest, and the most courageous _contadino_ for ten leagues around; and although Teresa was universally allowed to be the most beautiful girl of the Sabines, no one had ever spoken to her of love, because it was known that she was beloved by Vampa. And yet the two young people had never declared their affection; they had grown together like two trees whose roots are mingled, whose branches intertwined, and whose intermingled perfume rises to the heavens. Only their wish to see each other had become a necessity, and they would have preferred death to a day’s separation.

“Teresa was sixteen, and Vampa seventeen. About this time, a band of brigands that had established itself in the Lepini mountains began to be much spoken of. The brigands have never been really extirpated from the neighborhood of Rome. Sometimes a chief is wanted, but when a chief presents himself he rarely has to wait long for a band of followers.

“The celebrated Cucumetto, pursued in the Abruzzo, driven out of the kingdom of Naples, where he had carried on a regular war, had crossed the Garigliano, like Manfred, and had taken refuge on the banks of the Amasine between Sonnino and Juperno. He strove to collect a band of followers, and followed the footsteps of Decesaris and Gasparone, whom he hoped to surpass. Many young men of Palestrina, Frascati, and Pampinara had disappeared. Their disappearance at first caused much disquietude; but it was soon known that they had joined Cucumetto. After some time Cucumetto became the object of universal attention; the most extraordinary traits of ferocious daring and brutality were related of him.

“One day he carried off a young girl, the daughter of a surveyor of Frosinone. The bandit’s laws are positive; a young girl belongs first to him who carries her off, then the rest draw lots for her, and she is abandoned to their brutality until death relieves her sufferings. When their parents are sufficiently rich to pay a ransom, a messenger is sent to negotiate; the prisoner is hostage for the security of the messenger; should the ransom be refused, the prisoner is irrevocably lost. The young girl’s lover was in Cucumetto’s troop; his name was Carlini. When she recognized her lover, the poor girl extended her arms to him, and believed herself safe; but Carlini felt his heart sink, for he but too well knew the fate that awaited her. However, as he was a favorite with Cucumetto, as he had for three years faithfully served him, and as he had saved his life by shooting a dragoon who was about to cut him down, he hoped the chief would have pity on him. He took Cucumetto one side, while the young girl, seated at the foot of a huge pine that stood in the centre of the forest, made a veil of her picturesque head-dress to hide her face from the lascivious gaze of the bandits. There he told the chief all—his affection for the prisoner, their promises of mutual fidelity, and how every night, since he had been near, they had met in some neighboring ruins.

20109m

“It so happened that night that Cucumetto had sent Carlini to a village, so that he had been unable to go to the place of meeting. Cucumetto had been there, however, by accident, as he said, and had carried the maiden off. Carlini besought his chief to make an exception in Rita’s favor, as her father was rich, and could pay a large ransom. Cucumetto seemed to yield to his friend’s entreaties, and bade him find a shepherd to send to Rita’s father at Frosinone.

“Carlini flew joyfully to Rita, telling her she was saved, and bidding her write to her father, to inform him what had occurred, and that her ransom was fixed at three hundred piastres. Twelve hours’ delay was all that was granted—that is, until nine the next morning. The instant the letter was written, Carlini seized it, and hastened to the plain to find a messenger. He found a young shepherd watching his flock. The natural messengers of the bandits are the shepherds who live between the city and the mountains, between civilized and savage life. The boy undertook the commission, promising to be in Frosinone in less than an hour. Carlini returned, anxious to see his mistress, and announce the joyful intelligence. He found the troop in the glade, supping off the provisions exacted as contributions from the peasants; but his eye vainly sought Rita and Cucumetto among them.

“He inquired where they were, and was answered by a burst of laughter. A cold perspiration burst from every pore, and his hair stood on end. He repeated his question. One of the bandits rose, and offered him a glass filled with Orvietto, saying, ‘To the health of the brave Cucumetto and the fair Rita.’ At this moment Carlini heard a woman’s cry; he divined the truth, seized the glass, broke it across the face of him who presented it, and rushed towards the spot whence the cry came. After a hundred yards he turned the corner of the thicket; he found Rita senseless in the arms of Cucumetto. At the sight of Carlini, Cucumetto rose, a pistol in each

hand. The two brigands looked at each other for a moment—the one with a smile of lasciviousness on his lips, the other with the pallor of death on his brow. A terrible battle between the two men seemed imminent; but by degrees Carlini's features relaxed, his hand, which had grasped one of the pistols in his belt, fell to his side. Rita lay between them. The moon lighted the group.

"'Well,' said Cucumetto, 'have you executed your commission?'

"'Yes, captain,' returned Carlini. 'At nine o'clock tomorrow Rita's father will be here with the money.'

"'It is well; in the meantime, we will have a merry night; this young girl is charming, and does credit to your taste. Now, as I am not egotistical, we will return to our comrades and draw lots for her.'

"'You have determined, then, to abandon her to the common law?' said Carlini.

"'Why should an exception be made in her favor?'

"'I thought that my entreaties——'

"'What right have you, any more than the rest, to ask for an exception?'

"'It is true.'

"'But never mind,' continued Cucumetto, laughing, 'sooner or later your turn will come.' Carlini's teeth clenched convulsively.

"'Now, then,' said Cucumetto, advancing towards the other bandits, 'are you coming?'

"'I follow you.'

20111m

"Cucumetto departed, without losing sight of Carlini, for, doubtless, he feared lest he should strike him unawares; but nothing betrayed a hostile design on Carlini's part. He was standing, his arms folded, near Rita, who was still insensible. Cucumetto fancied for a moment the young man was about to take her in his arms and fly; but this mattered little to him now Rita had been his; and as for the money, three hundred piastres distributed among the band was so small a sum that he cared little about it. He continued to follow the path to the glade; but, to his great surprise, Carlini arrived almost as soon as himself.

"'Let us draw lots! let us draw lots!' cried all the brigands, when they saw the chief.

"Their demand was fair, and the chief inclined his head in sign of acquiescence. The eyes of all shone fiercely as they made their demand, and the red light of the fire made them look like demons. The names of all, including Carlini, were placed in a hat, and the youngest of the band drew forth a ticket; the ticket bore the name of Diavolaccio. He was the man who had proposed to Carlini the health of their chief, and to whom Carlini replied by breaking the glass across his face. A large wound, extending from the temple to the mouth, was bleeding profusely. Diavolaccio, seeing himself thus favored by fortune, burst into a loud laugh.

"'Captain,' said he, 'just now Carlini would not drink your health when I proposed it to him; propose mine to him, and let us see if he will be more condescending to you than to me.'

"Everyone expected an explosion on Carlini's part; but to their great surprise, he took a glass in one hand and a flask in the other, and filling it,—

"'Your health, Diavolaccio,' said he calmly, and he drank it off, without his hand trembling in the least. Then sitting down by the fire, 'My supper,' said he; 'my expedition has given me an appetite.'

"'Well done, Carlini!' cried the brigands; 'that is acting like a good fellow;' and they all formed a circle round the fire, while Diavolaccio disappeared.

"Carlini ate and drank as if nothing had happened. The bandits looked on with astonishment at this singular conduct until they heard footsteps. They turned round, and saw Diavolaccio bearing the young girl in his arms. Her head hung back, and her long hair swept the ground. As they entered the circle, the bandits could perceive, by the firelight, the unearthly pallor of the young girl and of Diavolaccio. This apparition was so strange and so solemn, that everyone rose, with the exception of Carlini, who remained seated, and ate and drank calmly. Diavolaccio advanced amidst the most profound silence, and laid Rita at the captain's feet. Then

everyone could understand the cause of the unearthly pallor in the young girl and the bandit. A knife was plunged up to the hilt in Rita's left breast. Everyone looked at Carlini; the sheath at his belt was empty.

"'Ah, ah,' said the chief, 'I now understand why Carlini stayed behind.'

"All savage natures appreciate a desperate deed. No other of the bandits would, perhaps, have done the same; but they all understood what Carlini had done.

"'Now, then,' cried Carlini, rising in his turn, and approaching the corpse, his hand on the butt of one of his pistols, 'does anyone dispute the possession of this woman with me?'

"'No,' returned the chief, 'she is thine.'

"Carlini raised her in his arms, and carried her out of the circle of firelight. Cucumetto placed his sentinels for the night, and the bandits wrapped themselves in their cloaks, and lay down before the fire. At midnight the sentinel gave the alarm, and in an instant all were on the alert. It was Rita's father, who brought his daughter's ransom in person.

"'Here,' said he, to Cucumetto, 'here are three hundred piastres; give me back my child.

"But the chief, without taking the money, made a sign to him to follow. The old man obeyed. They both advanced beneath the trees, through whose branches streamed the moonlight. Cucumetto stopped at last, and pointed to two persons grouped at the foot of a tree.

"'There,' said he, 'demand thy child of Carlini; he will tell thee what has become of her;' and he returned to his companions.

"The old man remained motionless; he felt that some great and unforeseen misfortune hung over his head. At length he advanced toward the group, the meaning of which he could not comprehend. As he approached, Carlini raised his head, and the forms of two persons became visible to the old man's eyes. A woman lay on the ground, her head resting on the knees of a man, who was seated by her; as he raised his head, the woman's face became visible. The old man recognized his child, and Carlini recognized the old man.

"'I expected thee,' said the bandit to Rita's father.

"'Wretch!' returned the old man, 'what hast thou done?' and he gazed with terror on Rita, pale and bloody, a knife buried in her bosom. A ray of moonlight poured through the trees, and lighted up the face of the dead.

"'Cucumetto had violated thy daughter,' said the bandit; 'I loved her, therefore I slew her; for she would have served as the sport of the whole band.' The old man spoke not, and grew pale as death. 'Now,' continued Carlini, 'if I have done wrongly, avenge her;' and withdrawing the knife from the wound in Rita's bosom, he held it out to the old man with one hand, while with the other he tore open his vest.

"'Thou hast done well!' returned the old man in a hoarse voice; 'embrace me, my son.'

20115m

Carlini threw himself, sobbing like a child, into the arms of his mistress's father. These were the first tears the man of blood had ever wept.

"'Now,' said the old man, 'aid me to bury my child.' Carlini fetched two pickaxes; and the father and the lover began to dig at the foot of a huge oak, beneath which the young girl was to repose. When the grave was formed, the father embraced her first, and then the lover; afterwards, one taking the head, the other the feet, they placed her in the grave. Then they knelt on each side of the grave, and said the prayers of the dead. Then, when they had finished, they cast the earth over the corpse, until the grave was filled. Then, extending his hand, the old man said; 'I thank you, my son; and now leave me alone.'

"'Yet——' replied Carlini.

"'Leave me, I command you.'

"Carlini obeyed, rejoined his comrades, folded himself in his cloak, and soon appeared to sleep as soundly as the rest. It had been resolved the night before to change their encampment. An hour before daybreak, Cucumetto aroused his men, and gave the word

to march. But Carlini would not quit the forest, without knowing what had become of Rita's father. He went toward the place where he had left him. He found the old man suspended from one of the branches of the oak which shaded his daughter's grave. He then took an oath of bitter vengeance over the dead body of the one and the tomb of the other. But he was unable to complete this oath, for two days afterwards, in an encounter with the Roman carbineers, Carlini was killed. There was some surprise, however, that, as he was with his face to the enemy, he should have received a ball between his shoulders. That astonishment ceased when one of the brigands remarked to his comrades that Cucumetto was stationed ten paces in Carlini's rear when he fell. On the morning of the departure from the forest of Frosinone he had followed Carlini in the darkness, and heard this oath of vengeance, and, like a wise man, anticipated it.

"They told ten other stories of this bandit chief, each more singular than the other. Thus, from Fondi to Perusia, everyone trembles at the name of Cucumetto.

"These narratives were frequently the theme of conversation between Luigi and Teresa. The young girl trembled very much at hearing the stories; but Vampa reassured her with a smile, tapping the butt of his good fowling-piece, which threw its ball so well; and if that did not restore her courage, he pointed to a crow, perched on some dead branch, took aim, touched the trigger, and the bird fell dead at the foot of the tree. Time passed on, and the two young people had agreed to be married when Vampa should be twenty and Teresa nineteen years of age. They were both orphans, and had only their employers' leave to ask, which had been already sought and obtained. One day when they were talking over their plans for the future, they heard two or three reports of firearms, and then suddenly a man came out of the wood, near which the two young persons used to graze their flocks, and hurried towards them. When he came within hearing, he exclaimed:

'I am pursued; can you conceal me?'
